Foreword

The Annual Conference of the EuroMed Academy provides an international forum for the dissemination of high-quality research and the exchange of ideas among academics, researchers, practitioners, and policymakers. By encouraging multidisciplinary dialogue, the conference promotes the development of new theoretical perspectives, empirical insights, and managerial approaches that contribute to advancing knowledge and addressing contemporary challenges in business and management.

Since its inception, the EuroMed Academy Conference has evolved into one of the leading international conferences in its field. Its growing reputation is reflected in the quality of the research presented, the diversity of its participants, and its increasing international reach. Beyond serving as a venue for presenting research findings, the conference facilitates scholarly debate, fosters international collaboration, and promotes the development of innovative research agendas.

The 19th Annual Conference of the EuroMed Academy welcomed 350 participants from 55 countries, bringing together academics, researchers, practitioners, doctoral students, and policymakers from across the globe. The conference programme reflected a broad spectrum of contemporary research across business, management, economics, marketing, entrepreneurship, innovation, sustainability, digital transformation, and related disciplines.

Maintaining high academic standards remains a fundamental principle of the EuroMed Academy. All papers and extended abstracts included in these Proceedings underwent a rigorous double-blind peer-review process conducted by experts in the respective fields. The accepted contributions represent a diverse collection of empirical, conceptual, methodological, and review studies that advance both scholarly understanding and managerial practice.

We trust that this Book of Proceedings will serve as a valuable reference for researchers and practitioners alike, stimulating further scholarly inquiry, encouraging interdisciplinary collaboration, and contributing to the continuous advancement of business and management research.

Acknowledgements

The successful organisation of the 19th Annual Conference of the EuroMed Academy is the result of the collective efforts and commitment of many individuals and institutions.

We would like to express our sincere appreciation to the Conference Chairs, the Scientific Committee, and the Organising Committee for their dedication, professionalism, and invaluable contribution to the planning and delivery of the conference.

Our special thanks are extended to the Track Chairs and Reviewers, whose expertise and commitment ensured the quality and integrity of the scientific programme. Through a rigorous double-blind review process, they provided constructive evaluations that contributed significantly to the selection and improvement of the papers included in these Proceedings.

We also acknowledge the important contribution of the Session Chairs and Paper Discussants, whose leadership and scholarly engagement enriched the academic discussions and promoted meaningful exchange among participants throughout the conference.

Finally, we extend our sincere gratitude to all authors, presenters, keynote speakers, practitioners, and participants. Their high-quality research, active participation, and willingness to engage in constructive dialogue are the foundation of the EuroMed Academy Conference and continue to strengthen its reputation as a leading international forum for scholarly exchange.

We hope that the collaborations established and the knowledge shared during the conference will continue to generate impactful research and meaningful contributions to both academia and practice in the years ahead.

Table of Contents

Understanding AI Adoption and Its Impact in Primary Education: A Multi-Level Analysis of Educators in Cyprus 1
Mrs. Maria Stylianou, Prof. Charalambos Vrasidas

INTELLECTUAL PROPERTY RIGHTS VERSUS PLATFORM USER BASE ON METAVERSE PLATFORMS 5
Ms. Milena Di Nenno, Mr. Minas Naltsidis

Can Brands Be Truly Feminist? A Critical Analysis Through the Lens of Fourth-Wave Feminism 9
Ms. Maria Mouskou

Beyond Rainbow-Washing: Reconceptualising Authentic Brand Activism and LGBTQI+ Consumer Well-Being 22
Mr. Panos Georgiou

Blockchain Technology as a Strategic Enabler of Buyer–Supplier Relationships in the Food Supply Chain 30
Dr. Sami El Naddaf

The Sustainability–Resilience Paradox in Tourism: A Systems-Based Sociological Conceptual Framework 33
Prof. Vanda Maráková, Mr. Branislav Očkaik

AI-Mediated Ethical Leadership in Service Ecosystems: H2H Marketing, Trust, Branding and the Human Filter 37
Mrs. Katerina Katsamba, Dr. Waldemar Pfoertsch

AI Chatbots in Customer Communication: A Systematic Literature Review 40
Ms. Henrieta Valová, Dr. Janka Taborecka

Acceptance of Metaverse Technology Along the Tourist Journey 44
Ms. Beáta Vaneková, Dr. Tomáš Gajdošík

Navigating the Triple Challenge: How Business Ecosystem Governance Positions Energy Firms for Digital, Sustainable, and Regulatory Success 48
Ms. Margaret Mastropetrou, Mr. Orestis Papamichos, Prof. Konstadinos Kutsikos

Management Model for a University Social Responsibility Program for a Business School in Latin America 63
Dr. Julianna Ramirez

Governmental Assistance Programs for Industry-University Collaboration: A Comparative Perspective 77
Dr. Osama Sam Al-kwifi, Dr. Sara Al-Maadeed

Exploring the Twin Transition: Evidence from Italian MSMEs 80
Ms. Martina Bocchini, Prof. Arturo Capasso, Prof. Matteo Rossi

Participatory Foresight for Societal Engagement in the Strategic Management Process 83
Dr. Erika Vaiginiene, Dr. Agne Paliokaite, Ms. Dovile Gaizauskiene, Ms. Aurinta Elenske

Generative AI in Global Marketing for Sustainability: A Systematic Review of Creativity, Cultural Adaptation, and Governance **85**
Mr. Mohamed Nassar, Dr. Amr ElAlfy, Dr. Osama Sam Al-kwifi

Mapping the Family SMEs Exporting Field: A Review and a Research Agenda **88**
Dr. Katerina Kampouri, Prof. Nikolaos Sklavounos, Ms. Efterpi Simoglou, Prof. Yannis Hajidimitriou

Digitalization, Emerging Technologies, and SMEs Internationalization: A Systematic Literature Review **91**
Prof. Carene Tchuinou Tchouwo, Prof. Majdi Ben Selma, Prof. Hela Chebbi

Grit in Virtual Teams: A Two-Stage Model **94**
Mr. Gabor Marki, Prof. Ilan Alon, Prof. Vas Taras, Prof. Shalom Levy

Emergent Strategy and Strategic Change in Practice: Evidence From Cases in the Agrifood and Wine Industries **98**
Ms. Katharina Mybes, Prof. Jon Hanf

A Point-of-Sale Experiment on the Influence of the Region of Origin on the Choice of Organic Wine **102**
Mr. Pedro Salvador, Prof. Beatriz Casais, Prof. Lígia Pinto

Strategic Motivations for Adopting Cryptocurrencies in the Wine Industry **107**
Dr. Michael Paul Kramer, Prof. Jon H. Hanf

A Delphi–ANP–ADAM Framework for Assessing the Sustainability Performance of Wineries **111**
Prof. Pier Paolo Miglietta, Dr. Leonardo Agnusdei, Prof. Paola De Bernardi, Dr. Giulio Paolo Agnusdei

Collaborative Strategies in Port-Based Free Zones: Strategic Integration with the Port of Luanda for Agrifood Value Chain Development **117**
Dr. Alberto Antonio Bengue, Prof. Valentina Chkoniya

Evaluating the Implementation of Green Energy Principles in Lithuania: Insights from LMDI Decomposition and Regression Analysis **121**
Prof. Gindrutė Kasnauskienė, Ms. Evelina Akinytė, Dr. Saulius Preidys, Dr. Viktorija Cohen, Mrs. Neringa Ramanauskė

Improving Savings Through Visual Framing: Experimental Insights on Goal Personalisation and Flexibility **126**
Ms. Victoria Georgiou, Dr. Christos Themistocleous

Exploring Disclosure Practices: Key Performance Indicators in SaaS Financial Reporting **129**
Ms. Carina Domat, Prof. Patrick Kraus

Does Greenwashing Matter for Chinese Banks' Performance: The Role of Gender Diversity **146**
Mr. Muhammad Ahmad, Mr. Ramiz Ur Rehman, Mr. Muhammad Akram Naseem, Mr. Joe Ueng, Mr. Niccolò Nirino

Counterfactual Explanations for Financial Asset Recommendation **149**
Dr. Tânia Carvalho, Dr. Ali Kordia, Mr. Petros Vamvakaris, Dr. Manolis Syllignakis, Prof. Maxime Cordy, Prof. Ioannis Krasonikolakis

The Strategic Intent Behind AI-Generated Advertising: A Theory-Driven Exploration of Perceived Creativity, Human Replacement and Brand Responses **153**
Dr. Catherine Lejealle, Dr. Saeedeh Rezaee Vessal, Dr. Elodie Jouny-Rivier

Internal Marketing as a Strategic Marketing Tool: Leveraging Personal and Organisational Values and Non-Financial Rewards to Foster Employee Engagement **156**
Dr. Evdoxia Kyriakou, Dr. Anna Zarkada, Prof. Ioanna Papasolomou

Internal Audit and Fraud Management in the Public Sector: The Case of Greece **159**
Dr. Nikolaos Antonakis, Dr. Dimitrios Mitskinis, Prof. Petros Lois, Prof. George Drogalas

Scaling Digital Platform Internationalization in Logistics Ecosystems: Insights from Open Syllo **174**
Prof. Sandra Filipe, Ms. Daniela Marques, Prof. Claudia Ribau

Impact of Lean Manufacturing Practices On Operational Efficiency in The Food Industry **177**
Mr. Eid Kanany, Mr. Sami El Naddaf, Dr. Nader Nader

Reframing Organisational Performance **180**
Mr. Joerg Haupt

Time of Crisis: How to Build a Resilient Organisation? **194**
Prof. Ligita Simanskiene, Dr. Jurgita Pauzuoliene, Mrs. Birute Paulikiene, Prof. Mariantonietta Fiore

Strategic Working Capital Optimization and Profitability in Omni-Channel and Q-Commerce Firms: Evidence from the UAE **197**
Mr. Qais Aldasouqi

Resource-Led Growth and Persistent Inequality in Botswana: A Panel Analysis of the Kuznets Hypothesis in Southern Africa **211**
Mr. Napoleon Tsougkas

Board structure, CEO power and Corporate Sustainability in Hotel firms: Impact on Financial Performance and Viability **222**
Dr. Panagiotis Dimitropoulos, Dr. Melinda Ratkai, Dr. Konstantinos Koronios

Liquidity management and financial resilience of NPOs under austerity periods: The case of the Greek debt crisis **225**
Dr. Panagiotis Dimitropoulos, Prof. Vasileios Giannopoulos

Artificial Intelligence in Human Resource Management: Enhancing Talent Acquisition or Eroding Employee Trust? **228**
Dr. Martin Sposato, Dr. Fotios Vouzas, Dr. Christina Nizamidou, Mrs. Kyriaki Stamatiadou

Effective Leadership for Innovation: The Role of Attachment Orientations and Ethical Climate **231**
Dr. Efrat Salton Meyer

Emotional Salary, Innovation, and Job Attributes: An Analysis of Perceptions of Job Satisfaction, Commitment, and Tenure among Millennials and Generation Z in Latin America **235**
Dr. Julianna Ramirez

Is Humble Leadership an Implicit Oxymoron? Examining Interpersonal Dynamics and Job Satisfaction **250**
Ms. Anastasia Travlou, Prof. Filotheos Ntalianis, Prof. Maria Ntaliani

Mapping the Uncharted Territory of Agile Teamwork: Identifying Knowledge Gaps and Setting a Research Agenda – A Systematic Literature Review **254**
Prof. Henning Tirrel

Mobile Applications and Marketing Communication: A Case of Prolife Pet Rescue **269**
Dr. Dalme Mulder, Mrs. Whanita Parkes

Understanding Social Media Marketing Adoption in Industrial Contexts: A Quantitative Analysis of Perceived Benefits and Barriers **272**
Dr. Zoe M. Chroni

The Impact of Social Media Platforms on Influencer-Follower Relationships **275**
Ms. Patrícia Silva, Ms. Mafalda Mendes

Should Brands Take a Stand? The Impact of Brand Activism on Consumer Responses: The Role of Message Source and Perceived Authenticity **278**
Ms. Auguste Ezerskyte, Prof. Dominyka Venciute, Prof. Ricardo Correia, Dr. Marius Kuslys

Trust, Transparency, and Consumer Learning in Bioeconomy Markets: Explaining the Gap Between Ecological Awareness and Purchase Decisions in Agrifood Systems **281**
Prof. Valentina Chkoniya, Prof. Madalena Abreu, Mrs. Inês Quintas Medina da Silva, Prof. Bráulio Alexandre Alturas

Human–AI Interaction Types in Academic Knowledge Creation: Evidence from Systematic Literature Reviews **285**
Dr. Przemyslaw Tomczyk, Prof. Demetris Vrontis

From Questionnaires to Queries: Testing the Equivalence of Human- and LLM-Generated Survey Data **288**
Prof. Henning Tirrel, Mr. Daniel Fröbel

Do ESG Scores Move Money? Evidence from U.S. Equity ETFs **291**
Dr. Svetlana Sapuric, Dr. Ifigenia Georgiou, Dr. Spyridon Repousis, Prof. Petros Lois

Do Limited Traffic Zones Reduce Urban Tourism Pressure or Relocate It? Hourly Spatiotemporal Evidence from Italy **296**
Dr. Alessandro Francesco Sinatra

Emotional Intelligence in Large Language Models: Capabilities, Limitations, and Future Directions **298**
Dr. Ali Halawi, Dr. Kholoud Fadel

Teaching Feminism in a Post-Feminist Era: Cultivating Academic Graduates as Agents of Gender Mainstreaming and Organizational Change **311**
Dr. Michal Gross, Prof. Dalit Yassour Borochowitz

Global Minds, Local Hands: How Does Cultural Context Shape Employee Experiences of DEI in Multinational Corporations (MNCs)? **314**
Prof. Andri Georgiadou, Prof. Sabine Bacouel-Jentjens

The Italian Capital of Culture Application Dossier as a Tool for Territorial Enhancement: The Case of Valeggio sul Mincio **318**
Prof. Davide Gaeta, Dr. Daniela Cavallo

The Sustainability and Modernization Gap in Tourism Performance Management: A Bibliometric Perspective (1979–2025) **322**
Prof. Eleftherios Aggelopoulos, Dr. Maria Kalogera, Dr. Elen Paraskevi Paraschi, Dr. Ioannis Lampropoulos

Geopolitical Instability in Israel and Its Impact on Hotel Sector Performance in Neighbouring countries Cyprus and Greece: Evidence from Monthly Tourism Data **325**
Dr. Chrystalla Markou, Dr. Costas Christodoulides

Luxury Hospitality In Southern France: Navigating The Sustainable Transition **361**
Dr. Alessio Travasi, Prof. Fabio Musso, Prof. Ulrike Mayrhofer

Perceived Social Presence and Trust in AI-Enabled Hospitality Services: Beyond Technology Acceptance Models **364**
Dr. Marwan Wahbi, Ms. Hanine El Sahili

UNDERSTANDING GENERATIVE AI ADOPTION AND ITS IMPACT IN PRIMARY EDUCATION: A MULTI-LEVEL ANALYSIS OF EDUCATORS IN CYPRUS

Maria Stylianou and Charalambos Vrasidas

Department of Education, University of Nicosia, Nicosia 2417, Cyprus

Keywords: Generative Artificial Intelligence; Primary Education; Teachers; Technology Acceptance Model; Professional Learning; Educational Technology; Qualitative Case Study

Abstract

Introduction - Purpose and Objectives

This study examines the use, adoption, and impact of generative artificial intelligence (GenAI) in primary education, focusing on how educators integrate GenAI into their professional and pedagogical practice, the factors influencing its implementation, and its pedagogical, professional, and organisational impact within the Cypriot primary education context.

Literature Review and Theoretical Framework

Existing research on GenAI implementation in education has primarily focused on technology acceptance, functional use, and learning outcomes, with limited attention to the dynamic pedagogical, organisational, and context-dependent processes shaping meaningful integration, particularly within primary education and early-adoption education systems such as Cyprus. Furthermore, previous studies have rarely examined how individual, pedagogical, organisational, and systemic factors interact to influence educators' implementation of GenAI and their pedagogical decision-making. To address this gap, the present study adopts an expanded Technology Acceptance Model (TAM), informed by selected constructs from the Unified Theory of Acceptance and Use of Technology (UTAUT).

Methodology and Methods

Drawing on a qualitative case study design, data were collected from fifteen primary school teachers through semi-structured interviews, concurrent think-aloud protocols, and AI-supported lesson-planning artefacts. Data were analysed using inductive thematic analysis and interpreted through an expanded Technology Acceptance Model (Davis, 1989), informed by selected constructs from the Unified Theory of Acceptance and Use of Technology (UTAUT) framework. The analysis examined the individual, organisational, and systemic factors shaping GenAI implementation, moving beyond functional accounts of technology use to provide a richer understanding of educators' professional and pedagogical practice.

Main Findings and Contribution

Findings indicate that primary school teachers integrated GenAI into professional organisation, lesson planning, instructional differentiation, assessment design, multimedia development, and self-directed professional learning. Participants perceived GenAI not as a substitute for professional judgement but as a pedagogical tool requiring continuous evaluation, adaptation, and critical mediation. Meaningful GenAI implementation emerged as a dynamic, multi-level process shaped by the interaction of individual, organisational, and systemic factors,perceived pedagogical value, AI literacy, social influence, leadership, professional learning, institutional support, available time, and broader curricular and policy conditions. Although participants demonstrated increasing professional confidence, pedagogical agency, and reflective practice, sustained implementation depended less on individual willingness than on organisational support, pedagogical guidance, leadership, professional learning opportunities, available time, and coherent institutional policies. GenAI contributed to the transformation of teaching practices by enhancing lesson design, supporting differentiated and inclusive instruction, and fostering student creativity and engagement. At the same time, the findings highlighted ethical concerns, tensions surrounding teacher autonomy and overreliance on AI, and variations in institutional readiness, demonstrating that responsible AI integration requires coherent policies, sustained professional learning, supportive leadership, and equitable access to technological resources.

Originality and Value

This study offers an original contribution by conceptualising GenAI implementation as a pedagogical, organisational, and context-sensitive process rather than merely a functional or technical form of technology acceptance. It advances an integrated conceptual understanding of GenAI implementation by

demonstrating how teacher agency, pedagogical mediation, organisational support, and systemic conditions interact to shape meaningful AI integration. The study also contributes empirical evidence from the underexplored context of Cypriot primary education, an early-adoption education system, providing insights that may inform research, policy, and educational practice in comparable contexts.

Research Limitations

The study is limited by its relatively small sample size and its focus on primary education within Cyprus, which may limit the transferability of the findings to other educational contexts. However, consistent with the qualitative case study approach, the study prioritises depth of understanding and contextual insight over statistical generalisation. Future research could explore GenAI implementation across larger and more diverse samples, different educational levels, and comparative international contexts to further examine the transferability of the proposed conceptual understanding.

Theoretical and Practical Applications/Implications

This study contributes to theory by extending existing technology acceptance research beyond functional and individualistic perspectives, proposing an integrated conceptual understanding of GenAI implementation as a dynamic, multi-level, and context-sensitive process shaped by the interaction of individual, pedagogical, organisational, and systemic factors. The findings further demonstrate that meaningful GenAI implementation depends not only on perceived usefulness and ease of use but also on teacher agency, AI literacy, pedagogical mediation, organisational support, leadership, professional learning, and coherent institutional policies. Practically, the study offers implications for education systems seeking to integrate GenAI responsibly through sustained professional development, supportive leadership, equitable technological infrastructure, and clear governance frameworks. Although grounded in the context of Cypriot primary education, the findings provide insights that may inform policy, research, and educational practice in other education systems undergoing the early stages of GenAI implementation.

Keywords: Metaverse, Creator Economy, Value Creation, Platform Ecosystems

Introduction

The metaverse is developing as a set of platform ecosystems in which the platform owner integrates metaverse-enabling technologies, while the content that gives these ecosystems their value is produced by the users that the literature defines as creators (Di Nenno et al., 2026; Krüger et al., 2025; Schöbel and Leimeister, 2023). Creator marketplaces on platforms such as Roblox are already worth millions of dollars (Roblox Corporation, 2025; Schöbel and Leimeister, 2023). Evidence remains limited, however, on the conditions under which creators decide to contribute content on a metaverse platform. Previous research emphasises, but does not test, the importance for creators of having control over how their creations are used, shared, and monetised, through Intellectual Property (IP) rights (Jung et al., 2025; Zhou et al., 2018). Moreover, studies show that creators are largely interested in the size of the platform user base, as it defines the potential market for earning revenues on their creations (Jung et al., 2025; Qayyum et al., 2024).

Purpose, Aim and Objectives

Our aim for this research is to test how those two conditions that the literature highlights as important, the size of the platform user base and the strength of intellectual property (IP) rights protection, shape creators' intention to contribute content. We ask what effect user base size and IP rights protection guarantees have on metaverse creators' intention to contribute content (dependent variable, calculated through a three-item scale adapted from (Lee and Shen, 2024), and we test four hypotheses: a main effect of each condition, an interaction between the two, and a dominance effect whereby strong IP rights protection sustains the intention to contribute even when the user base is small.

Literature Review and Theoretical Framework

Metaverse ecosystems depend on creators that are platform complementors, actors who build products and services on top of the platform (Krüger et al., 2025). In traditional platform ecosystems

complementors are usually firms with the resources to build on the platform (Inoue and Tsujimoto, 2018), whereas in the metaverse they include also individual users (Beheshti et al., 2024). Their participation is essential for value creation because their content encourages other actors to join the platform (Ferrigno et al., 2023).

Research on metaverse creators reports that market attractiveness, for which user base size is the clearest indicator, is what creators weigh most when evaluating a platform, since a larger user base widens the market for their creations (Jung et al., 2025). Market potential is weighed against governance risk, because ownership of content created inside the metaverse is unsettled and creators risk seeing their work reused without attribution or appropriated by the platform owner (Zhou et al., 2018). Where complementors are unpaid, or paid less than they expected, the benefit of a large user base may not materialise at all (Boudreau and Jeppesen, 2015), which is why the two conditions have to be examined both separately and jointly.

Methodology and Methods

We conduct a 2x2 between-subjects factorial experiment contrasting user base size (large versus small) and IP rights protection (strong versus weak), because this design separates the effect of each condition from their interaction and supports causal inference. Participants are 128 metaverse creators recruited through Prolific and CloudResearch Connect and screened in a pre-study in which they described the content they produce and the tools they use, so that the survey with the experiment would be sent only to respondents matching the creator profile. The participants are randomly assigned to one condition for each experimental factor: user base size (small vs. large) and IP rights protection (strong vs. weak). We analyse the data collected through factorial ANOVA and independent samples t-tests. We also check whether participants correctly perceived the experimental manipulations, through two independent-samples t-tests on each condition.

Expected Findings and Contribution

First results indicate that creators' intention to contribute responds to IP rights protection and not to the size of the user base, and that this intention stays high under strong IP rights protection even when the user base is small. We expect the completed analysis to confirm that the two conditions do not interact, which would mean that creators assess ownership guarantees on their own rather than jointly with market size. The study contributes empirical evidence on a governance mechanism that metaverse research has discussed without testing, and it suggests to platform owners entering the market that guarantees on content ownership may do more for creator participation than investment in user acquisition.

Research Limitations

The experiment manipulates two conditions only, so it says nothing about monetisation mechanisms, developer tools or onboarding rules. The analysis addresses the aggregate effect across a sample ranging from hobbyists to professionals, so differences between creator types remain untested, and the complexity of what is created may moderate the effect of IP rights protection.

CAN BRANDS BE TRULY FEMINIST? A CRITICAL ANALYSIS THROUGH THE LENS OF FOURTH-WAVE FEMINISM

Mouskou, Maria

Faculty of Communication and Media Studies, Cyprus University of Technology, Limassol, Cyprus

Keywords: Marketing, Feminism, Fourth-Wave Feminism, Popular Feminism, Feminist Branding, Neoliberal feminism, Poststructuralism, Feminist Critical Discourse Analysis

Abstract

After decades in which feminism was often treated as a "dirty" word, the feminist movement has gained renewed momentum, primarily fuelled by digital activism and what has been described as the fourth wave of feminism (Maclaran, 2015; Cabrera et al., 2021). Pop culture, media, and, following close behind, marketing campaigns appear to have embraced feminist values, such as empowerment, authenticity, gender equality, and more inclusive and intersectional representations of women. However, scholars have raised concerns about the rise of a feminist movement that is being increasingly popularised, commodified, depoliticised and reshaped by neoliberal values and market structures (McRobbie, 2009; Banet-Weiser, 2018; Rottenberg, 2014).

Drawing on the emergent field of fourth-wave feminism, marked by digital activism, intersectionality, and renewed attention to structural inequalities (Cochrane, 2013; Munro, 2013), this research aims to critically interrogate how brands appropriate feminist discourse and whether such appropriations can ever be considered authentic. Fourth-wave feminism offers a valuable theoretical lens for this analysis, because of its focus on inclusivity, intersectional justice and scepticism towards commercialisation (Zimmerman, 2017).

Introduction

The incorporation of feminist messaging in branding is not a new phenomenon. However, the rise of the fourth wave of feminism, alongside the proliferation of feminist discourse on digital platforms and social media, the emphasis on women's empowerment in contemporary media and popular culture, and the commercialisation of feminism calls for a renewed investigation into how marketing and branding engage with feminist values.

After decades of stigma during the postfeminist era of the 1980s through 2000s, in which feminist politics were presented as redundant and unfashionable in a supposedly egalitarian society where patriarchy was perceived as obsolete (McRobbie, 2004), feminism has finally made a comeback as women are once again seeking to challenge global injustices (Maclaran, 2015).

The emergence in the early 2010s of what is now referred to as the fourth wave of feminism, characterised by digital activism, intersectionality, and a renewed attention to structural inequalities (Cochrane, 2013; Munro, 2013), has marked a critical turn away from postfeminist complacency. Fourth-wave feminism is distinguished from previous feminist waves by its use of social media platforms to mobilise campaigns against sexual violence (#MeToo), workplace inequality, body policing, and online misogyny (Munro, 2013; Gill, 2016). In this context, the fourth wave of feminism represents a turning point: it reclaims feminism's political urgency, challenges neoliberal narratives of empowerment, and re-establishes solidarity as a central feminist value.

Although Rivers (2017) has cautioned against declaring the end of postfeminism, she nevertheless has declared the arrival of the fourth wave of feminism by saying "the voices arguing for an openly pro-feminist identity and a 'revival' of feminist politics have begun to be heard, culminating in a swell of activity that could be conceptualised as the arrival of the fourth wave" (p. 25).

This development has been mirrored by a broader embrace of feminism within popular culture and commercial practices. Celebrities such as Beyoncé, Emma Watson, Taylor Swift and

Miley Cyrus made feminism fashionable again by publicly declaring themselves as feminists (Banet-Weiser, 2018; Rivers, 2017). And as feminism gained renewed cultural visibility, brands moved swiftly to align themselves with feminist values. Campaigns such as Dove's 'Real Beauty', Always' #LikeAGirl, and Pantene's #sorrynotsorry adopted feminist branding by seeking to challenge gender stereotypes and empower women.

However, as the cultural and commercial legitimation has made feminism popular again, scholars have raised urgent concerns: Is feminist branding a genuine engagement with feminist goals, or does it represent the commodification and depoliticisation of feminism for commercial gain (Banet-Weiser, 2018)? Scholars such as McRobbie (2009) and Rottenberg (2014) argue that feminism itself has been increasingly reshaped by neoliberal values, promoting individual empowerment at the expense of collective action.

This research project seeks to build upon such critiques by examining whether contemporary branding practices perpetuate postfeminist and neoliberal ideologies, even as they outwardly claim feminist commitments. Drawing on the emergent field of fourth-wave feminism, this doctoral research proposes to critically interrogate how brands appropriate feminist discourses and whether such appropriations can ever be considered authentic.

The lens of fourth-wave feminism offers a dynamic and contemporary framework for assessing whether branded and popular culture representations truly challenge or merely reinforce systemic inequalities, given its focus on inclusivity, intersectional justice, and scepticism towards commercialisation (Zimmerman, 2017).

Research Aim and Questions

Research aim

This research aims to explore and critically assess how brands use feminist narratives for marketing purposes, understand consumer perceptions and analyse these practices in light of fourth-wave feminist theory.

As this doctoral research is in its early stages, the research questions have not yet been finalised. The research questions presented below represent the study's current conceptual direction and will be further developed and refined as the theoretical framework and empirical focus are more clearly defined.

Research questions

1. To what extent do brands include feminist values in their branding and marketing campaigns?
2. To what extent are these campaigns aligned with the principles of fourth-wave feminism?
3. How do female consumers perceive, critically interpret, negotiate and respond to feminist-oriented marketing campaigns and brand narratives?

Literature Review

The literature informing this study spans three intersecting domains: the historical and theoretical development of feminist waves, with particular attention to the emergence and defining characteristics of fourth-wave feminism; the commercialisation of feminist discourse and the rise of feminist branding; and the critical scholarly debates concerning the political consequences of branded feminism, including its relationship to neoliberal ideology, depoliticisation, and intersectional exclusion. This review gives a brief synthesis of these bodies of work.

Postfeminism

Following the suffragette movement of the first wave of feminism and the critique of the patriarchal status quo of the second wave, the third wave of feminism, also known as postfeminism, arrived in the 1990s. McRobbie (2004, 2009) argues that postfeminism neutralised the political force of the feminist movement by presenting feminism as redundant and unfashionable in a supposedly egalitarian society where patriarchy was perceived as obsolete. Postfeminism was not a feminist position but rather a cultural and ideological phenomenon characterised by the "taking into account" of feminism as a historical accomplishment that rendered ongoing feminist politics unnecessary (ibid).

Crucially, Gill (2007) insists that postfeminism is not simply anti-feminist, but operates through an “entanglement" with feminist ideas as it speaks the language of empowerment, choice, and agency but strips these concepts of any of their structural and collective dimensions.

Similarly, Rottenberg (2014) extends this analysis through the concept of ‘neoliberal feminism.’ The neoliberal feminist subject is one who accepts full personal responsibility for her own well-being and advancement, invests in herself as human capital, and understands gender inequality as a problem of individual attitude and effort rather than structural constraint.

Fourth-wave feminism

The emergence of fourth-wave feminism in the early 2010s represented a significant reassertion of feminist politics against the individualising and depoliticising tendencies of both postfeminism and neoliberal feminism. Scholars have identified several defining characteristics of the fourth wave, though, given the contested and internally diverse nature of feminist movements, there is no single authoritative account (Maclaran, 2015; Munro, 2013; Gill, 2016; Cochrane, 2013).

Perhaps online activism has been the most distinctive feature of the fourth wave. Digital spaces have acted as catalysts for the creation of virtual communities, sparking global protests of solidarity and challenging gender stereotypes (The Everyday Sexism Project), sexual violence (#MeToo, #IWillGoOut, “The Rapist is You”), inequalities of power (All Male Panels) and structural inequalities (UK Feminista) (Maclaran, 2015; Munro, 2013; Gill, 2016).

Fourth-wave feminism's embrace of intersectionality represents a significant advance over earlier waves, which were frequently critiqued for centring the experiences of white, middle-class, heterosexual women while marginalising or ignoring those of multiply oppressed groups (hooks, 2000; Crenshaw, 1991; Cochrane, 2013).

Fourth-wave feminism is also characterised by a renewed emphasis on the structural accounts of gender inequality. In explicit contrast to the neoliberal feminist subject described by Rottenberg (2014), fourth-wave feminism reasserts the collective and political dimensions of feminist struggle, seeking changes in law, institutional practice, economic organisation, and cultural norms rather than limiting feminist aspiration to individual self-improvement (Maclaran, 2015; Gill & Orgad, 2018). Hence, the fourth wave's characteristic scepticism toward the empowerment rhetoric, particularly when deployed in commercial contexts (Gill & Orgad, 2015; Rottenberg, 2014).

Popular feminism and feminist branding

As Banet-Weiser (2018) has argued, the early 2010s saw the emergence of what she terms "popular feminism": a form of feminist visibility highly compatible with media culture, celebrity, and consumer capitalism. Many celebrities made high-profile declarations of feminist identity, making feminism culturally fashionable and increasing its mainstream reach (Rivers, 2017). Popular feminism, Banet-Weiser (2018) argues, is characterised by its emphasis on visibility, representation, and inclusion and coexists comfortably with existing capitalist structures. Similarly, Gill and Orgad (2018) argue that branded feminism representations often promote a narrow, individualised form of empowerment compatible with neoliberal values.

Banet-Weiser's (2018) distinction between popular feminism and transformative feminism is central to this study's theoretical framework. Popular feminism, as Banet-Weiser defines it, operates at the level of visibility and representation, concerned with how women are seen, how they feel about themselves, and whether feminist voices are heard within mainstream culture. However, visibility does not necessarily lead to structural change. Popular feminism coexists comfortably with capitalism, because it does not challenge the economic structures within which commercial culture operates. Transformative feminism, by contrast, is oriented toward the structural change of the economic, legal, and cultural institutions that reproduce gender inequality.

Critical perspectives

The most sustained critique of feminist branding centres on its relationship to neoliberal ideology. McRobbie (2009) and Rottenberg (2014) have demonstrated that commercial feminist discourse consistently displaces the collective, political dimensions of feminism in favour of individualistic narratives of self-empowerment. The feminist subject constructed by brands is typically one that overcomes personal self-doubt, feels more empowered and confident and achieves success by adopting the right (branded) attitude and buying the right product. Structural inequalities, such as discrimination, pay gaps, institutional and sexual barriers, are largely absent from this narrative or are seen as something to individually overcome.

Rottenberg (2014) argues that this individualisation reflects an ideological transformation where the feminist subject adopts a neoliberal rationality. As such, feminist branding not only fails to strengthen feminist values, but also actively reproduces and normalises neoliberal values.

Closely related to the neoliberal critique is the argument that feminist branding systematically depoliticises feminist discourse. Gill and Orgad (2015, 2018) have developed the concept of a "confidence culture" to describe contemporary discourse, including self-help literature, media representations, corporate wellbeing programmes, and advertising, that tells women to "lean in," to be more assertive, to project confidence, to overcome imposter syndrome. The implication is that gender inequality persists not because of structural barriers but because women lack the psychological resources to succeed.

Maclaran (2015) extends this analysis to the marketing context, arguing that brands have enthusiastically adopted feminist rhetoric precisely because the individualised empowering rhetoric they present feminism to be is compatible with consumerism: buying the right product becomes an act of feminist self-expression.

Finally, as Zimmerman (2017) and Cochrane (2013) argue, branded feminist campaigns have systematically been focused on white, middle-class, heterosexual, and able-bodied women

while marginalising or ignoring women at the intersections of multiple other identities. This is not merely a representational failure, but an ideological one: by implicitly constructing white, middle-class femininity as the norm of feminist experience, feminist branding reproduces the very exclusions that fourth-wave feminism seeks to dismantle.

Methodology

In order to fully address the research questions, this research adopts a feminist post-structuralist approach in line with Maclaran's (2015) call for market and consumer research to move beyond simplistic empowerment narratives and instead engage with feminist theory as a critical and political tool that examines how feminist discourse is constructed, circulated and contested.

Feminism is approached not as a stable ideology but as a contested discourse shaped by cultural, political, and economic forces (McRobbie, 2009; Rottenberg, 2014). In line with fourth-wave feminism scholarship, particular attention is paid to intersectionality, digital mediation, and the tensions between feminist politics and neoliberal market logics (Munro, 2013; Maclaran, 2015; Banet-Weiser, 2018).

To address the research questions at multiple analytical levels, the study is structured around three interrelated methodological components: Critical Discourse Analysis, Qualitative Interviews, and Focus Groups. Together, these methods enable an examination of feminist branding as both a discursive practice and a lived, interpreted experience.

For all three methods, a purposive sampling approach is adopted as this research aims for analytical results that contribute to theory rather than statistical generalisations. As this research is qualitative and interpretive in nature, the goal is to contribute to theoretical insights rather than universal claims. As such, a purposive sampling approach, where case studies are selected based on relevance rather than statistical representation, is more appropriate.

Critical Discourse Analysis

Critical Discourse Analysis (Fairclough, 1995; Lazar, 2005) will be used to examine how gendered identities, empowerment discourses, and feminist values are constructed in selected case studies, such as advertisements, social media content and film portrayals that incorporate feminist rhetoric.

Critical Discourse Analysis (CDA) constitutes the primary analytical tool for examining how feminist values are articulated within marketing and popular culture texts. Drawing on Fairclough's (1995) understanding of discourse as both socially constitutive and ideologically loaded, the study employs Feminist Critical Discourse Analysis (FCDA) to foreground questions of gender, power, and inequality (Lazar, 2005).

This approach is particularly appropriate given feminist scholars' critiques of postfeminist and neoliberal appropriations of empowerment discourse, which often reframe structural inequalities as individual responsibilities (McRobbie, 2004; Rottenberg, 2014). FCDA allows for a systematic interrogation of how feminist language and imagery may signal progressiveness while simultaneously reproducing depoliticised or market-friendly versions of feminism (Gill, 2016; Gill & Orgad, 2018).

A purposive sample of high-visibility case studies will be selected for their explicit engagement with feminist themes and prominence in public discourse. Through this analysis, the study will assess whether branded feminist narratives meaningfully align with fourth-wave feminism principles or whether they reproduce postfeminist and neoliberal logics under the guise of empowerment rhetoric (Maclaran, 2012; Banet-Weiser, 2018).

Qualitative interviews

A number of semi-structured qualitative interviews will be conducted with self-identified women to explore how consumers interpret and respond to feminist branding at the level of individual meaning-making. This method is particularly suited to capturing the complexity, ambivalence, and reflexivity that characterise contemporary engagements with feminism (hooks, 2015; Gill, 2016).

Participants will be recruited through purposive sampling, with a primary focus on self-identified women. Interviews will invite participants to reflect on specific examples of feminist-oriented branding and media, including both globally recognisable campaigns and content encountered in their everyday lives. Key themes will include perceptions of authenticity, emotional responses, ethical concerns, feelings of inclusion or exclusion, and understandings of empowerment and solidarity. Interview data will be transcribed and analysed thematically using NVivo qualitative data analysis software.

Focus groups

A number of focus groups will be conducted to collect additional data to help answer the research questions. Focus groups will be utilised to investigate how brand narratives are collectively interpreted, negotiated, contested or legitimised through social interaction.

Participants will be organised into relatively homogeneous groups based on age or cultural context (to be determined) to facilitate open discussion. Each session will be structured around selected visual and textual prompts, such as advertisements, social media posts, or short media clips with explicit feminist messages.

While interviews explore individual experiences, focus groups enable the exploration of shared meanings, disagreement, and social norms surrounding feminist discourse (Gill & Orgad, 2018). Discussion will focus on how participants collectively evaluate feminist claims, articulate scepticism or endorsement, and negotiate tensions between feminist ideals and commercial motives. This method is particularly valuable for examining how feminist meanings circulate within popular culture and how they are reinforced or challenged through social interaction (Gill, 2016; Banet-Weiser, 2018).

The data gathered from the focus groups will be analysed thematically using NVivo qualitative data analysis software, similar to the interviews.

Expected Outcomes

This research is expected to make several contributions to feminist marketing scholarship. It aims to develop an analytical framework grounded in fourth-wave feminist theory to evaluate the authenticity of contemporary feminist branding practices. Through Critical Discourse Analysis, it aims to contribute to the debate of how brands appropriate feminist language while potentially reinforcing neoliberal ideologies of individual empowerment.

Furthermore, through the analysis of qualitative data from the interviews and focus groups, it seeks to reveal the complex ways in which women navigate, resist, or embrace commodified feminism, offering a deeper understanding of consumer agency within capitalist structures.

Ultimately, this research aims to contribute to the critical debate on the limits and possibilities of corporate feminism, offering conceptual tools to distinguish between superficial feminist appropriation and more substantive engagement with feminist values. In doing so, it will contribute to the ongoing debate between feminism and marketing on whether brands can meaningfully align themselves with feminist politics within neoliberal market structures (Maclaran, 2012; Gill & Orgad, 2018).

BEYOND RAINBOW-WASHING: RECONCEPTUALISING AUTHENTIC BRAND ACTIVISM AND LGBTQI+ CONSUMER WELL-BEING

Georgiou, Panos

Department of Business Administration, EUC, Nicosia, Cyprus

Keywords: Rainbow-washing, CSR (Corporate Social Responsibility), CRM (Cause-related marketing), Authentic Marketing, Brand Activism, DEIB, LGBTQI+, Well-being.

Introduction

Corporate sociopolitical activism (CSA) increasingly targets LGBTQI+ communities through Pride partnerships, rainbow branding and inclusion-themed campaigns (Montecchi et al., 2024) yet rainbow-washing describes a brand's use of LGBTQI+ symbols and Pride-related imagery primarily to signal support in advertising, without matching actions or commitments to LGBTQI+ rights (Allen and Wanjugu, 2026). While brand activism has lately gained significant attention (Ahmad et al., 2024) and such initiatives are often presented as unequivocal expressions of solidarity, critics highlight how rainbow-washing allows organisations to instrumentalise LGBTQI+ symbols and identities for commercial gain while maintaining ambiguous or contradictory organisational practices (Tressoldi et al., 2024; Schulman, 2021).

Brands have responded to consumer desires by increasingly integrating pro-LGBTQI+ initiatives in branding efforts over the last decade (Allen and Wanjugu, 2026). Rather than treating these campaigns as purely exploitative, recent scholarship conceptualises them as relations of "constitutive impurity", where commercial, political and community interests are inevitably entangled, and where both harm and well-being-enhancing outcomes are possible (Christensen et al., 2025). Despite growing scholarship on rainbow-washing and brand activism, there remains limited understanding of how these impure marketing arrangements shape LGBTQI+ consumer well-being across psychological, emotional and social dimensions (Powell et al., 2024). This study addresses that gap by examining how authentic LGBTQI+-oriented cause-related marketing builds bridges of trust, recognition and future cooperation instead of scepticism and detriment.

Aim and Objectives

This research aims to critically examine the impact of rainbow-washing on LGBTQI+ consumer well-being, analysing its psychological, emotional and social effects, particularly as manifested through consumer scepticism, engagement and trust. Additionally, it examines the relational and contextual conditions under which LGBTQI+-oriented activism fosters trust, mutual learning and cooperation, and when it instead reproduces scepticism and harm. The study is guided mainly by the following objectives: to assess the emotional, psychological and social impact of rainbow-washing on LGBTQI+ consumer well-being; to analyse how rainbow-washing affects consumer scepticism, engagement, trust and brand perception within diverse LGBTQI+ communities; to investigate the ethical dimensions of rainbow-washing within the CSR context; to evaluate whether authentic marketing can serve as an ethical branding approach that enhances LGBTQI+ consumer trust, engagement, belonging and well-being; and ultimately to develop and empirically refine a conceptual framework that links rainbow-washing, authenticity, engagement, trust and well-being.

Literature Review and Theoretical Framework

Diversity-washing is a more complex and context-dependent issue than other forms of CSR-washing (Beckert and Koch, 2025). It can be defined as the act of expressing support for a sociopolitical issue either through theoretical discourse or by presenting a concrete action plan, but subsequently failing to implement that action plan or to address the same issue happening within the organisation (Ahmad et al., 2024). Diversity-washing refers to situations in which an employer presents an outward image of inclusivity, while internally lacking concrete measures, systematic engagement with equality, or tangible results (Rudžiková, 2025). Pinkwashing originated as a critique of deceptive cause-related marketing in breast-cancer campaigns (Blackmer, 2019) and has since been extended to geopolitical and policy contexts (Conway and Edenborg, 2025). Subsequently, rainbow-washing is where LGBTQI+ rights are instrumentalised to deflect criticism or legitimise contested agendas (Beckert and Koch, 2025). Such performative gaps erode consumer trust. When inconsistencies between marketing messages and actual corporate practices come to light, rainbow-washed promotions are perceived as misleading and significantly damaging brand credibility particularly amongst well-informed consumers. (Hall et al., 2024). Equipped with awareness of these practices, consumers are likely to receive woke-branded advertising with heightened suspicion and scepticism (Caruelle, 2025).

Diversity efforts may be criticised by consumers who are supportive of the cause, but question the brand's authenticity (Campbell et al., 2025). Turner *et al.*, (2024) found that LGBTQI+ audiences are particularly critical of what they perceive as rainbow-washing, emphasising the need for brands to engage in more substantive and authentic forms of activism. If the inclusivity efforts are perceived as inauthentic or opportunistic, consumers may develop a more negative attitude (Allen and Wanjugu, 2026). Perceived authenticity partially mediates the relationship between inclusivity values and trust. In other words, when consumers perceive a firm to have strong inclusivity values, consumers are also more likely to perceive high authenticity and trust the firm more and also to hold a more positive attitude toward the same (Allen and Wanjugu, 2026). All of these conditions touch elements of consumers' lives and their experiences of the marketplace. They reaffirm the importance of recognising the complexities of how gender, sex, and sexuality interrelate and inform consumer well-being, intersecting with other markers of social locations (Steinfield et al., 2024).

There are many reasons why well-being matters (Lambert et al., 2020). Consumer well-being is conceptualised as multidimensional (psychological, emotional and social) and increasingly treats it as a core ethical benchmark for marketing and CSR, particularly for marginalised groups (Powell et al., 2024). Harmful issues identified include erasure of community voices, instrumentalization of identities, diversion from accountability and socio-psychological harm (Schulman, 2021). These conditions have detrimental impacts on well-being, which are magnified for those who already face other disadvantages for example lower socioeconomic power, racial and/or disability biases and lack of citizenship status (Steinfield et al., 2024). Yet there is a lack of understanding about how damaging each one of them is (Ahmad et al., 2024). While this question has been answered by many researchers, a recap is helpful for those who remain unconvinced of its necessity as a matter of policy and global research (Lambert et al., 2020). Thus, it's becoming imperative for companies to grasp how consumers perceive and engage with diversity, whether it be in a positive or negative manner (Campbell et al., 2025).

While brand activism can entail short to medium-term financial costs, sustained and substantive engagement with ethical and moral issues over time can mitigate perceptions of hypocrisy and strengthen brand equity (Anisimova et al., 2025). In addition, future research can further deepen the use of psychological theories in consumer studies of diversity and inclusion (DEIB) thereby informing more inclusive marketing practices (Branca et al., 2024). Drawing on relational ethics of constitutive impurity (Christensen et al., 2025), pride partnerships and LGBTQI+ cause related marketing (CRM) are conceptualised as inherently hybrid

arrangements in which commercial, political and community interests are entangled, and where both harm and well-being-enhancing outcomes are possible. Consequently, authentic marketing is treated as a relational, normative orientation within these impure arrangements, grounded in accuracy, integrity, continuity and the fulfilment of brand promises (Nunes et al., 2021; Schallehn et al., 2014). On this basis, the present study adopts a constructivist grounded theory (CGT) approach that foregrounds LGBTQI+ consumers as situated, critically literate agents who interpret, negotiate and contest these impure arrangements under structural power asymmetries.

Methodology and Methods

The research employs CGT with an abductive reasoning approach, acknowledging that preliminary conceptual frameworks exist but require empirical refinement through engagement with LGBTQI+ consumer experiences. Phase one comprises a systematic literature review (SLR) conducted across Scopus and EBSCO using five main keyword clusters: (i) rainbow-washing; (ii) brand activism and CSR ; (iii) authenticity (iv) DEIB and well-being; and (v) LGBTQI+ consumer identity. Initial searches retrieved 4,100 records (Scopus) and 4,651 records (EBSCO). Applying database-specific filters, last ten years, journal articles, English language, full text and peer-reviewed, reduced the yield to 645 (Scopus) and 1,692 (EBSCO), producing a combined pool of 2,337 records. Deduplication removed 122 items, yielding a corpus of 2,215 records (Scopus: 592; EBSCO: 1,623). Title-based screening against inclusion criteria reduced this to 721 articles (Scopus: 207; EBSCO: 514); abstract-based screening against exclusion criteria further reduced the corpus to 507 records (Scopus: 141; EBSCO: 366).

The study is currently at the full-text review stage, with remaining articles being assessed for final inclusion and thematic synthesis. Phase two comprises approximately 20 in-depth semi-structured interviews (60–90 minutes) with LGBTQI+ consumers recruited via purposive, theoretical and snowball sampling to capture intersectional diversity across age, gender identity, sexual orientation, ethnicity and geography. Analysis follows CGT protocols of open, axial and selective coding, assisted by ATLAS.ti, using constant comparison, theoretical memo-writing and iterative category refinement until theoretical saturation (Charmaz and Thornberg, 2021; Sebastian, 2019; Morse et al., 2016; Goulding, 2006).

Significance and Contribution

This study advances marketing theory by apprehending how rainbow-washing and more authentic LGBTQI+ cause-related marketing shape scepticism, trust, engagement and well-being, shifting attention from firm-level outcomes to the lived experiences of marginalised consumers (Montecchi et al., 2024). It enriches LGBTQI+ marketing and consumer-well-being scholarship by centring diverse voices and clarifying when "authentic" initiatives function as ethical, well-being-enhancing bridges and when they reproduce harm (Christensen et al., 2025), while offering practitioners evidence-based guidance to distinguish substantive allyship from opportunistic campaigns in a context of heightened scrutiny and documented corporate retreat from LGBTQI+ support (Conway and Edenborg, 2025). The research is original in integrating rainbow-washing, authentic brand activism and LGBTQI+ consumer well-being within a single theoretically driven and empirically grounded model that reconceptualises brand activism through an LGBTQI+ lens, examining how cause partnerships in contested sociopolitical domains expose consumers to backlash, withdrawals of support and symbolic gestures that may harm rather than help.

Emerging Theoretical Insights and Limitations

The SLR, currently at the full-text review stage, points to several emergent theoretical positions. Organisations that engage in LGBTQI+-oriented CSA must develop meaningful, reciprocal relationships with historically marginalised communities, and authenticity is fundamental to this process (Ciszek and Lim, 2021). Critically, perceived authenticity appears to mediate the relationship between an organisation's LGBTQI+ communication and the quality of its organisation-public relationships, meaning that symmetrical communication strategies only generate trust when consumers perceive them as genuine rather than performative (Allen and Wanjugu, 2026; Ciszek and Lim, 2021). This suggests that the structural conditions of organisational practice such as inclusive recruitment, supplier diversity and internal equity policies, are not peripheral to marketing authenticity but constitutive of it (Roberson et al., 2024).

The primary limitation of this study at its current stage is that Phase one (SLR) remains incomplete, and Phase two (qualitative interviews) has not yet commenced. Theoretical propositions are therefore provisional and subject to revision following full-text synthesis and empirical engagement with LGBTQI+ consumer experiences.

TITLE
BLOCKCHAIN TECHNOLOGY AS A STRATEGIC ENABLER OF BUYER-SUPPLIER RELATIONSHIPS IN THE FOOD SUPPLY CHAIN

El Naddaf, Sami[1]

[1]Antonine School of Business, Antonine University, Lebanon

Keywords: Blockchain Technology, Ethical Practices, Unethical Practices, Food Supply Chain, Technology, Food Fraud, Consumer Behavior.

Introduction

Blockchain technology (BCT) has emerged as a potential solution for improving transparency, traceability, security, and trust in supply chain management. Recent studies indicate that BCT can improve traceability and transparency through immutable records and secure information exchange (Ellahi et al., 2024; Karaduman and Gülhas, 2025), while also strengthening supply chain resilience and risk management (Zhou, 2024). These characteristics are particularly relevant to Lebanon, where recurring food scandals, food-safety concerns, and weaknesses in regulatory enforcement continue to affect consumer confidence.

Purpose, Aim and Objectives

The study aims to investigate the role of BCT in shaping buyer-supplier relationships in the food supply chain, with particular focus on ethical practices, transparency, and trust. It examines the impact of BCT on buyer-supplier relationships, traceability, and trust; explores its influence on consumer behaviour; develops a theoretical framework for BCT adoption in the food industry; and provides practical recommendations for enhancing ethical practices, particularly within the Lebanese context.

Literature Review and Theoretical Framework

Blockchain solutions can facilitate direct transactions between trading partners, support asset tracking, and strengthen the provenance of supply-chain data (Lacity, 2018). In the agri-food sector, BCT has also been identified as a potential sustainable business model innovation, highlighting its broader strategic relevance for supply chain management (Tiscini et al., 2020). However, the influence of BCT on the design and management of supply chains remains under-researched, particularly regarding buyer-supplier relationships and emerging economies. Earlier research also identified limited theoretical and empirical investigation of blockchain adoption in

food supply chains (Wang, 2018). The study therefore connects BCT with buyer-supplier relationships, trust, transparency, traceability, and ethical practices.

Methodology and Methods

The research focuses on the Lebanese food industry, where food-safety concerns, unethical practices, fragmented regulatory oversight, and trust-related challenges provide an appropriate context for investigating BCT. The study investigates buyer–supplier relationships and the challenges surrounding transparency, traceability, trust, and ethical behaviour.

Findings and Contribution

The study provides insights into how BCT may influence buyer–supplier relationships by improving the visibility, reliability, and traceability of information across the food supply chain. Its contribution focuses particularly on the potential of BCT to strengthen trust, enhance transparency, support ethical practices, and reduce opportunities for information manipulation and unethical behaviour.

Originality and Value

The originality of the research lies in examining BCT not only as a technological mechanism for improving efficiency and traceability, but also through its relationship with trust, ethical practices, and buyer-supplier relationships. Limited research has investigated these relational and ethical dimensions within the food industry of an emerging economy such as Lebanon.

Research Limitations

The study focuses specifically on the Lebanese food industry; therefore, economic, regulatory, cultural, and technological characteristics may limit the generalizability of its findings. Differences in technological readiness and levels of BCT adoption may also influence the applicability of the proposed framework.

Theoretical and Practical Applications and Implications

Theoretically, the study contributes to BCT and supply chain literature by integrating technology with trust, transparency, traceability, ethical practices, and buyer-supplier relationships. Practically, the findings may assist manufacturers, suppliers, buyers, policymakers, and governmental bodies in evaluating BCT as a mechanism for strengthening accountability, ethical practices, traceability, and stakeholder confidence within food supply chains.

THE SUSTAINABILITY–RESILIENCE PARADOX IN TOURISM: A SYSTEMS-BASED SOCIOLOGICAL CONCEPTUAL FRAMEWORK

Maráková, Vanda[1]; Očkaik, Branislav[1]

[1]Department of Tourism, Faculty of Economics, Matej Bel University in Banská Bystrica, Banská Bystrica, Slovakia

Keywords: Tourism Resilience, Sustainable Tourism, Systems Theory, Consumer Behaviour, Structuration Theory, Social Capital, Sustainability Paradox, Tourism Systems.

Introduction

Tourism systems increasingly experience environmental, economic and global uncertainties (Hall, Prayag and Amore, 2018; Wang et al., 2025). Therefore, resilience is a major area of interest in research and policy (Farsari, 2021). The primary assumption is that the promotion of sustainable behaviours among visitors will contribute to resilient tourism systems (Mandic et al., 2025). Despite increased awareness about sustainability issues in tourism, however, structural vulnerabilities (such as overtourism, and environmental pressures) still exist (Hartman, 2023; Sebastian Raimondo, Biondani and Giupponi, 2026). This means there is an imbalance between interventions focused on changing the behaviour of visitors and the desired system level results. This study conceptualizes this imbalance as the sustainability-resilience paradox. The sustainability-resilience paradox illustrates the conflict between the need to encourage behaviour change and the limited ability of behaviour change to produce resilience.

Purpose, Aim and Objectives

The study builds on the premise that resilient tourism destinations require sustainable visitor behaviour, which can only be achieved when tourism systems provide the structural, institutional, and social conditions that enable such behaviour. Accordingly, the study examines the relationship between visitor behaviour and tourism resilience to explain why behavioural change alone rarely produces resilient tourism systems. The purpose is to (1) reconceptualise resilience as an emergent system property, (2) position visitor behaviour within a complex tourism system, and (3) explain how system interactions condition the effectiveness of sustainable visitor behaviour.

Literature Review and Theoretical Background

Research on sustainable tourism has predominantly focused on promoting behavioural change, while studies on the attitudinal–behavioural gap demonstrate that pro-environmental values do not consistently translate into sustainable practices (Huang and Wang, 2024; Mandic et al., 2025). These perspectives primarily examine individual behaviour and provide limited explanation of the systemic conditions under which such behaviour contributes to tourism resilience. To address this gap, the present study integrates systems theory, Giddens' structuration theory, and Bourdieu's concept of social capital (Whittington, 2015; Pimentel, 2017). Systems theory conceptualises tourism as a complex adaptive system in which resilience emerges from interactions among interconnected subsystems (Hall, 2018; Farsari, 2021; Wang et al., 2025). Structuration theory explains how individual behaviour is simultaneously enabled and constrained by structural and institutional conditions, while social capital highlights the role of trust, networks, and social norms in supporting collective adaptation. Together, these perspectives provide the theoretical basis for the concept of system alignment, through which sustainable visitor behaviour can contribute to tourism resilience.

Methodology and Methods

The study adopts a conceptual research design based on an interdisciplinary qualitative synthesis of tourism resilience, systems theory, and sociological literature. The purposive literature search was conducted using the Web of Science and Scopus databases, with Google Scholar used to identify additional peripheral and seminal works. Only peer-reviewed journal articles were considered, except for foundational theoretical contributions where original books or book chapters constituted the primary source. The synthesis identifies recurring theoretical relationships concerning resilience, visitor behaviour, and systemic conditions to develop an integrated conceptual framework. This allowed the development of a systems-based conceptual framework introducing system alignment as the condition under which sustainable visitor behaviour contributes to tourism resilience. The study therefore aims to advance theory and provide a foundation for future empirical testing.

Results and Originality

The study proposes a systems-based framework in which tourism resilience emerges from the interactions among economic, infrastructure, governance, social, and demand subsystems. Within this framework, visitor behaviour is recognised as a necessary but conditional contributor to resilience. The study introduces system alignment as a multidimensional construct comprising structural (e.g., accessibility, pricing), institutional (e.g., governance,

policy), and social (e.g., norms, social capital) conditions that enable or constrain sustainable behaviour. When system alignment is weak, sustainable visitor behaviour is unlikely to translate into resilient tourism outcomes, giving rise to the sustainability–resilience paradox. Accordingly, behavioural change alone is insufficient, as resilience depends on the alignment of interacting tourism subsystems.

Value Added and Originality

The study provides new information by introducing the concept of sustainability-resilience paradox and by defining system alignment as a condition for the effectiveness of behaviour. The study contributes to the research field by moving from the analysis of determinants of behaviour to the analysis of the conditions under which behaviour affects resilience.

Limitations of the Study

The study is conceptual. There is no empirical verification of the conclusions presented. The conclusions are based on a synthesis of literature. Literature synthesis has a risk of being subjective. The generalization of the findings of the study is therefore limited.

Implications of the Study

The study conceptualises resilience as a system property that is dependent on multiple alignments. The study recommends that the implementation of coordinated interventions across structural, institutional and social dimensions are required for the establishment of the resilience of tourism. The study supports the idea that behavioural change remains relevant. However, it is only effective in a system where the behaviour of visitors is aligned.

AI-MEDIATED ETHICAL LEADERSHIP IN SERVICE ECOSYSTEMS: H2H MARKETING, TRUST, BRANDING AND THE HUMAN FILTER

Katsamba, Katerina[1]; Pfoertsch, Waldemar[1]

[1]CIIM Business School, University of Limassol, Limassol, Cyprus

Keywords: Human-centred AI; H2H Marketing; ethical leadership; service ecosystems; branding; trust; Human Filter; AI-mediated decision-making.

Introduction

Artificial intelligence is increasingly embedded in service ecosystems, where it filters attention, frames choices, recommends actions and participates in the construction of value, trust and legitimacy. Yet AI can mediate influence in ways that weaken human judgement, brand authenticity and ethical responsibility. Existing AI ethics frameworks do not fully explain how AI influence should be interpreted, governed and ethically filtered in service and brand contexts (Floridi and Cowls, 2019). Human oversight may remain nominal — a human may be formally in the loop while failing to exercise meaningful judgement (Elish, 2019). This paper argues that service ecosystems require a deeper form of ethical leadership: the Human Filter.

Purpose, Aim and Objectives

This paper develops the concept of AI-mediated ethical leadership by integrating Human-to-Human (H2H) Marketing (Kotler, Pfoertsch and Sponholz, 2021), service-dominant logic (Vargo and Lusch, 2016), ethical leadership and AI trust scholarship. It proposes the AAA framework — Attunement, Alignment and Ascendence — and positions the Human Filter as the unifying leadership capacity that interprets, questions and ethically evaluates AI outputs before these become service decisions, brand actions or institutional messages. A critical empirical gap is identified: limited research examines how leaders exercise ethically loaded service and brand judgement in the presence of AI systems.

Literature Review, Theoretical Framework and Conceptual Model

H2H Marketing places human beings, trust and value co-creation at the centre of marketing activity. In AI-mediated service ecosystems, however, AI systems act as mediating actors — structuring what becomes visible, which options appear relevant and which decisions seem

legitimate — without bearing moral responsibility for those effects. This causal-moral asymmetry is the paper's central problem.

The AAA framework addresses it through three mechanisms. Attunement: the capacity to recognise ethically and relationally salient information beyond predictive data — perceiving what AI misses when customers seek human accountability (Crolic et al., 2022). Alignment: governance boundaries ensuring AI influence remains consistent with organisational values and stakeholder dignity; mandated oversight without cultivated capacity produces moral crumple zones rather than genuine accountability (Elish, 2019). Ascendence: the ability to engage AI outputs reflectively, so that AI prompts better judgement rather than passive dependence.

The Human Filter unifies these mechanisms as the H2H Mindset enacted as interpretive leadership and distributed organisational capability: the capacity to question, contextualise and ethically evaluate AI-generated outputs before they become service decisions, brand actions or institutional messages.

Methodology and Methods

A phased strategy is proposed: qualitative interviews with service and brand leaders; survey research measuring AAA constructs using adapted scales from ethical leadership (Brown and Treviño, 2006) and AI trust scholarship; and scenario-based experiments varying AI output framing, transparency and ethical salience.

Main Findings, Originality and Value

Five propositions are advanced: Attunement predicts ethical awareness; Alignment predicts brand trust; reflective AI prompts increase willingness to challenge outputs; Human Filter capacity predicts stakeholder confidence; and psychological safety strengthens responsible AI use. Contributions span H2H Marketing theory, service-dominant logic, ethical leadership and branding — positioning the Human Filter as a measurable and trainable capability for responsible service innovation.

AI CHATBOTS IN CUSTOMER COMMUNICATION: A SYSTEMATIC LITERATURE REVIEW

Valová Henrieta[1]; Táborecká Janka[2]

[1]Faculty of Economics, Matej Bel University in Banská Bystrica, Slovakia

[2]Faculty of Economics, Matej Bel University in Banská Bystrica, Slovakia

Keywords: Artificial Intelligence, Chatbots, Customer Communication, User Experience, Technology Acceptance, AI Adoption

Introduction

Artificial intelligence is increasingly transforming customer communication by enabling companies to automate service processes, provide real-time responses and personalize interactions through chatbots, voice assistants and generative language models. At the same time, their implementation raises challenges related to trust, ethical issues and user acceptance. Existing research remains fragmented, with individual aspects of human-chatbot interaction frequently examined in isolation (Rapp et al., 2021).

Purpose, Aim and Objectives

The aim of this literature review is to systematically map existing knowledge on the use of AI and chatbots in customer communication and to identify the main thematic directions, theoretical approaches, methodological trends and research gaps shaping the field. Particular attention is paid to technology acceptance, customer experience, satisfaction, trust, anthropomorphism and human-AI interaction.

Literature Review and Theoretical Framework

Prior research commonly draws on established technology acceptance models, especially TAM and UTAUT, to explain users' behavioral responses and chatbot adoption. Perceived usefulness, ease of use and trust are repeatedly identified as important determinants of adoption (Pillai & Sivathanu, 2020). More recent studies increasingly emphasize customer experience, satisfaction and continued chatbot use, indicating a shift toward broader interactional and psychological perspectives (Nguyen & Le, 2025).

Methodology and Methods

Scopus served as the primary database, while Web of Science and ResearchGate were used as supplementary sources. Searches combined keywords related to AI, chatbots, customer communication, customer experience, technology acceptance, trust, personalization and automation. Approximately 1,100 records were initially identified. After title and abstract screening and the exclusion of studies not directly related to AI and chatbots in customer communication, 122 scientific articles published within the last five years were retained. References were managed in Zotero. Keyword co-occurrence analysis was conducted in VOSviewer, followed by content analysis to refine the thematic categorization.

Findings and Contribution

The VOSviewer analysis identified six interconnected clusters, which were subsequently refined into seven thematic categories. The greatest research attention was devoted to user experience, satisfaction and trust (21.31%), followed by anthropomorphism and human-AI interaction (18.85%), technology acceptance factors and intention to use AI tools (18.03%), and technological development and AI models (17.21%). Additional categories included automation of customer communication using AI (12.30%), chatbots in marketing communication and customer engagement (9.02%), and ethical, security and privacy aspects of AI use (3.28%).

Methodologically, prior research strongly favors quantitative, model-driven designs. Survey-based studies are most common, while qualitative and mixed-method approaches remain comparatively underrepresented. SEM and PLS-SEM are the most frequently applied analytical techniques. The synthesis shows that technological and adoption-related aspects are well developed, but customer perspectives are often examined in a partial and static manner. Relationships among user experience, satisfaction and trust, the effects of repeated chatbot use, the boundary between beneficial and counterproductive anthropomorphism, and the integration of ethical and privacy concerns remain insufficiently explored.

Originality And Value

The review integrates thematic and methodological perspectives to provide a structured overview of current AI chatbot research in customer communication. It also identifies a significant geographical gap, as research is concentrated mainly in Asia and the United States, while evidence from Central Europe and Slovakia remains limited.

Research Limitations

The scope of the review is defined by the selected databases and by its focus on studies published within the last five years.

Theoretical and Practical Applications and Implications

The findings provide a theoretical foundation for more comprehensive empirical research integrating technological, interactional and user-centered dimensions of chatbot use. They also highlight the need for context-specific research on customer perceptions, experiences and attitudes toward AI chatbots, particularly in underrepresented settings such as Slovakia.

ACCEPTANCE OF METAVERSE TECHNOLOGY ALONG THE TOURIST JOURNEY

Vaneková, Beáta; Gajdošík, Tomáš
Faculty of Economics, Matej Bel University, Banská Bystrica, Slovakia

Keywords: Metaverse, Tourism, Purchasing Behavior, Virtual Reality, Visitor Experience, Digital Technology, Immersion, Visitor Journey

Introduction

The rapid development of immersive digital technologies, especially the metaverse, is creating new opportunities for transforming decision-making processes and visitor experiences in tourism (Kılıçarslan et al., 2024). The metaverse enables interactive virtual environments based on virtual reality, augmented reality and artificial intelligence technologies that connect the physical and digital worlds (Lee et al., 2021). Despite the growing interest in the potential of the metaverse in tourism in the academic literature, there is still a lack of empirical research focused on its acceptance in the individual phases of the tourist journey (Sánchez-Amboage et al., 2024).

Purpose, Aim and Objectives

The aim of this paper is to examine the acceptance of metaverse technology in tourism from the perspective of the individual phases of tourist journey. Attention is focused on the perception of the metaverse on pre-travel decision-making, its role in shaping on-site experiences and its impact on post-visit reflection and willingness to recommend, while also identifying practical opportunities for its effective use throughout the visitor journey. The research is based on the Technology Acceptance Model (TAM) (Davis, 1989) and flow theory (Csikszentmihalyi et al., 2014), reflecting the different information needs, expectations and experiential mechanisms of visitors in the individual phases of purchasing behavior. The paper responds to the identified research gap by analyzing the acceptance of metaverse technology in tourism from the perspective of the individual phases of tourist journey and evaluating the metaverse as a tool for presenting tourist attractions and destinations. Within the TAM framework, the study focused primarily on perceived usefulness and perceived ease of use of metaverse technologies, while flow theory was reflected through the concepts of immersion and experiential engagement during the virtual experience.

Literature Review and Theoretical Framework

The empirical part is based on a quantitatively oriented experimental design, supplemented by observation. The research sample consisted of 90 respondents who participated in an experiment comparing traditional printed information materials with an immersive presentation of the same tourist attraction in a metaverse environment. Respondents first worked with printed materials and then took a virtual tour using Meta Quest 3S and Meta Quest 3 VR headsets. The length of the virtual experience ranged from 10 to 20 minutes, depending on the individual interest of the participants. To minimize contextual differences, all respondents were exposed to the same attraction content in both formats. Participants' previous experiences with VR technology were also captured in the survey as another descriptor of participants.

Methodology and Methods

Data collection was conducted using structured questionnaire to collect data, which consisted mainly of closed questions rated on a five-point Likert scale, supplemented by selected open questions, focusing on perceived informativeness, trustworthiness, usefulness, degree of immersion, intuitiveness of control and willingness to recommend the presented attraction. The data was processed using IBM SPSS Statistics. The Wilcoxon signed-rank test, Fisher's exact test, Mann–Whitney U test, and Spearman's correlation coefficient were used to test the hypotheses, with a significance level set at $\alpha = 0.05$.

Findings and Contribution

The results of the research showed that the metaverse presentation was rated significantly more positively than printed materials in all phases of the visitor journey. The most significant difference was in the pre-travel phase, where respondents perceived the metaverse as more trustworthy, informative and useful in planning and selecting a destination for their future vacation. During the stay, the metaverse presentation was associated with a higher degree of immersion in the atmosphere of the place and a better understanding of its historical and contextual background. In the post-travel phase, there was a higher willingness to recommend the attraction presented through the metaverse. The results correspond with previous studies emphasizing the ability of VR technologies to support destination marketing and pre-travel decision-making.

Originality And Value

Further analyses confirmed a strong positive correlation between the degree of immersion and willingness to recommend, as well as the important role of perceived usefulness and ease of use of the technology, in line with the assumptions of the TAM model. These findings support the principles of Marketing 6.0, according to which advanced technologies create value especially when they enhance the authentic experience, emotional engagement and sense of control on the part of the customer.

Research Limitations

The study is limited by its experimental design and reliance on subjective self-reported perceptions rather than actual visitor behavior in real tourism settings. In addition, the findings are based on a specific metaverse application and may not be fully generalizable to all tourism contexts.

Theoretical and Practical Applications and Implications

The paper contributes to the expansion of theoretical knowledge about the acceptance of the metaverse in tourism by systematically placing it within the framework of visitor journey phases and current marketing concepts such as Marketing 6.0 (Kotler et al., 2024). From a practical point of view, it highlights the potential of the metaverse as a complementary tool for marketing communication, heritage interpretation and visitor experience management. The metaverse does not appear to be a substitute for physical travel, but rather a technology that connects the informational and experiential levels throughout the visitor journey process.

NAVIGATING THE TRIPLE CHALLENGE: HOW BUSINESS ECOSYSTEM GOVERNANCE POSITIONS ENERGY FIRMS FOR DIGITAL, SUSTAINABLE AND REGULATORY SUCCESS

Mastropetrou, Margaret[1]; Papamichos, Orestis[2]; Kutsikos, Konstadinos[3]

[1]The Wave.Ahead Center for Growth Transformation, Business School, University of the Aegean, Chios, Greece

[2]Public Power Corporation Greece

[3]The Wave.Ahead Center for Growth Transformation, Business School, University of the Aegean, Chios, Greece

Keywords: Digital Transformation, Sustainability, Regulatory Compliance, Energy, Business Ecosystems, Innovation, Strategy

Abstract: The energy sector is undergoing a tremendous transition driven by digital transformation, sustainability and regulatory compliance. While each of these forces has received scholarly attention on its own, their interaction and effect on organizational strategy is underexplored. This study examines how energy firms might best position themselves to deal with these convergent pressures, guided by the hypothesis that an ecosystem-level governance provides a more resilient, innovation-oriented and effective response than firm-level measures. The main research question asks how these forces shape the internal dynamics and coordination challenges within energy business ecosystems. The paper is based on a systematic mapping study, which highlights a significant gap: previous studies have mostly viewed digital transformation, sustainability and regulatory compliance as independent forces rather than as concurrent ones. Building on this gap, a comparison of two significant European energy companies, is carried out, evaluating their different strategic approaches to handling these pressures. The findings verify that addressing the three factors as interdependent is better from a strategic and analytical standpoint. The analysis shows that an ecosystem governance approach facilitates coordination, accelerates innovation and enhances regulatory responsiveness. Future research could extend this analysis by investigating how transitional utilities can develop and coordinate competitive business ecosystems in order to derive practical strategies for attracting and retaining the right stakeholders.

Introduction

The global energy industry is undergoing a tremendous and inevitable transformation. Due to the convergence of digital technology, environmental requirements and changing regulatory frameworks, energy firms are becoming active players of complex, data- driven ecosystems, rather than just power producers and distributors. This change goes far beyond the adoption of new tools; it entails a fundamental restructuring of how value is created, exchanged and governed across the entire energy value chain (Mastropetrou et al., 2019; Kutsikos and Kontos, 2011). The systemic integration of technologies like blockchain, cloud computing, artificial intelligence (AI), and the Internet of Things (IoT), which together allow for real-time data collection, predictive analytics, and the automation of crucial energy processes, is at the core of this change (IEA, 2020). The rise of smart grids, virtual power plants (VPPs) and prosumer models shows a clear shift from the centralized, linear energy systems of the past to decentralized, interconnected and intelligent networks, where information is just as important as energy itself (Nazari and Musilek, 2023). At the same time, digital transformation and sustainability strategy are inextricably linked due to the demand to fulfill climate neutrality targets and adhere to institutional frameworks (Makridou et al., 2024). Despite considerable technological maturity, the disparity between digital intent and digital capabilities persist. The full potential of digital transformation is still limited by organizational fragmentation, a lack of interoperability standards, regulatory ambiguity, and human resistance. At the level of energy business ecosystems these tensions are particularly noticeable because governance structures struggle to keep up with the quickly changing institutional and technological realities (Chatzinikolaou et al., 2025). This paper examines the governance of energy business ecosystems at the intersection of digital transformation, sustainability and regulatory compliance. It claims that in order to advance a systemic and institutionally grounded knowledge of the energy transition, it is crucial to comprehend how ecosystem actors co-evolve and coordinate rather than concentrating on specific technologies or businesses in isolation. By doing this, it fills a gap in the literature for studies that integrate strategy, technology, and institutions into a logical analytical framework.

Aims and Objectives

The primary aim of this study is to show that energy companies that adopt a cooperative ecosystems strategy are better equipped to navigate the challenges of the energy transition than those who attempt to compete in isolation. As digital transformation, sustainability challenges

and regulatory requirements converge, no single firm has the complete collection of skills, data assets and institutional connections needed to successfully adapt. This paper makes the case that ecosystem involvement, which is defined by co-evolution, resource sharing, and cooperative governance, is a strategic requirement as opposed to an optional organizational paradigm. In order to accomplish this, the study pursues two interrelated goals. First, a Systematic Mapping Study (SMS) is first carried out, in order to compile the body of knowledge on digital transformation, sustainability, regulatory compliance, and energy business ecosystems. The SMS is employed to map the present level of knowledge, identify ongoing research gaps, and outline the main obstacles that energy companies encounter when trying to manage the transition on their own or in the absence of ecosystem governance frameworks. By systematically examining the range of available data, the SMS offers the empirical and theoretical framework upon which the study's arguments are developed. Second, to demonstrate the real-world effects of adopting an ecosystem strategy, the study compares two significant European energy firms, Public Power Corporation (PPC, Greece) and Enel (Italy). Enel, which has followed an explicitly ecosystem-oriented strategy through digital platforms, sustainability integration, and cross-sector partnerships, is contrasted with PPC, which operates mostly within a national setting with a more conventional organizational structure. By demonstrating how ecosystem orientation translates into quantifiable differences in flexibility, resilience, and strategic positioning during the energy transition, this comparison helps to root the theoretical argument in observable organizational reality.

Literature Review

Underpinning these objectives is a body of literature that links digital transformation, sustainability and ecosystem governance as interconnected processes restructuring the energy industry. According to Nazari and Musilek (2023), digital transformation in the energy sector is defined as the systemic integration of technologies, data, and processes that fundamentally alters value creation mechanisms, shifting energy systems from centralized, linear models to decentralized, interconnected, and smart networks. Real-time data collection and exploitation throughout the energy chain is made possible by the deployment of IoT, AI, cloud computing, and blockchain. The most notable examples of this change are smart grids and virtual power plants, which enable dynamic supply and demand management and turn passive consumers into active prosumers (Chatzinikolaou et al., 2025). Guo, Chen and Chen (2025), drawing on panel data from listed energy companies, demonstrate empirically that digital transformation significantly enhances sustainable development performance, though its benefits remain

unevenly distributed across firm size and value chain position — reinforcing the need for coordinated governance rather than firm-level technological adoption alone. With the energy trilemma of security, environmental performance, and equity taking on new dimensions through digital tools, sustainability serves as a strategic catalyst within this transition (Ojukwu et al., 2024; Hashim and Ojekemi 2026). At the institutional level, Environmental, Social and Governace (ESG) frameworks and regulatory compliance-based on tools like the Corporate Sustainability Reporting Directive (CSRD) and EU Taxonomy- have evolved from defensive mechanisms into strategic pillars that influence investor confidence, competitive differentiation, and access to green finance (Makridou et al., 2024). Kim and Yang (2025), through a systematic review, address the period of 2020 to 2024 as one of regulatory transition, in which ESG became from an optional corporate strategy, a fundamental governance expectation- a transformation that directly affects how energy firms manage compliance, reporting and stakeholder alignment. By facilitating structured sustainability reporting and boosting institutional legitimacy, digital ESG platforms further bridge compliance and transformation (Sharma et al., 2023). Energy business ecosystems constitute the organizational framework within which these perspectives converge, characterized as dynamic networks of interdependent actors- producers, consumers, regulators and technology providers- that co-evolve across macro, meso and micro levels and co-create value through the exchange of tangible and intangible resources (Kutsikos et al., 2014; Chatzinikolaou et al., 2025). Shahzad et al. (2025), in their digital mediation in energy communities study, find that energy ecosystems in their initial stage are defined by loosely attached stakeholder ecologies rather than fully mature governance frameworks, and that platform integration and coordinated governance are prerequisites for their maturation- an outcome that drives the current study's focus on meso-level coordination. According to the Co-Evolutionary Business Ecosystem Perspective (CEBEP), business model innovations result from actors working together with their institutional context and aligning around common resources to create sustainable value propositions (Zapata-Riveros et al., 2024). Although the concept of business ecosystem has seen great development in high-tech industries, where platform strategies have established new patterns of collaboration and competition (Giannaraki and Koutsikos, 2021), in the energy sector, relevant research remains limited and largely fragmented (Mastropetrou et al., 2025).

Methodology

Systematic mapping study is the best methodological approach for the current study, whose goal is to develop a comprehensive and evidence-based framework of how digital transformation, sustainability and regulatory compliance interact with energy business ecosystems, a field characterized by heterogeneity and where empirical data is varied and fragmented. In contrast to systematic literature review, which aims to answer a specific research question through synthesizing results, systematic mapping study focuses on categorizing and describing the available literature, identifying trends and research gaps (Vanhala et al., 2022). The application of this methodology is further justified by the specific elements of this field. Energy business ecosystems combine technological, environmental and regulatory dimensions withstanding deduction to a single disciplinary lens. Systematic mapping enables the analysis of this multi-layered reality through an objective, transparent and repeatable process, and with clear inclusion criteria of the selected studies, while producing a conceptual "map" of the research area that illustrates the concentration or lack of scientific data around critical fields, thus functioning as an orientation tool for future research (Oakley et al., 2015). Overall, systematic mapping combines rigor and flexibility, allowing for the construction of a coherent picture of the state of knowledge in a constantly evolving and complex field, like that of modern energy business ecosystems. The steps of the methodology include: planning, conducting the search and presenting the results.

Plan: Based on a first- level broad literature review and on parallel research efforts by the authors on business ecosystems, the main research question was formulated: How do digital transformation, sustainability, and regulatory frameworks shape the internal dynamics and coordination challenges within energy business ecosystems?

Conduct search: The initial search was conducted using search strings in scientific databases (Google Scholar and Science Direct) by reading through journal publications. The sets of keywords were subsequently developed based on the main concepts of digital transformation, sustainability, regulatory compliance and the energy sector. During the initial search, a key hypothesis was developed that directed the use of employed research methodology: The more digital, sustainability, and regulatory logics are integrated through an ecosystem-level governance model, the more resilient, innovation-oriented, and effective the energy business ecosystem becomes. The specific steps for searching are the following: As Kitchenham and Charters propose (2007), the hypothesis is divided into distinct aspects (i.e. population,

outcomes); a list of synonyms is created; search terms are identified; to get a comprehensive list of research objects, a backward and forward search is conducted; several inclusion and exclusion criteria were applied during the search. The key search strings that were used during the search are highlighted in table 1.

"digital transformation" or "sustainability" and "energy sector" "digital transformation" and "energy business ecosystems"	"sustainability" and "energy sector" "sustainability" and "energy business ecosystems"	"regulatory compliance" and "energy sector" "regulatory compliance" and "energy business ecosystems"

Table 1: List of search strings

The previous stage produced a large number of papers (132), which were then filtered according to titles, abstracts, and full text reading, as recommended by Petersen et al. (2015). Table 3 displays the pertinent inclusion and exclusion criteria.

Inclusion criteria	Exclusion criteria
Books or book chapters that provide information on digital transformation, sustainability or regulatory compliance in the energy sector.	Studies without empirical findings
Empirical studies with results based on observed and measured phenomena Derived knowledge from actual experience rather than from theory or beliefs.	Duplicates
Papers that provide scientific findings or reviews of research on the topic of digital transformation, sustainability, regulations or energy business ecosystems (opinion papers, validation papers, evaluation papers, case studies).	Studies not available in full text
Industry reports and thought leadership articles from top management consultancies (McKinsey, Bain, BCG).	Papers not written in English
Time frame: 2018- 2025: according to a number of research papers, the interest on the sustainability and digital transition started on 2018 (Rosario and Dias, 2022; Abelaira et al., 2025).	

Table 2: Inclusion- Exclusion Criteria

The result of the application of the inclusion/exclusion criteria was a pool of 78 papers. A classification step followed, based on a topic-related classification scheme, as proposed by Petersen et al. (2015). Initially, keywords and concepts suggesting a paper's contribution and context were found by analyzing and examining the abstracts of these papers. Keywords from several papers were then combined to provide a thorough grasp of the various topics covered. The authors chose to go deeper into the introduction and/or conclusion sections of the corresponding papers when abstracts were insufficient. 70 papers were chosen from the previously indicated pool of papers. The articles were arranged in this methodology phase using

the strategy created in the preceding step. The data extraction procedure was documented using a table that included all of the classification scheme's categories. A brief justification for each paper's placement in a particular category was provided. The data extracted from each study were as follows: title, author, publication date, main topic area, source (journal/conference, etc.). The retrieved data were then depicted using systematic maps to identify trends, concentrations and gaps in the literature.

Findings

Several insights on the study effort's premise were revealed by the examination of the selected body of scholarly and industry research material. The first mapping (temporal evolution) demonstrates a notable acceleration in publications after 2020, due to the COVID-19 pandemic's digital push (Mazza and Frantzi, 2021) and growing political pressure for climate action (Gazmarian et al., 2025). This attests to the topic's current relevance as well as its entry into a stage of scientific development (table 4).

Year of publication	Number of studies
2018- 2021	26
2022-2025	44

Table 3: Number of studies published throughout the years

The second mapping (thematic distribution) identifies five research clusters: (a) digital transformation, (b) sustainability, (c) regulatory compliance, (d) energy ecosystems and (e) their intersections. However it reveals a critical flaw: the three main dimensions are typically handled separately. Holistic frameworks integrating digital, sustainable and regulatory logics remain rare, indicating a topic fragmentation in the literature (table 5).

Research clusters	Number of studies
Digital transformation	38
Sustainability	15
Regulations	11
Energy ecosystems	6
All- encompassing	3

Table 4: Thematic distribution of selected studies

The third mapping (levels of analysis) reveals a concentration of research at the macro-level (policy, regulation) and micro-level (firms, technologies), while the meso-level- where inter-organizational coordination and ecosystem governance actually take place- is substantially under-researched (table 6).

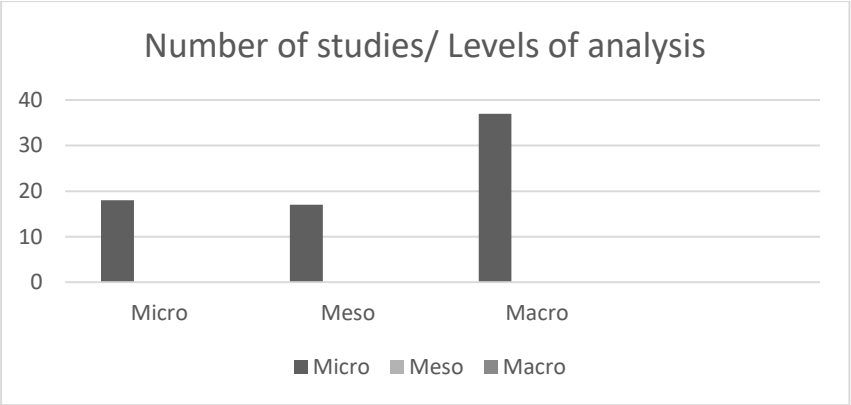

Table 5: Levels of analysis

Beyond the structural gaps, the mapping also examines a set of key challenges that energy firms face in their attempt to simultaneously incorporate the principles of digital transformation, sustainability and regulatory compliance. These challenges often interact: technological complexity and lack of skills limit the return on investment in smart infrastructure, while regulatory ambiguity hampers long-term strategic planning. The issue is therefore not just about technological solutions, but also about the institutional and organizational capacity to integrate the three dimensions of transformation (table 7).

Key challenges	Number of studies
Outdated/ incompatible systems	10
Lack of integrated systems	8
Cybersecurity/ data privacy	9
Lack of interoperability & standardization	5
Technological readiness	6
Environmental/ energy cost	12
Lack of digital culture	6
Misalignment of technological changes and regulatory adaptation	18
Complexity of operations	15
High investment- implementation cost/ risk	19

Table 6: Key challenges for the energy sector

When combined, the four mappings reveal a structural misalignment between the way academia has addressed these issues and how they actually appear in real-world situations. Research continues to approach digital transformation, sustainability requirements, and regulatory complexity as distinct domains and ignores the governance layer where their effects intersect, despite the fact that energy ecosystems are concurrently managing these challenges. Therefore it is both conceptually and empirically justified to close this twofold gap (thematic

fragmentation and level misalignment) by implementing an integrated governance framework that integrates digital, sustainability and regulatory logics simultaneously, specifically at the meso-level of energy business ecosystems.

Discussion

This section interprets the findings of the systematic mapping, by studying how digital transformation, sustainability and regulatory compliance converge in practice. Two European energy corporations- PPC and Enel- are used as illustrative cases to bridge the gap identified in the mapping with empirical understanding. Three factors led to the selection of PPC and Enel: (1) they both operate under the same EU regulatory frameworks (CSRD, SFDR, EU Taxonomy, European Green Deal) while navigating different national contexts, allowing for a comparison of how regulatory constraints translate into coordination mechanisms; (2) they represent different stages of transformation maturity—Enel as a proactive ecosystem orchestrator, PPC as a legacy utility in reactive transition; and (3) they both publish comprehensive sustainability reports, digital roadmaps, and ESG disclosures, allowing for systematic secondary-source analysis. PPC, the biggest energy provider in Greece and a former state monopoly is undertaking organizational and digital transformation under its “PPC Blue” strategic plan, with the goal of de-lignitization by 2026 (PPC Group, 2025). With its "Open Power" concept, Enel, which has operations in more than 30 countries, is regarded as a pioneer in smart technology, sustainable practices, and open ecosystem governance (Enel Group, 2024). While network modernization, ESG compliance, and adapting to quickly changing regulations are comparable concerns, their strategic approaches and ecosystem maturity are very different (Papamichos, 2025).

Parameter	PPC	Enel
Digital transformation	Smart grids, FTH FiberGrid, AI, data governance (PPC Group, 2025)	Smart grids, AI forecasting, digital platforms (Enel Group 2024)
Sustainability/ ESG	“PPC Blue”, delignitization target by 2026; ESG ratings (PPC Group, 2025)	Enel Green Power, Sustainable Development Goals (SDG) integration, circular economy, full ESG integration (S&P Global, 2025)
Regulatory compliance	Alignment with CSRD, EU Taxonomy; European Sustainability Reporting Standards (ESRS) data governance guidelines (PPC Group, 2025)	Advanced compliance framework; active role in European initiatives (OECD, 2023)

Ecosystem approach	Gradual expansion of partnerships with technology providers; more closed operating model	"Open Power" model with participation of regulators, start-ups and communities (Enel Group, 2024)
Key challenges	Digital divide, organizational inertia, transformation financing	International portfolio complexity, cybersecurity (S&P Global, 2025)
Overall path	Transitional stage of digital and ESG modernization (PPC Group, 2025)	Mature stage of digital and sustainable integration; good practice (Enel Group, 2024)

Table 7: Comparative analysis of PPC- Enel

Two essentially distinct models of ecosystem coordination are revealed by the comparison. PPC exemplifies a fragmented compliance-driven paradigm in which sustainability stays inward-looking (focused on own emissions rather than distributed networks), digital transformation acts reactively, and regulatory compliance serves as an external restriction rather than a coordination mechanism. The three logics persist in parallel without converging into a shared governance logic, which limits cooperative innovation and stakeholder alignment (PPC Group, 2025). Enel, on the other hand, is an example of a purpose-driven adaptive ecosystem. The "Open Power" model combines sustainability, digital transformation, and regulatory compliance into a cohesive strategy: sustainability serves as a partner-selection and alignment mechanism through SDG integration; digital platforms facilitate real-time data exchange and co-creation; and regulatory compliance is actively shaped through cooperation with EU institutions and the Organisation for Economic Co-operation and Development (OECD), acting as an institutional coordinator rather than a constraint (Enel Group, 2024; OECD, 2023; S&P Global, 2025). The case comparison confirms the critical gap identified in the mapping: most research handle digital transformation, sustainability, and regulatory compliance in isolation, failing to recognize that energy transformation occurs through networks of interdependent actors that co-evolve and co-create value. The identified challenges- lack of interoperability and technological readiness, regulatory ambiguity, organizational inertia- cannot be overcome by unilateral interventions; they require collective coordination and institutional alignment among energy firms, technology providers, regulators, prosumers and social actors (Mastropetrou et al, 2025). Each dimension plays a distinct, but interdependent role within the ecosystem: (1) Digital transformation reshapes structural and functional dynamics. While smart grids, AI and data-sharing platforms increase connectivity and enable adaptive coordination, they also create new frictions (interoperability gaps, governance deficits) that technology cannot fix on its own (Vrontis et al., 2022; Chatzinikolaou et al., 2025); (2) Sustainability serves as a regulatory compass acting as a guiding force and a source of institutional legitimacy; it

redefines value creation around long-term socio-environmental effect, draws in aligned players, and weeds out those who cannot adapt (Zapata-Riveros et al., 2024); (3) Regulatory frameworks provide the institutional scaffolding. ESG principles create common standards that promote cooperation, trust, and transparency, but they run the risk of becoming a source of institutional rigidity if compliance takes the place of shared purpose as the binding force (Makridou et al., 2024; Truong et al., 2025).

To fully answer the research question, it is crucial to emphasize that the three forces are co-shaping the internal dynamics of energy business ecosystems through a triadic articulation: digital transformation operationalizes sustainability by transforming abstract roles into measurable practices through data transparency and emissions monitoring (Ojukwu et al., 2024); sustainability gives digital transformation direction and legitimacy, transforming it from a technocratic intervention into an institutionally legitimated process (Sharma et al., 2023); regulatory frameworks mediate and stabilize their interaction by ensuring accountability and allowing heterogeneous actors to cooperate under common rules (Zatonatska et al., 2024). When these three forces work synergistically, they create resilient, innovative, and adaptive ecosystems. When they remain fragmented, they lead to institutional rigidity, technological underutilization, and failure to achieve sustainability goals- the dynamic that Mastropetrou et al (2025) identify as a barrier to ecosystem participation and maturation. The comparative analysis partially validates the hypothesis: the more an energy company integrates the logics of digital transformation, sustainability and regulatory compliance into a common ecosystem governance model, the more effectively it coordinates inter-organizational relationships and the more resilient and innovation-oriented the ecosystem becomes. This limited validation is itself theoretically noteworthy: it implies that integration is not linear but gradual, developing concurrently across organizational, institutional and technological aspects. This is demonstrated by Enel's sophisticated integration, which creates a self-reinforcing cycle that promotes innovation, resilience, and social legitimacy: digital platforms act as coordination infrastructure, sustainability offers regulatory orientation, and compliance guarantees institutional stability (Enel Group, 2024). The consequences of partial integration are evident in PPC's transitional trajectory, where the three logics function in parallel rather than synergistically: underutilized digital investments, limited collaborative innovation, and challenges in attracting and aligning external partners around a common sustainability vision (PPC Group, 2025). The theoretical implication is obvious: governance architecture- the extent to which digital, sustainability and regulatory reasoning are structurally aligned within the

ecosystem- determines the coordination capability, resilience and long-term competitiveness. The practical implication is similarly evident: transitional utilities cannot bridge this gap through partial compliance or standalone digital initiatives; what is necessary is a conscious structural design towards open, integrated ecosystem governance.

Conclusions and Future Work

This analysis confirms that energy business ecosystems are the essential organizational structure needed for a successful and sustainable energy transition, rather than just an alternate analytical framework. The level of integration of the three dimensions directly influences the internal coherence, adaptability and collaborative dynamics of energy ecosystems- making the ecosystem approach both a conceptual requirement and a strategic imperative (Papamichos, 2025). Ultimately, it is through this convergence of digital competence, sustainable orientation and institutional alignment that energy ecosystems can grow from fragmented groups of actors into cohesive, resilient and innovation-driven systems that can handle the complexity of the energy transition. Following these findings, our future work will shift focus towards the practical challenge of competitive positioning and ecosystem building. It will specifically look at how transitional utilities like PPC may build the collaborative capacity required to compete with established orchestrators like Enel by deliberately developing and orchestrating their own business ecosystems. Central to this effort will be the question how can companies at an earlier level of ecosystem maturity can attract, interact with and retain the right players within their ecosystems. This work expands on our earlier research on the motivations that drive organizations to join business ecosystems (Mastropetrou et al., 2021), translating these theoretical underpinnings into practical governance solutions for ecosystem builders in the energy industry.

MANAGEMENT MODEL FOR A UNIVERSITY SOCIAL RESPONSIBILITY PROGRAMME FOR A BUSINESS SCHOOL IN LATIN AMERICA

Ramírez-Lozano, Julianna Paola[1]

[1] Pontificia Universidad Católica del Perú, Lima, Perú.

CENTRUM Católica Graduate Business School, Lima, Perú

Keywords: Business School, Social Responsibility, Sustainability, SDGs, SME

Abstract

This study aims to describe a practical and successful application of a university social responsibility and sustainability programme management model, run by a business school in partnership with public-private financial institutions, that positively impacts women microentrepreneurial leaders in small and medium-sized enterprises. This research describes, analyses, and demonstrates the positive impact of the "Mujer, tu negocio crezca más" programme, highlighting the value of social intervention programmes and applied research in response to the implementation of a business school's social responsibility and sustainability model in a public-private partnership. The research was conducted through qualitative research, involving in-depth interviews with company executives and focus groups with women microentrepreneurs participating in the programme.

Introduction

This study analysed the design and implementation of a university social responsibility programme based on applied research and social intervention. The objective was to provide business training by volunteer professors from the Business School.

Female entrepreneurship plays an important role in economic and social development by fostering innovation, creating jobs, and reducing gender inequality (Campos et al., 2020). Despite these contributions, challenges such as limited access to financial resources and support networks persist, hindering women from competing on equal terms with men (Showkat et al., 2025).

The practical analysis of this experience made it possible to understand the concept of shared value and the positive impact it generates for all stakeholders involved in the programme. The programme was also related to the Sustainable Development Goals (SDGs).

Theoretical Framework

Microenterprises in Peru

The microenterprise sector is key to economic, social and regional development in developing countries, particularly in rural areas (Zamora-Pucha, 2020). Microenterprises are the source of a significant number of jobs and contribute to regional economic growth (Rodríguez Arrieta et al., 2019).

In Peru, microenterprises are defined as businesses with fewer than 10 employees and annual sales not exceeding 150 Applicable Tax Units (S/742,500 soles) (Ministerio de Trabajo y Promoción del Empleo, 2023). According to the Ministry of Production (Ministerio de la Producción, 2022), more than 2.1 million formal MSMEs were operating in 2021, of which 95.6% were microenterprises.

Microenterprises typically operate with simplified systems of production, administration, marketing, and/or finance, often managed by an individual with previous experience in the relevant field of work (Amorós et al., 2022). Recent research points to lower levels of productivity and low investment in technology and worker development, resulting in poor working conditions for employees (Lust, 2021). This has limited the improvement of working conditions and has perpetuated a situation in which precarious working conditions are seen as a source of profit (Lust, 2021).

Recent data show that 97% of microenterprises have not grown in the last 10 years. This provides evidence of the structural challenges they face on their path to growth and expansion (PQS, 2023).

Women microentrepreneurs: challenges and difficulties

Women's leadership in the approximately 1.4 million enterprises in this sector should be highlighted (Rincón, 2021). In particular, women show a remarkable entrepreneurship rate of 22.5%, surpassing the rate for men, which is 21.5% (Rincón, 2021). Approximately 33.8% of formal microenterprises are owned by women, corresponding to about 555 thousand microenterprises. Thus, entrepreneurship has a significant impact on personal recognition, autonomy in decision-making, and participation in business management and household decisions (Campos et al., 2020). Showkat et al. (2025) found a strong association between financial inclusion and women's economic empowerment.

Despite these advantages, women entrepreneurs face a number of difficulties due to their gender (Ruiz et al., 2023). These difficulties include the need to reconcile family and professional responsibilities, which hinders the development of their activities and the

performance of their businesses (Jaén et al., 2023). This puts women at a disadvantage and leads to higher levels of indebtedness (Velásquez and Portocarrero, 2019). Specifically, those competencies may play a crucial role in fostering an entrepreneurial culture, helping to enhance awareness of business opportunities, especially when women are driven by the desire to improve their autonomy and income (Llados-Masllorens and Ruiz-Dotras, 2022).

In terms of access to financial instruments, the lack of property in women's names or credit history can make it difficult to obtain credit from financial institutions or suppliers to start a business (Orihuela-Ríos, 2022).

Overall, women are less likely than men to start their own businesses, and this disparity tends to increase as a country's economic development progresses, which underscores the importance of examining women's entrepreneurship in conjunction with the level of economic development (Mouazen and Hernández-Lara, 2023).

Business education for women microentrepreneurs

Previous research has confirmed the critical importance of educational support and specific business education for the viability and sustainability of women-owned businesses (Nani and Mathwasa, 2023). Business education is essential for women microentrepreneurs, as several studies have shown that education levels have a positive impact on the performance of women-owned businesses (Serio, 2022).

The literature also shows a positive and significant impact of education on the overall performance of women-owned businesses, with a direct correlation to higher productivity and more efficient management (Serio, 2022). Limited availability of finance is one of the main barriers to business success for women entrepreneurs (Gutiérrez Cruz et al., 2021). These initiatives not only promote the success of women-owned enterprises but also play a critical role in closing persistent gender gaps in the entrepreneurial ecosystem (Carvallo Monsalve et al., 2023). In conclusion, business education emerges as a fundamental pillar in promoting women's entrepreneurship in Peru.

Municipal savings and credit banks

Their primary objective is to serve populations that are not reached by the formal banking system (Peruvian Federation of Municipal Savings and Credit Banks [FEPCMAC], 2022). They are owned by municipalities or local authorities, and their primary function is to encourage savings and offer financial services at the local level (Mayer et al., 2021). In the Peruvian financial system, municipal savings and credit banks have assumed responsibility for

servicing a significant portion of loans to micro and small enterprises, underscoring their importance in supporting this sector of the economy (Valverde and Ortiz, 2022).

Currently, 12 of these entities operate in Peru and 11 of them are grouped under the Peruvian Federation of Municipal Savings and Credit Banks (FEPCMAC) (Table 1). These entities were found to have managed a significant portion of the loans to this business segment in the Peruvian financial system (Gómez et al., 2018).

In light of this information, this study emphasises the importance of municipal savings and credit banks beyond their role as financial intermediaries.

Municipal Savings and Credit Bank (CMAC)	Established in	Member of the FEPCMAC
CMAC Arequipa	1985	Yes
CMAC Cusco	1980	Yes
CMAC Del Santa	1986	Yes
CMAC Huancayo	1988	Yes
CMAC Ica	1989	Yes
CMAC Maynas	1987	Yes
CMAC Paita	1989	Yes
CMAC Piura	1982	Yes
CMAC Sullana	1986	Yes
CMAC Tacna	1992	Yes
CMAC Trujillo	1982	Yes
CMCP Lima	1947	No

University social responsibility

University Social Responsibility (USR) is an approach in which higher education institutions recognise their obligation to society and strive to contribute to the well-being of the community

in which they operate (Vallaeys, 2021). A fundamental part of the USR is the integration of social responsibility values and principles into the university's mission and vision (Ramirez Lozano et al., 2023). It becomes a central component of the institution's identity and purpose (Larrán Jorge, 2016).

The USR is an approach to university management that is gaining relevance worldwide, including in Latin America, as a response to the organisational and academic impact of universities (Vallaeys, 2014). Studies have shown that USR can influence the positioning of universities and their interaction with the community (Cruz-Arango et al., 2022).

Taking into account these characteristics of university social responsibility, a model was proposed (Figure 1) in which it was possible to train women microentrepreneurs in collaboration with the Municipal Savings and Credit Banks.

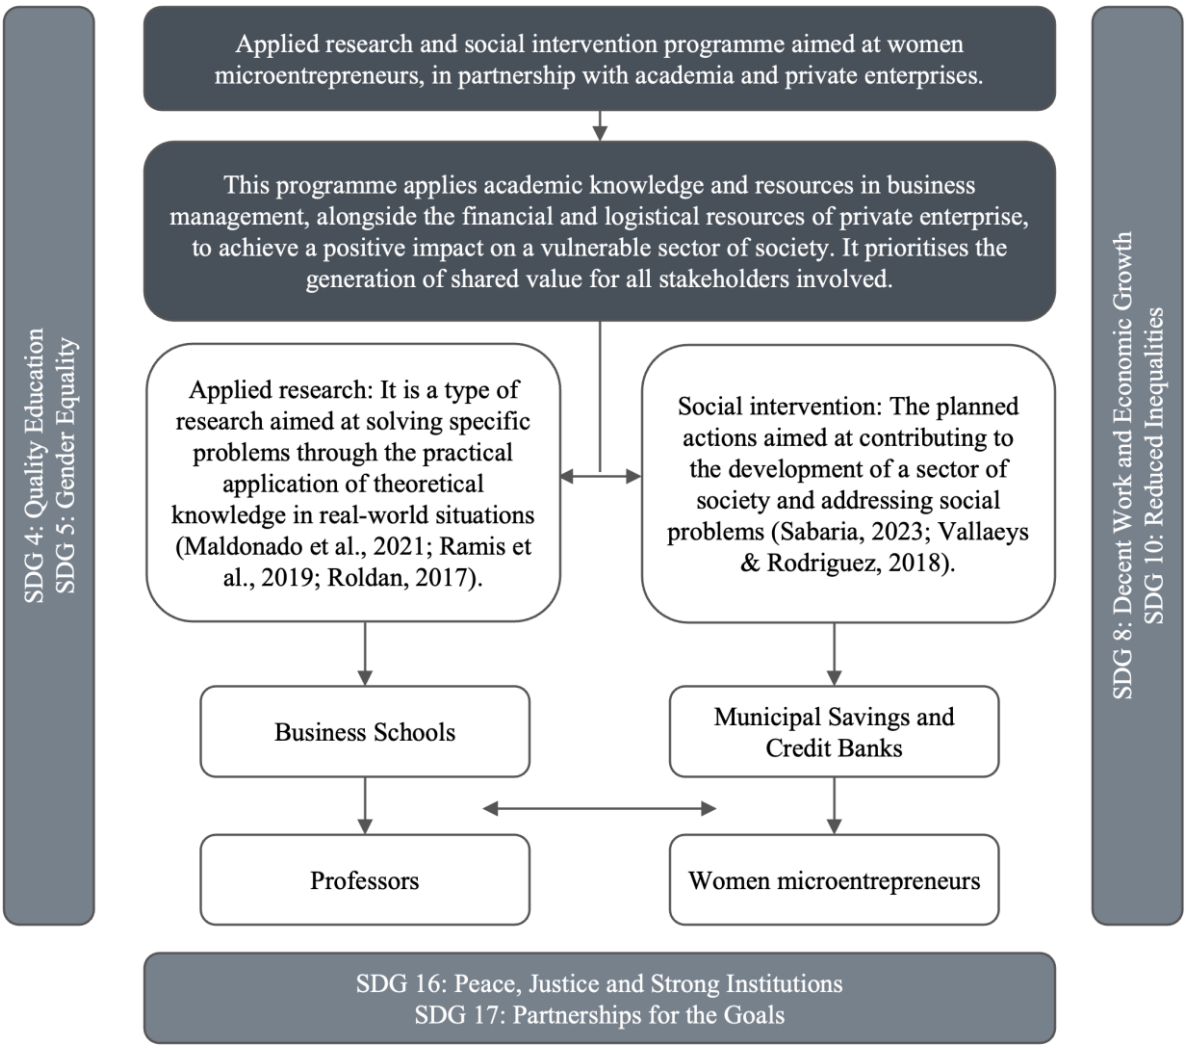

Figure 1: Theoretical Model of the Leadership and Business Training Programme for Women Microentrepreneurs

Source: Author's own creation

Methodology

Study approach

This qualitative study used in-depth interviews and focus groups as the main methods for data collection and analysis (Bansal and Corley, 2011).

The methodology proposed by Krueger (1991) and Hays and Singh (2011) was used to collect the data. The focus groups were conducted in person and led by the researcher. The data collected were analysed using thematic content analysis (Hays and Singh, 2011), which allowed for the identification of patterns and categories in participants' responses and a detailed understanding of their experiences and perspectives.

Programme description

The "Mujer, que tu negocio crezca más" (Woman, make your business grow) programme was developed as an applied research and social intervention initiative by a Peruvian Business School and Peruvian Municipal Savings and Credit Banks, institutions well-versed in the microenterprise ecosystem within the country.

The main objective was to provide a two-pillar programme: leadership training and business empowerment and improvement.

The objectives of the programme were as follows:

- Contribute to the co-creation of projects to improve the business of micro and small entrepreneurs.
- Provide two winners with a seed fund of S/4000 and S/2000.
- Contribute to the positioning of the participating companies as companies committed to the empowerment and growth of Peruvian women entrepreneurs.
- Conduct applied academic research on the business ecosystem of micro and small entrepreneurs.

During the first year (2023) of this programme, three editions were held in the cities of Cusco, Ica and Arequipa, each with the strategic support of the Municipal Savings and Credit Banks of Cusco, Ica and Arequipa, respectively. The programme was supported by 12 volunteer professors from the business school who also conducted applied research on lived reality.

In the third phase of the programme, participants had the opportunity to apply for a Seed Fund of $1200 for the first-place winner and $700 for the second-place winner based on their business improvement proposals. In the fourth phase of the programme, volunteer professors from the Business School conducted applied research focused on studying and analysing the ecosystem of microentrepreneurs in Peru.

Results

Profile of the participating microentrepreneurs

The average age of the participants was 36 years, with participants from Ica being the youngest with an average of 31 years, in contrast to those from Cusco and Arequipa who had an average age of 38 years. In addition, 7.36% had incomplete university education and 11.04% had incomplete technical education. Only 14.11% had completed secondary education.

> "To me, a woman should never neglect her responsibilities, she should find time for everything: for work, for the children, and for the family" (Participant from Ica)

Regarding the participants' businesses, the majority indicated that they had been operating between 1 and 5 years (60.11%), 25.14% had been operating for more than 6 years, and 14.75% had been operating for less than one year.

Gender gaps

One of the recurring themes in the focus groups was the balance between time devoted to family and time devoted to professional or entrepreneurial activities.

> "I worked in a company and had just had my baby. When she was three months old, I was supposed to leave her with someone and go back to work all day, but I decided not to. I had been through this situation with my son. So, I decided not to do the same thing this time. I started my own business, but with my daughter by my side." (Participant from Cusco)
>
> "I'm brave, as you say. I survived a year of the pandemic with a newborn. I'm a professional administrator, but I stopped working for my baby. However, my savings were running out, so I decided to risk the little money I had by starting a business and gradually making it grow. To be honest, I feel quite satisfied with everything I have achieved so far, and I will continue to move forward for my children" (Participant from Ica).
>
> " Being self-employed allows us to spend more time with our children, which we cannot do as employees, and as women we value that. We value time with our children" (Participant from Cusco)

In this sense, entrepreneurship is seen as an opportunity to continue to generate income for the household, while at the same time allowing them to manage their schedules to care for their children and spend more time with them in the early stages of life.

> "I believe in resilience. I also want to move forward and grow to give the best to my family, especially my daughters" (Participant from Ica)

> “I want to leave my children a legacy. Something they will enjoy and that will support them in the future." (Participant from Ica)

Therefore, motherhood remains a recurring theme among women microentrepreneurs.

Impact of the programme on microentrepreneurs

Among them, the workshop entitled "How to manage my business" received the highest satisfaction percentage (56.25%) of participants who indicated that their opinion of the workshop was "very good".

Satisfaction	Very good	Good	Fair	Poor	Did not attend	Total
Leadership and business empowerment	48.44%	39.06%	4.69%	0.00%	7.81%	100%
Workshop on Applied Research Methodology I	47.62%	36.51%	9.52%	1.59%	4.76%	100%
Management of your company's finances	45.31%	37.50%	7.81%	1.56%	7.81%	100%
Digital marketing and sales	57.81%	34.38%	6.25%	0.00%	1.56%	100%
Workshop on Applied Research Methodology II	54.10%	36.07%	6.56%	1.64%	1.64%	100%
How to manage my business	56.25%	34.38%	7.81%	0.00%	1.56%	100%
Workshop on Applied Research Methodology III	52.46%	36.07%	6.56%	1.64%	3.28%	100%
Sustainable Businesses	53.13%	34.38%	7.81%	0.00%	4.69%	100%
Average	51.89%	36.04%	7.13%	0.80%	4.14%	100%

Table 2: Satisfaction with the Programme Workshops

Source: Author's own elaboration

The average percentage of participants who reported a high or very high increase in the knowledge acquired in each programme workshop was 77.32%.

> "I feel very satisfied with everything I have learned and also for having established commercial ties with all the women entrepreneurs from Cusco. Thank you very much" (Participant from Cusco).

The results showed that 40.74% perceived a high level of income, 42.59% a medium level of income, 5.56% a very high level of income, and 11.11% perceived no change in their income. In addition, sustainable business training was included as part of the workshops.

> "My favourite course was the last one. Through this course, I learned that my customer really needs to take care of the environment. I don't use Styrofoam anymore and I try not to deliver my products in plastic bags" (Participant from Cusco).

Besides the workshops, two participants per region were selected to receive a seed fund based on their participation in the programme and their business improvement proposal. In general, the programme was well received by the participants, who rated it positively.

Impact on research professors

The professors who volunteered to assist in the workshops also found in this programme an opportunity to conduct applied academic research on the business ecosystem of women who own micro or small enterprises. As a result, five applied research projects were presented with information gathered from the participants and/or during the workshops.

- Studies on leadership and empowerment of women microentrepreneurs in emerging markets. The Peruvian case
- Reasons for the creation of women's microenterprises, capital structure, and the evolution of Peruvian women's entrepreneurship.
- Speeches about women microentrepreneurs and conversations among them about behaviours and attitudes for starting a business in Peru.
- Women microentrepreneurs in emerging economies: Impact of a training programme on their business environment, their customers, and the SDGs.
- The role of sustainable leadership training for women entrepreneurs.

The results of this research will contribute to the knowledge of the entrepreneurial ecosystem in the Peruvian market.

Impact on business school

The Business School strengthened its leadership as a business school committed to small businesses and entrepreneurs. Its contribution helped to generate indicators related to the Positive Impact Model that are supported by the four international accreditors: BGA, EQUIS, AACSB and BGA. As a result, it has become a national leader in sustainability and social responsibility. At the regional level, it is also recognised for its positive impact and contribution to the achievement of the SDGs and the 2030 Agenda.

The research conducted by CENTRUM PUCP's volunteer professors has helped position the institution as a leader in applied research on the microenterprise ecosystem and female entrepreneurship. In addition, the partnership between CENTRUM PUCP and the Municipal Savings and Credit Banks of Cusco, Ica and Arequipa was strengthened, laying the groundwork for future joint projects. Both institutions have experienced an improvement in their institutional image due to the positive reception of the programme and the campaign conducted

through the social media channels of CENTRUM PUCP and the three financial institutions, which together have more than 650,000 followers.

Impact on municipal savings and credit banks

The Municipal Savings and Credit Banks achieved improved positioning as companies committed to the training and continued growth of their female microentrepreneur clients. In addition, establishing alliances with one of the top business schools in Latin America provides an opportunity to stand out as socially responsible companies that contribute to development and support academia in generating new knowledge.

The programme had a positive impact on Sustainable Development Goals 4, 5, 8, 10 and 17 by providing women microentrepreneurs with access to business training from experts at a leading national business school.

Stakeholder	Impacts
Microentrepreneurs	• Women's empowerment, personal and business growth. • Access to a seed fund that will allow them to grow their businesses. • Building a stronger relationship of trust with the Municipal Savings and Credit Banks. • Receive training from volunteer professors from the best business school in Peru. • Participate in face-to-face workshops to develop key issues for their business development and personal growth.
Municipal Savings and Credit Banks	• Positioning as a company committed to the training and personal growth of women microentrepreneurs. • Positioning and improving the image of the company by valuing the development of its microentrepreneur clients. • Customer loyalty to the savings banks. • Attraction of new clients interested in the training offered by the PUCP Center and the possibility of winning the seed capital to improve their businesses. • Recognition as a socially responsible company. • Establish alliances with one of the business schools in Latin America.
Centrum PUCP	• Contribute to the fulfilment of its purpose as a business school that promotes good business. • Establish alliances with the most important Municipal Savings and Credit Banks in Peru. • Developing applied research based on the management of the mentoring and business training project for women micro-entrepreneurs from different regions of the country. • Being a reference in applied academic research in the study of the microenterprise ecosystem with the support of the Municipal Savings and Credit Banks.
Research professors	• Development of applied research relevant to the generation of knowledge about the microenterprise ecosystem and gender gaps in this sector.

Table 3: Impacts on Alliance Partners and Their Stakeholders

Source: Author's own creation

Discussion and Conclusions

The research shows that university social responsibility programmes developed from a social intervention and applied research approach are of great value in fulfilling the purpose of a business school, which is to contribute to quality education (SDG 4) for vulnerable populations, such as, in this case, Peruvian women microentrepreneurs.

The experience of this programme under the shared value creation approach (Porter and Kramer, 2011) in the framework of university social responsibility shows that business schools and universities in general in Latin America have an important role to play in society by generating shared value for all their stakeholders.

The study also identified areas for improvement, such as the management of schedules by volunteer teachers and the flexibility that should be granted to participants, since in addition to running their businesses, most of them are mothers and perform domestic tasks at home.

In terms of theoretical implications, this opens up further lines of research that will seek to study and understand the relationships between university social responsibility management and its links to the Millennium Development Goals, the Principles for Responsible Education, and social responsibility indicators.

GOVERNMENTAL ASSISTANCE PROGRAMS FOR INDUSTRY-UNIVERSITY COLLABORATION: A COMPARATIVE PERSPECTIVE

Alkwifi, Osama; Al-Maadeed Abdulla, Sara
Department of Management and Marketing, College of Business
Qatar University, Qatar

Keywords: Industry-University Collaboration, Governmental Assistance, Triple Helix framework, Qatar, Innovation,

Introduction

University–industry cooperation is an important driver of innovation, research commercialization, and knowledge-based economic development. Governments play a central role in enabling this cooperation by providing funding, policy incentives, regulatory support, and institutional platforms that connect universities with industry. This study examines how governmental support influences university–industry cooperation and how policy design affects innovation outcomes. It focuses on support instruments such as research grants, co-financing schemes, innovation programs, technology transfer initiatives, and regulatory arrangements. The study is particularly relevant to Qatar, where strengthening the innovation ecosystem and linking academic research with industrial development are important national priorities.

Purpose, Aim and Objectives

The purpose of this study is to analyze how governmental support mechanisms encourage university–industry cooperation and contribute to innovation outcomes. The main aim is to develop a comparative understanding of policy instruments used in Qatar and to identify lessons that can help strengthen Qatar's innovation ecosystem.

Literature Review and Theoretical Framework

The literature on innovation systems emphasizes that innovation depends on interaction among universities, industries, governments, and other institutional actors. Universities contribute knowledge, research expertise, and skilled graduates, while firms contribute market knowledge, practical needs, and commercialization capacity. Government provides the policy environment that enables these actors to work together. University–industry cooperation can take several forms, including joint research, contract

research, consultancy, technology transfer, internships, commercialization, patents, spin-offs, and shared research centers. However, collaboration is often limited by differences in goals, timeframes, incentives, and expectations between universities and firms. This study will use the Triple Helix framework, which explains innovation through the interaction of university, industry, and government. The framework is suitable because it highlights the role of government in shaping collaboration through funding, regulation, incentives, and strategic policy design.

Methodology and Methods

The study will adopt direct interviews supported by secondary data. This approach is appropriate because the study focuses on analyzing policy instruments, institutional arrangements, and innovation-related outcomes across countries.

Findings and Contribution

The study is expected to identify important differences in how governments support university–industry cooperation. Some countries may rely on direct funding, while others may emphasize matching grants, innovation agencies, or public–private research centers. The findings are expected to show how policy design affects the depth and quality of collaboration. For example, programs that require joint university–industry applications or co-financing may encourage stronger industry commitment than programs with limited collaboration requirements.

Originality and Value

The originality of this study lies in its focus on the design of governmental support instruments rather than only the general importance of university–industry cooperation. It examines how policy structure, funding intensity, implementation, and collaboration requirements affect innovation outcomes. The study is valuable because it provides a comparative and evidence-based understanding of how governments can strengthen university–industry cooperation. For Qatar, it can help identify policy gaps and recommend improvements that better connect academic research with industrial and national development needs.

Theoretical and Practical Applications and Implications

Theoretically, the study contributes to the Triple Helix and innovation systems literature by showing how government policy design shapes the relationship between universities and industry. It highlights government's role not only as a funder, but also as a coordinator, regulator, and strategic enabler of innovation. Practically, the study can support policymakers in designing more effective collaboration

programs. Recommendations may include stronger co-financing mechanisms, clearer collaboration requirements, better intellectual property arrangements, and improved evaluation of policy outcomes.

EXPLORING THE TWIN TRANSITION: EVIDENCE FROM ITALIAN MSMEs

Bocchini, Martina[1]; Capasso, Arturo[2]; Rossi, Matteo[3]

[1]Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Benevento, Italy

[2]Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Benevento, Italy

[3]Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Benevento, Italy

Keywords: Twin Transition, Digitalization, Sustainability, ESG Performance, MSMEs.

Introduction

The twin transition, understood as the integrated pursuit of digital and sustainable transformation, has emerged as a central topic in European academic, policy, and managerial debates (Trevisan et al., 2024). Although research shows the potential of digital technologies to enhance environmental and energy efficiency and governance transparency (Tabares et al., 2025), empirical evidence remains limited. The literature has emphasized macro-level or policy-driven analyses (Trevisan et al., 2024), while firm-level dynamics remain underexplored (Renn et al., 2021).

Purpose, Aim and Objectives

The purpose of this study is to examine how digitalization influences sustainability performance within Italian micro, small, and medium-sized enterprises (MSMEs). Specifically, the study aims to explore the relationship between digitalization and ESG performance (including its pillars). The objectives of the study are to assess whether digitalization and sustainability are correlated, examine how financial fragility shapes their relationship, and evaluate whether this relationship differs between agri-food and non-agri-food firms.

Literature Review and Theoretical Framework

The Resource-Based View (Barney, 1991) and the dynamic capabilities framework provide an interpretative lens for understanding the digitalization-sustainability relationship, as financial and managerial constraints may limit MSMEs' ability to develop and reconfigure the resources required for both transformations. Consistently, Renn et al. (2021) suggest that digital investments not aligned with sustainability objectives may compete with sustainability goals, while Lan and Zhou (2024) show that this relationship weakens under resource constraints. These challenges may be relevant in the agri-food sector, characterized by lower technological maturity (Annosi et al., 2023).

Methodology and Methods

The empirical analysis was conducted on a sample of 786 active Italian MSMEs (63 agri-food and 723 non-agri-food) and 110 MSMEs which declared bankruptcy after 2021. The relationship between digitalization and sustainability was examined over the period 2021-2023, and for each year four OLS regression models were estimated using the overall ESG score and its pillars.

Findings and Contribution

The results indicate that the impact of digitalization on sustainability is weak and context dependent. Among active MSMEs, no stable relationship emerges over 2021-2023, and the sectoral comparison reveals no systematic differences between agri-food and other firms. Digital investments do not automatically translate into improved ESG performance and may even be associated with lower sustainability outcomes in firms in financial distress, highlighting the role of resource constraints and managerial capabilities.

Originality and Value

This study provides firm-level quantitative evidence on the twin transition in Italian MSMEs, extending a literature largely focused on macro-level analyses. By comparing financially active and distressed firms, it shows how resource constraints shape the digitalization-sustainability relationship. In addition, the comparison between agri-food and other MSMEs explores the role of sector-specific characteristics.

Research Limitations

The study is limited using a proxy for digitalization, which may not fully capture the complexity of digital transformation, and by sample heterogeneity, which may have weakened the statistical robustness of the results.

Theoretical and Practical Implications

Digitalization should be interpreted as an enabling condition for ESG performance, rather than an automatic driver. Digital investments may generate sustainability benefits only when embedded within a sustainability strategy. Policies promoting twin transitions should consider MSMEs' actual capabilities, complementing technological incentives with support for managerial capabilities and skills.

This project has received funding from the Research Council of Lithuania (LMTLT), agreement No. S-MIP-25-64.

Keywords: Participatory Strategic Foresight, impact assessment; governance; immediate impact; intermediate impact

Strategic management has traditionally privileged managerial and expert-led processes of analysis, choice and implementation. Increasingly complex and uncertain environments require strategic processes that incorporate distributed knowledge, alternative perspectives, and longer-term societal concerns. Participatory foresight offers such an approach by combining futures-oriented inquiry with structured stakeholder engagement. Rather than treating participation as consultation around an already defined strategy, participatory foresight involves stakeholders in exploring uncertainty, constructing alternative futures and shaping shared strategic directions. This study examines whether such engagement generates effects beyond the strategic document and contributes to the strategic management process.

Purpose. The paper assesses the perceived impacts of societal engagement in participatory foresight and its contribution to co-created strategic management. It connects foresight impact research with strategy-as-practice, which conceptualises strategy as something actors do through situated practices and interactions (Jarzabkowski, 2005; Whittington, 2006). Building on foresight evaluation literature (Amanatidou, 2014, 2017; Harper, 2013), the study distinguishes immediate and intermediate effects across four domains: future awareness raising, learning, facilitating and embedding. The central argument is that participatory foresight can transform strategic management from expert-led planning into a process in which diverse actors jointly interpret uncertainty, develop shared future orientations and acquire ownership of implementation.

Methodology. The empirical setting is Lithuania 2050, a national participatory foresight and visioning process implemented between 2021 and 2023, involving more than 2,500 citizens, experts, policymakers, business representatives, academics, and civil society actors. An online survey was conducted in September–October 2024 among registered co-creators. Fifty-nine valid responses were retained. Immediate and intermediate impacts were measured using a six-point Likert scale and a previously validated multidimensional framework (Paliokaitė et al., 2025). Exploratory factor analysis used principal component extraction with Varimax rotation and Kaiser normalisation, applying a .70 factor-loading threshold. Reliability was assessed using Cronbach's alpha. Descriptive statistics, one-way ANOVA and, where appropriate, Mann–Whitney U and

Kruskal–Wallis H tests examined differences across demographic, professional and engagement characteristics.

Findings. Participants evaluated the effects of engagement positively across all measured dimensions. The strongest immediate outcomes were individual capacity to shape the future (M = 5.22, SD = 0.87) and time-distance awareness (M = 5.13, SD = 0.70). Among intermediate outcomes, shared implementation commitment was particularly strong (M = 4.94, SD = 0.94), followed by future engagement intent (M = 4.79, SD = 0.89) and enhanced long-term strategic orientation (M = 4.69, SD = 1.03). Participants' professional roles, represented institutions, sex and most demographic characteristics did not significantly differentiate perceived impacts, suggesting broadly shared and role-neutral effects. First-time involvement was associated with stronger individual empowerment ($p = .003$, $\eta^2 = .19$), while repeated participation showed near-significant associations with perceived knowledge creation ($p = .066$) and enhanced participatory inclusiveness ($p = .053$). Descriptive patterns further suggested that deeper and more interactive participation was associated with stronger trust, commitment and long-term orientation.

Originality. The study contributes to strategic management by showing that the value of participatory foresight lies not only in producing scenarios, visions or roadmaps, but also in changing the social conditions under which strategy is formed and implemented. The findings indicate that well-designed foresight can democratise strategic engagement while strengthening collective agency, strategic ownership and implementation responsibility.

Research Limitations. The study relies on self-reported perceptions, a relatively small sample, and a single national case; therefore, causal inference and broad generalisation are limited.

Theoretical and Practical Implications. Theoretically, the findings connect foresight impacts with participatory strategising by demonstrating how cognitive, behavioural, relational and institutional effects become part of the strategy process. In practice, they indicate that professional facilitation, iterative participation, attention to power asymmetries, and transparent feedback mechanisms are critical for converting societal engagement into strategic ownership and implementation commitment.

GENERATIVE AI IN GLOBAL MARKETING FOR SUSTAINABILITY: A SYSTEMATIC REVIEW OF CREATIVITY, CULTURAL ADAPTATION, AND GOVERNANCE

Nassar, Mohamed[1]; ElAlfy, Amr[1]; Al-kwifi, Osama Sam[2]

[1]School of Environment, Enterprise and Development (SEED), University of Waterloo, Waterloo, Canada

[2]Department of Management and Marketing, College of Business and Economics, Qatar University, Doha, Qatar

Keywords: Generative AI, Global Marketing, Sustainability, Greenwashing, Cultural Adaptation, SDG Engagement, Systematic Literature Review, PRISMA 2020.

Introduction

Generative AI (GenAI) has moved rapidly into mainstream marketing practice, generating advertising content, personalising communication, and drafting ESG disclosures, just as organisations face intensifying pressure to align with the United Nations Sustainable Development Goals (SDGs). The convergence is not benign: the same capability that audits ESG statements can also fabricate CSR testimonials and scale persuasion across cultural markets, making the challenge structural and institutional rather than transient.

Purpose, Aim and Objectives

This systematic review synthesises peer-reviewed evidence at the intersection of GenAI, marketing, and sustainability, asking under what institutional conditions GenAI supports credible sustainability outcomes in global marketing. Three research questions address how GenAI use is governed for sustainability (RQ1), how it is integrated into marketing operations (RQ2), and how cultural context shapes GenAI-enabled sustainable marketing (RQ3).

Literature Review and Theoretical Framework

Prior reviews address adjacent territory but not the three-way intersection: Yadav and Sondhi (2023) map AI in sustainable marketing pre-ChatGPT; Al Lawati and Al Busaidi (2025) examine AI and green marketing with GenAI as one component; Cerchione et al. (2025) adopt a knowledge-management lens; and Israfilzade and Sadili (2025) review GenAI in e-

commerce. None maps this interaction as its primary focus; theoretical orientation is instead coded as a characteristic of the corpus itself.

Methodology and Methods

The review follows the PRISMA 2020 protocol (Page et al., 2021). Searches in Scopus, Web of Science, EBSCO, ProQuest and Emerald covered English-language publications from January 2020 to May 2026. From 1,330 records identified, 77 studies met the eligibility threshold. Studies were coded for integration pattern, evidence strength, GenAI specificity, geographic context, and SDG engagement through a novel three-tier scheme; a second reviewer audited full-text decisions (95.9% agreement).

Main Findings and Contribution

First, the GenAI–greenwashing paradox is structural: nine studies demonstrate GenAI as anti-greenwashing infrastructure while seven demonstrate it enabling greenwashing, the same capability driving both. Second, the field is strongest in operational integration (50 studies), developed in governance (32), and weakest in cultural adaptation (7); Sub-Saharan African contexts are absent. Third, SDG engagement is paradoxical: 77% of the corpus engages SDG-relevant themes, yet only 10% explicitly identifies specific SDGs. Fourth, five inductively derived integration patterns expose saturated clusters and underdeveloped intersections across six dimensions.

Originality and Value

The review introduces a three-tier SDG coding scheme; reframes the GenAI–greenwashing tension as a structural property of the technology rather than a governance failure; develops a six-dimension integration-pattern framework; and synthesises early causal evidence that GenAI can measurably shift sustainability outcomes when properly configured.

Research Limitations

The corpus captures a snapshot of a rapidly evolving field and will require updating. Restriction to English-language peer-reviewed publications likely contributes to the under-representation of Sub-Saharan African and Latin American contexts. Future work could extend the synthesis through bibliometric methods and cross-cultural primary research.

Theoretical and Practical Applications and Implications

The review repositions the question from whether GenAI is good or bad to the institutional conditions under which it tilts either way. Marketers should embed disclosure, audit, and verification capacity into GenAI workflows; ESG officers should incorporate the carbon footprint of GenAI inference into sustainability accounting; policymakers should pair disclosure with substantive content standards; and multinational organisations should validate GenAI-generated insights locally before scaling.

MAPPING THE FAMILY SMEs EXPORTING FIELD: A REVIEW AND A RESEARCH AGENDA

Kampouri, Katerina[1]; Sklavounos, Nikolaos[2]; Simoglou, Efterpi[2]; Hajidimitriou, Yannis[2]

[1]School of Economics, Aristotle University of Thessaloniki, Thessaloniki

[2]Department of Business Administration, University of Macedonia, Thessaloniki, Greece

Keywords: family SMEs, family SME internationalisation, non-equity modes, exporting

Introduction

The internationalisation of family Small and Medium Enterprises (SMEs) has attracted considerable scholarly attention due to their distinctive internationalisation behaviour (Berrone et al., 2012). Despite this growing interest, existing reviews provide only a limited understanding of the key themes shaping research on family SME exporting (Arregle et al., 2021; Debellis et al., 2021), even though exporting constitutes the most common internationalisation mode for family SMEs, requiring lower resource commitment and offering greater flexibility than equity-based modes (Kuiken et al., 2024).

Purpose, Aims and Research Questions

Given that research on family SME exporting remains fragmented and lacks a synthesis of existing knowledge, the purpose of this study is to provide a foundation for the further development of this sub-field of inquiry. Specifically, this study aims to explore how exporting has been conceptualised and explored in the family SMEs internationalisation literature. We address two research questions: (i) What themes drive academic research on family SMEs' exporting? And (ii) What emerging key themes are likely to shape future inquiry in the family SMEs' exporting literature?

Methodology

To address the research questions, the study analyses and critically synthesizes empirical and conceptual studies published in peer-reviewed journals, following recommendations by methodological experts in review articles (e.g., Paul and Criado, 2020).

Findings and Contribution

The articles included in the data pool (n = 67) were published in 44 different academic journals between 1999 and 2025, with publication activity peaking in 2023. The majority of studies were published in the Journal of Family Business Strategy (six articles), followed by the Family Business Review (four articles), while the International Business Review and Journal of Management and Governance each published three articles. All of the studies, but one, were empirical (n= 66).

In organizing the literature on family SME internationalization, we identified two thematic categories i.e., (i) antecedents of exporting in family versus non-family SMEs and (ii) the role of socio-emotional wealth in the exporting behaviour of family SMEs. By critically assessing the findings in each thematic category, the study elaborates on the theoretical and the methodological approaches used and discusses key findings and promising areas for future research.

Originality/value

The study provides a comprehensive map of family SMEs' exporting research and enables a coherent understanding of the factors shaping family SMEs' exporting decisions. It also proposes exemplary research questions to support future research.

Research Limitations

The main limitation of this study is that it focuses exclusively on exporting, excluding other non-equity entry modes used by family SMEs.

Theoretical and Practical Applications and Implications

The findings may assist family managers and practitioners in better understanding the contextual factors shaping exporting decisions. The study may also contribute to theoretical discussions relating to family SMEs internationalisation by providing an understanding of the mechanisms underlying family SMEs' decisions to continue, discontinue, or progress beyond exporting towards more committed entry modes.

DIGITALIZATION, EMERGING TECHNOLOGIES, AND SMES INTERNATIONALIZATION: A SYSTEMATIC LITERATURE REVIEW

Tchuinou Tchouwo [1]; Ben Selma Majdi[2]; Chebbi Hela[3]

[1,2,3] University du Quebec in Montréal (ESG UQAM), Montréal, Canada

Keywords: digital transformation, international business, blockchain, artificial intelligence

Introduction, Purpose and Aim

The internationalization of small and medium-sized enterprises (SMEs) has long been explained by models based on the gradual accumulation of resources and knowledge. However, the rapid spread of digital technologies has profoundly transformed these trajectories, reducing barriers to entry into foreign markets and changing modes of access, learning, and value creation. Recent literature emphasizes that digitalization is no longer just a tool to support internationalization, but a strategic lever that shapes the international trajectories of SMEs (Westerlund, 2020).

This systematic review aims to analyze the role of digitalization and emerging technologies in the internationalization of SMEs by synthesizing the contributions, trends, and gaps identified in two complementary series of scientific articles.

Methodology

To conduct the systematic literature review, we used three categories of keywords relating to digital technologies, the internationalization process, and the SME context. These keywords were combined to obtain the following string of characters: (ICT OR “big data” OR iot OR “digital transformation” OR “digital technologies” OR blockchain OR “social media” OR cyberspace OR “artificial intelligence” OR “virtual reality” OR digital* OR “disruptive technologies” OR “Industry 4.0” OR “information technologies” OR e-commerce OR “digital economy” OR e-business) AND (internationali* OR “international growth” OR “international expansion” OR “international business” OR “international entrepreneurship” OR “international expansion” OR “global business”) AND (sme*)

The searches were conducted in the title, abstract, and keywords within three main academic databases: Scopus, ABI Inform Global, and Web of Science. The selected articles had to be

peer-reviewed academic publications explicitly addressing the role of Industry 4.0 technologies in the internationalization process of SMEs. The articles from the various databases were then imported into Covidence software to facilitate collaborative work.

A total of 461 articles were included in the initial Covidence database. After removing 174 duplicates, 287 articles were selected for the first stage of screening. The initial screening consisted of checking the inclusion criteria based on the article title and abstract. At the end of this stage, 164 references were deemed irrelevant and excluded, while 123 articles were retained for the next stage.

Main Findings and Contributions

A first set of studies highlights the central role of digital technologies in identifying and seizing opportunities for internationalization. Digital capabilities, combined with organizational agility, strengthen SMEs' ability to identify opportunities in uncertain environments (Omri, Yezza & Bécuwe, 2023). However, several studies emphasize that the adoption of digital technologies does not have a direct effect on internationalization, but rather that their impact depends on their integration into organizational processes, internal skills, and managerial practices (Cassetta et al., 2020). Critically, these dynamics are shaped by SME-specific characteristics that distinguish them from larger firms.

Resource constraints limit the scope and pace of digital adoption, while the central role of the owner-manager means that individual digital literacy and strategic vision disproportionately influence technology integration decisions. Moreover, the liability of smallness reflected in limited financial slack, reduced bargaining power, and narrower human capital bases conditions how SMEs translate digital capabilities into international performance. The heterogeneity across SME types (family firms, micro-enterprises, high-growth ventures) further complicates generalizations, calling for more fine-grained theorization grounded in SME-specific frameworks.

Furthermore, the literature highlights the growing importance of digital platforms, social networks, and websites as virtual gateways to international markets. These tools promote the international orientation of SMEs, facilitate learning about foreign markets, and reduce costs associated with geographical distance (Lee et al., 2022). Digital platforms also appear to accelerate the speed and scope of internationalization, although their effects remain heterogeneous across sectors and institutional contexts (Da Rocha et al, 2024).

GRIT IN VIRTUAL TEAMS: A TWO-STAGE MODEL

Márki, Gábor[1]; Alon, Ilan[1,2]*; Taras, Vas[3]*; Levy, Shalom[1]

[1]Department of Economics and Business Administration, Ariel University, Ariel, Israel

[2]Institute of Strategy and Management, Department of Strategic Management, Corvinus University, Budapest, Hungary

*(Corresponding Author)

Keywords: Grit, Self-Efficacy, Machine Learning, Virtual Teams, AI, Future of Work.

Introduction

Global virtual teams (GVTs) are the norm in international business (IB), prompting a rethinking of the role of perseverance (Bernardy & Antoni, 2021; Duckworth et al., 2007) as a driver of success. Geographic dispersion, digital reliance, and cultural diversity affect performance (Hofstede, 1980). The "friction paradox" explores whether automation reduces external friction while impacting internal resilience.

Purpose, Aim, and Objectives

The study explores how functional capabilities shape a digital transition cohort facing "cognitive debt" from technology dependence (Kasneci et al., 2023) and whether internal agency predicts grit better than external structure. It analyzes grit antecedents (Perseverance of Effort, PE; Consistency of Interest, CI) through Social Cognitive (H1), Cultural Dimension (H2), and Cognitive Load (H3) models to assess psychological and situational factors (Sweller, 1988).

Literature Review and Theoretical Framework

Although grit is important for adaptive performance, its distinction from conscientiousness and self-control remains debated (Credé et al., 2017). We define grit as flexible agentic control (Bandura, 1986). Effective grit ($Grit_e$) is expressed as:

$$Grit_e = Grit_i + (M \times SE) / CF$$

Here, $Grit_i$ represents intrinsic grit, *M* motivation (Dweck, 1986), *SE* self-efficacy, and *CF* contextual friction. First-language complexity (L_1C) (Brosa Rodríguez et al., 2024) can support mental resistance and grit development. Thus, grit is a dynamic behavioural expression shaped by motivation and context, rather than a fixed trait.

Methodology and Methods

A quantitative, cross-sectional design using X-Culture data [N = 11,761] from 100+ countries (Taras et al., 2025) analysed 64 indicators across psychological, cultural, linguistic, and macroeconomic domains. Automated machine learning (Alon et al., 2023) identified nonlinear patterns using a Light Gradient Boosted Trees model, validated by OLS regression for robustness.

Main/Expected Findings and Contribution

Results reflect relative predictive relationships rather than direct causal pathways and identify a two-stage asymmetric hierarchy. Stage 1 (Core-Periphery Split) confirms the Agentic Core's dominance. Motivation (LGO) is a precondition (Dweck, 1986). *SE* acts as a force multiplier, transforming this stock into performance. Stage 2 (Peripheral Drag) shows how *CF* (via Linguo-cultural Distance) influences core efficiency. Internal agency exerts a multi-fold predictive influence over external factors.

Originality and Value

We identify a friction paradox in which a lack of resistance stalls or drifts consistency, shifting grit's focus from outcomes to antecedents. Agency prevents digital efficiency from undermining resilience.

Research Limitations

This design provides a snapshot, limiting causal claims. High-dimensional data and structural nuance partially mitigate potential self-report bias; however, replication in professional GVT settings and longitudinal designs would strengthen causal inference.

Theoretical and Practical Applications/Implications

This study makes three contributions. First, it clarifies effective grit´s antecedents, showing self-efficacy and learning goal orientation as dominant predictors. Second, it distinguishes internal agency from contextual friction, revealing that psychological core drivers remain resilient despite environmental drag. Third, it demonstrates how AML complements theory by identifying the relative predictive importance of psychological, cultural, linguistic, and demographic predictors. These findings suggest that AI should serve as a tutor rather than an answer engine; friction-reducing automation may lower intrinsic motivation, requiring deliberate task design in MNEs. Structured difficulty is essential for building grit; removing challenges may inadvertently stunt perseverance.

EMERGENT STRATEGY AND STRATEGIC CHANGE IN PRACTICE: EVIDENCE FROM CASES IN THE AGRIFOOD AND WINE INDUSTRIES

Mybes, Katharina[1]; Hanf, Jon H.[1]

[1]Institute for Wine and Beverage Business / Economics, Hochschule Geisenheim University, Geisenheim, Germany

Keywords: Emergent strategy, change, disruption, case examples, wine industry

The agricultural sector, including the wine industry, currently experiences a multitude of impacts at once which disrupt the market environment: disrupted value chains due to geopolitical instabilities, imposed tariffs and increased production prices, changing consumer preferences paired with overproduction have caused prices to plummet, forcing numerous smaller players out of the market. Traditional markets are saturated and new outlets more difficult to access. Climate extremes and natural disasters aggravate working conditions. The global pandemic has shown that firms need to be able to react to even unforeseeable circumstances to ensure survival. These developments impact the agricultural sector, particularly traditional organizations like the wine industry (Henchion et al., 2024).

Anticipating this changing world, the concept of emergent strategy is an evolutionary process that responds to internal and external factors (Lynch, 2009; Mintzberg et al., 2009). It offers a more realistic perspective on strategizing in dynamic environments than static or linear strategizing. Strategic problems are inherently complex and multifaceted, which makes it impossible to fully analyze (Wit and Meyer, 2010). While strategic research is extensive, “neither theory nor practice of strategy has kept pace with the realities of today’s relatively boundaryless and barrier-free markets” (Kinni, 2014).

As a “means by which deliberate strategies change”, emergent strategy describes unintended patterns or consistencies in organizational behavior over time (Mintzberg and Waters, 1985). These patterns are implemented in the realized strategy of a firm and are integrated into the overall organizational strategy by retrospect sense-making (ibid, 1985).

They often are found in organizations responding directly or indirectly to change in their internal and external environment. Underlying organizational structures and characteristics are important to determine the organization's ability to identify threats or opportunities and its response (Mybes and Hanf, 2025; Adner and Helfat, 2003).

While the theoretical basis has been developed over 50 years ago, it proves more relevant today in this dynamic market environment than ever before. The drawback of Mintzberg's abstract theoretical construct of emergent strategy is that it remained mostly theoretical, lacking an extensive portfolio of empirical research and operationalization, making it "hard to grasp". As a consequence, popularity remained limited and existing empirical research focuses on specific types of organizations and sectors. Hence there are limited advancements of the theoretical concept. In order to derive strategic implications and recommendations for organizations, the individual components of the concept must be investigated for a better understanding of impact and interplay. This gap shall be closed with this paper, translating the abstract theoretical construct into concrete organizational practice. By providing different case examples and analyzing their individual components, key levers and their impact are identified. It makes the theoretical basis of emergent strategy more accessible and provides a foundation for further research.

The breakdown into the core components aims to help practitioners better identify such events in their internal and external environment. By doing so, they can improve recognition and integration of new strategic responses into their overall strategy.

Furthermore, the cases show that "deliberate and emergent strategies may be conceived as two ends of a continuum along which real-world strategies lie" (Mintzberg and Waters, 1985). Highlighting this continuum is a more realistic representation of organizational strategizing, further reducing the abstract nature of the theoretical concept. Different case examples of emergent strategy in the agri-food industry show steps leading to survival during crises, new business ventures, fundamentally shaping their unique strategic positioning and differentiation, or improving their portfolio. The responses lead to market creation, differentiation, increased customer engagement, and a sustained competitive advantage.

In a step-wise approach, 8 international cases were identified based on primary and secondary research. Three cases were dropped due to insufficient information. The remaining 5 cases include four winery-related cases and one farming case. 5 cases cover current events, one case is based on

a well-documented historic event. Followed up by additional secondary research and in-depth semi-structured interviews, details were obtained on preceding events, key components, internal antecedents and individual strategic decision-making. The individual parts of the overall strategy process (based on Mintzberg and Waters, 1985) were analyzed and evaluated. A step-by-step account leading up to the response and strategic integration is presented. A comparison of the cases and case components highlight that emergent strategic components will present themselves differently in different firms and organizational structures. This awareness makes the theoretical concept more palpable, approachable and highlights its relevance for organizational responses to today's disruptive market environments.

The main contribution is to provide a comprehensive account of emergent strategy examples – a theoretical construct which has been commonly neglected or insufficiently addressed due to its abstract nature. This is highly relevant for both scholars and practitioners, as it demystifies the process and provides a grounded account of how emergent strategies arise, enabling organizations to identify and adapt key factors to enhance their capacity to respond to technological change, innovation, and disruption. Providing examples from the agri-food sector adds to the field of research, as it has not been subject to research in this context.

As a conceptual study, it does not allow or aim for generalization. Future research could employ this study's components for a coherent analysis when designing a quantifiable, statistically significant research setting for broader generalization.

A POINT-OF-SALE EXPERIMENT ON THE INFLUENCE OF THE REGION OF ORIGIN ON THE CHOICE OF ORGANIC WINE

Salvador, Pedro[1,2]; Casais, Beatriz[1,2]; Pinto, Lígia[1,2]

[1] School of Economics, Management and Political Sciences, University of Minho, Braga, Portugal

[2] iBMS – Centre for Research in Business, Markets & Society, University of Minho, Braga, Portugal

Keywords: organic wine; region of origin; willingness to pay; sensory evaluation; certification; point-of-sale experiment

Introduction

Increasing consumer concern for sustainability, health, and ethical production practices (Apaolaza et al., 2017; Delmas and Grant, 2014) has fostered the development of organic wine markets. Prior research identifies certification, price premiums, sensory expectations, naturalness perceptions, and sustainability-related information as key drivers of organic and sustainable wine choice (Apaolaza et al., 2017; Bazzani et al., 2024; Borrello et al., 2024; Delmas and Grant, 2014; Modica et al., 2025). Recent evidence further suggests that consumers' willingness to pay depends not only on sustainability attributes but also on their interaction with region-of-origin information, territorial reputation, trust, and other extrinsic quality cues (Dominici et al., 2025; Gastaldello et al., 2025; Larvoe and Kallas, 2025).

Portugal provides a distinctive context because organic wine remains a relatively underdeveloped market segment, while region of origin has long served as a dominant signal of wine quality and authenticity (Ferreira, Lourenço-Gomes and Pinto, 2021). This setting enables examination of whether sustainability-related attributes can modify established evaluation patterns or whether traditional regional cues continue to dominate consumer valuation. Although previous research shows that region-of-origin information influences both sensory evaluations and willingness to pay (Ferreira, Lourenço-Gomes and Pinto, 2021), relatively few studies have examined sequential revisions of willingness to

pay following blind tasting and subsequent region-of-origin disclosure in real point-of-sale environments using incentive-compatible valuation mechanisms (Ferreira, Costa Pinto and Lourenço-Gomes, 2021).

Purpose, Aim and Objectives

This study examines how consumers evaluate organic wine in a real point-of-sale environment in Portugal by integrating sensory experience, extrinsic information cues, and incentive-compatible economic valuation. Specifically, it analyses: (i) the relative importance of organic production compared with other wine attributes; (ii) the role of sensory evaluation in shaping initial willingness to pay (WTP) under blind tasting conditions; (iii) the effect of region-of-origin disclosure on WTP; and (iv) patterns of WTP revision following information disclosure. The study therefore examines how sustainability attributes interact with traditional quality cues in shaping consumer valuation.

Literature Review and Theoretical Framework

The study draws on Cue Utilization Theory, Signaling Theory, and Credence Goods Theory to explain how consumers rely on extrinsic quality signals such as certification and region of origin when intrinsic quality cannot be fully assessed before purchase (Darby and Karni, 1973; Spence, 1973; Steenkamp, 1990). In organic wine markets, sustainability claims and certification function as credence cues, while recent evidence shows that consumer preferences and willingness to pay are shaped by their interaction with trust, sensory expectations, naturalness perceptions, and territorial reputation (Apaolaza et al., 2017; Bazzani et al., 2024; Borrello et al., 2024; Delmas and Grant, 2014; Dominici et al., 2025; Larvoe and Kallas, 2025; Modica et al., 2025). This theoretical perspective supports the study's sequential valuation approach, whereby consumers first evaluate wines under blind tasting conditions and subsequently revise their willingness to pay following region-of-origin disclosure.

Methodology and Methods

An experimental point-of-sale study was conducted with 49 participants in a specialised organic wine retail store in Braga, Portugal. Participants evaluated three organic wines

from established Portuguese wine regions and stated their initial willingness to pay (WTP) under blind tasting conditions. Region-of-origin information was subsequently disclosed, after which participants revised their WTP. An incentive-compatible Becker–DeGroot–Marschak mechanism elicited economically meaningful valuations. A post-tasting questionnaire collected socio-demographic data and measures of wine preferences, sustainability perceptions, trust in certification, self-assessed wine knowledge, social interaction, and price sensitivity. Data were analysed using descriptive statistics and paired comparisons.

Main Findings and Contribution

Individual sensory attributes are not significantly correlated with initial willingness to pay (WTP), whereas overall satisfaction shows a strong positive association, suggesting that consumers rely on holistic evaluations rather than isolated sensory characteristics. Region-of-origin disclosure produces a statistically significant increase in WTP overall, with significant effects for Douro and Dão wines, while only percentage increases are observed for Alentejo. Most participants do not revise their WTP after information disclosure; however, when revisions occur, they are predominantly upward. WTP appears bounded, with a median increase of approximately 13%, suggesting that sustainability attributes create economic value primarily when reinforced by established regional quality cues. The study therefore extends cue-based explanations of organic wine choice by demonstrating the complementary role of sustainability and region-of-origin information in consumer valuation.

Research Limitations

The findings are exploratory and context-specific to a specialised retail setting, limiting generalizability.

STRATEGIC MOTIVATIONS FOR ADOPTING CRYPTOCURRENCIES IN THE WINE INDUSTRY

Kramer, Michael Paul[1]; Hanf, Jon H.[1]

[1]Professorship of International Marketing Management, Hochschule Geisenheim University, Geisenheim, Germany

Keywords: cryptocurrencies, technology adoption, value creation, dynamic capabilities, wine industry

Introduction

This study explores why firms in the wine industry adopt cryptocurrencies as payment instruments and how they expect this adoption may contribute to strategic value creation. Cryptocurrency is a decentralized digital asset utilizing cryptography to secure transactions, manage issuance of new units, and verify asset transfer independently of a central authority (Nakamoto, 2008). It operates on a distributed ledger such as blockchain, Holochain, Hashgraph, or Directed Acyclic Graphs, which ensures transparency and immutability. This study empirically focuses on Bitcoin and examines managerial intentions in an industry characterized by cautious and uneven digital innovation adoption and only moderate digital maturity (International Organisation of Vine and Wine, 2021; Knitsch and Weltz, 2021; Loose, 2024). In contrast to this conservative setting, Bitcoin is a decentralized electronic payment system, enabling peer-to-peer transactions and replacing trust in third parties by cryptographic proof (Nakamoto, 2008). It operates on blockchain, a distributed ledger technology (DLT) (Kramer et al., 2021) where transactions are grouped into data blocks. These blocks are verified and added to the blockchain approximately every 10 minutes through Proof of Work (PoW) consensus mechanism, with each block cryptographically linked to the preceding one, to ensure an immutable ledger.

While the industry remains cautious about digital transformation, consumer engagement with digital assets has increased. By 2024, more than 10% of adults in most European countries held crypto assets (European Central Bank, 2025). Industry reports indicate that customers paying with cryptocurrencies generate higher order values and that a substantial share are new customers (Capital One, 2025; Forrester Consulting, 2025). While trust in cryptocurrency payments influences consumer willingness to interact with firms offering such options (Mutambik et al., 2024), evidence from other industries report mixed adoption effects (Eshghi and Farivar, 2025; Bahmani, 2025), highlighting the need to examine an-

ticipated value creation at the firm level. In the wine industry, previous research has primarily focused on blockchain applications for traceability and fraud prevention rather than payment adoption (International Organisation of Vine and Wine, 2021; Parry et al., 2024; Kramer et al., 2024). Given the wine industry's cautious approach to digital innovations this study asks:

> *What motivates firms in the wine industry to integrate cryptocurrencies as payment instruments and which strategic outcomes do they associate with this adoption?*

This study extends research on blockchain and cryptocurrency adoption in the wine industry by conceptualizing cryptocurrencies beyond their role as payment instruments as part of sensing capabilities of wineries. Theoretically, it extends dynamic capability theory to cryptocurrency payment adoption and by integrating signaling theory conceptualizes cryptocurrency payments as a combined sensing and signaling mechanism through which wineries examine market reactions, attract digitally oriented customer segments, and signal innovativeness. The study aims to provide empirical evidence on motivations and perceived strategic outcomes of cryptocurrency adoption in an industry characterized by credence signals.

Theoretical Framing

Dynamic capability theory provides the primary interpretive lens (Teece et al., 1997). Under this lens, adopting payment innovations can be conceptualized as a sensing activity through which wineries test market receptiveness, engage digitally oriented customer segments, and potentially signal innovativeness and future readiness (Spence, 1973).

Methodology

The study adopts an exploratory qualitative design based on semi-structured interviews with owners and managers of wine firms worldwide that have adopted cryptocurrencies. Interviews address motivations for adoption and anticipated benefits and value creation mechanisms. Data are analyzed inductively following the Gioia methodology (Gioia et al., 2013).

Expected Findings

The study is expected to show that cryptocurrency adoption is primarily motivated by strategic considerations such as innovation signaling, brand positioning, customer engagement, and experimentation rather than operational necessity.

Conclusions and Implications

This ongoing study is expected to contribute to digital transformation research in the wine sector by framing cryptocurrency adoption as a strategic rather than purely technical decision. Building on dynamic capability theory it anticipates conceptualizing adoption as a sensing activity. From a managerial perspective, it is expected to indicate that cryptocurrencies can serve as tools for strategic positioning and customer engagement.

A DELPHI-ANP-ADAM FRAMEWORK FOR ASSESSING THE SUSTAINABILITY PERFORMANCES OF WINERIES

Miglietta, Pier Paolo[1]; Agnusdei, Leonardo[2], De Bernardi, Paola[3]; Agnusdei, Giulio Paolo[4]

[1]Department of Biological and Environmental Sciences and Technologies, University of Salento, Lecce, Italy

[4]Department of Psychology and Health Sciences, Pegaso University, Naples, Italy

Keywords: Sustainability assessment, Delphi method, Multi-criteria decision-making (MCDM), Wine sector, Synthetic index

Introduction

Sustainability has become a central paradigm for agri-food systems, driven by global initiatives such as the Sustainable Development Goals (SDGs), the European Green Deal and the Farm to Fork Strategy (Guerrieri et al., 2025). From a theoretical perspective, the Natural Resource-Based View suggests that sustainability-oriented practices can generate competitive advantage and foster green innovation (Martínez-Falcó et al., 2024, 2025), while Stakeholder Theory highlights the need for firms to respond to the growing environmental and social expectations of stakeholders through transparent ESG practices (Martínez-Falcó et al., 2025). At the firm level, the Environmental, Social and Governance (ESG) framework provides a structured standard for embedding sustainability principles into corporate strategies and decision-making processes. The wine sector, while economically and culturally significant, is highly exposed to climate change and market pressures, as reflected in the recent decline in global vineyard area and wine production. However, sustainability assessment remains methodologically challenging due to subjectivity in indicator selection, weighting and aggregation (Opon & Henry, 2020). To address these limitations, this study proposes an integrated multi-criteria framework combining the Analytic Network Process (ANP) and the Axial Distance-based Aggregated Measurement (ADAM) method to provide a multidimensional evaluation of sustainability performance in Italian wine companies.

Methodology

This study adopts an integrated and sequential methodological framework combining Delphi, ANP and ADAM to assess sustainability performance in wine growers and wineries (Figure 1).

The process starts with the Delphi method, used to identify and validate a set of sustainability indicators through structured expert consultation.

Starting from the ESG4AGRI questionnaire, an initial set of indicators grouped into four ESG criteria was submitted to a multidisciplinary expert panel, made up of 15 academics, 15 specialists in corporate sustainability and ESG reporting and 10 professional practitioners from the agricultural sector. Through iterative rounds and a predefined consensus threshold, the most relevant indicators were selected for subsequent analysis.

The Analytic Network Process (ANP) is then applied to structure the decision problem and model interdependencies among criteria and sub-criteria (indicators). Pairwise comparisons are conducted to obtain a limited supermatrix, in which the relative weights of criteria and sub-criteria are provided.

Finally, the ADAM method, a geometry-based multi-criteria decision-making technique, was adopted to aggregate weighted indicators into a synthetic sustainability score. At this stage, different companies represent the alternatives and are evaluated using empirical indicator values corresponding to the criteria and sub-criteria previously weighted through the ANP. These values are normalized on a nine-point scale to ensure comparability across indicators and consistency with the weighting structure derived from the pairwise comparison process. The method then assesses each company by calculating the volume of a polyhedron built within a three-dimensional coordinate system. The maximum volume is considered as the ideal condition (score equals to 100), whereas the minimum corresponds to the anti-ideal condition (score equals to 0), and the sustainability score for each company is obtained through linear normalization within this range.

The framework was tested on 32 wineries located in two wine-growing regions of southern Italy, that are Salento (Apulia) and Irpinia (Campania).

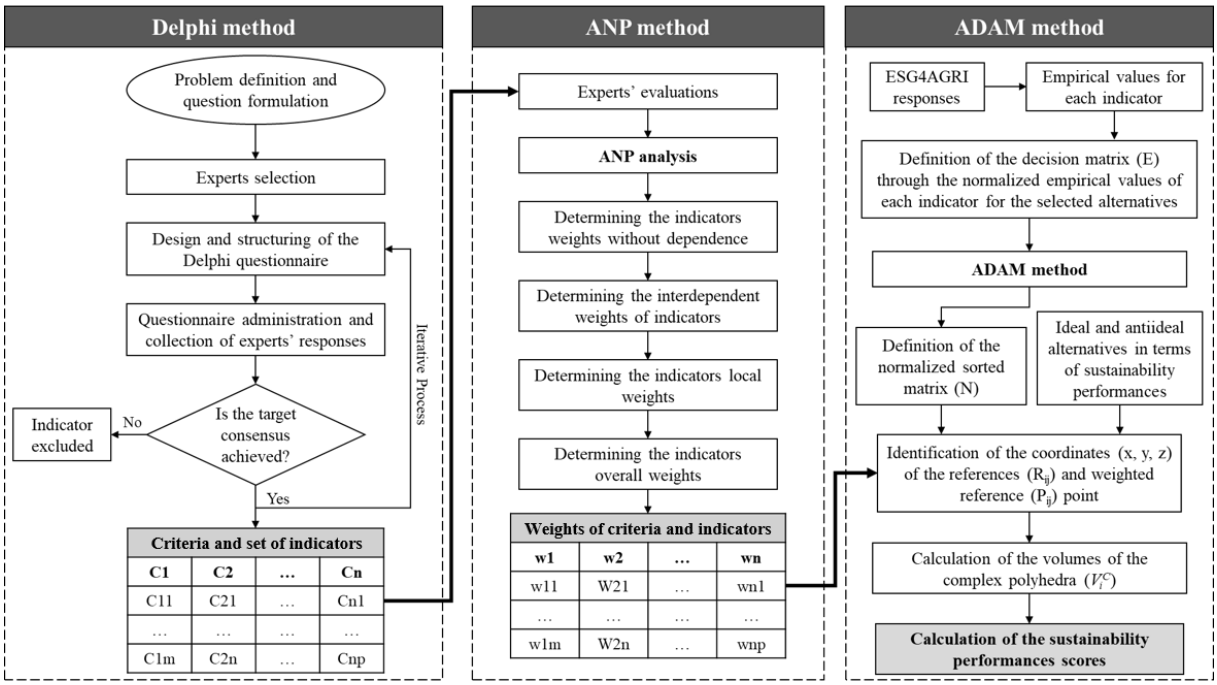

Figure 1: Methodological framework

Results and discussion

After three iterative rounds of expert consultation, the Delphi process resulted in the selection of 13 sustainability indicators. Indicators achieving the predefined consensus threshold were retained, ensuring both scientific robustness and sectoral relevance.

The ANP analysis was subsequently applied to determine the relative importance of criteria and indicators, considering the interdependence among them. Results indicate that Criterion 2 received the highest overall weight (0.486), followed by Criterion 1 (0.200), Criterion 3 (0.197) and Criterion 4 (0.117).

Criteria	Weights	Indicators	Weights
Criterion 1: Products and strategies contributing to healthy and sustainable dietary patterns	0.200	Percentage of products displaying sustainability information certified or verified by third-party organizations	0.057
		Number of initiatives promoting sustainable consumption of products, beyond those mandated by law	0.119
		Product safety: Number of food safety analyses conducted in addition to those required by law	0.023
Criterion 2: Social and environmental sustainability of operations and internal processes	0.486	Training hours per employee	0.104
		Percentage of women out of total employees	0.100
		Percentage of employees out of total workers	0.175
		Electricity consumption per revenue	0.017
		GHG emissions per revenue	0.061
		Water consumption per revenue	0.029
Criterion 3: Corporate commitment to promoting and fostering a sustainable supply and value chain	0.197	Percentage of expenditure on local suppliers out of total supplier expenditure	0.197
Criterion 4: Corporate citizenship	0.117	Percentage Number of main activities or projects carried out in support of the local community	0.036

		Number of stakeholder engagement initiatives	0.069
		Percentage of women in governance positions	0.012

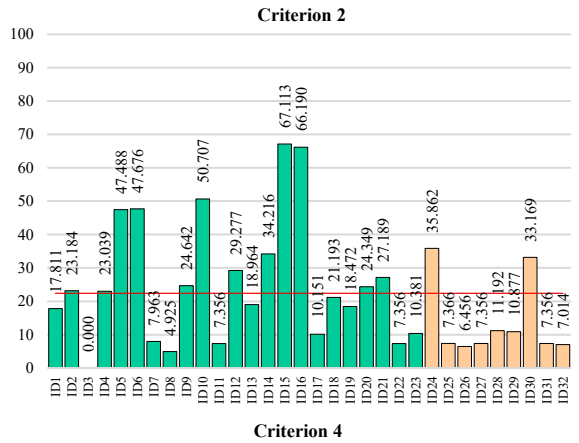

Table 1: Weights for criteria and indicators calculated through ANP

The ADAM method highlights different sustainability patterns across the four criteria. Consistent with the ANP weighting structure, the highest performance levels are observed in Criterion 2, confirming the strategic centrality of internal management practices. Criterion 3 also displays relatively strong results, suggesting that reliance on local suppliers and short supply chains represents a consolidated dimension within the sector.

On the other hand, product-related strategies and corporate citizenship emerge as comparatively weaker areas. The limited performance in these criteria indicates that external communication, stakeholder engagement and community-oriented initiatives remain underdeveloped relative to internal processes.

The overall distribution of composite sustainability scores is moderately concentrated in the lower-to-mid performance range, with few firms reaching advanced levels. This configuration suggests an intermediate stage of sustainability maturity, characterized by heterogeneous progress and incremental adaptation rather than systemic transformation (de Almeida Santos et al., 2020). Regional comparison further indicates that contextual factors (such as market exposure, structural conditions, and innovation ecosystems) shape both variability and performance trajectories across enterprises.

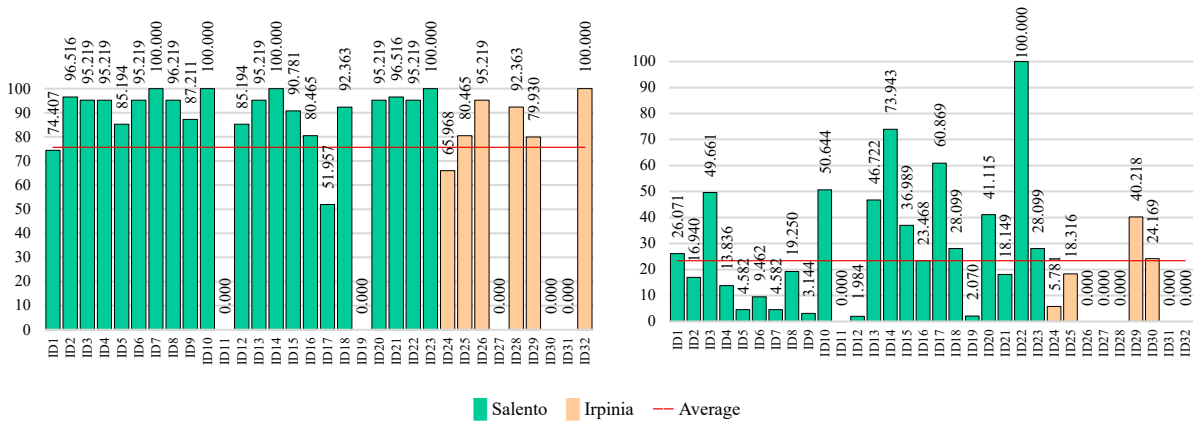

Figure 2: Criterion scores calculated through ADAM

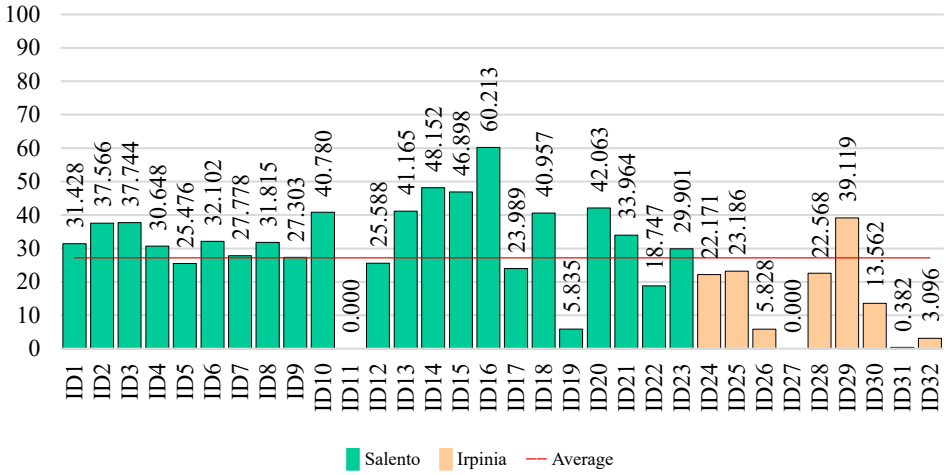

Figure 3: Overall sustainability scores calculated through ADAM

Conclusions

This study demonstrates the analytical robustness and practical applicability of the integrated Delphi–ANP–ADAM framework for assessing sustainability performance in the wine sector. By combining expert-based indicator selection, systemic weighting and geometric aggregation, the approach enhances transparency and comparability in multidimensional evaluation. However, several limitations must be acknowledged. The analysis is restricted to a relatively small sample of wineries located in two regions of southern Italy, limiting external generalizability. The cross-sectional design does not capture dynamic sustainability trajectories over time and reliance on expert judgment may introduce residual subjectivity.

Future research should expand the sample size, incorporate longitudinal data and test the framework across diverse agricultural contexts to strengthen empirical validation and scalability.

COLLABORATIVE STRATEGIES IN PORT-BASED FREE ZONES: STRATEGIC INTEGRATION WITH THE PORT OF LUANDA FOR AGRIFOOD VALUE CHAIN DEVELOPMENT

Chkoniya, Valentina[1]; Bengue, Alberto Antonio[2]

[1]Polytechnic University of Coimbra, Coimbra, Portugal

[2]University of Aveiro, Aveiro, Portugal

Keywords: Agrifood Business; Free Zones; Port Strategy; Collaboration; Value Chains; Logistics Integration; Angola; Port of Luanda

Introduction

The increasing complexity of global agrifood systems has intensified the need for integrated logistics, efficient distribution networks and cross-sector collaboration, particularly in emerging economies. Port-based free zones can facilitate trade, investment, and value chain development. The Port of Luanda represents a critical gateway for Angola's agrifood sector; however, limited integration between free-zone activities and port operations constrains logistics efficiency, value creation and regional competitiveness.

Purpose, Aim and Objectives

This study examines how collaborative strategies can strengthen the integration of port-oriented free zones with the Port of Luanda and support agrifood value-chain development. It aims to identify mechanisms to improve coordination among port authorities, logistics providers, agrifood firms, and policymakers. The objectives are to examine collaboration mechanisms, identify institutional and operational barriers, and explore strategies to improve information sharing, logistics, and value-added activities.

Literature Review and Theoretical Framework

The study draws on cluster development, supply chain integration, and inter-organisational collaboration theories. Port governance research highlights the importance of institutional

coordination and context-specific implementation (Sabbagh *et al*., 2024). Free zones are conceptualised as collaborative ecosystems where public and private actors can co-create value. Dynamic capabilities and organisational coordination can strengthen competitiveness (Chaudhuri *et al.*, 2025), while applied data science can support information-based coordination (Chkoniya, 2021). Agrifood supply-chain optimisation further emphasises coordinated value creation (Fiore *et al.*, 2018).

Methodology and Methods

A qualitative case study focused on the Port of Luanda and connected free-zone activities. Semi-structured interviews were conducted with port administrators, agrifood operators, logistics providers and government representatives. Documentary analysis complemented the interviews through policy, infrastructure and trade documents. Thematic analysis identified patterns concerning collaboration, governance, information sharing, regulatory coordination and operational integration (Doppen *et al.*, 2025).

Findings and Contribution

Findings indicate fragmented stakeholder collaboration, institutional misalignment, regulatory inconsistencies and limited information sharing. Infrastructure and logistical bottlenecks particularly constrain perishable agrifood products requiring timely handling and cold-chain logistics. Nevertheless, public-private partnerships, integrated logistics platforms, joint planning, shared digital information systems, and trust-based relationships provide opportunities for stronger coordination. Integration could also enable processing, packaging and quality certification within free zones (Fiore *et al.*, 2018).

Originality and Value

The study extends cluster and supply-chain perspectives to port-based free zones in an emerging economy. Its originality lies in conceptualising the port–free-zone relationship as a collaborative ecosystem rather than solely as transport infrastructure. It identifies governance and coordination mechanisms that link logistics integration to agrifood value creation and competitiveness.

Research Limitations

The qualitative single-case design limits statistical generalisation. Findings also reflect selected stakeholder perspectives and the institutional context of Luanda. Comparative research across emerging-market ports could extend the findings.

Theoretical and Practical Applications and Implications

The study demonstrates the relevance of collaborative governance, supply chain integration, and cluster perspectives for port-centred agrifood ecosystems. Managers should participate actively in collaborative networks, while policymakers should align infrastructure investment, regulatory coordination and digital information systems. Stronger integration of the Port of Luanda free zone could support Angola's agrifood competitiveness, regional trade, and economic diversification (World Bank, 2025).

EVALUATING THE IMPLEMENTATION OF GREEN ENERGY PRINCIPLES IN LITHUANIA: INSIGHTS FROM LMDI DECOMPOSITION AND REGRESSION ANALYSIS

Gindrutė Kasnauskienė[1]; Evelina Akinytė[2]; Saulius Preidys[3];Viktorija Cohen[4]; Neringa Ramanauskė[5]

[4]Department of Economic Policy, Vilnius University, Vilnius, Lithuania

[5]Department of Department of Theoretical Economics, Vilnius University, Vilnius, Lithuania

Keywords: Green energy, Lithuania, LMDI decomposition, CO_2 emissions, energy efficiency, OLS regression

Introduction

The global shift towards a low-carbon economy has evolved from an environmental niche concern into a fundamental pillar of national economic strategy. For Lithuania, this transition is inextricably linked to the European Union Green Deal (European Commission, 2019), which requires a thorough transformation of energy systems in order to achieve climate neutrality (LR Žemės Ūkio ministerija, 2021). This study is significant because Lithuania is striving for total energy independence from fossil fuels, while also navigating the financial and technological constraints that are inherent in a smaller economy (Li et al., 2015). As the country integrates into the EU's green energy infrastructure, it is vital to evaluate the efficacy of these strategic principles to ensure sustainable economic growth and national security.

Purpose, Aim and Objectives

The primary aim of this research is to evaluate the practical implementation of green energy principles in Lithuania using a rigorous quantitative approach, moving beyond policy rhetoric to empirical verification. The study is guided by four key objectives: (1) synthesising existing literature on green energy dimensions; (2) curating and visualising multi-decade Lithuanian energy datasets; (3) executing a Logarithmic Mean Divisia Index (LMDI) decomposition

alongside an Ordinary Least Squares (OLS) regression to map causal drivers; and (4) formulating evidence-based policy recommendations to optimise the transition path.

Literature Review

In the field of energy economics, theoretical frameworks are employed to categorise green principles into four distinct dimensions: decarbonisation, energy efficiency, technological advancement and energy security. While the European Union provides a unified policy umbrella and has experienced a surge in renewable integration, scientific literature highlights that smaller developing markets often encounter 'green bottlenecks' — institutional and financial barriers that impede the scaling of clean technology (Herce et al., 2024). The transition mechanisms that are effective in mature economies do not invariably exhibit linear scalability in smaller, rapidly developing markets such as Lithuania. Despite its rapid growth, Lithuania still faces significant infrastructure modernisation challenges compared to leaders such as Germany and Sweden (Landes, 2025; OECD, 2025). The research gap pertains to the contextual efficacy of green principles within "fast followers" developing markets, in accordance with the energy economics framework and the specific context that has been provided.

Methodology and Methods

The research employs a sophisticated, two-tiered quantitative methodology designed to move beyond the limitations of existing qualitative literature. Adopting a strictly empirical approach ensures analytical transparency and international comparability, providing a rigorous assessment of the drivers behind Lithuania's energy transition. Firstly, the Logarithmic Mean Divisia Index (LMDI) additive decomposition is utilised to disaggregate changes in energy consumption into activity, structural and intensity effects. The selection of this method is predicated on its path-independent properties and its capacity to manage zero values in datasets. Secondly, in order to complement the structural insights of the LMDI, an ordinary least squares (OLS) regression model has been developed in an attempt to identify the determinants of CO2 emissions. This model assesses the strength and direction of relationships between green energy indicators, such as security, innovation, and fossil fuel reduction, and broader environmental outcomes. The majority of extant empirical studies on Lithuania's energy sector were confined to data that ended in 2009. This study extends the analysis significantly by utilising annual data from 1995–2023 for LMDI decomposition. The regression analysis was conducted using quarterly data from 2010 Q1 to 2024 Q3. In order to guarantee the highest attainable level of

statistical integrity, the methodology incorporates a rigorous battery of diagnostic tests. The augmented Dickey–Fuller (ADF) test was employed to ascertain stationarity, whilst the Breusch–Pagan test was used to identify heteroscedasticity. Finally, the Shapiro–Wilk test was implemented to evaluate the normality of the residuals.

Main Findings and Contribution

The empirical results offer a nuanced perspective on Lithuania's energy trajectory. LMDI analysis shows that robust economic growth continues to push energy demand upwards, but the intensity effect, driven by significant improvements in energy efficiency, has been the main mitigating factor. The structural effect reveals a gradual shift towards less energy-intensive sectors. The empirical results provide a nuanced perspective on Lithuania's energy trajectory. LMDI analysis demonstrates that sustained robust economic growth continues to propel increasing energy demand; however, the intensity effect, driven by substantial advancements in energy efficiency, has emerged as the predominant mitigating factor. The structural effect demonstrates a gradual shift towards less energy-intensive sectors. Furthermore, the OLS regression analysis corroborates the notion that renewable energy production is a statistically significant driver of decarbonisation, with a negative coefficient ($\beta = -0.065$, $p = 0.025$). While Foreign Direct Investment (FDI) is also statistically significant ($\beta = -0.164$, $p < 0.001$), the relatively small magnitude of its coefficient suggests a limited quantitative impact, indicating a secondary rather than decisive role. Conversely, market price signals exhibit a substantially more pronounced efficiency-enhancing effect (energy price index: $\beta = -0.386$, $p < 0.001$), thereby emphasising their pivotal role in incentivising emissions reductions. Nevertheless, the study concludes that, despite the adoption of 'green' principles, their impact is not yet significant enough to fully decouple economic growth from emissions.

Originality and Value

This research provides a pioneering, dual-layer, empirical assessment of the Lithuanian energy sector. The study offers policymakers a comprehensive diagnostic tool by distinguishing between long-term structural evolutions (via LMDI) and short-term causal drivers (via regression analysis). The study's unique value lies in its identification of 'untapped potential' in market integration and innovation. It seeks to demonstrate how the work under discussion successfully bridges the so-called "gap" between the theoretical principles of green thinking and the practical "bottlenecks" faced by a developing market. It is argued that the work under

discussion offers a clear roadmap for directing public and private capital to maximize both environmental and economic returns.

Research Limitations

The findings are currently limited by the use of aggregate national-level data, which may hide variations specific to certain sectors (e.g. the transport sector's slower transition compared to industry). Furthermore, the relatively recent adoption of certain EU Green Deal policies means that the long-term structural shifts predicted by the model are still in their early stages of manifestation.

Theoretical and Practical Implications

The adoption of green energy principles in Lithuania signifies a multifaceted transition encompassing decarbonisation, efficiency, innovation, and energy security. The transition is constituted by institutional restructuring that enhances energy sovereignty. LMDI results confirm relative decoupling, while the emerging structural effect signals movement towards an "Electricity Economy", consistent with Sustainability Transitions Theory. The findings of the regression analysis provide substantiation for the roles of renewables, price signals, and FDI, thereby validating the Pollution Halo mechanism and indicating active green technology transfer.

In practice, the combined LMDI-regression framework facilitates precise differentiation between structural and short-term decarbonisation effects, thereby informing Lithuania's strategic energy planning. The results of the study identify domains of efficiency that are not performing well and guide targeted investment in sectors such as transport and buildings, while refining support for offshore wind and green hydrogen. The study's findings contribute to the enhancement of the European Green Deal's implementation by offering insights into the policy implications for CO_2 emissions. The research further supports the balanced management of sustainability, competitiveness, and affordability, a principle that aligns with the Continental European Network.

For future research, the following recommendations are made: firstly, LMDI analysis is to be applied on a sectoral basis in order to identify unique drivers in transport and agriculture; secondly, dynamic panel models are to be utilised for the purpose of making cross-country comparisons; and thirdly, quantile regression is to be implemented in order to understand the performance of green principles during different economic cycles or emission intensity levels.

IMPROVING SAVINGS THROUGH VISUAL FRAMING: EXPERIMENTAL INSIGHTS ON GOAL PERSONALISATION AND FLEXIBILITY

Georgiou, Victoria[1]; Themistocleous, Christos[1]

[1]Department of Communication and Marketing, Cyprus University of Technology, Limassol, Cyprus

Keywords: Experiment, Financial Goals, Saving Goals

Background

While many people are aware of the benefits of saving, inadequate saving habits remain a crucial problem for individuals and the global economy (Bialowolski et al.,2024) while insights converge on the Present Bias as the main force that hinders saving behaviour for individuals who can save, but don't.

In this paper, we triangulate these insights with Goal-Setting Theory (Locke and Latham,2002) and its specific tenet of Goal Specificity. Well-specified goals provide greater motivation than generic, do-your-best goals that lack an external referent. We identify a research gap, within the context of saving behaviour, that relates to the motivational effects of goals that are well-defined but are either self-set (internally motivated) or set by an external entity (externally motivated). Formally, our first research question is:

RQ1: *Are people who set specific goals on their own, more motivated to save money than those who are given a specific, pre-set goal?*

Another tenet of goal-setting theory relates to the level of flexibility offered during goal pursuit. A pertinent insight refers to the *What-the-Hell-Effect* where individuals who are failing to meet certain goals may experience strong demotivation and thus abandonment of effort. To examine ways of mitigation, the experiment allowed for flexibility in the goal pursuit to enforce a "get-back-on-track" behaviour without feeling failure or disappointment on saving attempts. Consequently, the second research question is:

RQ2: *Is the presence of flexibility in the pursuit of a saving goal more motivating than its absence?*

The value of this study lies in combining visual framing and goal-setting in the context of personalisation and flexibility of saving goals.

Methods

Design

The study employs a 2×2 full factorial between-subjects experiment that lasted 14 days, and manipulated two key factors: Goal Personalisation (Pre-fixed vs Personalised) and Flexibility (Rigid vs Flexible), with a pre-test and a post-test questionnaire.

Sample

The sample consisted of 58 adults aged 18-29 years. Participants were regular consumers of ready-made coffee and expressed an interest in improving their saving habits. 15 participants were assigned to Groups 1 and 3 respectively, and 14 participants were assigned to Group 2 and 4, respectively. As the targeted behaviour was the reduction of coffee spending, participants were required to consume at least five ready-made coffees per week in recent months, while having the alternative to make their own coffee at home.

Process

The first group received a simple journal with 14 rigid circles (one for each day) and a pre-set goal of €50, colouring the corresponding circle if they saved the money. A picture displaying the monetary goal was shown in the journal. The second group had exactly the same journal as the first, with the only difference being that they had three "flex days" where they could buy coffee as usual. The goal was adjusted to adhere to the two-week period of the experiment and was thus reduced to €40 to account for the flex days. The third group received a personalised journal based on a product or service they chose at around €50 (i.e. handbag). A picture of their desired product was displayed in the journal. Finally, the fourth group was identical to the third, except there were 3 flex days, so the product or service they set to acquire was around €40.

Findings and Discussions

Results show the reduction of ready-made coffee purchases across all four groups over the 14-day period. Between-group analyses indicated a significant difference in percentage coffee reduction (H=8.940, p=.030), with the personalised and flexible condition (Group 4) demonstrating the highest mean rank (MR=38.36). Significant differences were also observed in the frequency with which participants thought about the financial benefits of saving (H=10.660, p=.014). Pairwise comparisons revealed that the personalised and rigid condition (Group 3) scored significantly higher than the group with a pre-fixed goal and flexibility (Group 2) (p=.007).

Findings suggest that small, structured saving goals can promote saving behaviour. Interestingly, while significant improvements were observed within all groups, only limited between-group differences were observed, suggesting that the goal-setting component of the intervention itself may have played a more important role than the specific experimental condition assigned.

EXPLORING DISCLOSURE PRACTICES: KEY PERFORMANCE INDICATORS IN SAAS FINANCIAL REPORTING

Domat, Carina [1]; Kraus, Patrick [1]

[1]Business School, Pforzheim University, Pforzheim, Germany

Keywords: Software-as-a-Service, SaaS, Software Industry, Financial Reporting, KPIs

Abstract

Software-as-a-Service (SaaS) is driving a fundamental shift in the software industry through cloud-based access and subscription-based business models. Unlike traditional software vendors, SaaS companies operate in a recurring revenue model that emphasizes long-term customer relationships and continuous value delivery. Consequently, their performance cannot be fully captured through conventional financial metrics. Key performance indicators (KPIs) tailored to the SaaS business model hence play a central role in management. The primary objective of this research is to investigate the disclosure practices of KPIs within the context of financial reporting of US and German software companies. The study analyses how SaaS KPIs are embedded within the broader financial reporting context using a qualitative thematic coding approach.

This study contributes to the understanding how SaaS-specific KPIs are reported in external financial communication. From both an investor and regulatory perspective, the quality of these disclosures is crucial for informed decision-making. Moreover, as SaaS companies operate globally and face different regulatory environments as well as investor expectations, their approaches to KPI disclosure may vary considerably.

Introduction

Software-as-a-Service (SaaS) is driving a fundamental shift in the software industry through cloud-based access and subscription-based business models. Users can access software over the internet, while service providers manage the infrastructure, maintenance, and updates. This may significantly reduce costs and enables scalable, usage-based pricing (Wirtz, 2024). Unlike traditional software vendors, SaaS companies operate in a recurring revenue model that emphasizes long-term customer relationships and continuous value delivery. This structural difference

fundamentally alters how performance is generated and evaluated. As a result, conventional financial metrics provide a limited view of the key value drivers behind SaaS operations. This shift has significant implications for financial and operational controlling, demanding flexible, forward-looking tools and practices (Thaler and Pierer Von Esch, 2020). Key performance indicators (KPIs) tailored to the SaaS business model now play a central role in management.

Given the growing importance of performance measurement in the SaaS sector, it is essential to understand how companies present relevant information in their external financial reporting. Annual reports increasingly combine traditional accounting figures with non-GAAP metrics, raising concerns about consistency, transparency, and comparability. From both investor and regulatory perspectives, the quality of these disclosures is crucial for supporting informed decision-making (Lessambo, 2022). The primary objective of this study is to investigate KPI disclosure practices within the context of SaaS financial reporting. As these firms increasingly rely on non-GAAP metrics to communicate business performance, there is a growing need to understand not only which indicators are disclosed but also how they are defined, calculated, and integrated into the broader performance narrative. The overarching aim is to provide a structured assessment of current SaaS KPI reporting practices and to evaluate their effectiveness in promoting comparability and supporting stakeholder understanding.

The paper is structured as follows: the subsequent section provides a brief literature review discussing relevant themes specific to the SaaS context. We then present the research design, which is followed by presenting and discussing the empirical findings. The main findings and implications are then summarized by a conclusion.

Literature Review on SaaS KPI Reporting

SaaS performance metrics

The selection and application of performance metrics are crucial for evaluating growth, efficiency, and value. Recent studies and industry benchmarks consistently identify a core set of metrics that capture the recurring nature of SaaS operations. Among the most prominent metrics are Annual Recuring Revenue (ARR) and Net Dollar Retention (NDR), which serve as indicators of revenue predictability and customer value development. A study conducted by Gupta et al. (2022) as part of Deloitte's financial benchmarking of enterprise SaaS firms shows that NDR functions as a key leading indicator of long-term growth. According to the authors, NDR cap-

tures the revenue dynamics within the existing customer base and is directly linked to ARR growth through its components: expansion, contraction, and churn. The higher the NDR, the faster ARR tends to grow. Firms with NDR rates above 120 per cent reportedly experience significantly stronger revenue growth. According to Deloitte's analysis, increasing NDR from 120 per cent to 160 per cent can more than double a company's revenue within three years (Gupta et al., 2022). These findings are supported by McKinsey analyses conducted by Roche and Tandon (2021) as well as Barsamian (2021), which describe NDR as essential to enterprise valuation and a common benchmark used by investors. Brun et al. (2024) further confirm this relationship through benchmarking data from Norwegian business-to-business (B2B) SaaS firms, illustrating NDR as a consistent driver of sustained revenue growth. Beyond financial metrics, customer-centric KPIs have gained increasing relevance in managing SaaS business models, reflecting a broader shift toward more comprehensive KPI reporting. One illustrative example is Bosch, which developed a practical framework tailored to digital business models. In addition to Monthly Recuring Revenue (MRR), this framework includes Conversion Rate, Customer Acquisition Cost (CAC), and Customer Lifetime Value (CLTV), each aligned with different phases of the SaaS lifecycle (Nasca, 2019).

Strategic drivers of disclosure

Empirical research shows that both internal motivations and external influences play a central role in shaping the scope and quality of non-GAAP reporting. The following synthesis highlights how SaaS firms use KPI disclosure as a tool for investor communication and strategic positioning. Boesso and Kumar (2007) demonstrate that internal company characteristics are key drivers of voluntary disclosure volume. In their comparative content analysis of 72 corporate reports from Italy and the United States, they find that company size, business complexity, and stakeholder orientation significantly influence the amount of disclosed information. The strategic use of KPIs as a communication tool is highlighted by Krasodomska and Zarzycka (2021), who demonstrate that KPI disclosure often serves as a signaling mechanism to build investor trust. Their regression-based study shows that companies facing higher capital market pressure tend to report more KPIs, often with the implicit goal of signaling financial health and forward-looking confidence. In this context, KPIs are carefully selected and framed to influence investor perception and strengthen market credibility. This perspective is especially relevant for SaaS companies, which often use ARR or NDR to communicate potential for future growth rather than short-term profitability. The findings imply that KPI disclosure in the SaaS sector

frequently serves a strategic purpose by aligning reported metrics with investor expectations and growth narratives. Cho and Kim (2021) investigate how voluntary disclosures influence stock liquidity outcomes. In their analysis of a large sample of 8-K filings by U.S. firms, they find that positive disclosures have a disproportionately strong impact on liquidity compared to negative ones. This asymmetry is linked to short-selling constraints, estimation risk, and differences in interpretability.

Quality and consistency of disclosure

Although identifying appropriate KPIs is crucial for effective performance communication, their impact ultimately depends on the clarity and consistency of their presentation. While these disclosures are intended to enhance transparency and foster better stakeholder understanding, empirical research reveals substantial variation in the quality of these practices. Black et al. (2017) provide evidence that non-GAAP reporting has increased significantly in recent years and is now widely used across all industries. However, concerns remain regarding the comparability and consistency of these disclosures, as companies frequently vary their non-GAAP calculations. These findings suggest that the mere presence of KPIs does not ensure informative value, unless properly defined and explained. Supporting this conclusion, Zarzycka and Krasodomska (2022) capture that high disclosure volume is not always correlated with greater transparency. In fact, companies often report many indicators without providing sufficient definitional clarity or strategic commentary. Consequently, even widely adopted SaaS metrics risk losing their decision-usefulness for investors and other stakeholders. However, firms that operate in highly regulated or capital market-oriented industries tend to provide more contextualized information.

Smith and Van Der Heijden (2017) provide evidence of how financial analysts engage with company-reported metrics. Based on a series of expert interviews, their study reveals that inconsistently defined KPIs pose a recurrent challenge for meaningful cross-company comparisons. Analysts frequently recalculate these metrics using internal models to reconstruct comparability. Black et al. (2021) show that most firms are internally consistent in calculating non-GAAP figures, significant differences remain across firms and sectors. Notably, their findings indicate that, on average, deviations from standard non-GAAP reporting practices can enhance the informativeness of earnings figures by better reflecting firms' core operational performance. However, the potential for increased informational value depends on the consistency and trans-

parency with which these metrics are applied. This supports the view that customized KPIs commonly used in SaaS reporting can be valuable tools for communicating performance, provided they are clearly explained, logically derived, and consistently used over time. Adding on this, Dechow et al. (2025) develop a quantitative rating system to assess the quality of individual non-GAAP exclusions. They conclude that low-quality disclosures reduce interpretability and are associated with increased SEC scrutiny, greater analyst forecast variation, and slower assimilation of earnings information by the market. Importantly, their findings prove that, despite notable cross-industry differences in disclosure quality, most firms apply their exclusions consistently over time. According to the authors, this criterion is regarded as a key indicator of disclosure quality. Although both Black et al. (2021) and Dechow et al. (2025) primarily focus on non-GAAP earnings adjustments, their approaches to evaluating disclosure quality are highly relevant beyond that narrow scope. In the context of SaaS firms, where key metrics fall outside formal accounting standards, these findings underscore the value of structured qualitative criteria when assessing the transparency and informativeness of voluntary disclosures.

Taken together, the literature indicates that both internal and external factors influence the disclosure of SaaS KPIs. This suggests that tailoring metrics to firm-specific contexts can enhance strategic relevance as well as communicative effectiveness. However, this level of flexibility requires clear definitions and contextualization to ensure decision usefulness. Table 1 consolidates the key findings by summarizing the most frequently cited criteria for evaluating KPI disclosure practices.

Criteria	**Description**	**Sources**
Clarity of Definitions	Are KPIs clearly defined with comprehensible terminology and calculation methods?	Zarzycka and Krasodomska (2022), Black et al. (2017)
Transparency of Disclosure	Are KPIs explained and justified in sufficient detail?	Black et al. (2017, 2021), Dechow et al. (2025)
Contextual Framing	Are KPIs embedded in a strategic or narrative context?	Smith and Van Der Heijden (2017), Black et al. (2017), Boesso and Kumar (2007)
Stakeholder Orientation	Do the KPIs reflect the information needs of external stakeholders?	Krasodomska and Zarzycka (2021), Nyahas et al. (2018), Boesso and Kumar (2007)

Consistency Over Time	Are KPIs presented consistently across periods?	Black et al. (2021), Dechow et al. (2025)
Comparability Across Firms	Do the KPIs allow benchmarking by aligning with industry standards?	Zarzycka and Krasodomska (2022), Smith and Van Der Heijden (2017), Black et al. (2021)

Table 1: Criteria for Evaluating KPI Disclosures (created by the authors)

Research Design and Method

This study employs a qualitative research design to investigate the disclosure of KPIs in SaaS financial reporting. A qualitative approach was selected due to its flexibility and ability to capture both the content and context of disclosure practices. Given the limited regulatory guidance on non-GAAP disclosures specific to SaaS business models, a qualitative methodology provides the necessary analytical depth to explore firm-level communication strategies and interpretive nuances. The study uses qualitative thematic analysis. This method is particularly suited for the systematic evaluation of text-based data and enables the identification of both explicit content (e.g., KPI definitions and calculation methods) and implicit dimensions such as narrative framing and strategic positioning. The empirical basis of this study consists of secondary data in the form of publicly available annual reports issued by listed SaaS companies. Annual reports serve as key instruments through which companies report financial performance and strategic direction to external stakeholders. These documents often combine quantitative elements, including tables and charts, with qualitative components, particularly management commentary, strategic outlooks, and explanatory narratives. A purposive sampling strategy was applied, whereby companies were deliberately selected based on their potential to provide relevant and diverse insights into SaaS-specific KPI disclosures. Purposive sampling allows for the intentional inclusion of cases that are particularly informative and theoretically meaningful (Kuckartz, 2014).

This study focuses on publicly listed German and U.S. software companies operating in the B2B SaaS segment. These two markets are considered among the most mature and globally influential in the SaaS sector. From an initial pool of twelve companies from the S&P 500 index (Information Technology) and TecDAX, eight were selected for analysis. Selection criteria included relevance to the B2B SaaS context, the availability and quality of annual reports, as well as the extent to which SaaS-specific information was disclosed. Annual reports of the fiscal

year 2024, which have been disclosed around mid 2025 have been used for the analysis. The final sample includes the companies SAP, TeamViewer, ATOSS Software, Nemetschek Group, Salesforce, Workday, Oracle, and ServiceNow. The sample ensures a balanced regional distribution, which allows potential comparisons between disclosure practices in different regulatory environments.

The data analysis is conducted using template analysis and is supported by the qualitative data analysis software ATLAS.ti, which enables systematic coding, retrieval, and comparison of text segments across documents. Following the approach outlined by King (2004), a coding template is developed and refined iteratively throughout the analysis. An initial set of themes is inductively derived from a subset of reports and guided by the research questions. The coding structure is hierarchically organized into higher-order themes, subthemes, and individual codes. Key to this process is the iterative refinement of the template, in which codes are continuously evaluated and adjusted based on empirical observations. For instance, the code "Recurring Revenue" captures various expressions of recurring income streams, including ARR, MRR, and general references to subscription or SaaS revenue. The final coding scheme is provided in Table 2. Given the scope of the paper, solely the constructs 1 and 4 will be discussed here.

	Construct (**Theme**/*Subtheme*)	**Code**
1	**Types of reported SaaS KPIs**	
	Revenue Metrics	Recurring Revenue, Cloud Revenue, Revenue Retention, Remaining Performance Obligation
	Customer Metrics	Churn Rate, Net Promoter Score, Renewal Rate, Number of Subscribers
	Efficiency Metrics	Billings, Contract Value, Rule of 40
2	**Initial Presentation of KPIs**	
	Accounting Framework	Non-GAAP Disclosure, Revenue Recognition
	Terminology & Measurement	Labelling, Definition, Calculation Method
3	**Transparency of KPI Disclosures**	
	Interpretation and Critical Reflection	Interpretation, Limitations, Influencing Factors
	Disclosure Consistency	Narrative-Quantitative Gap, Inconsistent Terminology

4	**Contextualization of KPIs**	
	Comparative Framing	Historical Comparison, Forecasting, Benchmarking
	Strategic Framing	Management Commentary, Strategy Alignment, Investor Relevance, Risk Integration

Table 2: Final Coding Scheme (created by the authors)

Findings and Discussion

Types of reported SaaS KPIs

Revenue-related KPIs serve as the core of performance reporting in SaaS companies and represent the most comprehensively covered category across the analyzed sample. All eight companies disclose revenue indicators that reflect the recurring nature of their business model, highlighting the central role of SaaS-specific KPIs in communicating financial stability and long-term value creation. Among these, Subscription Revenue, Cloud Revenue, ARR, and RPO are most prominently reported. Their widespread use highlights a shared understanding of their relevance in conveying the predictability and sustainability of SaaS business models. At the center of this group is subscription revenue, which is disclosed by all companies across the sample, either as a standalone figure or in combination with broader cloud revenue. Notably, US-based companies report subscription revenue separately, while German firms tend to aggregate it with other cloud-related income. These broader disclosures often include components such as maintenance and support revenue, which are contractually linked to software usage but may not be part of the core subscription model. While this practice may reflect differences in internal accounting practices, it can reduce transparency by blurring the distinction between recurring and non-recurring revenue.

Similarly, several companies report ARR as a separate figure to provide a more standardized and forward-looking perspective on revenue generated from active subscriptions. ARR is frequently used to signal business momentum, particularly in investor communications and strategic planning contexts. In some cases, ARR is further elaborated through supplementary disclosures, namely ARR growth rates or currency-adjusted ARR, which enhance transparency and provide more detailed insight into recurring revenue dynamics. Like that the literature identifies subscription revenue, alongside ARR and MRR, as a fundamental indicator of financial stability and long-term viability in subscription-based business models (Ebert and Schmid,

2024; Momsen, 2019). By contrast, MRR is disclosed far less frequently. Other commonly reported metrics in this category are RPO and Cloud Backlog. These figures provide important forward-looking information and help assess the predictability of future revenue streams. While U.S. companies tend to report RPO, German companies more frequently use backlog figures, including cloud order backlog or simply cloud backlog.

Customer-related KPIs represent the second major category of SaaS-specific performance indicators. While they are not universally reported across all companies in the sample, most firms (Salesforce, ATOSS, SAP, ServiceNow, TeamViewer) include at least one metric in this area. This reflects a growing awareness of the strategic relevance of customer retention, satisfaction, and engagement within subscription-based business models. Among the most frequently disclosed metrics in this category are churn rate and the NPS. Only a few (TeamViewer: number of customers; ServiceNow: number of customers with ACV greater 1 million USD, renewal rate) companies in the sample disclose further customer metrics, including the renewal rate or the number of subscribers. Their limited presence suggests that customer-related indicators have not yet been systematically integrated into corporate reporting. Compared to revenue metrics, customer KPIs exhibit greater variation in both frequency and format. Furthermore, no clear pattern emerges based on region or company size, as only a few firms report multiple customer-related indicators, while others omit them entirely. This inconsistency may result from differences in internal data availability, analytic capabilities, and the degree to which companies prioritize qualitative aspects in their external communication. Customer-related KPIs can be considered essential for measuring performance in SaaS business models, primarily due to their strong association with long-term value creation and risk management (Momsen, 2019). The observed reporting practices, however, show a clear gap between recommendations in literature and actual disclosure behavior. For instance, while academic literature frequently highlights CLTV as essential for evaluating customer profitability (Seidenstricker et al., 2025), it is largely absent from the analyzed sample. This indicates that performance measurement in practice remains focused on financial results, whereas customer dynamics, despite their strategic relevance, are often underrepresented in external reporting.

Efficiency-related KPIs form the third major category. These indicators aim to assess how effectively a company converts operational activity into sustainable growth and profitability, thereby reflecting the scalability of the business model. Efficiency metrics focus on structural

performance factors. These include how effectively a company translates operational activity into revenue, manages pricing models, and scales its cost base relative to growth. The distinction between these categories is not always clear-cut. Some indicators, such as Annual Contract Value (ACV), could also be interpreted through a customer lens. However, for the purpose of this analysis, these metrics are classified as efficiency KPIs when they primarily serve to evaluate monetization potential, pricing structures, or cost-value relationships on a strategic level. Depending on how they are framed, these indicators may serve as leading or hybrid indicators, providing early signals of commercial performance and future revenue capacity.

Within the sample, efficiency and operational metrics are disclosed infrequently. The few identified KPIs include ACV, Billings, and the Rule of 40. ACV captures the average or total value of customer contracts over a one-year period and provides insights into pricing strategy as well as sales effectiveness. Billings refer to invoiced amounts within a reporting period and may indicate short-term cash flow dynamics. In one instance, Billings are further disaggregated into Retained Billings, New Billings, and Non-recurring Billings (TeamViewer, 2024). Lastly, the Rule of 40 combines a company's revenue growth with its profit margin into a single benchmark, reflecting a balanced approach to scalable and sustainable growth. These metrics appear only in isolated cases (TeamViewer: Billings, ACV; ServiceNow: Rule of 40, ACV) and are not systematically applied across the sample. Furthermore, no regional pattern can be observed, as reporting frequency remains generally limited regardless of company characteristics. These findings align only partially with the literature. Several studies underscore the relevance of customer- and efficiency-focused metrics for steering operational decisions, identifying risks early on, and assessing long-term company value (Nasca, 2019; Ottens and Wahrlich, 2022). Suggested frameworks often refer to CLTV, CAC, and Conversion Rates as necessary complements to traditional financial indicators (Brun et al., 2024; Roche and Tandon, 2021).

The selective and inconsistent disclosure of customer and efficiency metrics indicates significant problems. While revenue metrics provide a common basis for evaluating financial performance, they offer only a partial view of the key drivers of success in subscription-based business models. The lack of transparency into customer-related outcomes and operational scalability reduces the explanatory power of financial statements. Moreover, the absence of standardized and comparable metrics complicates peer analysis, which are particularly important in the dynamic and growth-oriented SaaS environment. These findings challenge the conclusions

of Boesso and Kumar (2007), who argue that internal structural characteristics, particularly firm size and business complexity, are drivers of voluntary disclosure volume. In the present sample, Oracle, one of the largest companies analyzed, reports the fewest SaaS-specific KPIs, while ATOSS, a comparatively small provider, offers one of the most comprehensive disclosure sets.

Contextualization of KPIs

The analysis of comparative framing in KPI disclosures captures that many SaaS companies aim to enhance the interpretability of performance metrics by embedding them in internal or external reference frameworks. Across the sample, three main approaches can be identified: (i) historical comparisons, (ii) forecasting, and (iii) benchmarking. These elements are used to situate KPIs within a broader narrative and reinforce their strategic significance. As noted by Krasodomska and Zarzycka (2021), framing strengthens the signaling function of KPIs in communicating future-oriented performance and operational credibility.

Firstly, (i) historical comparisons represent the most widespread method of contextualizing KPIs. Many firms report key metrics using year-over-year (YoY) or quarter-over-quarter (QoQ) comparisons to indicate growth dynamics and reinforce perceived performance continuity. Salesforce, for instance, highlights a 17 per cent increase in its RPO compared to the previous year, signaling sustained customer demand and strengthening expectations of future revenue. For stakeholders, these comparisons enhance the transparency and credibility of KPI disclosures, as they highlight not only short-term momentum but also the longer-term direction of company performance. QoQ comparisons are less common across the sample, as these figures are typically reported in separate quarterly updates for investors. While most companies limit their comparisons to the current and prior year, German companies tend to adopt a more extended perspective in their framing. ATOSS, for instance, tracks the increase in its share of recurring revenue and explicitly presents this trend as evidence of a successful structural transformation:

> "While in 2015, 38% of our total revenue came from recurring revenue streams, this figure had increased to 46% by 2020 and has now reached 65% by 2024. […] This excellently reflects our strategy to ensure high-quality, long-term income and underlines the sustainability and profitability of our business model."
> (ATOSS, 2024 p. 47)

This long-term view reinforces the company's strategic narrative and signals the stability and maturity of its business model. Similarly, SAP and Nemetschek provide five-year comparisons of selected KPI metrics, offering stakeholders a broader view of performance evolution. While the literature does not explicitly focus on time-based comparisons as a distinct framing technique, related concepts such as the importance of consistency over time (Black et al., 2021) and contextual explanation (Smith and Van Der Heijden, 2017) point to their relevance.

Several firms integrate (ii) forecasting elements into their KPI communication. Forward-looking statements and targets serve not only to articulate strategic ambition but also to influence investor expectations. German companies, particularly SAP and Nemetschek, provide explicit medium-term goals for KPIs. SAP, for example, forecasts cloud revenue between €21.6 billion and €21.9 billion in 2025, corresponding to 26-28 per cent growth. These goals are typically aligned with strategic frameworks, reinforcing the company's long-term vision. U.S. firms, in contrast, are more cautious in their use of numerical forecasts and often restrict forward-looking disclosures to revenue outlooks or broad segment expectations. A similar pattern can be observed with (iii) benchmarking practices, which appear only rarely. When used, these comparisons are often qualitative and serve to signal market leadership rather than provide systematic peer analysis. Firms may emphasize their position through claims of industry-leading growth or customer metrics, even without disclosing specific benchmarks. For example, SAP asserts that none of its major competitors achieved comparable cloud growth. Similarly, ATOSS highlights a 1.6 per cent churn rate as "one of the best in the sector" (ATOSS, 2024, p. 55). While these references enhance perceived performance, they typically lack detailed comparative data.

Overall, while both U.S. and German companies use comparative framing to enhance KPI disclosures, notable differences emerge in scope and emphasis. U.S. firms focus more on short-term growth and market-oriented framing, suggesting a stronger orientation toward investor signaling. In contrast, German companies apply longer-term comparisons, reflecting a broader stakeholder approach. These differences support the findings of Boesso and Kumar (2007) as well as Krasodomska and Zarzycka (2021) and Zarzycka and Krasodomska (2022), who emphasize that disclosure quality is influenced by strategic intent. The observation further demonstrates that disclosure practices are shaped not only by regulatory frameworks but also by underlying assumptions regarding the purpose of performance communication. The generally

larger size and higher market exposure of U.S. firms likely reinforce this signaling orientation, as both competition and investor scrutiny tend to increase with organizational scale.

Finally, it can be explored how SaaS KPIs are strategically framed to align with broader narratives of transformation, value creation, and stakeholder engagement. A common instrument is management commentary, where executives explicitly emphasize the strategic importance of selected KPIs. Statements from executive board members or CEOs frequently highlight ARR, NRR, or Churn Rate. Table 3 presents illustrative examples from ATOSS and SAP, both of which use customer and revenue-based indicators to link financial performance to long-term business stability.

SAP (2024, p. 7)	**ATOSS (2024, p. 55)**
"Total cloud backlog […] is 40% higher than in the previous year […] and with a share of recurring revenues now accounting for 83% of our total revenue, we have very solid future prospects."	"Customers don't just stay with ATOSS - they grow with us, as our strong net revenue retention rate.

Table 3: Management Commentary on SaaS KPIs (created by the authors)

Building on this, the strategic alignment of KPIs is often closely tied to management commentary. Executives use narrative framing to position performance indicators within broader corporate objectives and transformation incentives. Rather than presenting metrics in isolation, companies link them to overarching themes, including customer loyalty, recurring revenue growth, and sustainable business development. Particularly, NRR, Churn Rate, and NPS are referenced as key indicators of progress toward these strategic goals (ATOSS, 2024; SAP, 2024; Nemetschek, 2024). Notably, German companies tend to disclose more structured strategy-KPI linkages and concrete targets, while U.S. firms typically limit themselves to broader directional statements. It is also striking that ATOSS, despite being one of the smallest companies in the sample in terms of revenue, provides particularly transparent and well-structured contextual information. This reinforces that reporting depth is not strictly tied to company size but may reflect a deliberate commitment to communicative clarity and investor orientation. While the literature broadly affirms the role of voluntary disclosure in strategic communication and stakeholder alignment (Boesso and Kumar, 2007; Krasodomska and Zarzycka, 2021).

Another dimension of framing relates to investor relevance. ServiceNow explicitly justifies the disclosure of customer metrics in terms of their usefulness for investor decision-making. This reflects a broader trend among larger, U.S.-based firms to align KPI disclosure with capital market expectations and to strengthen investor confidence through targeted transparency. By linking operational metrics directly to perceived shareholder value, these firms reinforce the financial materiality of their KPIs. In contrast, German and smaller firms tend to emphasize operational relevance and internal steering logic, often presenting KPIs in the context of business model transformation or efficiency goals rather than investor signaling. These patterns align with the findings of Nyahas et al. (2018), who argue that firms adapt disclosure based on the perceived power and urgency of stakeholder groups, placing greater emphasis on investors where capital dependency and visibility are high.

Conclusion

The analysis reveals that SaaS companies predominantly emphasize revenue-related KPIs in their financial reporting. These indicators are generally well defined and often embedded in broader performance narratives, reflecting their strategic relevance for capital market communication. In contrast, customer- and efficiency-related KPIs are less frequently reported and often lack clear definitions as well as contextual framing. These patterns suggest a gap between recommended performance measures by literature and actual industry practices. The degree to which metrics are embedded in coherent narratives and linked to strategic objectives differs considerably. U.S. companies tend to apply more standardized formats, align more closely with regulatory expectations, and offer more consistent contextual and strategic framing. In contrast, German firms often present aggregated disclosures and apply qualitative framing only selectively. These patterns suggest that disclosure practices are shaped by a combination of structural influences and firm-specific communication strategies. Ultimately, cross-company comparability is limited.

For practitioners, the study emphasizes the importance of linking internal performance management with clear and consistent external reporting. Transparent definitions, methodological clarity, and purposeful framing are key to improving comparability and building stakeholder trust. High-quality reporting is not exclusive to large firms, as smaller companies can also demonstrate credibility through clarity and coherence. As every research this study is subject to several limitations. First, the analysis draws exclusively on secondary data from publicly

available annual reports, which restricts insights into the internal decision-making and strategic motivations behind KPI disclosure. It remains largely unclear to what extent the reported metrics are used for management purposes or whether additional KPIs are tracked but not disclosed. The sample is restricted to US and German software firms. Future research could use qualitative interviews with internal stakeholders, to offer a deeper understanding of the strategic and operational rationale behind KPI disclosures.

DOES GREENWASHING MATTERS FOR CHINESE BANK'S PERFORMANCE: THE ROLE OF GENDER DIVERSITY

Muhammad Ishfaq Ahmad[1], Ramiz Ur Rehman[1], Muhammad Akram Naseem[2], Joe Ueng[3], Niccolò *Nirino*[4]

[1]Teesside International Business School, Teesside University, Middlesbrough, UK

[2]Lahore Business School, The University of Lahore, Lahore, Pakistan

[3]Cameron School of Business, S.T Thomson University Houston, Texas, United States

[4]Department of Management, University of Turin, Turin, Italy

Keywords*:* Green-washing, Gender Diversity, Chinese Banks, Return on Assets, Return on Equity, Board Size, Board Independence, Financial Leverage

Introduction: Banks are considered as the backbone of any economy and play very important role for the development of any economy; therefore, China does not have any exception. There is strong pressure on China internally and externally to manage the environment issues. To overcome this pressure many firms they started the word around ESG but to meet the expectations of all the stakeholders they started the greenwashing, and media exposed this firms' greenwashing behaviour.

Purpose Aims and Objectives: Following the legitimacy and upper echelon theories, the study examines the role of greenwashing and Chinese banking performance and weather presence of the females in the board moderates this relationship.

Literature Review and Theoretical Framework: Existing literature on ESG adopted different theoretical framework, however majority of the studies seems to explain the different variation in ESG disclosure through legitimacy theory and Upper echelon theory framework (Baldini et al., 2018). Legitimacy theory explains the organization social acceptance for its survival. Suchman (1995) defined legitimacy as "a generalized perception or assumption that the actions of any entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs and definitions".

The study test the following hypothesis

H1: Does greenwashing have any impact on the Banks performance.

H2: Females presence in the corporate board moderates the relationship between greenwashing and banks performance.

Methodology and Methods: To test the proposed hypothesis, the study used fixed effect regression across 46 Chinese banks including Big 4. The data is taken from Refinitiv from 2015-2024. The outcome variable is return on asset (ROA) and return on Equity (ROE). Both measures are widely used as the proxy of the bank's performance (Le et al., 2023).

We employed the following econometric model to measure the role of greenwashing on the banking performance

$$ROA_{it} = \alpha + \beta_1 Gw_{it} + \beta_2 BGD_{it} + \beta_3 (BS_{it} * GW_{it}) + \beta_4 BS_{it} + \beta_5 BI_{it} + \beta_6 DE_{it} + \mu_i + \lambda_t + \varepsilon_{it}$$

$$ROE_{it} = \alpha + \beta_1 Gw_{it} + \beta_2 BGD_{it} + \beta_3 (BS_{it} * GW_{it}) + \beta_4 BS_{it} + \beta_5 BI_{it} + \beta_6 DE_{it} + \mu_i + \lambda_t + \varepsilon_{it}$$

Where i stands for banks and t is for time. ROA is return on Assets, GW is greenwashing, BGD is board gender diversity, BS is board size, BI is board independence, DE is total debt to equity.

Findings: The study examined the impact of greenwashing on the banking financial performance which is unexplored in the existing literature of greenwashing (Birindelli et al.., 2024) as majority of the studies on the non-financial sector (Zahid et al., 2023). The results show that greenwashing is no longer beneficial for the firms as few studies reported the positive outcomes of greenwashing (Li et al., 2023). The latest developments in the China such as the establishment of Central environmental protection inspection (CPEI) policy created the awareness among the stakeholders (Zhao and Lee, 2024) and there is no economic benefit of the greenwashing.

Originality and Value: This study is unique and original in its nature. This is first study that consider the Chinese banking and studied the greenwashing phenomena in the banking sector. Chinese banks are the pioneer in launching the green bonds and big promoters and supporters of the green initiatives; therefore, the study expose the banking sector greenwashing.

Research Limitations: Despite all this, the study has few limitations which are the opportunities for the future research. First this study considered the only Chinese banks, further studies can consider the comparative studies sample from the developing countries. This study only considered the gender diversity of the board members future studies may consider other types of diversity such as education, age and experience. The further studies may consider the role of ownership by studying the state-owned banks and non-state-owned banks.

Theoretical and Practical Implications:

The study highlighted the role of females in the banking sector to minimize the greenwashing in the financial institutions. The study supports the upper echelon theory which considers the characteristics of the higher management in the decision making. Similar to other sectors, it confirms that higher management characteristics e.g gender (Zahid et al., 2023) matters in banking sector and plays critical role to control the greenwashing.

Abstract

Financial asset recommendation (FAR) is a subdomain of recommender systems that identifies suitable financial securities for investors, with the expectation that they will invest capital in the recommended assets. Effective recommendation systems rely on modelling pricing data to distinguish between high-performing and potentially undervalued assets.

In this work, we use machine learning models to predict the future profitability of financial assets and rank them as investment recommendations. However, these models are inherently opaque, providing only a score without explaining why a particular asset was selected over others. This lack of transparency makes it difficult to assess whether the model's predictions are financially meaningful and not influenced by arbitrary patterns in the training data.

Preliminary results show that counterfactuals explanations were successfully generated for all assets in two of the 61 evaluation windows. The modest improvements in predicted profitability suggest that small changes to historical price patterns are often sufficient to improve recommendations while remaining close to the factual prices.

Keywords: Financial Asset Recommendations, Explainable Artificial Intelligence, Counterfactual Explanations, FinTech

Introduction

Explainable artificial intelligence not only improves transparency but can also transform recommendation systems into decision-support tools. In particular, counterfactual explanations

provide actionable insights by identifying the minimal changes required for an asset to become a more attractive investment under alternative market conditions.

Existing applications mainly focus on credit-related tasks using binary classifiers (Černevičienė & Kabašinskas, 2024). Attention has also shifted towards time-series counterfactuals, where preserving temporal coherence is essential to ensure realistic explanations (Delaney, et al., 2021; Wang, et al., 2024).

However, counterfactual explanations remain unexplored for regression-based FAR systems that derive profitability recommendations from historical price trajectories. We address this gap by providing actionable explanations and evaluating their stability over time using an expanding window approach.

Our goal is to provide analysts and investors with actionable insights into the models' recommendations by identifying minimal price changes that would lead to higher predicted profitability.

We evaluate our approach on two expanding evaluation windows. Counterfactuals were successfully generated for 97% of assets in both windows; at the level of individual asset-day queries, 81–82% yielded a valid counterfactual. For the remaining queries, 12–13% had no admissible counterfactual within our search bounds.

In practice, small counterfactual price changes indicate recommendations that are close to changing and may require monitoring, while the absence of a feasible counterfactual suggests a more robust recommendation. This differs from feature-attribution approaches (e.g., SHAP, LIME) commonly used in FAR.

Methodology and Methods

The proposed work extends the research by (Sanz-Cruzado, et al., 2026), who adopted an expanding window evaluation strategy to model FAR. Within each window, real historical price series are converted into financial indicators such as return and volatility measures over multiple time horizons. These indicators are then used by regression models to predict asset profitability and generate recommendation rankings.

Using the FAR-Trans datasets (Sanz-Cruzado, et al., 2024), we investigate counterfactual explanations for these profitability-based recommendations. Although the underlying models operate on financial indicators, counterfactuals are generated directly over the original 21-day

price windows to produce explanations that are more intuitive and actionable for analysts and investors. Starting from each asset's price history, we employ DiCE with a genetic algorithm (Mothilal, et al., 2026) to identify alternative price patterns that would increase the asset's predicted profitability while remaining consistent with its historical price behaviour. We then assess each counterfactual in terms of how much the predicted profitability improved, the number of price shifts, and how far the alternative trajectory deviated from the original.

Research limitations

Despite the promising results, this work presents a few limitations that motivate future research. First, the counterfactual objective is relatively simple, aiming only to exceed the factual profitability score while constraining the target by the asset's historical maximum profitability. While this avoids unrealistic objectives, it may restrict the search space for assets with consistently low returns.

A second limitation concerns the realism of the generated explanations. Although generated price patterns are constrained to remain within historical ranges, the optimisation process does not enforce temporal smoothness, potentially resulting in unrealistic fluctuations between consecutive observations.

Finally, the counterfactual generation is computationally demanding. Our approach relies on a genetic search which requires substantial resources, making analyses across all expanding windows challenging.

Conclusion and Expected Contributions

In this work, we investigate counterfactual explanations for profitability-based FAR by generating alternative historical price patterns that reveal the market conditions required to improve an asset's recommendation. These explanations have the potential to support more informed investment decisions. In summary, *i)* we provide counterfactualsdirectly on raw historical price data; *ii)* we perform a temporal analysis across expanding windows to study the stability of explanations under changing market conditions, including periods of high volatility; and *iii)* we identify which assets consistently have realistic and low-cost counterfactuals versus those for which no achievable alternative exists.

THE STRATEGIC INTENT BEHIND AI-GENERATED ADVERTISING: A THEORY-DRIVEN EXPLORATION OF PERCEIVED CREATIVITY, HUMAN REPLACEMENT AND BRAND RESPONSES

Lejealle, Catherine [1] Rezaee Vessal, Saeedeh [2]; Jouny-Rivier, Elodie [3]

[1] Departement of marketing, ISC Paris, Paris, France
[2] De Vinci Higher Education, De Vinci Research Center, Paris, France
[3] Departement of Marketing, Essca, Angers, France

Keywords: Artificial intelligence, advertising effectiveness, strategic intent, bad buzz, consumer perception.

Introduction and purpose

The rapid diffusion of generative artificial intelligence (AI) in advertising is profoundly reshaping creative processes and brand-consumer relationships. While some AI campaigns receive praise, others provoke strong backlash and "bad buzz." This contrast suggests that consumer responses cannot be explained solely by intrinsic creative qualities. Moving beyond simple "human vs. machine" comparisons, this study explores a critical research gap: the shift from output-based evaluation to intent-based interpretation. We argue that consumer evaluations depend on *perceived strategic intent* — how audiences interpret a brand's underlying motives for adopting AI over human labor — viewed through the lens of reputational risk and strategic integrity.

Theoretical framework

In advertising, creativity is conceptualized as the joint presence of divergence and relevance (Smith et al., 2007). When creativity is delegated to machines, consumers shift their focus to the symbolic meaning of the brand's technological choice. To theorize these reactions, this research extends Situational Crisis Communication Theory (SCCT) (Coombs, 2017) to AI-

generated advertising, conceptualizing AI-induced "bad buzz" as a form of technology-induced reputational crisis driven by perceived corporate opportunism. This is complemented by consumer resistance and brand hate literatures, which highlight how value incongruence triggers negative behaviors (Hegner et al., 2017; Kucuk, 2008). We propose a distinction between two inferred dimensions:

1. *AI-for-efficiency:* AI is perceived as a cost-cutting tool substituting human creativity.
2. *AI-for-augmentation:* AI is seen as expanding creative possibilities while preserving human authorship.

Methodology

This study adopts a qualitative, theory-building approach based on semi-structured interviews with Generation Z consumers, selected for their technological literacy and ethical sensitivity. Participants will be exposed to contrasting AI-generated advertisements from the same brands (e.g., Coca-Cola's *Christmas* and *Masterpiece*). This comparative interpretative setup isolates how different AI applications (efficiency vs. augmentation) affect perceptions. Data will be processed using thematic coding focusing on strategic intent attribution, perceived human replacement, and affective brand responses.

Findings and contribution

Preliminary findings suggest that rejection emerges when AI use is interpreted as an efficiency-driven strategy aimed at reducing costs and bypassing human labor, triggering perceptions of opportunism and negative word-of-mouth. Conversely, when AI is perceived as augmenting human creativity, it reinforces brand innovativeness, legitimacy, and cultural relevance.

Originality, limitations and implications

The paper contributes by shifting the analysis of AI ads to consumers' interpretive processes, applying crisis theory to technological decisions, and formalizing the construct of strategic integrity. *Limitations:* Focusing exclusively on Gen Z limits generalizability to older cohorts. Additionally, qualitative data captures subjective interpretations rather than quantifiable

behavioral metrics. *Implications:* Theoretically, it shows that consumer response depends on inferred corporate motives rather than just aesthetic realism. Practically, it highlights that marketers must proactively frame AI as an augmentative tool and ensure absolute alignment between technological choices and ethical positioning.

INTERNAL MARKETING AS A STRATEGIC MARKETING TOOL: LEVERAGING PERSONAL AND ORGANISATIONAL VALUES AND NON-FINANCIAL REWARDS TO FOSTER EMPLOYEE ENGAGEMENT

Kyriacou, Evdoxia[1]; Zarkada, Anna[2]; Papasolomou, Ioanna[3]

[1]CIIM Business School, University of Limassol, Limassol, Cyprus

[2] Department of Communication and Marketing, Cyprus University of Technology, Limassol, Cyprus

[3] School of Business, University of Nicosia, Nicosia, Cyprus

Keywords: Internal marketing, employee engagement, personal values, organisational values, Higher Education Institutions

Introduction

In the current VUCA environment, organisations increasingly need to direct marketing strategy internally as well as externally, as employee engagement (EE) can support sustainable competitive advantage (Ahmed and Rafiq, 2003; Kumar and Pansari, 2016). However, Internal Marketing (IM) remains conceptually ambiguous and inconsistently operationalised, limiting understanding of its strategic outcomes (Rafiq and Ahmed, 2000; Papasolomou et al., 2017; Kyriacou, 2024). This study therefore examines IM as a strategic, values-based system of non-financial rewards that strengthens EE through perceived organisational values while accounting for employees' personal values.

Purpose, Aim and Objectives

The purpose of this study is to examine IM as a strategic, values-based non-financial reward system that fosters EE. Specifically, it investigates the direct and indirect relationships between PIM and EE by assessing the mediating role of perceived organisational values and the moderating influence of employees' personal values.

Literature Review and Theoretical Framework

Building on evidence highlighting the fragmented conceptualisation and operationalisation of IM (Papasolomou et al., 2017; Kyriacou, 2024; Brown et al., 2025), this study conceptualises IM as a strategic organisational capability integrating internal communication, organisational culture and non-financial reward practices. Drawing on the relational perspective of IM

(Ahmed and Rafiq, 2003; Ballantyne, 2003; Lings and Greenley, 2005), the proposed framework suggests that perceived IM strengthens EE through perceived organisational values, while employees' personal values moderate these relationships.

Methodology

This paper reports the quantitative phase of a sequential mixed-methods study. Data (n = 415) were collected using a census survey of employees across Higher Education Institutions (HEIs) in an EU country. The proposed conceptual model was tested using moderated mediation analysis.

Main Findings and Contribution

The findings provide empirical support for the conceptualisation of Perceived Internal Marketing (PIM) as a coherent strategic system of non-financial rewards that is positively associated with EE ($\beta = .493$, $p < .001$). This relationship is partially mediated by Perceived Organisational Values (POV), with PIM positively predicting POV ($\beta = .498$, $p < .001$), which in turn predicts EE ($\beta = .155$, $p = .001$). Furthermore, the indirect effect of PIM on EE through POV is contingent upon employees' Personal Basic Values (PBV) (index of moderated mediation = .021, 95% CI [.008, .037]), suggesting that the effectiveness of IM depends partly on employees' underlying value orientations.

Originality and Value

This study contributes to IM theory by providing empirical support for its strategic conceptualisation as a values-based mechanism through which employee engagement is fostered via perceived organisational values while recognising the contingent influence of employees' personal values. It further extends existing evidence through sector-wide findings from a census survey across HEIs within a resource-constrained service context.

Research Limitations

The findings should be interpreted in light of the study's cross-sectional design and single-sector, single-country context, which may limit their generalisability.

Theoretical and Practical Implications

The findings highlight the importance of embedding organisational values within IM strategy and suggest that managers reinforce value-consistent internal communication, employee recognition and participation to strengthen sustainable EE (Kyriacou, Papasolomou and Zarkada, 2026).

Abstract

Purpose: This paper explores the role of internal audit in the management of fraud. Specifically, it seeks to examine the relationship between the organizational positioning, competencies, and activities of internal audit and the management of fraud within the public sector in Greece.

Design/methodology/approach: This study uses a sample of 108 questionnaires from public organizations in Greece. Statistical analysis was performed using the linear structural equation modeling (SEM) method.

Findings: Findings show that the internal audit organizational status and competence are significant factors of fraud management. As a result, when internal auditors hold the right level of authority and possess the necessary skills within an organization, they are more likely to carry out tasks that improve fraud management.

Originality/value: The originality of this study lies both in the fact that not enough research has been conducted that delves deeper into this subject and the method that was used for the data analysis.

Keywords: Public Organizations, Internal audit, Fraud management, Greece

Paper type: Research paper

Introduction

In recent years, the significance and attention afforded to internal auditing have notably increased in both the public and private sectors. Within the public sector, internal audit has assumed an increasingly prominent role over the past decades, as it serves to ensure the

preservation and effective utilization of public resources. The present study aims to explore the role of internal audit in the management of fraud. More specifically, it seeks to examine the relationship between the organizational positioning, competencies, and activities of internal audit and the management of fraud within the public sector in Greece.

Fraud constitutes a deliberate and deceptive act characterized by dishonesty and falsehood, perpetrated by an individual, group, or organization with the intention of obtaining undue advantage at the expense of others (Narayana and Ariyanto, 2020). Fraud management refers to the systematic process of assessing fraud risk on a regular basis, with the aim of identifying, evaluating, and responding to instances of fraud encountered by a public sector organization. It also involves the formulation and implementation of a comprehensive fraud control plan to ensure the coordination and strategic focus of anti-fraud measures within the organization. Effective fraud management is of paramount importance in the public sector, as its operations are particularly susceptible to recurrent types of fraudulent activity, including the misappropriation of raw materials or assets, embezzlement of funds, corruption/bribery, and illicit commissions.

This study is grounded in agency theory, with a particular emphasis on the role of internal audit in fraud management, examined through the lens of its organizational positioning, capabilities, and functional activities. Agency theory provides a useful framework not only for understanding the presence of internal audit functions within public sector entities, but also for interpreting specific attributes such as their hierarchical placement (including their relative size), the competencies of audit personnel, and the breadth of their operational activities (Adams, 1994). Nevertheless, the magnitude and nature of the contribution that each of these characteristics can offer remain open to empirical investigation. Chambers and Odar (2015) underscore the increasingly prominent role of internal auditors in fraud management, noting that their contribution is particularly critical when audit procedures pertain to public interest entities (Neu et al., 2013). Previous literature on the subject under examination is limited regarding the contribution of the organizational position, capabilities, and activities of internal audit to fraud management. However, more broadly, the relationship between internal audit and fraud management has been examined in several studies conducted in the United States, Australia, Malaysia, the United Kingdom, and the Netherlands (see Mihret, 2014; Law, 2011; Coram et al., 2008; Vanasco, 1998). The present research concentrates on the organizational status, capabilities, and activities of internal audit, as there is often a lack of clarity regarding whether audit practitioners hold a consistent understanding of these three dimensions.

The results of the study contribute to the expansion of the literature on the importance of internal auditing in fraud management, demonstrating that the organizational status and capability of internal audit have a positive impact on fraud management in public sector organizations. Furthermore, based on the findings, it is recommended that public service administrations and their internal auditors prioritize strengthening the organizational position and the competence of auditors before deciding on the specific activities to be undertaken. The findings have practical implications for regulatory bodies, such as the Institute of Internal Auditors and relevant ministries, in order to enhance the role of internal auditing across all public sector organizations.

The remainder of the paper is organized as follows. Section 2 reviews the literature and develops the hypotheses. This is followed by a discussion of the research methodology in Section 3. Section 4 presents and discusses the results. The final section provides the conclusions.

Literature Review and Hypotheses Development

Internal audit organizational status

Agency theory suggests that if internal auditing is part of the governance structure (see Jensen and Meckling, 1976), then, as indicated by Farber's (2005) findings, the quality of governance improves—something considered crucial in companies for combating fraud. The core activity of the internal auditor is the prevention and detection of fraud within the entity (Chambers and Odar, 2015). According to Ebaid (2011), the organizational status of internal auditing focuses both on the personal characteristics and personality of the internal auditor and on independence, objectivity, and support from management. The internal auditor should maintain direct communication with the audit committee and inform it of any irregularities or fraudulent activities identified (Drogalas et al., 2024). The effectiveness of internal auditing is directly influenced by the support it receives and the relationship it maintains with management (Mihret and Yismaw, 2007; Mitskinis et al., 2025). Management should filter the results of risk assessments and other information before these are communicated to the audit committee, regardless of the reporting process, thereby reducing personal threats from both the audit committee and management (Norman et al., 2010). Norman et al. (2010), in their research, showed that internal auditors should report to their managers when they feel threatened during the audit process, and they found that auditors feel more threatened when reporting directly to the audit committee. On the other hand, research by Khelil et al. (2016) shows that private access to the audit committee has a positive effect on the ethical courage

of the head of the audit function. Therefore, the exact influence of the organizational status of internal auditing remains inconclusive. Nevertheless, internal auditors are in a position to facilitate fraud management both as members of the organization and as providers of internal assurance (Stewart and Subramaniam, 2010). Based on the above, we conclude that the organizational status of internal auditing is vital for strengthening anti-fraud measures within the organization, and we formulate the following hypothesis.

H1: Internal audit organizational status is positively related with fraud management.

Internal audit competence

The concept of capability, according to Chambers (2014), refers to intelligence, education, and training—key elements that add value to an organization. The capability of internal auditing is the result of a long and intensive preparation process that includes formal education in the relevant subject, the development of skills and methods, and requires continuous study and updating. Furthermore, internal auditors' certification is considered part of their overall capability and serves as an indicator of a considerable level of competence necessary for advancement within internal audit departments (Gramling and Myers, 1997). In addition, essential characteristics such as education and experience are included, along with computer literacy and communication skills (Harrington, 2004). Basic skills of internal auditors include technical, analytical, evaluative, interpersonal, and organizational competencies (Seol and Sarkis, 2005), which, combined with their experience, contribute to the quality of their work (Gramling and Hermanson, 2009; Zain et al., 2006). These characteristics together form the capability of internal auditors and influence their decision-making related to fraud (Suwaidan and Qasim, 2010). Proper prioritization of the internal auditor’s main competencies is deemed necessary for the effective management of fraud within an organization (Chambers and Odar, 2015). Moreover, modern internal auditing is based on the three fundamental pillars of the three "E": effectiveness, efficiency, and economy (Ridley, 2008). Therefore, based on the above and as demonstrated by Roussy and Brivot (2016) regarding the profile of internal auditors and their defined criteria, we conclude that the capability of internal auditing is of vital importance for strengthening anti-fraud measures within the organization, and we formulate the following hypothesis.

H2: Internal audit competence is positively related with fraud management.

Internal audit activities

The core activities of internal auditing include evaluating the efficacy of an organization's internal audits and reporting to management on where and how those controls could be improved (Moyes and Baker, 1995). Internal auditing plays a significant role in the prevention and detection of organizational fraud and ensures that the internal audit program is properly designed (Perry and Bryan, 1997). Through a well-structured internal audit program, internal audit activities seek to detect potential fraud not only in financial data but also in non-financial aspects, such as the procedures of organizational units and compliance with laws and regulations, which contribute to effective fraud management (Rae and Subramaniam, 2008). Internal auditors exercise due diligence and are sensitive to fluctuations in management's performance incentives (Asare et al., 2008), which compels them to enhance fraud risk assessment activities by adapting audit plans accordingly. Therefore, based on the above, we conclude that internal audit activities are vital for strengthening anti-fraud measures within the organization, leading us to formulate the following hypothesis.

H3: Internal audit activities are positively related to fraud management

Sample and Research Methodology

Data collection, Sample and Questionnaire

The present study aims to explore fraud management through the lens of internal auditing. More specifically, it seeks to investigate the relationship between the organizational positioning, competencies, and activities of internal audit functions and the management of fraud within the Greek public sector. Data were collected through a structured questionnaire, a widely recognized instrument in qualitative research methodologies (Prickett and Rapley, 2001; Arvaiova et al., 2009). The design of the questionnaire was informed by an extensive review of the relevant literature and focuses on assessing fraud management in relation to the organizational status, skill sets, and operational practices of internal auditors (see Appendix). Prior to distribution, the questionnaire was reviewed and refined following consultations with three experienced internal auditors.

The questionnaire is composed of closed-ended questions to minimize ambiguous interpretations, facilitate the coding of responses, and streamline statistical analysis. The initial four questions constitute the first section, focusing on demographic information, while

the subsequent 14 questions employ a five-point Likert scale to capture respondents' levels of agreement or disagreement, ranging from "Strongly disagree" to "Strongly agree" The second section addresses the organizational status of internal auditing and comprises three questions. The third section includes five questions pertaining to the competence of internal auditing. The fourth section consists of three questions related to the activities performed by internal auditing. Finally, the fifth section contains three questions concerning fraud management, which represents the dependent variable of the study.

The management of fraud, which is the dependent variable, was formed using questions from Mihret (2014); Albrecht et al. (2012) and Archer (2011). The organizational status of internal audit, which constitutes the first independent variable, was formed using questions from Mihret and Yismaw (2007); Ebaid (2011) and Endaya and Hanefah (2013). The second independent variable, referring to the capability of internal audit, was formed using questions based on Ebaid (2011) and Chambers and Odar (2015). The third independent variable refers to the activities of internal audit, and the questions composing it were formed based on the studies of Coram et al. (2008) and Aksoy and Kahyaoglu (2013).

The research data was collected from public organizations in Greece, such as social insurance institutions, the Independent Authority for Public Revenue, hospitals, and municipalities. The questionnaires were addressed to internal auditors and financial department directors, who are primarily involved in fraud management. The respondents were selected based on their position and expertise (McEvily and Marcus, 2005).

A total of 135 emails were sent, and 115 responses were received. Of these, 7 were excluded due to missing essential data, resulting in 108 valid responses, corresponding to a response rate of 80%. According to the literature (Hair et al., 2017), a minimum of 10–20 observations per predictor variable is required. Given that the present study includes three independent variables, at least 60 observations are needed, making the sample size adequate. Furthermore, Bollen (1989) recommends a sample-to-parameter ratio of at least 5:1 for metric analysis. Thus, for the 14 questionnaire items, at least 70 observations are required—another criterion that is met.

Methodology analysis

The researchers examined the model using the SPSS 29 software in combination with AMOS 20. At first, scale verification was performed. The scales were verified using the Cronbach's alpha estimate of credibility. The research hypotheses were verified by structural equation modeling (SEM) using the AMOS 20 software. For the purposes of the research, three

independent variables and one dependent variable were identified. The dependent variable refers to the "fraud management" while the three independent variables representing the corresponding hypotheses refer to the "internal audit organizational status", the "internal audit competence" and the "internal audit activities".

Results

Descriptive Statistics

The descriptive statistics are provided below.

		Frequency	Percent
Age group	18 - 30	15	13.9
	31 – 50	56	51.8
	51 <	37	34.3
Education level	Bachelor's Degree	29	26.9
	Master's Degree	74	68.5
	Doctoral Degree	5	4.6
Experience	0-5 years	11	10.2
	6-10 years	27	25.0
	11-15 years	17	15.7
	16-20 years	28	25.9
	21 years or more	25	23.2
Organization size (staff)	1 – 50	8	7.4
	51 – 100	36	33.3
	101 – 200	52	48.2
	201 <	12	11.1

Table 1: Sample's descriptive statistics
(source: authors' survey, 2026)

According to Table 1, out of a total of 108 people, 68.5% of respondents hold a Master's degree. 51.8% of the sample which participated in the questionnaire belong to the age group 31-50 while 25.9% of the respondents have experience between 16 and 20 years.

Testing of Cronbach's alpha coefficient

Results of testing of Cronbach's Alpha coefficient are shown in Table 2.

No	Scales	Symbol	Number of obs. variables	Cronbach's Alpha
	Independent variables			
1	Internal audit organizational status	IAOS	3	0.748
2	Internal audit competence	IAC	5	0.878
3	Internal audit activities	IAA	3	0.715
	Dependent variables			
1	Fraud management	FM	3	0.721

Table 2: Results of testing of Cronbach's Alpha coefficient of scales

(source: authors' survey, 2026)

The results of the Cronbach's alpha tests for the ranges described in Table 2 above showed that these scales had the Cronbach coefficient of > 0.6.

Testing of model and research hypotheses

Researchers employ the Structural Equation Modeling (SEM) approach to validate existing models and research hypotheses (Hai and Tu, 2019). The reliability of the measurement model was assessed using the Comparative Fit Index (CFI), the Standardized Root Mean Square Residual (SRMR), and the Root Mean Square Error of Approximation (RMSEA) (Zu et al., 2010; Kline, 2015). According to recommended criteria in the literature (Hu and Bentler, 1999; Byrne, 2013), all indicators fall within acceptable ranges, suggesting a good model fit. The CFI value is 0.901 — on a scale from 0 to 1, values near 0.90 or higher are considered acceptable (Bentler, 1992), with 1.0 indicating a perfect fit. The RMSEA is 0.080, which is right at the threshold; Hu and Bentler (1999) state that values below 0.080 indicate an acceptable fit. The SRMR value is 0.041, which is well below the 0.080 threshold, and values close to 0.00 reflect a near-perfect fit. Additionally, the model has 74 degrees of freedom and a p-value of 0.000 (< 0.05), indicating statistical significance (Hair et al., 2006). The Chi-square to degrees of freedom ratio (χ^2/df) is 2.043, which is below the acceptable maximum of 5.0 (Lomax and Schumacker, 2004). According to the regression

weights (Table 4), the internal audit organizational status and competence have the same significant impact on the fraud management.

The results suggest that fraud management is likely to improve when the internal audit function reports administratively to executive management and functionally to the board's audit committee. This supports the idea that the internal audit's hybrid reporting structure enhances governance quality, which is especially crucial in organizations prone to fraud (Farber, 2005), such as public organizations — making agency theory a useful lens for examining differences in how fraud is managed. The findings also indicate that management should consistently seek input from internal audit when aiming to enhance fraud management practices. In this context, the internal audit function is viewed as a collaborator with management in efforts to enhance fraud management. This aligns with Norman et al.'s (2010) finding that internal auditors might perceive a higher risk of fraud when they report to executive management instead of the audit committee.

Also, internal auditor's competence thus plays a key role in stirring entity-wide fraud awareness, fraud investigations and reporting. Especially, the sufficient continuing professional development and the skills of internal auditors play an important role in fraud management. As a result, internal audit competence enhances adherence to audit plans and improves the clarity of audit reports presented to management and the audit committee, ensuring effective communication of fraud investigation findings and appropriate action when fraud is detected.

Relationship			Estimate	S.E.	C.R.	P	Label

Conclusions

The purpose of this paper is to examine the contribution made by the internal audit organizational status, internal audit competence and internal audit activities on fraud management in the Greek public organizations. We conducted a survey with a sample of 108 participants working in public organizations who are internal audit managers and department heads. When internal auditors are skilled and hold a respected position within the organization, they are more likely to engage in activities that strengthen fraud management.

This study offers several implications. This study investigates the influence of the internal audit function's organizational status on the effectiveness of fraud management. It posits that internal auditors who maintain independence, characterized by functional reporting to the

audit committee and administrative reporting to executive management, are better positioned to enhance the processes of fraud prevention, detection, and reporting. In addition, the study has shown that internal auditors who possess adequate expertise, competencies, and experience are more capable of assisting management in developing robust anti-fraud strategies. The findings have practical implications for regulatory bodies, such as the Institute of Internal Auditors and relevant ministries, in order to enhance the role of internal auditing across all public sector organizations. Also, this research helps internal auditors in fraud prevention, detection and reporting as necessary.

Nevertheless, the study has some limitations concerning the design of the questionnaire, notably the reliance on closed-ended questions, which limits the depth of information, gathered. Furthermore, the small sample size restricts the scope of the conclusions that can be drawn but also serves as an incentive for future studies to involve a larger sample and a wider variety of targeted questions, which would enhance the understanding of the topic being investigated. Finally, this study aspires to contribute to the limited related literature using a sample of public organizations and to support the contribution of internal audit organizational status and competence in fraud management.

Appendix

Questionnaire

Kindly, evaluate the subsequent variable items using the criterion shown below:

- Strongly disagree
- Disagree
- Neither disagree / nor agree.
- Agree
- Strongly agree

Internal audit organizational status

- Internal audit maintains an administrative reporting relationship with executive management
- Internal audit functionally reports directly to the audit committee.
- Internal audit advises management on fraud management.

Internal audit competence

- Internal auditors consistently receive guidance on performance standards.
- Internal auditors receive training to develop the skills required to carry out their responsibilities.
- Exists a sufficient continuing professional development for internal auditors.
- Internal audit findings are always based on documents and reliable data.
- Internal audit is carried out in accordance with international standards for professional performance of internal audit.

Internal audit activities

- Internal audit provides an independent assessment of how effectively management is performing.
- Internal audit serves to ensure the organization's assets are not subject to misuse or misappropriation.
- Internal audit participates in the preparation of the risk treatment plans.

Fraud management

- We take appropriate action in case of detected fraud.
- We have established procedures for disclosing evidence related to identified fraud.
- Risk based internal audits are carried out in our organization.

SCALING DIGITAL PLATFORM INTERNATIONALIZATION IN LOGISTICS ECOSYSTEMS: INSIGHTS FROM OPEN SYLLO

Filipe, Sandra[1]; Marques, Daniela[2]; Ribau, Cláudia[1]

[1] GOVCOPP Research Unit & ISCA-UA, University of Aveiro, Portugal
[2] ISCA-UA, University of Aveiro, Portugal

Digital transformation is changing how logistics actors coordinate activities, exchange information and develop services across organisational and geographical boundaries. In this setting, digital platforms can support data sharing, interoperability and collaboration among ports, logistics operators, transport companies, technology providers and public institutions. Their relevance is particularly evident in logistics ecosystems, where fragmented information flows and heterogeneous technological systems can constrain operational visibility, efficiency and innovation (Ben-Daya et al., 2019; Baptista and Nunes, 2025).

This study investigates how digital strategies contribute to the internationalization of Open Syllo, a logistics data platform developed within the NEXUS Agenda innovation ecosystem. Rather than interpreting internationalization primarily as a sequence of country-entry decisions, the study examines it as a process of extending a platform ecosystem across geographical contexts. This perspective responds to the limitations of conventional internationalization approaches, which tend to emphasise gradual commitment and experiential learning by individual firms (Johanson and Vahlne, 2009). Although these concepts remain useful, digital platforms may grow internationally through distributed users, partner networks, digital connectivity and data-based services, often with less dependence on physical presence (Ojala et al., 2018; Zeng et al., 2019).

The research uses a qualitative single-case design based on secondary data. The evidence includes NEXUS project documentation, notably internationalization and marketing plans, stakeholder-related reports and documents concerning the strategic positioning and development of Open Syllo. Materials produced between 2024 and 2026 were analysed thematically. The analysis focused on four interconnected areas: the platform's internationalization approach, its use of digital communication, stakeholder participation and ecosystem partnerships.

Open Syllo functions as a shared digital environment that supports the integration and management of logistics data. It enables actors to exchange information in a structured manner and provides a basis for developing complementary data-driven applications and services. Its international potential derives from this scalable infrastructure, but also from the ability to organise relationships among actors with different roles, knowledge and interests. Therefore, technological availability is necessary but insufficient for cross-border platform expansion (NEXUS Agenda, 2026).

The findings show that Open Syllo's international development is shaped by ecosystem-building activities. International events, online communication and collaboration with external organisations contribute to making the platform visible and credible in logistics and innovation networks. Digital channels are particularly important because they communicate the platform's purpose and capabilities to dispersed audiences while maintaining regular interaction with current and potential stakeholders. Their function is therefore not limited to promotion: they can contribute to legitimacy, relationship development and coordination across borders (Watson et al., 2018; Kromidha and Robson, 2021).

Stakeholder engagement is equally important. Logistics actors, port authorities, technology firms, research organisations and public institutions can contribute operational knowledge, data, technological capabilities and access to local networks. In new geographical contexts, these organisations can facilitate implementation, help adapt services to local conditions and reduce uncertainty among prospective adopters. Partnerships consequently operate as more than supporting arrangements: they can become practical channels through which a platform enters and becomes embedded in new markets.

The study contributes to research on digital internationalization by highlighting an ecosystem-based interpretation of platform expansion. The Open Syllo case suggests that international scaling results from the interaction between digital infrastructure, communication, stakeholder involvement and collaborative partnerships. For platform managers, this implies that international growth requires active ecosystem orchestration, including trust-building, transparent communication, clear participation incentives and attention to interoperability. Policymakers can support these processes by encouraging common data standards, interoperable digital infrastructures and international collaboration in logistics and mobility ecosystems.

Keywords: Digital platforms; digital strategy; internationalization; innovation ecosystems; logistics platforms; NEXUS Agenda.

IMPACT OF LEAN MANUFACTURING PRACTICES ON OPERATIONAL EFFICIENCY IN THE FOOD INDUSTRY

Kanany Eid[1]; EL Naddaf, Sami [2]; Nader Nader [3]

[1]Department of Management, Antonine University, Lebanon

[2]Department of Management, University of Nicosia, Nicosia, Cyprus

[3]Department of Accounting and Auditing, Antonine University, Lebanon

Keywords: Lean Manufacturing, Operational Efficiency, Food Industry, Process Improvement, Quality Performance, Cost Reduction, Sustainability.

Dixit, Dave and Singh (2015) argue that lean manufacturing is a systematic approach aimed at eliminating non-value-added activities, improving process flow, and maximizing customer value through continuous improvement practices. It integrates techniques such as Just-In-Time (JIT), Kaizen, and waste reduction to enhance operational efficiency. LM has evolved into a widely adopted management philosophy across industries, demonstrating significant improvements in productivity, cost reduction, and quality performance (Bhamu and Sangwan, 2014; Tortorella et al., 2020).

Although lean manufacturing is a comprehensive strategy for eliminating waste, improving process flow, and maximizing customer value across various industries, its application in the food industry presents several unique challenges (Aleksandar, 2022). These include strict food safety regulations, product perishability, fluctuating demand, and complex supply chain coordination. Such constraints often limit the effective implementation of lean practices and require adaptation to industry-specific conditions. Despite the growing interest in lean's implementation, the research evidence analyzing the effect of lean on operational efficiency amongst food manufacturing firms, especially in developing economies, is still limited. Food manufacturers operate in an environment where input costs are increasing, pressure to compete and to meet ever higher customer expectations for quality and sustainability are growing. Operational inefficiencies like overproduction, waiting time, excess inventory, and process variability have a direct effect on

profitability and performance. Lean tools like 5S, Kanban, Just-In-Time (JIT), Total Quality Management (TQM) and Total Productive Maintenance (TPM) are commonly encouraged as mechanisms to remedy these inefficiencies (Bhamu and Sangwan, 2014). However, the degree to which these practices lead to measurable improvements in the food sector operationally, needs to be investigated on a larger empirical basis. The purpose of this study is to look at the effect of lean manufacturing patterns on operational effectiveness in the food industry. The central research question is stated as follows: What is the impact of lean manufacturing practices on the dimensions of operational efficiency in food manufacturing companies?

A quantitative research design will be used, where data will be gathered using a structured questionnaire using a population of 200 professionals working in food manufacturing companies in the form of managers and supervisors. The questionnaire measures the extent to which lean practices are adopted and the extent to which they are perceived to impact operational efficiency indicators, namely quality performance, cost reduction, and production timeliness. The study is expected to indicate a moderate to high level of lean adoption, with commonly used tools including 5S, Kaizen, and TQM. It is also anticipated that the results will reveal a significant positive relationship between lean implementation and quality performance, particularly in reducing defects and improving process consistency.

Moreover, potential challenges that may hinder full lean implementation, such as employee resistance and insufficient training are to be identified.

This research is expected to contribute to the existing literature by providing empirical insights into the impact of lean practices on operational efficiency in the food industry, while identifying key barriers to successful implementation. It extends current research by integrating efficiency measures with barrier analysis and offers practical guidance for managers seeking structured approaches to performance improvement, emphasizing the strategic role of lean adoption in achieving sustainable operational outcomes.

REFRAMING ORGANISATIONAL PERFORMANCE: FROM OUTCOME CONTROL TO IMPACT DESIGN

Haupt, Joerg
Smart-F-Solutions LTD., Larnaca, Cyprus

Keywords: Organisational Performance, Impact Design, Business Model, Organisational Identity, Customer Relationship Quality, Leadership, Systemic Management, Strategy

Introduction

Organisational performance remains a central concern in both management research and practice. Over recent decades, organisations have increasingly relied on performance measurement systems, targets, and control mechanisms to steer outcomes. Kaplan and Norton (1996) demonstrated that structured performance measurement systems can translate strategy into operational execution and improve alignment across organisational levels.

While such approaches have contributed to transparency and operational discipline, more recent research highlights their limitations in complex and dynamic environments. de Araújo et al. (2024) show that traditional performance management systems often struggle to capture systemic interdependencies and non-linear cause–and–effect relationships, which are characteristic of modern organisations.

In practice, a persistent paradox can be observed: the increasing use of performance indicators is often accompanied by rising coordination costs, reduced adaptability, and declining clarity of direction. This suggests that performance cannot be fully explained by measurable outputs alone. Instead, it appears to emerge from deeper systemic conditions that shape how organisations function.

This observation is not entirely new. Similar limitations have been discussed in different research streams over several decades. However, despite conceptual advances and numerous practical initiatives, these insights have not yet been systematically integrated into coherent models of organisational performance.

At the same time, organisations are increasingly operating in digitally mediated environments. Advances in digital technologies, data analytics, and artificial intelligence have fundamentally changed how organisations interact internally and with external stakeholders.

These developments have significantly expanded the possibilities for coordination, communication, and performance monitoring. However, they have also introduced new forms of complexity. Customer interactions are often fragmented across multiple channels, organisational processes are increasingly technology-dependent, and decision-making is influenced by growing volumes of data.

Despite this transformation, the role of technology is often treated as a separate or purely operational concern. Existing performance models rarely integrate technological factors into a coherent explanation of how organisational performance emerges.

This creates an additional gap: the lack of integration between human, organisational, and technological dimensions in the design of organisational performance.

Research Gap and Objectives

The academic discourse on organisational performance is characterised by multiple well-developed but largely disconnected perspectives.

Performance management research has primarily focused on measurement systems and control mechanisms (Kaplan and Norton, 1996). Leadership and organisational behaviour research has emphasised the importance of culture, values, and behavioural patterns in shaping organisational outcomes (Schein, 2010). Capability-based perspectives, particularly the dynamic capabilities framework, have highlighted the importance of adaptability and resource reconfiguration for long-term competitiveness (Teece, 2007; Zhang et al., 2023).

In addition, research on engagement and human dynamics has demonstrated that psychological conditions such as trust, autonomy, and involvement significantly influence individual and collective performance (Kahn, 1990; Edmondson, 2018; Gallup, 2023). Systems thinking has further emphasised that organisational outcomes emerge from the interaction of multiple interconnected elements rather than from isolated actions (Ackoff, 1999; Malik, 2010).

Despite these advances, three key shortcomings can be identified:

- **Fragmentation of perspectives**
  Behavioural dynamics, organisational capabilities, and performance management are typically analysed separately, even though they are systemically interconnected.
- **Limited focus on underlying conditions**
  Performance is often assessed at the level of outputs and indicators, while the underlying conditions that generate performance remain insufficiently addressed.
- **Lack of integrated models**

There is a lack of conceptual frameworks that systematically link behavioural, capability-based, and steering-related dimensions into a coherent system of organisational performance.

This paper addresses this integration gap by developing the concept of **Result Architecture**. The central research question is:

How can organisations move from managing results to designing the conditions under which sustainable performance and results emerge?

Literature Review and Theoretical Framework

The literature on organisational performance can be grouped into four major streams, each providing important insights but remaining limited in isolation.

Performance management

Performance management research has traditionally focused on measurement systems and strategic alignment. Kaplan and Norton (1996) demonstrated how performance indicators can link strategic objectives with operational activities.

However, more recent research indicates that such approaches often fail to capture complexity. de Araújo et al. (2024) show that performance management systems tend to focus on linear cause–effect relationships and struggle to reflect systemic interactions, which are critical in dynamic environments.

Leadership and behavioural dynamics

Leadership and organisational behaviour research emphasises the importance of culture, values, and interaction patterns. Schein (2010) argues that organisational behaviour is deeply rooted in shared assumptions that shape how individuals perceive and respond to their environment.

Research on engagement further supports this perspective. Kahn (1990) demonstrated that psychological conditions such as meaningfulness, safety, and availability influence engagement and performance. More recent work by Edmondson (2018) highlights the role of psychological safety in enabling learning, collaboration, and performance. Empirical data from Gallup (2023) confirms that engagement levels remain a critical determinant of organisational outcomes across industries.

Capabilities and adaptability

Capability-based perspectives focus on the ability of organisations to adapt and remain competitive. Teece (2007) introduced the concept of dynamic capabilities, describing how

organisations can integrate, build, and reconfigure internal and external competencies in response to changing environments.

More recent research extends this perspective. Zhang et al. (2023) show that dynamic capabilities are strongly linked to organisational performance, while Baishya et al. (2025) highlight the role of managerial capabilities in shaping organisational effectiveness.

Systems thinking

Systems thinking provides a holistic perspective on organisations. Ackoff (1999) argues that organisational outcomes are primarily determined by system design rather than by individual actions. Malik (2010) further emphasises that managing complexity requires a systemic approach that integrates multiple dimensions of organisational functioning.

Synthesis

While each of these perspectives provides valuable insights, they remain insufficiently integrated. Performance management focuses on outputs, leadership research focuses on behaviour, capability-based approaches focus on resources, and systems thinking focuses on structure.

What is missing is a coherent framework that integrates these dimensions into a unified explanation of how organisational performance emerges.

Methodology and Conceptual Approach

This study adopts a conceptual research design to integrate fragmented theoretical perspectives into a coherent framework. Conceptual research is particularly suitable in contexts where existing theories provide partial explanations but lack integration into a unified system (Jaakkola, 2020).

In this context, the present study contributes by developing an integrative framework that connects behavioural, capability-based, and steering-related perspectives into a unified explanation of organisational performance.

The conceptual model developed in this paper is informed by extensive practical experience in organisational development and performance management. These observations revealed recurring patterns regarding the interaction between behavioural dynamics, organisational capabilities, and performance outcomes.

In particular, practical experience indicates that organisational performance is rarely determined by isolated factors, but rather emerges from the interplay between leadership behaviour, the

level of competence within the organisation, and the clarity of strategic direction. These patterns have been observed consistently across multiple organisational contexts.

While these insights provide the empirical intuition underlying the model, the purpose of this paper is to translate them into a conceptually structured and theoretically grounded framework. The methodological approach, therefore, combines:

- theory integration
- structural synthesis
- conceptual abstraction

This enables the development of a coherent system model that integrates behavioural, capability-based, and steering-related perspectives into a unified explanation of organisational performance.

Findings: The Result Architecture

The central finding of this study is that organisational performance cannot be adequately explained or managed at the level of outcomes alone. Instead, it emerges from the interaction of underlying systemic conditions.

The Result Architecture provides a structured framework for understanding and designing these conditions.

Causal logic of organisational performance

At the core of the Result Architecture lies a clear causal relationship: Impact → Performance → Results.

Results represent the observable outcomes of organisational activity. Performance reflects the quality and effectiveness of execution. However, performance itself is not a primary input, but the consequence of underlying organisational conditions.

This perspective is consistent with systems thinking, which emphasises that outcomes arise from the structure and dynamics of the system rather than from isolated actions (Ackoff, 1999).

While the causal logic explains how organisational results emerge, it does not yet provide a structured framework for designing the underlying conditions. To address this limitation, the concept of Result Architecture is introduced. It provides a systematic approach to organising and aligning the key dimensions that shape organisational impact, performance, and results.

Anchoring in the business model and organisational identity

The Result Architecture is anchored in the organisation’s business model, which defines its strategic direction and intended value proposition within the market.

At the same time, the business model reflects the organisation's identity, understood as the consistent expression of its purpose, positioning, and behavioural orientation. This understanding is aligned with organisational culture research, which emphasises the role of shared assumptions and values in shaping organisational behaviour (Schein, 2010).

The integration of business model and identity ensures that strategic intent is not only defined conceptually but also consistently translated into behaviour.

This becomes particularly visible in the quality of customer relationships. Customer interactions reflect how internal organisational dynamics are translated into external value and therefore serve as a direct indicator of organisational effectiveness. Empirical research confirms that engagement and relational quality are closely linked to organisational performance (Gallup, 2023).

Core Dimensions of the Result Architecture

The Result Architecture integrates three interdependent dimensions that jointly determine organisational performance: impact, competence, and steering.

Impact: The impact dimension captures the behavioural and relational dynamics within the organisation. It reflects how individuals and teams think, act, interact, and make decisions in everyday organisational contexts.

This includes leadership behaviour, communication patterns, levels of engagement, trust, and the overall quality of collaboration. Research on organisational culture shows that shared assumptions and behavioural norms strongly influence how organisations function (Schein, 2010).

In addition, research on engagement demonstrates that psychological conditions such as meaningfulness, safety, and involvement significantly affect individual performance (Kahn, 1990). Edmondson (2018) further highlights that psychological safety enables learning, collaboration, and innovation, which are critical for organisational effectiveness.

From a systemic perspective, impact represents the underlying "energy" of the organisation. It determines whether capabilities are effectively utilised and whether organisational structures function as intended (Ackoff, 1999).

Impact is particularly visible in the quality of customer relationships. These interactions reflect how internal dynamics are translated into external value. Empirical evidence shows that higher levels of engagement and relational quality are associated with improved performance outcomes (Gallup, 2023).

Without a coherent, aligned impact dimension, even well-defined strategies and strong capabilities cannot translate into sustainable performance.

In practice, this dimension can be operationalised through structured approaches to engagement, process quality, and leadership behaviour, as reflected in integrated performance frameworks.

Competence: The competence dimension refers to the organisation's ability to translate intentions into effective, consistent, and scalable action.

It encompasses technical expertise, methodological capabilities, and personal and social competencies. These elements determine how reliably tasks are executed, how problems are solved, and how efficiently resources are utilised.

The importance of capabilities for organisational performance is well established in the literature. Teece (2007) introduced the concept of dynamic capabilities, emphasising the ability of organisations to integrate, build, and reconfigure competencies in response to changing environments.

More recent research confirms that dynamic capabilities are strongly associated with organisational performance and adaptability (Zhang et al., 2023). Baishya et al. (2025) further highlight the role of managerial capabilities in shaping organisational effectiveness.

Competence provides the structural stability of organisational performance. It ensures that performance is not dependent on individual effort alone, but can be reproduced across teams and over time.

Without sufficient competence, even high levels of engagement and strong leadership cannot be translated into consistent outcomes. Conversely, competence without aligned impact may lead to technically correct but strategically misaligned actions.

The competence dimension can be further specified through structured competency architectures that integrate technical, methodological, and behavioural capabilities across organisational levels.

Steering: The steering dimension provides direction, alignment, and focus within the organisation.

It includes strategic priorities, decision-making structures, governance mechanisms, and resource allocation. Steering defines what is relevant, what is prioritised, and how organisational attention is directed.

From a systemic perspective, steering ensures alignment between organisational activities and strategic intent. This aligns with systems thinking approaches, which emphasise that effective system design requires clear orientation and coherence (Ackoff, 1999).

Malik (2010) further argues that managing complexity requires clear principles of direction and decision-making rather than excessive control. This perspective highlights that effective steering creates orientation rather than relying solely on control mechanisms.

Effective steering enables decentralised action while maintaining overall coherence. It ensures that organisational activities remain aligned with the business model and organisational identity. Without effective steering, organisational efforts may become fragmented, leading to inefficiencies and conflicting priorities, even if impact and competence are strong.

The steering dimension can be supported by management frameworks that integrate governance, strategic alignment, and leadership processes into a coherent system of organisational direction.

Interdependence of the dimensions: The three dimensions are highly interdependent and cannot be managed in isolation.

- Impact shapes how competence is applied
- Competence determines how effectively impact is translated into performance
- Steering aligns both dimensions with organisational direction

Sustainable organisational performance emerges only when all three dimensions are coherently aligned. Weaknesses in one dimension cannot be fully compensated by strengths in others.

Differentiation of results: To provide a more precise understanding of organisational outcomes, results can be differentiated into four key dimensions:

- Revenue
- Quality
- Reputation (internal and external)
- Profitability

This differentiation reflects the multi-dimensional nature of organisational performance and allows for a more nuanced interpretation of outcomes.

Technology as an Amplifier of Organisational Impact

While the Result Architecture explains organisational performance through the interaction of impact, competence, and steering, an additional dimension has become increasingly relevant in contemporary organisational contexts: the role of technology.

In many traditional models of organisational performance, technology is treated primarily as an operational or supportive element. However, this perspective underestimates its systemic influence. In digitally mediated environments, organisational impact no longer emerges solely from human interaction but from the interplay between human behaviour, organisational processes, and technological systems.

From this perspective, technology does not constitute an independent dimension of organisational performance. Instead, it functions as a cross-dimensional factor that shapes and amplifies the existing components of the Result Architecture.

- Technology directly affects the impact dimension. Communication, collaboration, and customer interaction are increasingly mediated through digital interfaces. As a result, the quality of organisational impact is co-determined by the design and integration of technological systems. Customer relationship quality, in particular, is no longer exclusively shaped by interpersonal interaction but also by the consistency, responsiveness, and coherence of digital touchpoints.
- Technology transforms the competence dimension. Beyond traditional technical and behavioural capabilities, organisations must develop the ability to integrate and utilise technological systems, including data-driven tools and artificial intelligence, effectively. This form of "technological competence" goes beyond technical proficiency and includes the capacity to design meaningful interactions between human and digital elements.
- Technology expands the possibilities of the steering dimension. The increasing availability of real-time data enables more precise monitoring and decision-making. However, this does not reduce the need for managerial judgement. On the contrary, the availability of data increases the complexity of decision-making and reinforces the importance of coherent orientation and prioritisation.

Taken together, technology can be understood as a structural amplifier of organisational impact. It enhances the reach, consistency, and scalability of organisational behaviour, but also increases the consequences of misalignment. Poorly designed technological systems can fragment communication, reduce relational quality, and introduce additional complexity into the organisation.

This perspective suggests that the integration of technology is not primarily a question of digital adoption, but of systemic design. Organisations must deliberately align technological systems with their underlying impact logic to ensure that performance emerges coherently and sustainably.

Result Architecture and Its Relationship to Organisational Performance

The following figure integrates the core elements of the Result Architecture and illustrates their relationship to organisational performance.

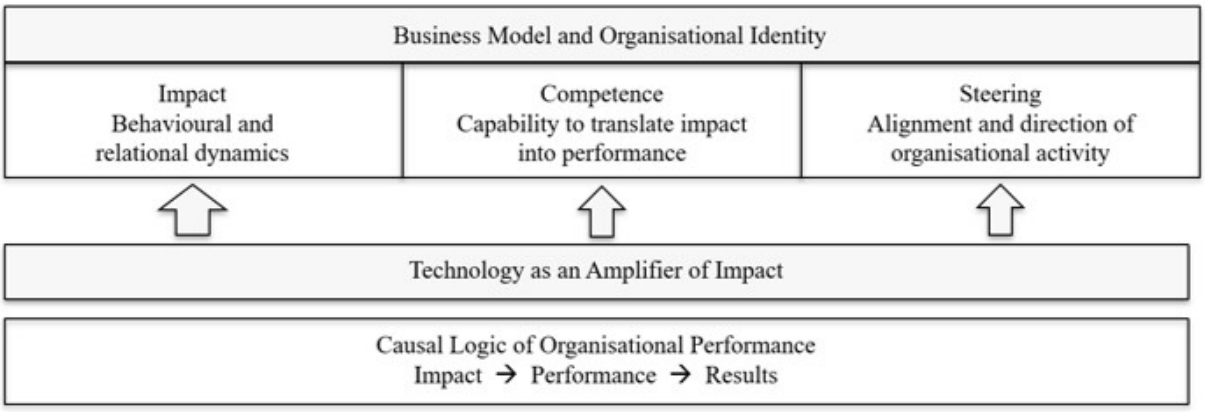

Figure 1: *Illustration of the Result Architecture and its relationship to organisational performance.*

The architecture is anchored in the organisation's business model and identity and comprises three interdependent dimensions: impact, competence, and steering. Technology is conceptualised as a cross-dimensional amplifier that influences these dimensions. Organisational performance emerges through the causal logic from impact to performance and results.

Expected Impact of the Result Architecture

The Result Architecture provides a structured approach to addressing fundamental challenges in organisational performance by shifting the focus from controlling outcomes to designing the underlying conditions.

- The model enables a reduction of organisational complexity. Traditional performance management approaches often rely on increasing levels of measurement and control, which can lead to fragmentation and coordination inefficiencies. By contrast, the Result Architecture focuses on aligning impact, competence, and steering, thereby creating more coherent organisational behaviour. This perspective is consistent with systems thinking, which emphasises that system design is more effective than isolated interventions (Ackoff, 1999).
- The model strengthens the connection between internal organisational dynamics and external value creation. By placing customer relationship quality at the centre of organisational effectiveness, the Result Architecture establishes a direct link between behaviour, interaction, and market outcomes. Empirical research indicates that engagement and relational quality are strongly associated with performance indicators such as productivity, customer loyalty, and profitability (Gallup, 2023).
- The integrated perspective on impact, competence, and steering enhances organisational adaptability. Rather than addressing the behavioural, capability-based, and strategic

dimensions separately, the model provides a coherent framework for aligning them. This is particularly relevant in dynamic environments, where adaptability depends on the interaction of multiple organisational factors (Teece, 2007; Zhang et al., 2023).

Finally, differentiating results into revenue, quality, reputation, and profitability enables a more nuanced understanding of organisational performance. This multi-dimensional perspective allows organisations to move beyond simplified performance indicators and to develop more targeted and effective managerial interventions.

Discussion

The Result Architecture integrates previously fragmented research streams into a coherent conceptual framework. It connects insights from performance management, leadership and behavioural research, capability-based perspectives, and systems thinking into a unified explanation of organisational performance.

From a theoretical perspective, the model extends traditional performance management approaches by shifting the focus from outputs to underlying systemic conditions. While performance management research has traditionally emphasised measurement and control (Kaplan and Norton, 1996), the Result Architecture highlights the importance of behavioural dynamics, organisational capabilities, and alignment mechanisms as primary drivers of performance.

This perspective is consistent with leadership and organisational behaviour research, which emphasises the importance of culture, values, and interaction patterns (Schein, 2010; Edmondson, 2018). It also aligns with capability-based approaches, which highlight the role of adaptability and resource reconfiguration (Teece, 2007), as well as with systems thinking, which emphasises the importance of system design and interdependencies (Ackoff, 1999; Malik, 2010).

By integrating these perspectives, the Result Architecture provides a more comprehensive explanation of organisational performance. It challenges the assumption that results can be directly controlled and instead emphasises that performance emerges from the alignment of underlying conditions.

Theoretical Contribution

This paper contributes to the literature in three main ways.

- It integrates previously fragmented perspectives on organisational performance into a coherent conceptual framework. By linking behavioural dynamics, organisational capabilities, and steering mechanisms, it provides a more comprehensive understanding of how performance emerges.
- It shifts the level of analysis from outputs to systemic conditions. Rather than focusing solely on performance indicators, the Result Architecture emphasises the underlying drivers of performance, thereby extending existing performance management approaches.
- The paper demonstrates the value of conceptual integration as a methodological approach. By synthesising insights from different research streams, it contributes to the development of theory in contexts characterised by complexity and fragmentation (Jaakkola, 2020).

In addition, the paper extends existing perspectives on organisational performance by integrating technology as a systemic factor. Rather than treating technology as a separate domain, the Result Architecture conceptualises it as a cross-dimensional element that shapes and amplifies impact, competence, and steering.

This perspective contributes to the literature by linking technological and human-centric views of organisational performance. It suggests that performance in contemporary organisations cannot be fully understood without considering how digital systems influence behavioural dynamics, capability development, and decision-making processes.

By embedding technology within a systemic impact logic, the paper provides a more comprehensive framework for analysing and designing organisational performance in digitally mediated environments.

Managerial Implications

The findings of this study have several implications for management practice.

- Organisations should reconsider their reliance on outcome-based control as the primary mechanism for managing performance. While performance indicators remain important, they should be complemented by a focus on the underlying conditions that generate performance.
- Management attention should shift towards the deliberate design of impact, competence, and steering. This requires a holistic perspective that integrates behavioural, capability-based, and strategic dimensions.

- The alignment of business model and organisational identity should be recognised as a central element of organisational effectiveness. Consistency between strategic intent, behaviour, and external perception is critical for sustainable performance.

Finally, differentiating results into revenue, quality, reputation, and profitability provides a practical framework for analysing and managing organisational outcomes more effectively.

Research Limitations and Future Research

As a conceptual study, this paper does not provide empirical validation of the proposed model. While the model is informed by practical observations and theoretical integration, its generalisability remains to be tested.

Future research should focus on empirical validation of the Result Architecture. In particular, the following areas represent promising directions:

- Quantitative studies could examine the relationship between the three core dimensions (impact, competence, and steering) and different performance outcomes.
- The role of customer relationship quality as a mediating variable between internal organisational dynamics and external results should be investigated.
- Longitudinal studies could analyse how the interaction between impact, competence, and steering evolves over time and influences organisational adaptability.
- Comparative studies could analyse organisations applying traditional performance management approaches versus those adopting a systemic design perspective.

These research directions provide a basis for further development and validation of the proposed model.

Conclusion

This paper reframes organisational performance as an emergent property of systemic conditions rather than a directly controllable outcome.

By introducing the concept of Result Architecture, it provides a structured framework for understanding and designing the conditions under which sustainable performance and results can emerge.

The integration of behavioural dynamics, organisational capabilities, and steering mechanisms offers a comprehensive perspective on organisational effectiveness. Anchored in the business model and organisational identity, the model connects internal dynamics with external

outcomes and provides a foundation for both practical application and future research in increasingly digitally mediated organisational environments.

TIME OF CRISIS: HOW TO BUILD A RESILIENT ORGANISATION?

Ligita, Šimanskienė[1]; Jurgita, Paužuolienė[2]; Birutė, Paulikienė[3]; Mariantonietta, Fiore[4]

[1,2,3] Department of Management and Economics, Klaipeda University, Lithuania

[4] Department of Economics, University of Foggia, Italy

Keywords: resilience, organisational resilience, service sector, crisis.

Introduction

In the first decade of the twenty-first century, the topic of organisational resilience to unforeseen events gained prominence in scholarly research, highlighting the increasing frequency of events caused by extreme natural disasters—droughts, floods, and earthquakes. Periods of crisis expose organisational vulnerabilities while simultaneously creating opportunities for renewal, innovation, and long-term transformation. Organisational resilience has emerged as a strategic capability that enables organisations not only to withstand disruptions but also to adapt, learn, and emerge stronger from adverse events. Recent studies highlight the significant role of the human dimension—such as leadership styles, employee well-being, and personal and professional factors—in shaping responses to disasters. Furthermore, research has shown that employee resilience is a key determinant of organisational resilience as a whole (Liang & Cao, 2021). However, the resilience of organisations has not yet been sufficiently examined simultaneously at organisational level. The aim of the study is to evaluate the interaction of resilience across organisational level in workplace crisis situations.

Literature review

Examining the concept of organisational resilience constitutes a well-established area of research in which no major theoretical contradictions are evident; however, various terminologies highlight distinctive features of the resilience framework. Initially, the literature emphasises that resilience is a dynamic, multi-level construct (Burnard & Bhamra, 2019), yet it remains without a clear definition (Ruiz-Martin et al., 2018). Resilience may be construed as either an intended outcome or as a process that produces the desired outcome (Melián-Alzola et al., 2020;). Accordingly, resilience is associated with the capacity to recover and can be appraised only post-disruption. When conceptualised as a process, resilience encompasses the capacity to respond effectively to

adverse events not only following their occurrence but also in the pre-emptive and simultaneous phases. According to Cimellaro et al. (2010), resilience comprises a dual capability: the ability to maintain functionality and the ability to restore capacity after losses incurred by an extreme event. Some authors emphasise that the capacity to cushion the impact of disruptions must be achieved within a minimal time frame and at low costs (financial, human, workload resources, etc.), and that the restored functional capacity must encompass all aspects of the operation. Although there are frequent attempts to define resilience, Gibson and Tarrant (2010) recognise that there is no quick fix, single process, management system, or software programme that guarantees resilience.

Research Methodology

Research method. The study used a quantitative research method - a questionnaire survey. The survey instrument consisted of an organisational resilience scale (9 statements), and demographic information. A five-point Likert scale was used to assess resilience levels, where 1 meant "completely disagree" and 5 meant "completely agree". The sample was selected using a probability simple random sampling method. Organisations were randomly selected from the entire population, giving them equal opportunities to enter the study. The questionnaire was distributed electronically in May–June 2025, distributing information to service-sector organisations via associations of these organisations and directly through individual organisations.

Main findings

Respondents employed in the private sector are more likely to agree that the organisation as a whole is successful and that everyone understands its functions. These results indicate a generally positive assessment of organisational resilience factors in the private sector, ranging from the management of financial resources and employee trust in managers to business continuity and the flexibility of work processes. The size of the organisation and the sector have a considerable impact on organisational resilience. Small and private-sector organisations appear to be the most resilient. The results indicate a generally positive assessment of resilience factors in the private sector, spanning financial resource management, employee trust in managers, business continuity, and the flexibility of work processes.

Theoretical and Practical Implications

From a **theoretical perspective**, this study contributes to the growing body of resilience literature by highlighting resilience as a dynamic organisational capability rather than a static attribute. It reinforces the view that resilience develops through the interaction of leadership, organisational culture, crises management. From a **practical perspective**, the findings underscore that resilience should become a core strategic priority rather than merely an operational response to emergencies. Managers should invest in developing resilient leadership, strengthening internal and external communication systems, promoting employee well-being, encouraging innovation, and establishing mechanisms for organisational learning following disruptive events.

Research limitations. Our study was limited to the service sector. If the study were conducted in the manufacturing sector, where social communication and networks may be less integral to achieving the results, the findings could differ. **Future research** could further investigate sector-specific resilience strategies, the role of emerging technologies such as artificial intelligence in crisis preparedness, and the long-term relationship between organisational resilience, sustainability, and organisational performance across different institutional and cultural contexts.

STRATEGIC WORKING CAPITAL OPTIMIZATION IN UAE DIGITAL RETAIL: A COMPARATIVE ANALYSIS OF E-COMMERCE, OMNI-CHANNEL, AND Q-COMMERCE BUSINESS MODELS

Aldasouqi, Qais[1]

[1]Digital, Majid AlFuttaim, Dubai, United Arab Emirates

Keywords: Working Capital Management, Cash Conversion Cycle, Digital Retail, UAE, Panel Data, E-Commerce, Omni-Channel, Q-Commerce.

Abstract

This study examines the relationship between working capital management (WCM) and firm performance across three distinct digital retail business models in the United Arab Emirates: e-commerce, omni-channel retail, and quick-commerce (Q-commerce). Using an expanded unbalanced panel dataset of seven firms over 2019–2025 — comprising 38 firm-year observations and 31 usable regression observations after controlling for sales growth — a fixed-effects regression model is estimated with the Cash Conversion Cycle (CCC) as the primary explanatory variable and Return on Assets (ROA) as the dependent variable. The full-sample fixed-effects model yields a CCC coefficient of −0.00037 ($p = 0.702$), indicating a negative directional relationship that does not reach conventional significance thresholds. Firm size is the dominant performance predictor ($\beta = 0.101$, $p = 0.073$), and sales growth emerges as a significant negative predictor in the verified-firm robustness model ($\beta = -0.163$, $p = 0.042$). The non-significance of CCC in the full sample is attributed to cross-model structural heterogeneity and the influence of proxy data for the two e-commerce firms. Drawing on efficiency theory, liquidity theory, resource-based theory, and agency theory, the study documents five structurally distinct WCM profiles: Spinneys (CCC −99 to −120 days), Talabat (CCC rapidly rising from −54 to −27 days due to grocery expansion), MAF/Carrefour (CCC deteriorating from 15 to 42 days), Lulu and Union Coop (positive CCC 15–34 days). The study extends WCM theory to a digitally native emerging Gulf market context and provides model-specific optimisation guidance for practitioners. As UAE disclosure standards expand, the findings provide a replicable framework for future confirmatory research across the GCC region.

Introduction

The management of working capital — the short-term assets and liabilities that fund daily operations — represents one of the most consequential financial decisions available to firm managers. Unlike long-term capital allocation, working capital decisions are continuous, reversible, and directly linked to the liquidity position that determines whether a firm can honour near-term obligations while pursuing growth. The Cash Conversion Cycle (CCC), defined as the number of days between a firm's cash outflows for inventory or services and its cash inflows from customers, serves as the primary metric through which WCM efficiency is measured and benchmarked (Deloof, 2003; Raheman and Nasr, 2007).

The UAE presents an especially instructive research context. The country's digital retail sector has experienced among the fastest growth rates globally, accelerating sharply through and after the COVID-19 pandemic. The UAE now hosts three structurally distinct business models operating under materially different WCM constraints: pure-play e-commerce platforms (Amazon.ae, Noon) with near-zero CCCs driven by pre-payment norms; omni-channel retailers (Lulu Retail, Union Coop, Carrefour UAE, Spinneys) maintaining large physical inventories alongside digital fulfilment; and Q-commerce operators (Talabat) facing dark-store inventory management alongside rapid delivery obligations. The UAE also carries particular significance for the EuroMed research community as a principal trade and logistics hub linking European supply chains, Mediterranean sourcing networks, and Asian manufacturing — institutionalised through the Jebel Ali Free Zone and Abu Dhabi Global Market. WCM practices developed in the UAE are progressively being adopted across GCC markets and North African economies including Egypt, Morocco, and Tunisia.

Despite this significance, empirical WCM research specific to Gulf-region digital retail remains sparse. This study addresses that gap by contributing theoretically — applying four complementary lenses to explain cross-model WCM heterogeneity — empirically, by constructing the most comprehensive longitudinal panel dataset yet assembled for UAE digital retail (seven firms, 2019–2025), and practically, by producing model-specific WCM guidance grounded in observed performance. The study pursues three objectives: to quantify the CCC–profitability relationship using fixed-effects panel regression; to compare WCM configurations across three business model types; and to evaluate robustness using a verified-data subsample.

Literature Review

Foundations of working capital management research

Efficiency theory predicts that firms minimising the cash cycle reduce financing costs, improve liquidity buffers, and lower distress risk. Deloof (2003) established this negative CCC–profitability relationship empirically for Belgian firms — a finding replicated extensively. Raheman and Nasr (2007) confirmed it for Pakistani listed firms. Enqvist, Graham and Nikkinen (2014) demonstrated that the relationship strengthens during economic stress. Baños-Caballero, García-Teruel and Martínez-Solano (2012) proposed a non-linear optimal CCC for Spanish SMEs, published in Small Business Economics (Vol. 39, No. 2, pp. 517–529), finding that excessively short CCCs constrain growth through customer credit restrictions. Their 2014 work in Journal of Business Research (Vol. 67, No. 3, pp. 332–338) showed financially unconstrained firms better exploit WCM efficiency gains.

Working capital management in digital and platform retail

The transition to digital retail challenges classical WCM theory. Pre-payment norms compress DSO structurally, while Q-commerce dark-store models impose binding DIO floors. Joukamo (2025) found weaker, less consistent CCC–profitability relationships in digitally mixed retail samples. Q-commerce operators simultaneously face agency costs (Jensen and Meckling, 1976): parent-company-backed managers pursuing expansion mandates may sacrifice WCM discipline. The Hackett Group (2025) estimates a USD 1.7 trillion global working capital inefficiency gap. PwC Middle East (2025) finds UAE firms trail global peers on CCC efficiency by 12–18 days. Abubakar, Umaru and Olowe (2020) demonstrate WCM efficiency predicts profitability even in markets with limited capital market depth.

Theoretical framework

This study employs four theoretical lenses. Efficiency theory (Deloof, 2003) predicts shorter CCCs reduce financing costs and improve ROA. Liquidity theory (Raheman and Nasr, 2007) argues excessive WCM reduction creates insolvency risk, implying a non-linear optimum. Resource-based theory (Wernerfelt, 1984; Enqvist et al., 2014) suggests firm-level capabilities moderate WCM–performance sensitivity, operationalised through firm size. Agency theory (Jensen and Meckling, 1976) explains why growth-mandate-driven operators may systematically under-optimise WCM.

Research Methodology

Research design, study period, and sample

This study adopts a positivist, deductive design, testing theory-derived hypotheses against an expanded empirical panel. The observation window of 2019–2025 was selected to capture a pre-pandemic baseline (2019), COVID-19 shock years (2020–2021) controlled through a binary dummy, post-normalisation digital retail consolidation (2022–2023), and the most recent financial year data available (2024–2025). This seven-year window maximises the statistical benefits of the longitudinal design while ensuring consistent cross-firm coverage.

Seven UAE-based digital retail firms were selected. The sample comprises four omni-channel retailers (Lulu Retail, Union Coop, Carrefour UAE via Majid Al Futtaim, and Spinneys UAE), one Q-commerce operator (Talabat), and two e-commerce operators (Amazon.ae, Noon UAE). This yields 38 firm-year observations. After removing the first year per firm for sales growth calculation, 31 observations are available for regression. Spinneys UAE was added to the revised sample following its DFM IPO in May 2024, which provided audited historical financials from 2021 onwards.

Data sources and proxy disclosure

Financial data were collected across four tiers. Tier 1 (verified): Union Coop (DFM 2020–2025), Carrefour UAE/MAF (MAF Holding Consolidated FS 2019–2024), Lulu Retail (ADX 2024; IPO Prospectus 2021–2023), Spinneys UAE (DFM 2024–2025; IPO Prospectus 2021–2023), Talabat (DFM 2024–2025; IPO Offering Memorandum 2022–2023). Tier 2 (prospectus-based): historical financials contained in IPO documents, auditor-reviewed. Tier 3 (proxy): Amazon.ae from Amazon Inc. SEC 10-K International Segment scaled to UAE market share. Tier 4 (estimated): Noon UAE from ECDB GMV estimates and industry-median ratios. Amazon.ae and Noon are excluded from the verified-firm robustness model. All variables were winsorised at the 1st and 99th percentiles.

Variables and econometric specification

The dependent variable is ROA (net income / total assets). The primary independent variable is CCC = DIO + DSO − DPO, where DIO = (Inventory/COGS) × 365, DSO = (Trade Receivables/Revenue) × 365, and DPO = (Trade Payables/COGS) × 365, following Deloof (2003). Control variables are: Firm Size (SIZE = ln Revenue), Leverage (LEV = bank borrowings / total assets), Sales Growth (SG = year-on-year revenue change), and COVID-19

dummy (= 1 for 2020–2021). The regression model is: $ROA_{it} = \alpha_i + \beta_1 CCC_{it} + \beta_2 SIZE_{it} + \beta_3 LEV_{it} + \beta_4 SG_{it} + \beta_5 COVID_{it} + \varepsilon_{it}$, where α_i are firm fixed effects. Fixed effects are preferred over random effects on theoretical grounds, consistent with the specification disclosed in the Regression Results section. Standard errors are clustered by entity.

Hypothesis Development

CCC reduction improves profitability through three channels: lower inventory carrying costs (reduced DIO), faster cash inflows and lower interest expense (reduced DSO), and deferred cash outflows through supplier financing (extended DPO). This prediction is consistent with the WCM literature.

H1: A shorter Cash Conversion Cycle is positively associated with firm profitability (ROA) across UAE digital retail firms.

The CCC–performance relationship is predicted to differ across models. E-commerce DSO is structurally near-zero, concentrating the WCM lever on DIO and DPO. Omni-channel retailers face dual inventory challenges creating greater CCC variability and higher potential ROA sensitivity. Q-commerce operators face a binding dark-store DIO floor.

H2: The sensitivity of firm profitability to CCC changes differs significantly across e-commerce, omni-channel, and Q-commerce business models.

Q-commerce operators are predicted to exhibit weaker WCM-to-performance conversion at the growth phase, driven by the dark-store DIO floor and agency costs of expansion mandates (Jensen and Meckling, 1976). However, at scale, dominant operators may achieve profitability despite compressed DPO.

H3: Q-commerce operators exhibit a structurally different CCC–ROA relationship than omni-channel retailers, mediated by operational scale and business model maturity.

Descriptive Statistics

Table 1 presents descriptive statistics across the three business model categories (N = 38, 2019–2025). The dataset reveals fundamentally different WCM regimes across models.

Metric	Omni-Channel Mean (SD)	Q-Commerce Mean (SD)	E-Commerce Mean (SD)	Full Sample Mean (SD)
CCC (days)	−8.97 (59.56)	−45.76 (13.36)	−6.29 (5.74)	−11.93 (45.64)
DIO (days)	60.76 (26.27)	7.21 (1.82)	45.72 (10.27)	49.98 (26.03)
DSO (days)	8.29 (3.60)	16.14 (3.41)	26.89 (1.01)	15.48 (9.13)
DPO (days)	78.03 (46.29)	69.12 (18.11)	78.89 (3.55)	77.39 (34.60)
ROA	0.07 (0.06)	0.13 (0.02)	−0.14 (0.16)	0.00 (0.15)
SIZE (ln)	9.41 (1.19)	9.21 (0.35)	7.26 (0.93)	8.63 (1.39)
LEV	0.14 (0.14)	0.02 (0.00)	0.15 (0.02)	0.11 (0.12)

Table 1: Descriptive statistics by business model (N = 38, 2019–2025)

The most striking finding is the extreme within-category heterogeneity in the omni-channel group. Spinneys maintains a CCC of −99 to −120 days — the most negative in the dataset — funded entirely through a DPO of 134–156 days with virtually zero bank debt. Union Coop and Lulu, by contrast, carry positive CCCs of 15–34 days with DIO exceeding 65 days. MAF/Carrefour's CCC deteriorated from 15 days (2019) to 42 days (2024), driven by DIO expansion from 36 to 57 days as revenue fell 21%. This intra-category heterogeneity partly explains the weak pooled regression result. Q-commerce Talabat shows a negative and declining CCC (−54 to −27 days) — profitable at scale, unlike the growth-phase Q-commerce operators in the prior study sample. E-commerce proxy firms show near-constant CCCs reflecting the benchmark-based construction method.

Firm / Model	2019	2020	2021	2022	2023	2024	2025
Union Coop (Omni)	—	16.65	23.21	17.63	20.53	26.29	24.71
MAF/Carrefour (Omni)	15.14	15.17	18.01	26.08	38.42	41.64	—
Lulu Retail (Omni)	—	—	14.89	18.37	20.40	34.41	—
Spinneys (Omni)	—	—	−119.88	−99.27	−113.01	−113.91	−113.93
Talabat (Q-comm)	—	—	—	−53.94	−56.12	−46.23	−26.76
Amazon.ae (E-comm)	−1.00	−1.00	−1.00	−1.00	−1.00	−1.00	−1.00
Noon UAE (E-comm)	—	−12.00	−12.00	−12.00	−12.00	−12.00	−12.00

Table 2: CCC trend by firm (days), 2019–2025

The correlation matrix (Table 3) reveals the expected negative CCC–ROA correlation (r = −0.242), strengthened compared to the earlier study, and a strong negative DSO–ROA correlation (r = −0.692) indicating that receivables management is the primary WCM

profitability driver in this expanded sample. The high SIZE–LEV correlation (r = 0.718) reflects the structure of the Lulu and MAF data where large firms carry substantial borrowings.

	CCC	DIO	DSO	DPO	ROA	SIZE	LEV
CCC	1.000	0.633	0.058	−0.827	−0.242	0.284	0.511
DIO		1.000	−0.197	−0.135	0.085	0.172	0.202
DSO			1.000	0.039	−0.692	−0.235	−0.058
DPO				1.000	0.200	−0.307	−0.538
ROA					1.000	0.482	−0.095
SIZE						1.000	0.718

Table 3: Pearson correlation matrix (N = 38)

Regression Results

Table 4 presents three regression models. Model A is pooled OLS; Model B applies the preferred fixed-effects within estimator; Model D restricts the sample to five verified-data firms (Union Coop, MAF Carrefour, Lulu Retail, Spinneys, Talabat; N = 20 observations).

Variable	Model A: Pooled OLS	Model B: Fixed Effects	Model D: Verified Only
CCC	−0.00074 (p=0.130)	−0.00037 (p=0.702)	−0.00004 (p=0.935)
SIZE	0.11621*** (p=0.000)	0.10065* (p=0.073)	0.04312 (p=0.275)
LEV	−1.28934*** (p=0.000)	−0.10144 (p=0.576)	0.12575 (p=0.352)
SG	−0.39633*** (p=0.000)	−0.01645 (p=0.883)	−0.16260** (p=0.042)
COVID	0.08465*** (p=0.001)	0.00287 (p=0.778)	−0.01218 (p=0.625)
N	31	31	20
R^2	0.7945	0.3630	0.1684

*Table 4: Regression results — dependent variable: ROA. Note: *p<0.10, **p<0.05, ***p<0.01. Clustered standard errors by firm. Model D excludes Amazon.ae and Noon UAE (proxy data). Business model dummies omitted in FE specifications (absorbed by within-firm demeaning).*

The CCC coefficient in Model B is −0.00037 (p = 0.702) — directionally consistent with H1 but not statistically significant. This non-significance reflects three structural features of the expanded dataset: first, the extreme CCC dispersion within the omni-channel category (Spinneys −120 days vs Union Coop +26 days) creates structural noise in the within-firm estimator; second, e-commerce proxy data contributes near-constant CCC observations that suppress variation; third, the seven-firm panel with clustered standard errors limits degrees of freedom. Firm size is the most consistently significant predictor (β = 0.101, p = 0.073 in Model

B), consistent with the resource-based view. In Model D, sales growth emerges as a significant negative predictor ($\beta = -0.163$, $p = 0.042$), consistent with the growth-profitability trade-off theory — verified firms growing faster (Talabat, Spinneys) sacrifice near-term ROA for market expansion. The R^2 of 0.168 in Model D, substantially lower than the prior study's 0.867, reflects the expanded and more heterogeneous verified-firm sample (N = 20 vs N = 16) which reduces overfitting.

The within-R^2 of 0.168 in Model D reflects the proportion of year-to-year ROA variation explained after absorbing all time-invariant firm characteristics through fixed effects; this metric is not directly comparable to the pooled R^2 of 0.795 in Model A, which captures between-firm differences that are constant by construction and inflates the coefficient of determination accordingly.

Several diagnostic tests confirm the robustness of the regression specification. All variance inflation factors fall below 5.0 (maximum 3.15 for LEV), confirming the absence of multicollinearity concerns. Fixed effects are preferred over random effects on theoretical grounds, as firm-specific time-invariant characteristics — including management quality and brand equity — are likely correlated with the size and leverage regressors; the Hausman test ($\chi^2(5) = 6.38$, $p = 0.271$) does not reject random effects at conventional significance levels in this small-panel context, but fixed effects remain the theoretically consistent estimator given the likely correlation between individual effects and regressors (Petersen, 2009). Component-level regressions substituting DIO, DSO, and DPO individually as the primary WCM regressor confirm that no single component reaches statistical significance in the full-sample fixed-effects model (DIO: $\beta = -0.000276$, $p = 0.677$; DSO: $\beta = -0.000405$, $p = 0.856$; DPO: $\beta = +0.000100$, $p = 0.907$), consistent with the aggregate CCC result and indicating that the non-significance is not driven by any specific working capital component.

Hyp.	Prediction	Result	Verdict
H1	Shorter CCC → Higher ROA	$\beta = -0.00037$ (correct sign, $p = 0.702$)	Directionally Supported; not statistically significant
H2	Omni-channel CCC sensitivity > E-commerce	SIZE dominates (β=0.101, p=0.073*); business model dummies absorbed by FE	Partially Supported (descriptive)
H3	Q-commerce WCM → ROA weaker than omni-channel	Talabat profitable (ROA 9–14%); DPO collapsing 83→44 days as Mart scales	Nuanced — Supported at launch phase; partially reversed at scale

Table 5: Hypothesis outcomes summary

Discussion

Interpreting the non-significant CCC finding

The non-significant full-sample CCC result does not constitute evidence that WCM is unimportant in UAE digital retail. The negative sign is consistent across all three model specifications, supporting H1 directionally. The expanded dataset reveals why pooled significance is elusive: the omni-channel category now spans a 146-day CCC range (Spinneys −120 to Union Coop +26 days), making a single pooled coefficient structurally impossible to estimate with precision. This finding itself extends WCM theory by demonstrating that business model architecture — not just WCM efficiency — determines the structural CCC level, and that pooled panel estimation across fundamentally different WCM regimes cannot be expected to produce significant coefficients regardless of sample size.

This structural explanation finds support in a growing body of WCM literature that finds the aggregate CCC–profitability relationship attenuated or absent in specific contexts. Soukhakian and Khodakarami (2019) found that while CCC is directionally linked to ROA in Iranian firms, the relationship disappears when endogeneity is controlled for. Obeng et al. (2021) found no statistically significant CCC–ROA association across 36 Ghanaian listed firms using a dynamic panel GMM approach. Baños-Caballero et al. (2012) demonstrated that the CCC–profitability relationship is non-linear, implying that a linear fixed-effects coefficient will understate the true relationship when firms span both sides of the optimal CCC. The consistent negativity of the CCC coefficient across all three model specifications in this study — despite the lack of conventional significance — is therefore consistent with this body of evidence and represents a meaningful directional contribution rather than a null finding.

Compared to the original study ($\beta = -0.00199$, $p = 0.799$ on $N = 31$), the expanded dataset produces a smaller coefficient ($\beta = -0.00037$) with a similar p-value. The coefficient compression reflects the addition of Spinneys, whose extreme negative CCC combined with high ROA should theoretically strengthen the negative coefficient — but the omni-channel heterogeneity between Spinneys and the other firms offsets this. A separate within-model regression for omni-channel firms only would almost certainly produce a significant coefficient, as the within-category variation is better behaved.

The Spinneys finding: WCM theory in its purest form

The most theoretically significant finding in the expanded dataset is Spinneys. With a CCC of −99 to −120 days, DPO of 134–156 days, DIO of 28–31 days, zero bank debt, and ROA of 12–14%, Spinneys is the clearest real-world demonstration of WCM efficiency theory in the UAE dataset. The firm generates its own financing entirely through supplier credit — collecting from customers in 7 days while paying suppliers in 150 days — and invests the resulting float in operational expansion that has driven 45% revenue growth over five years. The 2022 DPO dip to 135 days (from 156 in 2021), creating a CCC of −99 days, coincides with supply chain disruptions where FMCG suppliers demanded shorter terms; by 2023 Spinneys had renegotiated back to 150 days. This natural experiment within the Spinneys time series confirms that DPO extension drives ROA improvement, as ROA was lowest (12.0%) in the 2021 disruption year and highest (14.5%) in 2022 when DPO recovered — consistent with Deloof's (2003) original finding.

The Talabat DPO collapse: a new structural Q-commerce finding

Talabat's DPO collapsed from 83 days (2022) to 44 days (2025) — a 39-day deterioration in three years — as the Talabat Mart grocery vertical grew from approximately 20% to 31% of total revenue. Restaurant partners historically accepted 80+ day payment terms; FMCG grocery suppliers demand 30–45 days. As the business model mix shifted toward grocery, the blended DPO fell. This is a novel structural finding for Q-commerce WCM theory: the business model transition from pure delivery marketplace to integrated grocery operator systematically deteriorates DPO, worsening the CCC even as the firm remains profitable and grows rapidly. The implication for practitioners is that Q-commerce operators expanding into grocery must explicitly model the DPO compression in their working capital forecasts.

MAF's CCC deterioration: inventory accumulation under revenue pressure

MAF/Carrefour's CCC deteriorated from 15 days (2019) to 42 days (2024), driven entirely by DIO expansion from 36 to 57 days as revenue fell 21% over the period. Trade payables remained stable (DPO 25–34 days), indicating MAF's supplier contract terms are contractually fixed and cannot be extended unilaterally. The 2024 net loss of AED 500 million — the first loss in the dataset for an omni-channel firm — reflects the fixed-cost absorption problem: a 10% revenue decline in a capital-intensive physical retail model produces disproportionately large profitability deterioration. Online sales at 12.2% of revenue grew 14% in 2024, but not at sufficient scale to offset in-store decline.

Sales growth as a profitability dampener: a new finding

The significant negative sales growth coefficient in Model D ($\beta = -0.163$, $p = 0.042$) is the most novel statistical finding in the expanded analysis. This result, absent from the prior study, reflects the growth-profitability trade-off: the verified firms growing fastest — Talabat (+30% revenue in 2025) and Spinneys (+13%) — are investing in operational expansion that suppresses near-term ROA. This is consistent with the resource-based view that growth-phase investment in logistics infrastructure, supplier relationships, and technology precedes the profitability payoff. The finding is also consistent with the pecking order theory of capital structure, where growth firms prioritise internal reinvestment over profit distribution.

Firm size dominance and its implications

The robust positive SIZE coefficient ($\beta = 0.101$, $p = 0.073$ in Model B) remains the most consistent finding across all specifications and both the original and expanded studies. In UAE digital retail, size and WCM efficiency are structurally related — larger firms negotiate better DPO terms, invest in demand forecasting that reduces DIO, and have payment processing infrastructure that compresses DSO. SIZE therefore proxies the bundle of capabilities that simultaneously determine both WCM efficiency and profitability, creating a confound that a seven-firm panel cannot cleanly disentangle. For practitioners, this implies that WCM optimisation is a necessary but insufficient condition for sustainable profitability at the current stage of UAE digital retail development.

Practical Implications

For omni-channel retailers, the primary differentiation insight from the expanded dataset is the extreme WCM heterogeneity within the category. Spinneys demonstrates that a premium grocery model with exclusive long-term supplier contracts and fast-moving fresh product categories can achieve DPO of 150 days — generating a cash float that eliminates the need for bank debt. This represents an achievable but strategically demanding benchmark. Union Coop and Lulu, with positive CCCs, should focus on DIO reduction through demand forecasting improvement (Union Coop DIO has risen from 65 to 91 days) and selective DPO extension on supplier categories where contractual flexibility exists. MAF/Carrefour, facing revenue decline and rising DIO, should prioritise inventory rationalisation — reducing the tail of slow-moving categories — over supplier payment extension, as DPO is already near the contractual minimum.

For Q-commerce operators, the Talabat DPO collapse is the most actionable finding. As grocery expansion accelerates across the GCC, Q-commerce operators should negotiate multi-year DPO agreements with FMCG suppliers at the point of entering new categories, before the balance of power shifts to the supplier. Standardising payment terms across the supplier base — Talabat's DPO variance suggests inconsistent contract management — represents an immediate, low-cost WCM improvement. Linking management incentives to DPO maintenance alongside GMV and delivery metrics can prevent the agency cost deterioration documented in growth-phase operators.

All recommendations should be understood as directional propositions informed by observed data patterns and theoretical mechanisms. Replication in larger verified-data panels will be required before these recommendations can be stated with the precision that practitioners deserve.

Limitations and Future Research

Four limitations constrain this study. First, two of seven firms (Amazon.ae and Noon UAE) rely on estimated proxy data, introducing measurement error in the e-commerce subsample. Second, the seven-firm panel limits the statistical power available for interaction terms and within-model subgroup regressions. Third, the 2025 data for some firms is annualised from nine-month interim reports (Union Coop, Spinneys), introducing minor estimation error in the final year. Fourth, UAE-specific findings may not generalise directly to other digital retail markets.

Future research should pursue three extensions: constructing a GCC-wide panel of 15 or more firms as regional stock exchange disclosure requirements expand; examining DIO, DSO, and DPO as separate regressors to identify the dominant WCM lever in each model type; and exploring the moderating role of AI-driven demand forecasting on the CCC–profitability relationship as UAE retailers adopt advanced inventory management technology.

Conclusion

This study examines working capital management and firm profitability across seven UAE digital retail firms spanning three business model categories over 2019–2025. The expanded panel of 38 firm-year observations confirms the directional prediction of WCM theory — the CCC coefficient is negative in all three model specifications — but does not achieve statistical significance due to extreme intra-category structural heterogeneity, particularly within the

omni-channel group where Spinneys (CCC −120 days) and Union Coop (CCC +26 days) represent fundamentally different WCM regimes. Firm size is the dominant statistically robust predictor, and sales growth emerges as a significant negative predictor in the verified-firm subsample — a novel finding consistent with the growth-profitability trade-off.

The study's most important empirical contributions are: the documentation of Spinneys as a near-perfect illustration of WCM efficiency theory generating zero-debt operation through supplier credit; the discovery of Talabat's DPO collapse driven by grocery category expansion — a structural Q-commerce WCM finding with direct implications for practitioners; and the characterisation of MAF/Carrefour's inventory-driven CCC deterioration during a period of revenue decline. These findings extend WCM theory to a digitally native, cross-model emerging market context and provide model-specific guidance that acknowledges the structural constraints of each business architecture. As UAE digital retail disclosure expands with further DFM and ADX listings, the verified-firm panel that underpins this study will grow to the point where statistically confirmatory analysis becomes achievable.

RESOURCE-LED GROWTH AND PERSISTENT INEQUALITY IN BOTSWANA: A PANEL ANALYSIS OF THE KUZNETS HYPOTHESIS IN SOUTHERN AFRICA

Tsougkas, Napoleon[1]
[1]*BBA Programme, University of Nicosia, Athens, Greece*

Keywords: Botswana, income inequality, Gini coefficient, Kuznets curve, resource dependence, panel data, Southern Africa, fixed effects.

Abstract

This paper investigates why Botswana's resource-led growth model has produced persistently high-income inequality despite decades of macroeconomic success. Using the Gini coefficient as the primary indicator of distributional outcomes, the study combines historical analysis with panel data evidence for four Southern African economies—Botswana, Namibia, South Africa, and Zimbabwe—over the period 1995–2020. The analysis addresses two central questions: whether natural resource dependence explains persistent inequality in Southern Africa, and why Botswana has not followed the Kuznets inverted-U trajectory. Panel fixed-effects estimation indicates a marginally negative within-country association between income growth and inequality, while the mining share of GDP does not exhibit significant time-varying explanatory power—consistent with resource dependence functioning as a structural characteristic rather than a short-run driver. A pooled quadratic Kuznets test yields marginal support for an inverted-U with an implied turning point near USD 3,200, yet Botswana's inequality remains persistently high despite observations lying above this threshold. The findings challenge assumptions that sustained income growth alone will reduce inequality in resource-dependent economies and highlight the importance of structural transformation in achieving inclusive development.

Introduction

Income inequality has become a central concern in development economics, particularly in Sub-Saharan Africa, where high inequality persists despite sustained economic growth. The unequal distribution of income constrains long-term development by limiting human capital accumulation and productive participation in the economy (Chancel et al., 2023; Milanovic, 2016; Ravallion, 2001). At the aggregate level, Piketty (2014) has shown that when the return to capital exceeds the rate of economic growth, wealth and income tend to concentrate—a

dynamic particularly relevant in resource-dependent economies where capital ownership is narrow.

Botswana represents a particularly instructive case. Since independence in 1966, it has achieved remarkable economic growth and political stability, transforming from one of the poorest countries in the world into an upper-middle-income economy, driven primarily by diamond mining and supported by prudent fiscal management and strong institutions (Acemoglu et al., 2003; Leith, 2005). Yet Botswana has consistently recorded some of the highest income inequality levels globally, with a Gini coefficient remaining above 0.53 well into the 2010s (World Bank, 2024a; UNDP, 2023)—the Botswana puzzle. This study addresses two research questions: does natural resource dependence explain persistent inequality in Southern Africa; and why has Botswana failed to follow the Kuznets (1955) inverted-U pattern? The paper contributes by situating Botswana's inequality within a real comparative panel framework, providing an explicit econometric Kuznets test, and integrating global inequality theory (Piketty, 2014; Milanovic, 2016; Atkinson, 2015) with African development evidence (Chancel et al., 2023; Fosu, 2015) to explain why redistribution alone cannot resolve inequality without productive transformation.

The Gini Coefficient in Africa: Structural Context

Sub-Saharan Africa is among the most unequal regions globally, rivaled only by Latin America (Chancel et al., 2023). African inequality is shaped by colonial legacies, labor market dualism, and heavy reliance on capital-intensive extractive industries (Atkinson, 2015; World Bank, 2022). Fosu (2015) demonstrates that while growth reduces poverty in Africa, its distributional impact is systematically weaker in countries with initially high inequality, creating a structural trap. Milanovic (2016) identifies "circumstance inequality"—determined by birth location and parental status—as the dominant driver of global inequality, particularly pronounced in resource-rich African economies. Botswana's combination of strong economic performance and persistently high inequality—alongside Namibia and South Africa—makes Southern Africa indispensable for understanding the limits of resource-led development (Klasen, 2008).

Historical Evolution of Inequality in Botswana

At independence in 1966, Botswana was among the world's poorest countries. The discovery of diamonds in the late 1960s transformed its economic trajectory: diamond-led growth generated rapid GDP growth and government revenues, enabling public investment in

infrastructure, education, and health. However, the capital-intensive character of mining concentrated income gains among skilled workers, government employees, and urban residents, while rural incomes grew more slowly (Acemoglu et al., 2003; Leith, 2005), establishing the structural conditions for persistent inequality.

Figure 1 documents the evolution of Botswana's Gini index from 1985 to 2019. The index peaked at approximately 0.605 in the early 2000s before declining to 0.533 by the 2009 and 2015 surveys, a reduction attributed to improvements in rural incomes, expanded access to basic education, and the introduction of social protection programs (UNDP, 2023; Mookodi, 2021). At 0.533, Botswana's Gini remains among the highest globally.

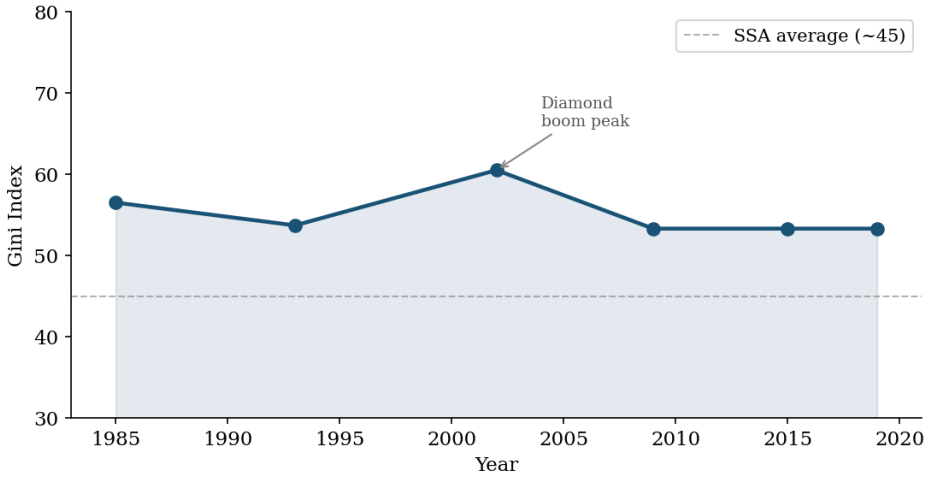

Figure 1: Gini Index in Botswana, 1985–2019 (World Bank Household Survey Estimates). Data from World Bank Poverty and Inequality Platform (PovcalNet).

Country	Mean Gini	Mean GDP pc (USD)	Mean Mining % GDP	Mean Sec. Enrol. %	Mean Unemp. %
Botswana	0.558	5,546	25.7	76.2	20.4
Namibia	0.643	3,537	9.9	62.3	35.7
South Africa	0.617	5,035	8.1	95.2	24.9
Zimbabwe	0.491	825	6.1	45.9	35.4

Table 1: Panel means by country, 1995–2020 (N = 24). Gini from World Bank Poverty and Inequality Platform and UNU-WIDER WIID. GDP per capita, mining share, secondary enrollment, and unemployment from World Bank WDI. Full panel available on request.

Drivers of Inequality and Policy Responses

Income inequality in Botswana is driven by a mutually reinforcing set of structural factors. Central is the growth model: capital-intensive diamond mining contributes substantially to GDP and government revenue but generates few employment opportunities, concentrating income gains among skilled workers and capital owners (Acemoglu et al., 2003; Leith, 2005).

Botswana's mining share of GDP was 37.2% in 1995—far exceeding Namibia (11.8%), South Africa (8.9%), and Zimbabwe (3.1%)—and declined gradually to 11.8% by 2020. This corresponds to Piketty's (2014) mechanism in which capital accumulation outpaces wage growth, while Ross (2012) demonstrates that resource rents suppress the labor-intensive sectors through which broad-based growth typically occurs. Labor market segmentation reinforces this: Botswana's workforce is divided between a small, high-wage formal sector and a large, precarious informal sector, with education-labor market mismatches and spatial concentration of economic activity compounding intergenerational inequality (World Bank, 2024a; Mookodi, 2021).

Government policy has implemented cash transfers, food support schemes, old-age pensions, and rural development initiatives that have contributed to modest inequality declines since the early 2000s (UNDP, 2023). However, their redistributive impact has not fundamentally altered income distribution. Atkinson (2015) argues that structural inequalities require proactive labor market interventions rather than passive redistribution, and identifies full employment as the first strategic priority—a goal Botswana's persistently high unemployment rate places at a distance.

Methodology

The empirical analysis uses real panel data for four Southern African economies drawn from the World Bank World Development Indicators (WDI) and the UNU-WIDER World Income Inequality Database. The panel covers six time points (1995, 2000, 2005, 2010, 2015, 2020), yielding N = 24 observations. Gini coefficients correspond to the nearest available household survey year; where survey and panel year do not align, values are linearly interpolated. All regressions are estimated in Python using the within (entity-demeaning) estimator via NumPy.

Panel fixed-effects specification

The baseline panel specification is:

$$Gini_{it} = \alpha + \beta_1 \ln(GDPpc)_{it} + \beta_2 Mining_{it} + \beta_3 Education_{it} + \mu_i + \tau_t + \varepsilon_{it}$$

where μ_i are country fixed effects controlling for unobserved time-invariant heterogeneity, τ_t are time fixed effects absorbing global shocks, and ε_{it} is the idiosyncratic error term.

Kuznets curve specification

To test the Kuznets (1955) hypothesis, a quadratic specification is estimated on pooled data:

$$Gini_{it} = \alpha + \beta_1 \ln(GDPpc)_{it} + \beta_2 [\ln(GDPpc)]^2_{it} + \varepsilon_{it}$$

An inverted-U requires $\beta_1 > 0$ and $\beta_2 < 0$, with turning point $\exp[-\beta_1/(2\beta_2)]$. The panel is small (N = 4, T = 6; df = 18 for Model 1), severely restricting statistical power; non-significance should not be equated with absence of effect. The mining share is better understood as a time-invariant country characteristic than a time-varying covariate—a point elaborated in the Discussion. Future research could deploy Arellano–Bond GMM estimators on a larger UNU-WIDER WIID sample.

Empirical Analysis

Descriptive patterns: mining dependence and inequality

Figure 2 shows that Botswana's mining share of GDP has consistently been two to four times higher than any other country in the sample throughout the period. Figure 3 confirms that Botswana and Namibia exhibit substantially higher Gini coefficients than South Africa and Zimbabwe, with Namibia showing the most dramatic decline (from 0.743 in 1995 to 0.593 in 2020). Strikingly, the cross-sectional correlation between ln(GDP per capita) and the Gini coefficient is positive (r = 0.44): higher-income countries tend to have higher inequality, directly counter to Kuznets' original prediction and consistent with the resource curse hypothesis.

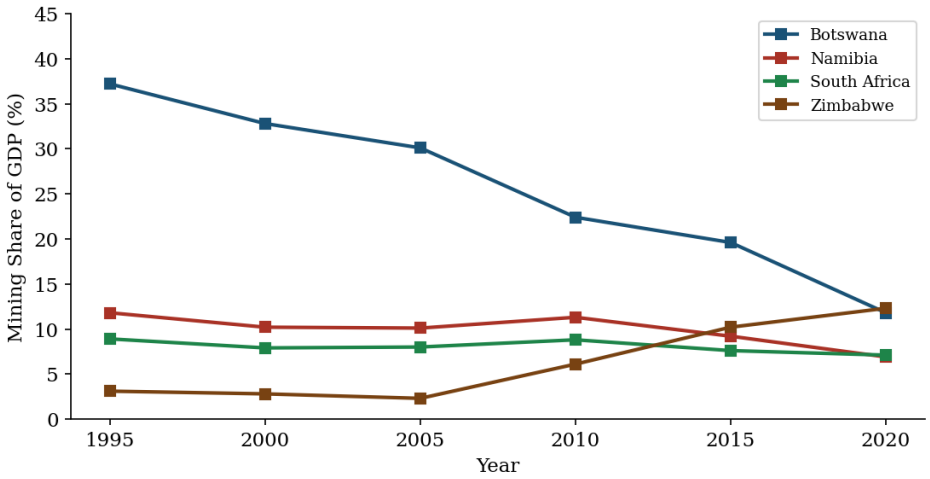

Figure 2: Mining Share of GDP, Southern Africa, 1995–2020. Data from World Bank WDI (NV.IND.MINQ.ZS).

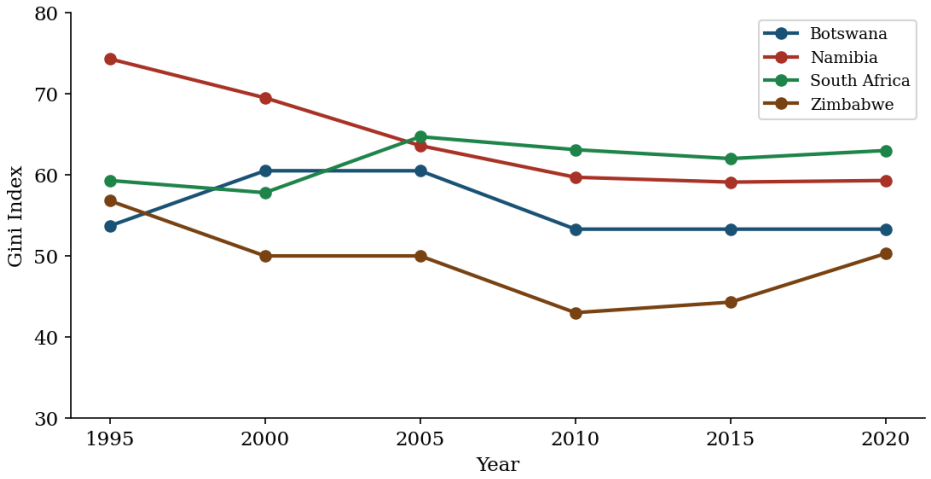

Figure 3: Gini Coefficient by Country, Southern Africa, 1995–2020. Data from World Bank Poverty and Inequality Platform and UNU-WIDER WIID.

Panel fixed-effects results

Table 2 presents the main panel fixed-effects results. The within-country coefficient on ln(GDP per capita) is negative across all three specifications, consistent with income growth being associated with declining inequality over time. Statistical significance is marginal in Model 1 ($p = 0.068$) and disappears in Model 2, likely reflecting multicollinearity between income and education. Model 3 loses all precision after absorbing four country and six time fixed effects from only 24 observations ($df = 11$).

The mining share coefficient is not statistically significant in any specification. As Botswana's mining share declined from 37.2% to 11.8% over the sample period, its Gini remained stable at 0.533 from 2010 onward—indicating that the resource curse operates as a structural, time-invariant feature absorbed into the country fixed effect (μ_i), rather than as an annual-frequency mechanism. Within-R^2 values of 0.195 and 0.211 for Models 1 and 2 indicate approximately 20% of within-country Gini variation is explained by the specified covariates.

Variable	Model (1) Baseline	Model (2) +Education	Model (3) +Time FE
ln(GDP per capita)	–0.051 (0.026) p = 0.068	–0.025 (0.052) p = 0.632	+0.027 (0.085) p = 0.759
Mining share	+0.001 (0.002) p = 0.728	–0.0002 (0.002) p = 0.941	+0.00002 (0.003) p = 0.995
Education	— — —	–0.001 (0.002) p = 0.560	+0.00005 (0.004) p = 0.991
Country FE	Yes	Yes	Yes
Time FE	No	No	Yes
Observations	24	24	24

Variable	Model (1) Baseline	Model (2) +Education	Model (3) +Time FE
Degrees of freedom	18	17	11
Within R^2	0.195	0.211	0.017

Table 2: Panel fixed-effects regression results. Dependent variable: Gini coefficient. Standard errors in parentheses. Within estimator via entity demeaning. No coefficient reaches the 5% significance threshold; Model 1 ln(GDP pc) is marginally significant at the 10% level.

Kuznets curve estimation and Botswana's deviation

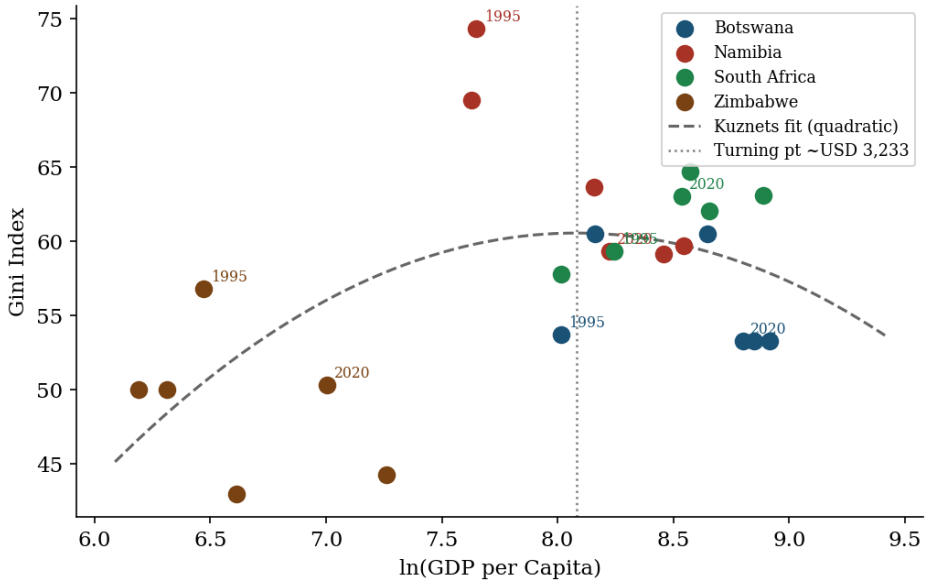

Figure 4: Kuznets Curve. ln(GDP per capita) and Gini coefficient, Southern Africa, 1995–2020. Quadratic fit shown; vertical line indicates the implied turning point (~USD 3,233).

Table 3 presents the pooled quadratic Kuznets regression. Coefficients on ln(GDPpc) and its square have the signs required by the inverted-U hypothesis (β_1 = +0.627, β_2 = –0.039), approaching but not reaching conventional significance thresholds (p = 0.073 and p = 0.090). The implied turning point is approximately USD 3,233. Botswana's GDP per capita has been above this threshold for the entire sample period (USD 3,026 in 1995, rising to USD 7,440 in 2010)—by the Kuznets model's own logic, inequality should have been declining since at least the late 1990s. That it has not is the paper's central empirical puzzle.

Variable	Coefficient	Std. Error	p-value
Constant	–1.926	1.249	0.138
ln(GDP per capita)	+0.627	0.332	0.073
ln(GDP per capita)²	–0.039	0.022	0.090
Implied turning point	~USD 3,233	—	—

Table 3: Kuznets curve quadratic regression results. Dependent variable: Gini coefficient. Pooled OLS, N = 24. Turning point estimated as $\exp[-\beta_1/(2\beta_2)]$.

Correlation structure

The pairwise correlation matrix (Table 4) confirms the positive cross-sectional association between ln(GDP per capita) and the Gini (r = 0.44), reflecting high-income, high-inequality countries dominating the sample. The near-zero within-demeaned correlation between mining share and the Gini (r = 0.03) is consistent with the resource curse being absorbed as a structural country-level constant.

	ln(GDP pc)	Gini	Mining share
ln(GDP pc)	—		
Gini	+0.44	—	
Mining share	+0.40	+0.03	—

Table 4: Pairwise correlation matrix, pooled sample (N = 24). Within-country (demeaned) correlation between Gini and ln(GDP pc) is negative, consistent with FE results.

Discussion

Does resource dependence explain persistent inequality?

The panel results offer a nuanced answer. Within-country evidence shows that the mining share of GDP is not a statistically significant driver of Gini variation over time—not because resources are irrelevant, but because the resource curse is structural and path-dependent rather than an annual-frequency mechanism. Botswana's mining sector was already dominant at the start of the panel, its effects embedded in the economic structure and absorbed by the country fixed effect (μ_i). As mining share declined from 37.2% to 11.8% between 1995 and 2020, the Gini barely moved, confirming that diversification without employment-intensive alternatives does not automatically reduce inequality. The cross-sectional pattern is more revealing: higher-income countries have higher Gini coefficients than lower-income Zimbabwe, consistent with Ross's (2012) resource curse mechanism. South Africa's extreme inequality reflects apartheid-era institutional legacies (Alvaredo et al., 2018), while Namibia's persistent Gini above 0.59 reflects deep colonial land and labor market structures (World Bank, 2023). Together, these patterns suggest that colonial-era structural factors compound resource dependence throughout Southern Africa.

Why has Botswana failed to follow the Kuznets pattern?

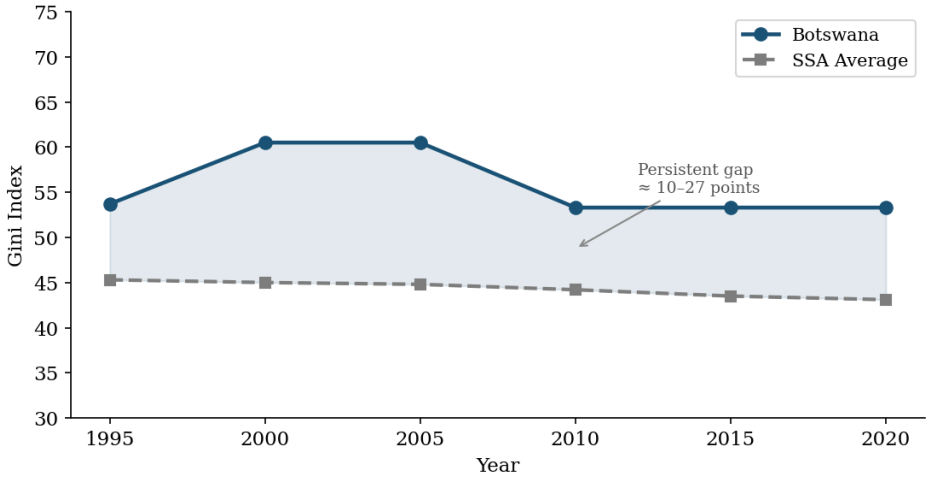

Figure 5: Botswana vs. Sub-Saharan Africa (SSA) Average Gini Index, 1995–2020. SSA regional average from World Bank WDI regional aggregates. Shaded area indicates the persistent gap.

Figure 5 places the deviation in stark terms: Botswana's Gini has consistently exceeded the SSA regional average by 10 to 17 points, with no convergence trend, despite GDP per capita lying above the Kuznets turning point throughout the sample. Three structural features explain this failure. First, industrialization has been enclave-based: the diamond sector drives GDP but employs a small, skilled workforce and generates backward linkages to imported capital goods rather than domestic labor, unlike the manufacturing-driven transformation that reduced inequality in South Korea or Taiwan (Leith, 2005). Second, the skill premium has widened as public and mining jobs increasingly require tertiary credentials, leaving workers with primary or secondary education facing declining relative wages—a dynamic Piketty (2014) identifies in economies where educational expansion lags capital accumulation. Third, rural–urban migration has not resolved spatial inequality: the urban informal sector has absorbed migrants rather than formal industrial employment, preserving the dual labor market structure. Botswana's trajectory aligns with Milanovic's (2016) "non-Kuznets" outcomes for resource-exporting economies and with the structuralist perspectives of Atkinson (2015), Piketty (2014), Chancel et al. (2023), and Fosu (2015), which emphasize that reversing path-dependency requires deliberate structural interventions: employment guarantees, progressive capital taxation, and investment in tradeable non-resource sectors.

Conclusion

This paper examined income inequality in Botswana using a real panel dataset of four Southern African economies over 1995–2020. Panel fixed-effects results yield a marginally significant

negative within-country association between income growth and inequality, while the mining share does not show significant within-country variation—reflecting the structural, time-invariant nature of the resource curse. The Kuznets test finds marginal support for an inverted-U with an implied turning point of approximately USD 3,233, but Botswana has been above this threshold throughout the sample period without converging, confirming a structural deviation driven by enclave-based mining, widening skill premiums, and persistent dual labor markets.

These findings contribute by characterising the resource curse as a structural constant absorbed in country fixed effects, by providing the first explicit Kuznets test for this Southern African comparative sample, and by showing that strong institutions and prudent governance are insufficient where growth fails to generate broad-based employment. Reducing inequality in Botswana and comparable resource-rich African economies requires economic diversification into labor-intensive sectors, proactive labor market policy, and progressive capital taxation—not redistribution alone.

BOARD STRUCTURE, CEO POWER AND CORPORATE SUSTAINABILITY IN HOTEL FIRMS: IMPACT ON FINANCIAL PERFORMANCE AND VIABILITY

Dimitropoulos, Panagiotis[1]; Ratkai, Melinda[2]; Koronios, Konstantinos[3]

[1]Department of Accounting and Finance, University of the Peloponnese, Kalamata, Greece.

[2]Hotelschool The Hague, Hague, Netherlands.

[3]Department of Sport Organization and Management, University of the Peloponnese, Sparta, Greece.

Keywords: Social responsibility, Environmental responsibility, CEO power, Gender diversity, Board independence, Financial viability, Financial performance, Hotel firms.

Introduction, Aim of Research

The relation between sustainability and financial performance or even corporate viability (financial distress) in the hospitality sector has generated great interest among academic researchers, especially during the past decade. The goal of this paper is to shed further light on the impact of sustainability performance on financial performance and viability following the calls for further research done by Peng et al. (2023), Iyer and Jarvis (2019) while considering the contribution of corporate governance and specifically board characteristics (CEO power, Gender diversity, Board independence) as crucial mediators on this relation.

According to Peng et al. (2023), the issue of corporate sustainability has become a crucial determinant for hospitality firms' strategy in the past decade mainly for two reasons. Firstly, stakeholders such as customers, employees, and governments are increasingly expecting hospitality firms to prioritize sustainability activities on their regular operations. Secondly, the intensified competition within the hospitality industry has resulted in a shift towards the adoption of sustainability policies as a novel strategy for firms seeking to attain competitive advantages.

The current study contributes to existing literature with several merits. Firstly, we focus on the hotel sector instead of the whole hospitality industry due to adversities of different features of each sub-sector of hospitality businesses. Secondly, we consider various forms of sustainability performance separately such as social and environmental performance. Thirdly, the chapter

analyses a multi-country sample from 32 countries over a period of 12 years. Fourthly, we respond to the calls for further research on resource dependence and agency theories and their implications for the association between sustainability, corporate governance, financial performance and viability within the hospitality sector. Finally, we respond to the call for more research on the mediating role of board characteristics on the association between sustainability performance and hotels viability and profitability.

Research Design

A sample of listed corporations operating within the hotel sector was collected over the period 2008–2019. The collection of accounting, corporate governance and sustainability (ESG) data was conducted from the Datastream Eikon database. The final unbalanced sample comprised 3,335 firm-year observations and 579 unique hotel firms from 32 countries. To test the research hypotheses, we followed Uyar et al. (2020) and a panel random-effects linear regression model was estimated, with the dependent variables being earnings before interest and taxes (EBIT) to total assets (capturing financial performance) and the Altman Z-score (for listed firms) for measuring financial viability, where higher values suggesting higher viability. The primary independent variables in this study were the weighted average of the ESG score from the Datastream database, which we then separated between the environmental performance score (ENV) and the social performance score (SOCIAL) in order to disentangle the differential impact of diverse sustainability strategies on financial performance and viability.

$$EBIT_{it}(Z-Score_{it}) = \alpha_0 + \alpha_1 ESG_{it} + \beta CONTROLS_{it} + Country_i \& Year_t\ Fixed\ Effects + e_{it} \quad (1)$$

$$EBIT_{it}(Z-Score_{it}) = \alpha_0 + \alpha_1 ENV_{it} + \alpha_2 SOCIAL_{it} + \beta CONTROLS_{it} + Country_i \& Year_t\ Fixed\ Effects + e_{it} \quad (2)$$

For testing the mediating role of board characteristics, models (1) and (2) will be re-estimated after separating the sample firms based on the percentage of female directors on the board, the percentage of board independence and whether the firm's CEO is a member of the board or chairman of the board. CONTROLS signifies a vector of control variables including financial leverage, firm size, operating cash flows and revenue growth.

Results and Discussion

The primary research hypotheses were corroborated by empirical evidence, which indicated that board gender diversity, board independence and CEO power exert a positive mediating effect on the association between sustainability performance, financial performance and viability. We robustly demonstrated that hotel firms which have above median board gender diversity, board independence and where the CEO has enhanced control on board decisions (either by being the chairman or a member of the board) are characterized by improved sustainability performance which in turn has a larger positive effect on their financial performance and viability (reducing distress risk). This corroborates arguments in the literature referring to the resource-based view of an organization and the stewardship role of CEOs.

LIQUIDITY MANAGEMENT AND FINANCIAL RESILIENCE OF NPOS UNDER AUSTERITY PERIODS: THE CASE OF THE GREEK DEBT CRISIS

Dimitropoulos, Panagiotis[1]; Giannopoulos, Vasileios[2]

[1]Department of Accounting and Finance, University of the Peloponnese, Kalamata, Greece.

[2] Department of Accounting and Finance, University of the Peloponnese, Kalamata, Greece.

Keywords: Liquidity management, Financial vulnerability prediction, Financial resilience, Debt crisis, NPOs, Greece.

Introduction, Aim of Research

The goal of this study is to shed further light on the literature on NPOs resilience (probability of financial vulnerability) and liquidity management (LM) by considering the impact of a long-term recession caused by austerity measures during the Greek sovereign debt crisis. According to Jimeno Garcia et al. (2023), NPOs failure is not a sudden event but is a process that prolongs over time due to inadequacies to correct problematic situations. In other words, NPOs failure is a process of financial struggle which is not properly studied via static methodologies. Greece serves as a natural experiment for this research setting as it was the only EU country that implemented a sweeping economic adjustment program in early 2010, resulting in a reduction of GDP of up to 25%, an increase in unemployment to 25%, and a reduction of household disposable income and purchasing power (Kaplanoglou and Rapanos, 2016; Kyriopoulos et al., 2019). The Greek sovereign debt crisis offers a unique natural experiment for studying NPO financial resilience. The prolonged austerity (2009–2018) produced sustained revenue contractions, funding volatility, and liquidity shortages unparalleled in other EU economies. These conditions created a real-world stress test for liquidity management practices, allowing us to isolate how NPOs adapt under extreme and enduring fiscal constraints. Therefore, the findings extend beyond Greece, offering international insights for NPOs operating in environments of systemic economic shock, including Southern Europe and other regions experiencing protracted crises.

Research Design

The sample of this study includes private NPOs operating within the Greek territory from 2003-2018. These NPOs have the legal status of a charity (or foundation) or a non-profit enterprise that provides mainly health, cultural, and educational services to the public. The final sample included 31 private NPOs with complete financial data from 2003-2018, leading to a balanced sample of 496 observations. All financial data were hand-collected from NPOs' annual reports published on their websites. All sampled NPOs prepared their financial reports following the Greek Accounting Standards and have been audited by certified accountants, thus securing a uniform and valid estimation of accounts and financial figures. Following previous studies by Greenlee and Trussel (2000) and Trussel (2002), we estimated the probability of financial vulnerability for capturing the likelihood of NPOs' financial vulnerability. At first, a score is estimated based on the formula: Z = -3.061 + 0.1153*X1 + 1.2528*X2 – 2.2639*X3 – 3.4289*X4, where X1 is total equity/total revenues, X2 is the concentration of revenue income as Σ〖(〖Revenue sources〗_j/(Total revenues))〗^2, X3 is administrative expenses/total expenses, X4 is the margin estimated as (revenues – expenses)/revenues. Then, the probability of financial vulnerability (Prob FV) is estimated as 1⁄((1+ e^(-(-Z)))). A Prob (FV) above 0.10 provides a strong indication of financial vulnerability. At the same time, a value below 0.07 indicates that the NPO is deemed safe, so higher Prob (FV) values suggest a higher probability of vulnerability. In our setting, we estimated a dichotomous variable (DISTRESS) receiving unity (1) if an NPO has a Prob (FV) above 0.10 for any given year and zero (0) otherwise, and was the dependent variable on the following panel logit fixed-effect regression model estimated with robust standard errors:

$$DISTRESS_{it} = a_0 + a_1 WC_{it} + \beta_i CONTROLS_{it} + e_{it} \quad (1)$$

CONTROLS is a vector of control variables including SIZE which is the natural logarithm of total assets and captures the size of NPOs, SURPLUS which captures NPOs' profitability and is measured as the ratio of annual net income divided by total assets, and GROWTH measured as the annual revenue percentage change.

Results and Discussion

Empirical evidence documented that the larger the liquidity, the smaller the financial vulnerability probability of the NPOs. Also, NPOs with more cash, fewer receivable collection days, and more payable days (larger cash conversion cycles) are associated with a lower probability of

vulnerability. This impact is even more significant during the debt crisis than in the pre-crisis period, where efficient LM during austerity times boosts the NPO's financial resilience. The results present substantive implications for managers of NPOs. Firstly, NPO managers should promote the increase of current assets and further control and even reduce short-term liabilities to improve their probability of survivorship. Secondly, NPO managers should focus more on the specific traits of WC, namely accounts receivable, accounts payable, and cash reserves, as those have a differential impact on the probability of vulnerability. The sample of the study is relatively small due to insufficient financial data availability. Since we wanted to examine the impact of the austerity period on NPO financial vulnerability, we required NPOs to operate for an extended period. This could create some sample selection bias, which can be resolved by extending the sample by including other NPOs from countries with similar (though not so extensive) austerity periods, such as Greece (Spain, Italy, Portugal, etc.).

ARTIFICIAL INTELLIGENCE IN HUMAN RESOURCE MANAGEMENT: ENHANCING TALENT ACQUISITION OR ERODING EMPLOYEE TRUST?

Sposato, Martin[1]; Vouzas, Fotis[2]; Nizamidou, Christina[3]; Stamatiadou, Kyriaki[4]

[1]College of Business, Zayed University, Dubai, UAE

[2]Department of Business Administration, University of Macedonia, Thessaloniki, Greece

[3]EuroMed Academy, Nicosia, Cyprus

[4]Department of Business Administration, University of Macedonia, Thessaloniki, Greece

Keywords: Human Resources, Artificial Intelligence, Talent Acquisition, Employee Relations, Trust, Recruitment Technology, HR Analytics, Workforce Management.

Artificial intelligence technologies have become increasingly prevalent in human resource management, fundamentally altering how organizations attract, evaluate, and retain talent. Contemporary HR departments deploy AI-powered systems for resume screening, performance evaluation, and employee engagement monitoring (Budhwar et al., 2022), promising enhanced efficiency, reduced bias, and improved decision-making. However, their implementation raises concerns about preserving human judgment in personnel decisions and maintaining employee-organization trust. Employee responses differ across AI applications, with AI-supported recruitment tools often seen as more objective and efficient, whereas AI-driven performance evaluations or promotion systems may raise fairness and transparency concerns.

This research examines how AI implementation in HR processes affects employee perceptions of organizational fairness and trustworthiness. We investigate whether algorithmic decision-making in recruitment, performance evaluation, and promotion strengthens or undermines the employee-employer psychological contract. Our objective is to assess the tension between HR analytics' promised efficiency gains and the potential deterioration of interpersonal trust. We additionally explore whether algorithmic transparency moderates employee acceptance of AI-mediated HR decisions.

AI integration into HR practices builds on long-standing research in personnel psychology and organizational behavior. Traditional talent management approaches emphasize interpersonal

interaction, subjective judgment, and contextual understanding. Conversely, AI systems rely on pattern recognition, statistical correlation, and standardized criteria (Sposato et al., 2025). This creates theoretical tension between computational efficiency and relational authenticity (Raisch & Krakowski, 2021). Organizational justice theory suggests that procedural fairness significantly influences employee attitudes (Colquitt, 2001), as commitment may diminish when HR processes appear impersonal, regardless of outcomes. Trust theory indicates that transparent, accountable decision-making strengthens employer-employee relationships (Glikson & Woolley, 2020).

We employ a mixed-methods approach combining quantitative surveys and qualitative interviews across three financial services and retail organizations that recently implemented AI-driven HR systems with varied cultures and digital maturity. Our quantitative phase utilizes validated scales measuring organizational trust, perceived fairness, and psychological contract fulfilment, administered to 230 employees before and after AI implementation. Statistical analysis examines correlations between AI exposure and trust indicators while controlling demographic variables. Our qualitative phase conducts semi-structured interviews with 45 employees and 15 HR professionals to capture nuanced perspectives on how algorithmic decision-making influences workplace relationships.

Preliminary analysis reveals employee trust in HR systems decreases when algorithmic processes lack transparency regarding decision criteria. Employees express concern about automated performance evaluations that overlook contextual factors, whereas organizations maintaining human oversight experience minimal trust erosion. Younger employees demonstrate greater acceptance of AI-mediated HR decisions than older colleagues, suggesting generational differences. Findings indicate that HR-AI's impact on employee trust depends critically on the implementation approach rather than technology adoption itself.

This research contributes to emerging literature on algorithmic management by focusing on HR functions where interpersonal trust is essential (Kellogg et al., 2020). While previous studies examined efficiency gains from HR analytics, fewer investigated potential relational costs. Our work advances understanding of how organizations can leverage AI capabilities without sacrificing human elements that sustain employee commitment. Findings indicate that long-term dependence on AI-driven HR systems can shift organizational culture and fairness perceptions, affecting employee well-being. These insights offer practical guidance for HR professionals navigating technological advancement and relationship preservation.

EFFECTIVE LEADERSHIP FOR INNOVATION: THE ROLE OF ATTACHMENT ORIENTATIONS AND ETHICAL CLIMATE

Salton Meyer, Efrat[1]

[1]Baruch Ivcher School of Psychology, Reichman University (RU) Herzliya, Israel

Keywords: Innovation leadership, Creativity, Attachment orientations, Ethical climate, Leader-follower relationships, Burnout, Wellbeing.

Achieving high-quality innovation requires high levels of creativity, technical expertise as well as resilience, effective teamwork, collaboration, and trust in challenging conditions. These can be achieved when people are at their best, enabling that is leader's role including by managing workplace psychological dynamics. This work focuses on two central yet under-integrated factors in leading innovation: attachment orientations of leaders and subordinates (for a recent review see Mayseless and Popper, 2019), and organizational ethical climates in contemporary organizations characterized by rapid technological change, uncertainty, and increasing demands for innovation.

The purpose of this work is to examine how attachment orientations of leaders and subordinates and organizational ethical climates are linked to outcomes that can impact innovation. An existing gap in research on that necessitates new conceptual and empirical paths. The current presentation proposes a multi-level model linking individual, interpersonal, and organizational factors to consequences related to innovation.

Individual differences in attachment orientations include secure attachment comprising positive mental representations of self and others, insecure attachment incorporates anxious (hyper activating) and avoidant (deactivating) strategies (Mikulincer and shaver, 2007;2016). Attachment security is central in skill acquisition, growth, self-actualization (Mikulincer and shaver, 2007) that are important for innovation. Research has revealed that attachment orientations are significant in explaining leader follower interpersonal dynamics; secure leaders were perceived more effective and their subordinates' satisfaction and wellbeing were higher (De Sanctis and Karantzas, 2008), in challenging times leaders' attachment security was found especially significant for subordinates (Mayseless and Popper, 2019). Subordinates of insecure leaders reported higher burnout and lower job satisfaction (Ronen and Mikulincer, 2012). Subordinates'

insecure attachment was related to distress, burnout, and negative perceptions of leaders (Salton Meyer et al., 2016; Salton Meyer and Ein-Dor, 2021), and was negatively linked to employee creativity through the mediating role of leader-member exchange [LMX] and team-member exchange [TMX]) (Kirrane et al., 2019).

Caring ethical climates comprise concern for the well-being of others, they were preferred by workers and were linked to subordinates' wellbeing, satisfaction, and lower burnout (Salton Meyer et al., 2016). Negative outcomes such as burnout were related to reduced creativity which is needed for innovation (Bunjak, et al., 2021). Ethical climates can function as activating contextual cues for subordinates' attachment orientations (Salton Meyer et al., 2018). The role of ethical climate in innovative behaviors in nursing has been investigated (Akkoç, et al, 2022), however, the role of both attachment orientation of leaders and followers and ethical climates in innovation leadership have not been explored.

This work adopts a conceptual integrative insight approach grounded in prior empirical research on attachment orientations, leadership, ethical climate and creativity in organizations and synthesizes a framework focused on innovation leadership.

The meaningful contributions of this conceptual work include the significance of the link between leaders' secure attachment and subordinates' positive workplace consequences and positive views of leaders that can contribute to workers' learning and development, that are central for creativity in innovation. Also, insecure attachment orientations of leaders and subordinates related to negative workplace consequences that may hinder innovation processes. Finally, caring ethical climates are associated with more positive feelings and attitudes that may be related to ingenuity and invention. The integration of these in a framework portrays how attachment orientations and ethical organizational climates can be central for innovation in organizations.

This conceptual work builds on prior empirical findings and offers a novel integrative construct that connects innovation leadership in contemporary workplaces to attachment orientations and organizational ethical climates. The original contribution of the current presentation is in its suggestion that innovation leadership in organizations is connected to both attachment orientations and to ethical organizational climates.

However this conceptual presentation is based on empirical work in few organizational contexts, which may limit generalizability. Further empirical research across diverse organizational settings is suggested.

This work highlights the importance of integrating central psychological and organizational perspectives in innovation leadership research. It suggests that organizations may enhance innovation by developing leaders' "people skills" and fostering caring ethical climates. Practical implications include highlighting important aspects of managers' training and mentoring as well as the importance of fostering caring ethical climates in organizations that strive for innovation.

EMOTIONAL SALARY, INNOVATION, AND JOB ATTRIBUTES: AN ANALYSIS OF PERCEPTIONS OF JOB SATISFACTION, COMMITMENT, AND TENURE AMONG MILLENNIALS AND GENERATION Z IN LATIN AMERICA

Ramírez-Lozano, Julianna Paola[1]

[1] Pontificia Universidad Católica del Peru, Lima, Perú.

CENTRUM Católica Graduate Business School, Lima, Perú.

Keywords: Millennials, Generation Z, job satisfaction, job commitment, job tenure

Abstract

Purpose

The study analyses the perceptions of Millennial and Generation Z employees regarding key factors such as salary, innovation, and job attributes, and their relationship with job satisfaction, commitment, and tenure in Peru, a Latin American context. It also provides empirical evidence on the new labour dynamics of these generations.

Design/methodology/approach

Mixed-methods study with 271 questionnaires of Millennial and Generation Z employees in Peru, complemented by 4 focus groups (2 per generation, one for women and one for men).

Findings

The study reveals that emotional salary (M=4.59), career path opportunities (M=4.58), and competitive economic compensation (M=4.52) are the main determining factors. The cross-generational importance of emotional salary is confirmed, while the possibility of innovating emerges as a progressive factor from job satisfaction to organisational commitment. Millennials show greater appreciation of intrinsic attributes compared to Generation Z, while both generations converge in the appreciation of extrinsic attributes.

Originality/value

It provides Latin America–specific empirical evidence on new generations' job expectations, developing a conceptual framework with three variables that explain generational job decisions and validating culturally adapted measurement instruments.

Practical implications

It provides insight into the current context in which Millennials and Generation Z operate, offering recommendations for companies to improve recruitment processes and implement policies that promote job tenure.

Introduction

The contemporary labour landscape is undergoing an unprecedented transformation with the massive incorporation of Millennials (born 1981–1995) and Generation Z (born 1996–2010) into the workforce (Mendoza et al., 2021). Millennials and Generation Z are increasingly demanding regarding social responsibility policies that lead to job satisfaction, such as environmental care and the company's relationship with its employees (Ramirez Lozano et al., 2024).

Previous studies recognise the demands of the new generations, highlighting flexible schedules, freedom to innovate, career development, recognition, emotional salary, and other aspects such as the company's concern for environmental care and social responsibility towards its stakeholders.

When they see that their company is not offering them opportunities for growth, they look elsewhere (Golik, 2013). However, most studies have been conducted in developed countries, with limited empirical evidence in Latin American emerging economies where socioeconomic dynamics may shape these preferences.

Labour turnover indicators in the region show that 67% of employees under 35 consider changing jobs within the next two years (Deloitte, 2021), revealing a misalignment between generational expectations and current organisational value propositions. In Peru, according to the National Institute of Statistics and Information (INEI, 2025), the Economically Active Population (EAP) reached approximately 18,377,200 people in the first quarter of 2025.

The present study addresses this issue through three fundamental research questions: (1) What aspects are relevant for employees to feel job satisfaction with the company where they work? The research contributes to knowledge by extending social exchange theory and work motivation models to the Latin American context, proposing an integrated three-level hierarchical framework to understand generational job decisions.

Literature Review

Millennial and Generation Z population

Millennials, born between 1981 and 1995, entered the workforce during a period of economic uncertainty after being raised during economic prosperity and expansion (Aydogmus, 2019). Generation Z, born between 1996 and 2010, integrates technology into personal and professional life, enhancing job performance (Naim and Lenka, 2018).

Emotional salary and cross-generational job expectations

Millennials are fast learners, question rules, show little interest in corporate hierarchy, and seek meaningful work with constant recognition. Generation Z feels confident using technological tools to perform their jobs and is considered to possess strong technical skills (Bermúdez-González et al., 2023). Expectations regarding emotional salary show convergence between both generations, leading to the following hypothesis:

H1: In terms of the decision of job tenure within an organisation, emotional salary is considered an important variable by both Millennial and Generation Z employees.

Innovation and progression in organisational commitment

Companies recognise innovation as essential to remain competitive in a constantly evolving market. The incorporation of young talent not only refreshes and diversifies the workforce but also brings a modern vision suited to the current context (Battista et al., 2014). A culture that fosters business innovation is one of the most significant attractions for Generation Z and Millennial employees, being essential for achieving higher levels of job satisfaction and for developing stronger organisational commitment (Hill et al., 2024).

H2: The possibility of innovating within the company is considered a more important attribute for achieving job commitment than for achieving job satisfaction.

Generational differences in the valuation of intrinsic attributes

Responsibility for oneself, making independent decisions, and achieving financial independence are fundamental criteria for them (Broadbridge et al., 2007). For these generations, authority is built through example rather than power (Caldumbide, 2012). Generation Z shows characteristics in its approach to work. Differences in how relational and recognition aspects are valued across generations lead to the following hypothesis:

H3: For achieving job satisfaction, Millennials place greater importance on intrinsic attributes such as the work climate compared to Generation Z professionals.

Convergence in the valuation of extrinsic attributes

Millennials and Generation Z show an inclination towards jobs that offer high salaries, opportunities for career advancement, teamwork, and the performance of meaningful tasks (Ali et al., 2024). Generation Z and Millennial employees place significant value on organisational pay practices due to the uncertain business environment and economic recession (Bermúdez-González et al., 2023).

While salary remains a relevant factor, these young employees also value non-monetary benefits such as health insurance, paid time off, and company-funded professional development opportunities (Aydogmus, 2019). Convergence in economic aspects and organisational prestige across both generations leads to the following hypothesis:

H4: For achieving job satisfaction, both Millennial and Generation Z professionals equally value extrinsic attributes such as economic salary, company prestige, or organisational recognition.

Corporate culture and talent retention policies

Research in human resource management emphasises the need to integrate employee retention strategies as essential principles in organisational policies to achieve job tenure. These young professionals value a friendly work environment, opportunities for continuous learning, the use of innovative technologies, and programmes that promote corporate social responsibility.

Employee tenure is influenced by a range of factors, including job satisfaction, organisational trust, organisational culture, effective leadership, and job commitment. One of the factors that most strongly and quickly contributes to employee tenure is offering attractive salaries and economic and social benefits that help increase employee motivation (Septiem & Martin-Rios, 2017).

Determinants of job satisfaction and job commitment

Job satisfaction and job commitment are fundamental aspects for the success and stability of any organisation (Stynen et al., 2014). Work–life balance and job flexibility positively impact the job satisfaction and performance of Millennials and Generation Z, which in turn influences their level of job commitment and tenure within the company (Waworuntu et al., 2022; Jung and Yoon, 2021).

Currently, companies are adapting to integrate the new generation of employees, requiring them to adopt new strategies in their culture and employment offerings (Garavito Quiroga et al., 2022). It is an essential part of employee commitment and can have a significant impact on

an organisation's sustainability (Vergara, 2019). Unlike previous generations, these groups value job flexibility (Lee et al., 2023). Another important determinant of job satisfaction and job commitment for Millennials and Generation Z is professional development and growth opportunities (Pant and Venkateswaran, 2019).

Methodology

Research design

The specific objectives of the study were to identify the main factors influencing job tenure for Millennials and Generation Z; to examine expectations regarding work–life balance and their impact on job satisfaction; to characterise the elements that generate organisational commitment among Millennials and Generation Z; and, finally, to determine the professional aspirations and medium- and long-term career projections of the employees studied.

The research adopted a sequential explanatory mixed-methods approach. It includes a survey of Millennial and Generation Z individuals. The study was complemented by qualitative research through focus groups, also conducted with individuals from these generations, including both men and women participants.

Quantitative research

A total of 157 questionnaires (57.9%) were completed by Generation Z participants, while 114 (42.1%) were completed by Millennials.

Instrument and measurements

The structured and standardised questionnaire includes relevant categories such as (i) job satisfaction, (ii) job commitment, (iii) job tenure, and (iv) additional information such as gender, age, educational level, district of residence, studies, occupation, marital status, among others.

Data analysis

The same software was also used to perform inferential tests, such as the t-test, to examine mean differences between groups based on gender, education (undergraduate and postgraduate), and age (20–29 years and 30–39 years).

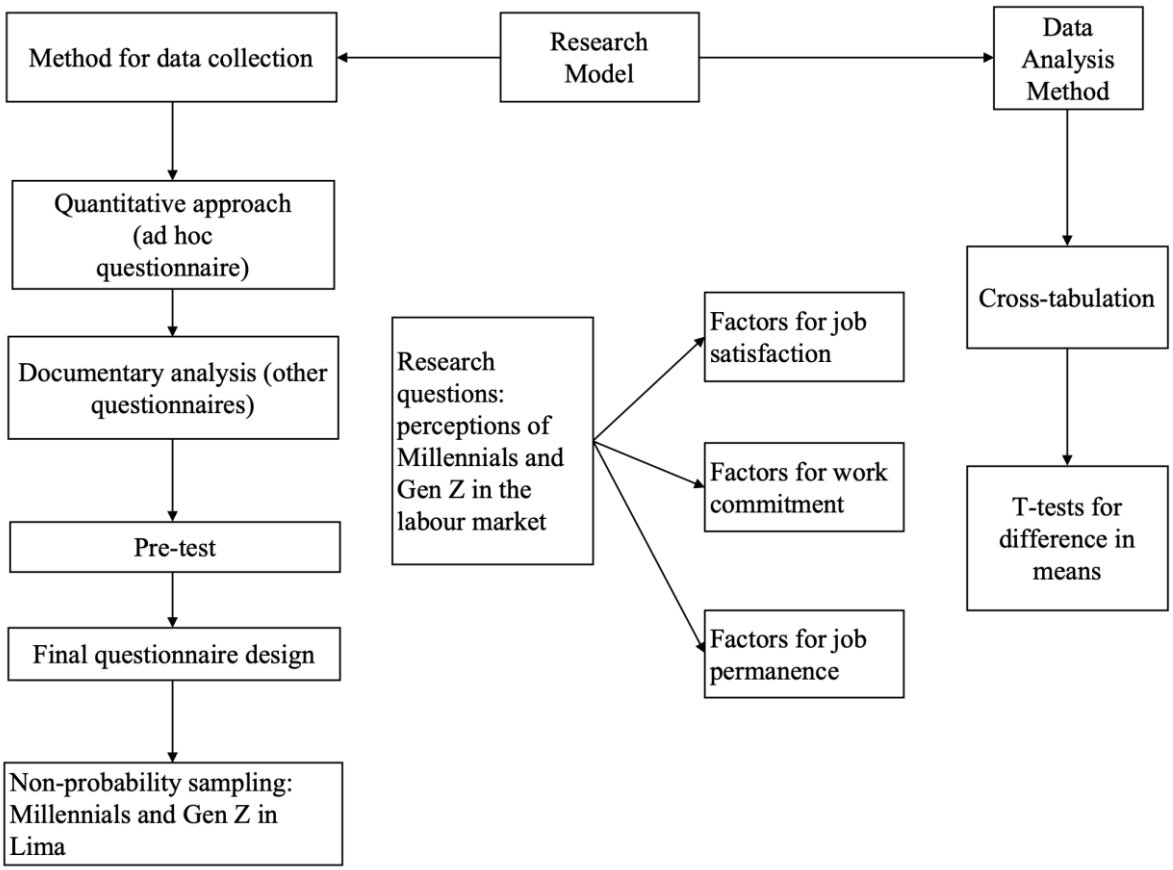

Figure 1: Research model of the study
Source: Author's own creation

Qualitative research

At the qualitative level, four focus groups were conducted with young employees from the Millennial and Generation Z generations to understand their perceptions, attitudes, and behaviours regarding job satisfaction, job commitment, and job tenure. Some employees were in their first or second job, while others were in their sixth or seventh job, with work experience ranging from 3 to 15 years. The analysis was conducted using the Thematic Analysis methodology in Psychology for qualitative content (Braun and Clarke, 2006), based on the transcriptions of the four focus groups.

Results

Quantitative study analysis

The data obtained through the questionnaire in the quantitative study allow for the evaluation of the relevance of attributes, both for the total sample and across different segments, using a traditional Likert scale from 1 (not important) to 5 (very important).

Job satisfaction

When evaluating the first aspect of the employee–organisation relationship, job satisfaction, a group of the most relevant attributes emerges. The opportunity to follow a career path (mean score 4.55), perceived emotional salary (4.52), a positive work climate and concern for organisational culture (4.52), as well as receiving a market-competitive salary (4.50), are rated as the most important attributes by the participants.

Following this group, at a slightly lower level, is the evaluation of the supervisor and other higher-level managers (4.40), with the remaining aspects forming a third group of attributes with similar mean scores ranging from 4.16 to 4.26.

When analysing differences in perceptions between the two generations studied, it is observed that, regarding job satisfaction, the perception of offering quality products or services is more relevant for Millennials (mean 4.44 versus 4.18 for Generation Z, with a p-value of 0.07, confirming the statistical significance of this difference).

Analysing the results by gender, men value the opportunity to innovate within the organisation the most (4.34 versus 4.18 for women, with a p-value of 0.12), while women place higher importance on corporate social responsibility (CSR), also giving greater importance to an attribute such as care for the environment (4.26 compared to 4.07 for male participants, with a p-value of 0.11).

On the other hand, participants with graduate education perceive greater importance in monetary salary (4.62 versus 4.45 for participants with university education, with a p-value of 0.09) and in the company offering products and services suited to society (4.35 versus 4.20 in the other segment, with a p-value of 0.2 confirming the significance of this difference in means). Meanwhile, those with only university education value working strictly within working hours more (4.24 versus the average of 3.99 for graduate individuals, with a p-value of 0.06).

Job commitment

The second aspect evaluated in this study was employees' commitment to the company, identifying five attributes as most relevant from the respondents' perspective: (1) work environment and focus on organisational culture (mean of 4.52), (2) emotional salary (4.49), (3) career path within the organisation (4.44), (4) monetary compensation in line with or above the market (4.43), and (5) good relationship with managers and superiors (4.42).

In the main group of attributes, it is notable that Millennials place the highest value on relationships with managers (mean of 4.54 versus 4.34 for Generation Z, with a p-value of 0.05), a pattern not observed for job satisfaction.

Regarding gender differences among participants, two findings stand out in men's evaluation of attributes related to job commitment. Men place higher value on both respect for working hours (mean of 4.26 versus 4.10 for women, with a p-value of 0.17 confirming this difference in means) and the opportunity to innovate within the company (4.37 compared to 4.16 for women, with a p-value of 0.07).

Meanwhile, participants with graduate education place greater value on the opportunity to pursue a career within the organisation (4.56 versus 4.40 for those with only university education, with a p-value of 0.1), the opportunity to innovate (4.37 versus 4.21, with a p-value of 0.18), and the recognition of leaders' ethical and responsible behaviour (4.28 versus 4.12 for those with university education, with a p-value of 0.19).

Desire for job tenure

Regarding the last element evaluated in the employee–company relationship, two clear attributes stand out as part of the main group, both exceeding an average rating of 4.5: receiving monetary compensation in line with or above the market (mean of 4.59) and the emotional salary or non-monetary benefits provided by the organisation (4.54).

A second group of attributes, with similar averages, also appeared: the opportunity to pursue a career path within the organisation (4.47) and a good work environment with focus on developing organisational culture (4.44).

Regarding the main group of attributes, it should be noted that the attribute "receiving monetary compensation in line with or above the market" is more valued by Millennials (mean of 4.8 versus 4.49 for the following generation, with a p-value of 0.94 confirming the statistical significance of this difference)

Men consider attributes such as the opportunity to innovate within the company more important (mean of 4.37 versus 4.16 for women, with a p-value of 0.07 confirming the difference between these means) and respect for working hours (4.26 versus 4.10 for female respondents, with a p-value of 0.17).

Qualitative study analysis

The analysis of qualitative results is presented based on the factors identified as determinants of job satisfaction, commitment, and tenure among Millennial and Generation Z professionals.

Evaluation of traditional attributes

Traditional attributes such as monetary salary and basic working conditions remain important for participants. However, these factors appear as necessary but not sufficient conditions to generate long-term job satisfaction and job commitment.

> "I take with me the experiences of knowledge, and if there have been friendships I was able to make, I take those friendships wherever I go." (focus group 3 participant)

This statement reflects how, for young professionals, the value of work goes beyond the merely economic.

Emergence of intangible factors

Participants strongly emphasised the importance of intangible factors in their decision regarding job tenure:

- **Work schedule flexibility and work–life balance**: Desire for continuous progress and career growth
- Professional recognition: "The economic aspect and the professional aspect[...]" noted one participant, highlighting the importance of both for job satisfaction
- Organisational culture and work environment: Provides an inclusive workplace, professional development opportunities, flexible benefits, and a collaborative atmosphere

Importance of professional development and growth

The analysis reveals that opportunities for professional development are one of the main motivators for job tenure within an organisation.

> "In fact, this company has a clear career path. You start as a junior, then become an assistant analyst, then a senior analyst, and finally receive company benefits." (focus group 2 participant)

Expectations about the employer-employee relationship

Participants expressed a clear expectation of transparency and trust in their work relationships.

> "I was told 'I would love for you to be a manager, but you know what? You're thirty years old, and my managers in this company are over forty.' This illustrates how a lack of transparency regarding promotion criteria can negatively affect young employees' perception." (focus group 1 participant)

Young employees especially value consistency between the values companies declare and their daily practices.

> "What I value most is the way employees are treated, whether you've been there eight years or two months or a month, everyone treats you as an equal," highlighting the importance this generation places on fairness in treatment and organisational culture.

Work-life balance

The analysis reveals widespread concern about balancing personal and professional life. Young participants perceive that current job demands often intrude on personal time, creating tensions and potentially affecting well-being.

They expressed a strong preference for work environments that provide flexibility and autonomy in time management. Remote work and hybrid models emerged as highly valued modalities among younger participants.

> "I think what I value most about my current company are the business trips, particularly not having to accompany the manager. They give me a lot of freedom regarding my schedule and decision-making." (focus group 3 participant)

Drivers of organisational commitment

The analysis reveals an interesting dynamic between the value placed on emotional and economic salary. Although the economic factor remains relevant, a clear appreciation of intangible aspects of work emerges.

> "Yes, I prioritise emotional factors over economic ones because, ultimately, your performance depends on your motivation. Without motivation, you won't achieve anything." (focus group 1 participant)

Leadership style emerges as a determining factor in organisational commitment. Testimonies show that leaders who recognise work, provide constructive feedback, and show genuine interest in the development of their teams foster higher levels of commitment.

Discussion

H1: Cross-cutting importance of emotional salary

Emotional salary showed similar importance for both generations, with no significant differences between Millennials and Generation Z ($p > 0.05$), validating its cross-cutting relevance. This aligns with Tarigan et al. (2022) on Generation Z's valuation of non-monetary factors, including a positive work environment and continuous professional development, and

suggests that emotional salary represents a lasting evolution in job expectations across generations.

H2: Progressive importance of innovation

Qualitative data show a clear progression in the value placed on opportunities to innovate from job satisfaction to organisational commitment, consistent with evidence that an innovation culture attracts Millennial and Generation Z employees and supports both outcomes (Hill et al., 2024).

H3: Millennials prioritise intrinsic attributes

Specifically, they value leaders' ethics and responsibility more (4.28 vs.
This finding aligns with research indicating that Millennials expect to find fulfilment in their work, value meaningful work, and consider consistency between declared values and organisational practices essential (Pant and Venkateswaran, 2019).

H4: Similar valuation of extrinsic attributes

Both generations value monetary salary and corporate prestige similarly, with no significant differences, confirming economic pragmatism and the role of competitive compensation as a foundation for other career aspirations.

The predominance of emotional salary suggests a more holistic psychological employment contract. The hierarchy (emotional salary > career path > monetary salary) indicates that Herzberg's (1959) hygiene factors remain preconditions while motivational factors extend to self-actualisation, innovation, social impact, and work–life balance, consistent with Jung and Yoon (2021).

Findings reveal more convergence than divergence between Millennials and Generation Z, contrary to media stereotypes; nevertheless, Millennials place greater value on interpersonal relationships and business ethics, while Generation Z shows greater pragmatism and autonomy. In Peru, global generational job expectations are shaped by regional socioeconomic realities; theories therefore require adaptation to emerging economies, where basic economic stability shapes but does not eliminate broader aspirations for professional fulfilment.

Conclusions

This study provides significant empirical evidence on the job perceptions of Millennials and Generation Z in a Latin American context, challenging generational stereotypes while confirming contemporary work trends. These changes transcend generational divides and

reflect a holistic conception of employment that combines economic aspirations, personal development, and social impact.

The three determining factors in job commitment are emotional salary (M = 4.59), career path opportunities (M = 4.58), and competitive monetary compensation (M = 4.52), indicating that intangible aspects may outweigh purely economic considerations in initial employment decisions. Work environment and organisational culture are cross-cutting factors in job satisfaction (M = 4.52), job commitment (M = 4.52), and job tenure (M = 4.44), supporting investment in culture to attract and retain young talent.

Theoretical and practical contributions

The integrated four-level model extends Herzberg's (1959) work motivation theory to Latin America and, through identity-based exchanges, personal development, and social purpose, extends Blau's (1964) social exchange theory to the contemporary psychological employment contract. The Peruvian evidence also shows that global expectations adapt to regional socioeconomic realities. Practically, the findings support redesigning talent management, retention policies, and employee value propositions in Latin American organisations. More humanised and meaningful work is a cross-cultural phenomenon with local manifestations, and organisations can respond through effective, culturally sensitive policies without sacrificing operational efficiency or economic competitiveness.

The results validate the four proposed hypotheses, providing robust empirical support for specific but limited differences between generations: emotional salary is cross-cutting with no significant differences; innovation progresses from job satisfaction to organisational commitment; Millennials place greater value on work environment and recognition; and both generations converge in valuing monetary salary and corporate prestige.

Practical recommendations

- Comprehensive salary policies: Develop compensation systems that combine economic and emotional elements, including flexible schedules, recognition, and development opportunities.
- Structured career paths: Implement mentorship and professional development programmes with clear growth trajectories.
- Positive organisational culture: Invest in work environment, effective communication, and consistency between declared values and actual practices.
- Work flexibility: Adopt hybrid and remote modalities that enable work–life balance.

- Spaces for innovation: Create progressive opportunities for creative contribution and development of new ideas.

Limitations and future research directions

These limitations should be considered when interpreting the results. Future research should address them through:

- Longitudinal studies: To examine the evolution of job attitudes over time
- International comparative analysis: Incorporating different Latin American cultural contexts
- Intra-generational differences: Exploring variations within each generation
- Organisational strategies: Evaluating the effectiveness of different business responses
- Impact of emerging trends: Analysing how technological and social factors shape job expectations

IS HUMBLE LEADERSHIP AN IMPLICIT OXYMORON? EXAMINING INTERPERSONAL DYNAMICS AND JOB SATISFACTION

Travlou, Anastasia[1]; Ntalianis, Filotheos[2]; Ntaliani, Maria[3]

[1] ICON plc (ISS Division), Athens, Greece

[2] Department of Business Administration, University of Piraeus, Piraeus, Greece

[3] Department of Agricultural Economics and Rural Development, Agricultural University of Athens, Athens, Greece

Keywords: Humble Leadership, Psychological Contracts, Job Satisfaction, Motivation, Greece.

Introduction

Is humble leadership an implicit oxymoron? Building on seminal research (Owens and Hekman, 2012), the current study calls into question the popular perception of humility as a trait not typically associated with successful leadership. Recent studies highlight how humble leadership serves as a critical resource in addressing contemporary employee disengagement problems (Rego et al., 2019). Despite these advances, research remains fragmented, limiting our understanding of how humble leadership simultaneously operates at the interpersonal level through different psychological mechanisms (i.e., psychological contract and internal motivation) to influence job satisfaction, particularly in underexplored Mediterranean contexts such as Greece (Rockstuhl et al., 2012). Thus, the primary goal of this research is to provide greater insight into how humble leadership fosters employee job satisfaction by shaping the interpersonal and motivational dynamics between leaders and their subordinates within the Greek context.

Purpose, Aim and Objectives

The research aims to investigate the relational mechanisms linking leader humility to employee outcomes—specifically, how humble leader behavior influences internal motivation and perceptions of psychological contract breach (Rousseau, 1989) in Greece. It further explores whether humble leadership mitigates a) the negative effects of perceived contract breaches on job satisfaction and b) enhances the positive effects of internal motivation on job satisfaction by serving as a relational signal of support and equity.

Methodology and Methods

Data were collected through an online questionnaire, designed in accordance with institutional ethical guidelines ensuring voluntary participation, anonymity, and confidentiality. The final sample consisted of 230 employees (mean age = 36.49 years; range 23–65 years), predominantly women, from diverse sectors including hospitality, healthcare, finance, and sales in Athens, Greece. The survey utilized well-validated measures to assess employees' perceptions of their leader's humility (Owens et al., 2013), internal motivation (Battistelli et al., 2017; Gagné et al., 2015), psychological contract breach (Robinson and Morrison, 2000), and job satisfaction (Brayfield and Rothe, 1951). Analysis was conducted using regression analysis as well as the PROCESS macro (Hayes, 2014) to test the proposed interpersonal pathways.

Main/Expected Findings and Contribution

Findings reveal that humble leadership enhances job satisfaction primarily through indirect interpersonal pathways. Specifically, humility in leaders reduces employees' perceptions of psychological contract breach, which directly translates to higher job satisfaction. Additionally, humble leaders foster internal motivation, which independently contributes to satisfaction. These results align with recent evidence suggesting that humble leaders create a safe environment for interpersonal risk-taking and engagement (Jiang et al., 2021; Ervianto et al., 2025). Interestingly, higher internal motivation slightly diminished the marginal impact of humility, indicating that its interpersonal benefits are most significant for less intrinsically motivated employees.

Theoretical and Practical Applications/Implications

These results highlight the central role of interpersonal relationships in mediating leadership effectiveness in the Mediterranean context. Greek employees experience greater job satisfaction when leaders demonstrate humility by upholding relational obligations and fulfilling the psychological contract. Practically, organizations should promote humility in leadership as a core competency. Human resource strategies should leverage training and experiential workshops to cultivate these interactions, as humble leadership serves as a vital job resource for navigating complex organizational landscapes and meeting modern workforce needs (Wang et al., 2023). Notwithstanding these contributions, future research should seek to address limitations associated with common source bias and restricted generalizability by employing methodological triangulation and utilizing larger, more diverse samples.

MAPPING THE UNCHARTED TERRITORY OF AGILE TEAMWORK: IDENTIFYING KNOWLEDGE GAPS AND SETTING A RESEARCH AGENDA – A SYSTEMATIC LITERATURE REVIEW

Tirrel, Henning[1]

[1]Faculty of Business, Ostfalia University of Applied Sciences, Wolfsburg, Germany

Keywords: Agile Teamwork, Systematic Literature Review, SLR, Research Agenda, Gap, Agile Transformation, COVID-19, Agility

Abstract

Agile teamwork has been introduced in several companies. However, the empirical foundation remains limited and relevant information on the agile transformation process is lacking. Thus, this study aims to summarize open knowledge gaps and provide an agenda for further research on agile teamwork. A systematic literature review was conducted by using EBSCOhost and Emerald Insight databases, which identified 17 relevant peer-reviewed journal articles on agile teamwork. Findings highlight that there are still several knowledge gaps on agile teamwork. These have been categorized into four domains: Definitions, composition of the team, virtuality/technology and methodology. This is the first study which presents future potential for agile teamwork research based on a systematic literature review. Thus, this sets the starting point for researchers in this field for generating more empirical findings.

Introduction

Companies are increasingly introducing and adopting agile work practices due to their beneficial effects on team efficacy and creativity (Junker *et al.*, 2022; Singh *et al.*, 2023; Uraon, Chauhan, *et al.*, 2024). The agile transformation process enables teams to work independently instead of adhering to strict hierarchical orders (Tripp *et al.*, 2016). Thus, employees work future-oriented and proactively by adopting agile work practices (Grass *et al.*, 2020; Parker *et al.*, 2019), being the aim of the agile transformation process (Rigby *et al.*, 2020). Furthermore, agile work practices are no longer confined to software development and are now implemented in various companies and departments (Cappelli and Tavis, 2018). As

such, agile work is employed in several teams without following strict rules of agile methods like Scrum (Junker *et al.*, 2022; Schwaber and Sutherland, 2017).

Although several companies are undergoing the agile transformation process, literature on how agile work affects work teams is lacking (Junker *et al.*, 2022; Mathieu *et al.*, 2019). In addition, the COVID-19 pandemic might also have influenced the transformational route due to more inclusion of flexible work practices and technology usage (Kamp *et al.*, 2024; Tirrel, 2023). Thus, the research question raised is: What are current knowledge gaps in agile teamwork? In line with the research question, the aim is to develop and present avenues for further research on agile teamwork to set an empirical foundation.

Therefore, this paper contributes to knowledge by, firstly, systematically analyzing the existing literature on agile teamwork. Secondly, potential knowledge gaps are derived and structured, derived from existing literature and presenting the route for further research on agile teamwork in various companies and various departments. The findings have implications for theory but also for organizations which are currently or in the future undergoing the agile transformation process.

Research methodology: systematic literature review

A systematic literature review (SLR) is applied in this study for identifying, selecting, analyzing and synthesizing relevant information (Brereton *et al.*, 2007). The usage of a review protocol is of paramount importance as it makes studies replicable, transparent as well as rigorous due to the careful evaluation of literature, leading to reliable findings (Atewologun *et al.*, 2017; Brereton *et al.*, 2007; Christofi *et al.*, 2017; Denyer and Tranfield, 2009; Inkinen, 2015; Kitchenham, n.d.; Tranfield *et al.*, 2003; Webster and Watson, 2002). A quality assessment is also implied which relies on the implicit quality of peer-reviewed papers and ranked journals (Tranfield *et al.*, 2003). Therefore, the SLR is "a specific methodology to locate research, to select and evaluate the contributions made by each study and analyze and synthesize the data" (Lozano-Reina and Sánchez-Marín, 2020, p. 2). In the following sections, the review protocol with its in- and exclusion criteria as well as the search strategy and selection of relevant papers will be described.

Inclusion criteria

The researcher has to define which studies are included in the SLR, based on three criteria: Search boundaries, search terms and strings as well as the timeframe (Dada, 2018; Wang and

Chugh, 2014). This study focuses on electronic databases only, which are subject specific, i.e., focusing on business management. The EBSCOhost and Emerald Insight databases have been analyzed. Keywords were developed for this research in order to cover a broad area and obtain many potentially relevant articles (Kauppi *et al.*, 2018; Müller-Seitz, 2012; Tirrel and Winnen, 2018). This minimized the risk of missing articles in literature. For this study, the timeframe was determined between 2016 and 2026. Thus, the last decade of research on agile teamwork has been included. This makes it possible to derive a modern research agenda, as the papers included are not too old and identified research gaps have not already been closed. In addition, times before and after the COVID-19 pandemic are included, which may have affected agile teamwork.

Exclusion criteria

Papers which have not undergone a peer-review were eliminated in order to achieve results of high quality, i.e. implicit quality of papers is the foundation of this analysis (Tranfield *et al.*, 2003; Vrontis and Christofi, 2021). Furthermore, the papers were evaluated according to their ranking in the Association of Business School Academic Journal Quality Guide as well as the Scopus indices (Matturro *et al.*, 2022; Tirrel, 2023). Book chapters, conference proceedings and other papers have thus been excluded from this study. Furthermore, only papers published in English, the standard for knowledge-based scientific papers (Kauppi *et al.*, 2018), and German (mother tongue of the researcher) were included in order to outperform the language bias (Bettany-Saltikov and McSherry, 2016). Moreover, papers were controlled for duplicates, which were eliminated.

Search strategy and selection of relevant papers

The search string, i.e., combination of keywords, has been entered into the databases. The following search string has been used “agile teamwork” OR “agile team work”. This includes the modern and the older spelling, so as not to exclude any articles based on the spelling. Moreover, both spellings were combined by the Boolean operator OR. The search string is very narrowed, in order to answer the research question (Tandon *et al.*, 2024). This led to 172 articles in the database.

Following the steps from Tirrel et al. (2021), the literature was analyzed by conducting the database queries, removal of duplicates, reading by title, abstract and full text. Relevant papers have gone through the procedure; irrelevant papers were eliminated. Thus, finally 17 papers set

the foundation for the further analysis for this study. Figure 1 visualizes the selection of relevant papers.

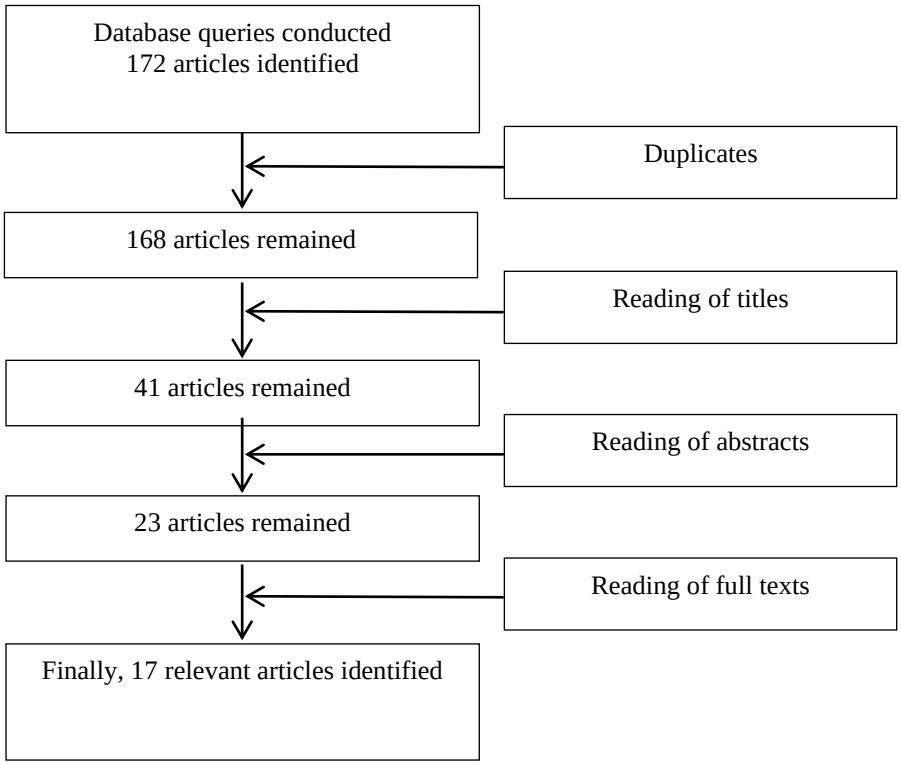

Figure 1. *Research process*

Source: Own depiction based on Tirrel et al. (2021)

Descriptive results of the literature analysis

The descriptive results uncover that 17 relevant papers were identified. All of them were published in peer-reviewed journals. By analyzing the Scopus performance criteria, seven papers were ranked as Q1, eight as Q2 and none as Q3 or Q4 while two papers were not indexed in Scopus. The h-index of the papers varies from 34 to 230. The SJR ranges from .368 to 4.850 (average of 1.2). One paper was listed as ABS 4*, two as ABS 4, three as ABS 2 and six as ABS 1 while five papers were not listed in the ABS journal ranking. Although the last ten years were included in the SLR, the identified papers were published between 2021 and 2025, i.e., the last five years.

Table 1 provides an overview of the identified papers as well as the journal indices.

Findings

The findings are multifaceted and provide various implications for further research. The results will be discussed first. Second, a structured research agenda will be provided. An overarching result is that no SLR has been conducted before with this research aim, underlining the originality of this study.

Data synthesis

By analyzing the data, four major categories arose: definitions, composition of the team, virtuality, and methodology.

The identified articles will be discussed for each major category with its relevant implications. Referring to the definitions, Strode et al. (2022, p. 40) underline that there is no "shared understanding of concepts in teamwork theory", which is supported by Rietze and Zacher (2022), and that components and mechanisms for the coordination of teamwork are not interrelated. Furthermore, Ng *et al.* (2025) refer to comparable constructs like adaptability, VUCA or lean management.

Referring to the composition of the team, there is an ongoing debate on the differences and similarities of characteristics like empowerment or agility in traditional versus agile teams (Langholf and Wilkens, 2021). This comes in line with the discussion on when there is too much of a good thing, i.e. when agile teamwork is – for instance based on too complex work, no shared mental model, less reflexivity – understood as a burden instead of a benefit (Benlian *et al.*, 2025; Junker *et al.*, 2025; Krüger *et al.*, 2025; Rietze and Zacher, 2023). In addition, the influence of diversity in teams relating to age, gender as well as functional diversity are unknown (Granow and Asbrock, 2021). Bastiaansen and Wilderom (2022) highlight agile mindsets are the foundation for agile teamwork. However, role conflicts arise while a focus on individual needs is desired (Bastiaansen and Van Dun, 2025; Benlian *et al.*, 2025; Junker *et al.*, 2025; Ng *et al.*, 2025). Furthermore, globalization enhances mixed teams with team members from different nationalities with various cultural backgrounds (Bastiaansen and Wilderom, 2022; Granow and Asbrock, 2021; Krüger *et al.*, 2025). Additionally, team members stem from a variety of organizations/industries or business units (Bastiaansen and Wilderom, 2022; Granow and Asbrock, 2021; Krüger *et al.*, 2025) while the focus is on white collar workers (Ng *et al.*, 2025). Various leadership roles also have to be explored (Peeters *et al.*, 2022). Finally, it is unclear how the COVID-19 pandemic has influenced team-related variables like

psychological health (Rietze and Zacher, 2022, 2023). Research tends to focus on positive outcomes of agile teamwork, while disadvantages are less of a topic of discussion (Ng *et al.*, 2025).

Virtuality/technology has been introduced into agile teams especially due to the COVID-19 pandemic (Granow and Asbrock, 2021; Junker *et al.*, 2022; Rietze and Zacher, 2022, 2023). This leads to new and different roles which also arise due to asynchronous communication and since not every team member is very familiar with the digital environment (Wong and Van Gils, 2022). Artificial intelligence, robotics, climate tech and quantum will probably also change the collaboration (Bastiaansen and Van Dun, 2025).

Finally, there are certain findings related to methodology. Causality is often lacking in research on agile teamwork, e.g., since cross-sectional data was used (Junker *et al.*, 2022, 2025; Krüger *et al.*, 2025; Peeters *et al.*, 2022; Rietze and Zacher, 2022; Uraon, Bharati, *et al.*, 2024; Uraon, Chauhan, *et al.*, 2024) which often comes in line with having potentially biased data, i.e., common method bias (Benlian *et al.*, 2025; Junker *et al.*, 2025; Krüger *et al.*, 2025; Peeters *et al.*, 2022; Uraon, Bharati, *et al.*, 2024). Moreover, several time intervals are often not in the limelight (Ng *et al.*, 2025). Validated scales are rare in this context (Hofman *et al.*, 2023). Existing analyses are often bound to specific companies or contexts (Junker *et al.*, 2022; Uraon, Bharati, *et al.*, 2024). Thus, by referring to the composition of the sample, different perspectives which include various viewpoints from different roles (also outside the team), industries, nationalities intra- or inter-team aspects are lacking in existing studies (Bastiaansen and Van Dun, 2025; Granow and Asbrock, 2021; Junker *et al.*, 2022, 2025; Rietze and Zacher, 2022; Uraon, Bharati, *et al.*, 2024; Wong and Van Gils, 2022). Regarding the sample size, previously generated data and derived results were often limited in terms of representativeness due to small samples (Hofman *et al.*, 2023; Rietze and Zacher, 2023; Wong and Van Gils, 2022). Moreover, agile practices are studied in a bundle, assuming synergies between the individual effects (Peeters *et al.*, 2022). Generally speaking, different methodologies, like mixed methods, multi-level analysis or observations were seldom applied (Bastiaansen and Van Dun, 2025; Bastiaansen and Wilderom, 2022; Rietze and Zacher, 2023; Uraon, Bharati, *et al.*, 2024).

Future research agenda

Based on the four categories developed beforehand, now the research agenda will be derived. Thus, there are different gaps in existing research on the definitions. Therefore, it is necessary

to create precise definitions for the various concepts in relation to the theory of teamwork (Rietze and Zacher, 2022; Strode *et al.*, 2022) and to analyze the impact of relevant factors like trust, communication and shared mental models on factors of agile teamwork in order to generate basic knowledge of the relationships (Strode *et al.*, 2022). Furthermore, the definition has to be distinct from VUCA, adaptability and lean management (Ng *et al.*, 2025).

Referring to the composition of the team, it has to be analyzed if agile or traditional teams are superior (Langholf and Wilkens, 2021). To do so, team and individual performance indicators have to be analyzed, like organizational citizenship behavior (Uraon, Chauhan, *et al.*, 2024). Then, the influence of agile teamwork on the performance indicators enables a comparison between traditional and agile teams. This comes in line with analyzing when a burden overweighs the benefits of agile teamwork, i.e. when there is too-much-of-a-good-thing (Rietze and Zacher, 2023). Thus, task characteristics as well as needs of team members have to be analyzed regarding their (in)congruence (Benlian *et al.*, 2025), which could influence role conflicts (Bastiaansen and Van Dun, 2025; Junker *et al.*, 2025; Ng *et al.*, 2025). Moreover, the time of working agile in combination with shared mental models, team reflexivity as well as performance and empowerment has to be analyzed (Krüger *et al.*, 2025). Additionally, agility in blue collar workers teams has to be analyzed (Ng *et al.*, 2025). New insight on how various industries or diversity-related variables affect agile teamwork are necessary (Granow and Asbrock, 2021; Krüger *et al.*, 2025). In addition, it needs to be researched how organizations can create an agile mindset, i.e., setting the foundation for agile teamwork (Bastiaansen and Wilderom, 2022), e.g., in interactions like meetings (Krüger *et al.*, 2025). Since globalization is on the go, the impact of different cultures, e.g., nationalities, has to be analyzed (Bastiaansen and Wilderom, 2022; Granow and Asbrock, 2021). As agile teamwork is still focusing on positive aspects, researching disadvantages has to be more in the focus of future analysis (Ng *et al.*, 2025).

The impact of virtuality/technology on new roles in these virtual settings is still lacking (Wong and Van Gils, 2022). Moreover, the nexus between agile work as well as performance in virtual teams is underresearched (Granow and Asbrock, 2021; Junker *et al.*, 2022; Rietze and Zacher, 2023). Thus, after the COVID-19 pandemic new research is necessary, which could even be replications of studies conducted during the pandemic (Rietze and Zacher, 2022). These studies should also analyze the (psychological) well-being of team members (Rietze and Zacher, 2022). Finally, new technologies like artificial intelligence or robotics have to be analyzed (Bastiaansen and Van Dun, 2025).

Finally, implications for further research regarding methodology, i.e., methodological shortcomings, are presented. Studies should concentrate on conducting experimental or longitudinal studies, so causality is no longer lacking (Bastiaansen and Van Dun, 2025; Benlian *et al.*, 2025; Junker *et al.*, 2022, 2025; Krüger *et al.*, 2025; Rietze and Zacher, 2022; Uraon, Bharati, *et al.*, 2024; Uraon, Chauhan, *et al.*, 2024). In addition, qualitative analysis should be conducted in order to gain more in-depth insights on certain phenomena, related to agile teamwork (Rietze and Zacher, 2022). Moreover, future studies have to rule out methodological biases like the common method bias (Junker *et al.*, 2025; Krüger *et al.*, 2025; Peeters *et al.*, 2022; Uraon, Bharati, *et al.*, 2024; Uraon, Chauhan, *et al.*, 2024) and to identify perfect time intervals for multiple data generations (Ng *et al.*, 2025). New studies should focus on debating different viewpoints, not only discussing one, like those of different team members with various cultural backgrounds (Granow and Asbrock, 2021; Junker *et al.*, 2022; Krüger *et al.*, 2025; Peeters *et al.*, 2022; Wong and Van Gils, 2022). Furthermore, agile teamwork across the boundaries of companies or even industries should be analyzed (Junker *et al.*, 2022; Rietze and Zacher, 2022; Uraon, Bharati, *et al.*, 2024). In addition, new scales need to be developed, as the foundation for quantitative analysis (Hofman *et al.*, 2023). Then, mediation and moderation analysis of certain intervening factors should be performed (Benlian *et al.*, 2025; Peeters *et al.*, 2022; Uraon, Bharati, *et al.*, 2024; Uraon, Chauhan, *et al.*, 2024). By doing so, it is recommended to rather rely on leader ratings, instead of self-ratings from the team (Uraon, Chauhan, *et al.*, 2024) or even combine both ratings and compare them in multi-level, also intra-/inter-team, analyses (Bastiaansen and Van Dun, 2025; Benlian *et al.*, 2025; Junker *et al.*, 2025; Rietze and Zacher, 2022). Moreover, if team-level data is analyzed, the team has to fulfill the questionnaire instead of using self-reported perceptual individual-level data (Uraon, Bharati, *et al.*, 2024). Finally, agile practices have to be analyzed individually in order to identify interaction effects between those practices, leading to a more detailed empirical foundation (Peeters *et al.*, 2022).

Limitations

This study has some limitations. First, an SLR is not capable of analyzing all the available literature due to its inclusion and exclusion criteria. Therefore, relevant papers might have been missed based on the aforementioned criteria. Second, this study yielded a limited number of relevant papers due to its very narrow search string. Thus, familiar literature might not have been included in this analysis. Third, one relevant database has been chosen which is

considered of being representative. However, other relevant papers might exist which were published elsewhere. Consequently, further literature or bibliometric analyses are recommended with other, and broader, in-/exclusion criteria. Nevertheless, a solid body of literature has been analyzed, leading to a comprehensive picture of the status quo.

Conclusion

In conclusion, the literature reviewed reveals significant gaps in our understanding of agile teamwork, spanning definitions, team composition, the influence of virtuality and methodological approaches. To address these gaps, further research needs to refine theoretical frameworks, explore the contextual nuances of diversity and globalization, and deepen insights into agile mindsets and virtual team dynamics. From a methodological perspective, the application of longitudinal and experimental designs, the elimination of biases and the development of robust measurement scales are essential to advance the field. By integrating different perspectives and contexts, future studies can provide a comprehensive and viable foundation for improving agile teamwork practices and outcomes. Then, research and practice will have a better basis for undergoing the agile transformation process.

MOBILE APPLICATIONS AND MARKETING COMMUNICATION: A CASE OF PROLIFE PET RESCUE

Mulder, Dalmé[1]; Parkes, Whanita[2]

[1]Department of Communication Science, University of the Free State, Bloemfontein, South Africa

[2]Department of Communication Science, University of the Free State, Bloemfontein, South Africa

Keywords: Mobile applications, marketing communication, stakeholder engagement, South African nonprofit organizations, animal welfare

Introduction

In South Africa, the most common forms of animal cruelty are restriction of movement, food and water deprivation, assault, neglect, and lack of medical care. Education and community initiatives to address this issue and focus on the responsibility of pet ownership should therefore be a priority. Due to a lack of government support for this matter in South Africa, private NPOs offer financial assistance and support towards animal welfare, caring for neglected or abused animals. One such NPO, Prolife Pet Rescue, recognized the need for a pro-life animal sanctuary.

Purpose, Aim and Objectives

Due to the unsupportive environment in which NPOs in South Africa operate, support from the local community and other stakeholders is critically needed. This study explored how a mobile application can strengthen communication within the nonprofit sector, using Prolife Pet Rescue as a case study. The research investigated stakeholder perceptions and communication needs and explored the best way to integrate a mobile application into the NPO's marketing communication strategy.

Literature Review and Theoretical Framework

An integrated marketing communication (IMC) approach served as the point of departure and theoretical framework for this study. As stakeholder-centered, interactive process of cross-functional planning and alignment of organizational, analytical, and communication methods, it enables dialogue by communicating consistent messages across all media to support long-term relationships that create value. By embracing interactivity through a mobile application (app), a welfare organization can use it as a direct communication tool with the community, enabling two-way communication. As the Uses and Gratifications Theory's components reflect the influence of social media content on engagement behaviors, it was employed as a theoretical lens in the study. This study also utilized the two-way symmetrical model within the excellence theory as a framework for creating excellence between the organization and its public. Insights from the uses and gratifications theory assist in formulating communication for excellence, as described by the excellence theory. For an NPO to achieve its goals, it must communicate with the public to convince them to partake in its cause. Therefore, public relations (PR) is critical for nonprofit organizations (NPOs) to help build awareness, establish credibility, attract donors and volunteers, and enhance public engagement.

Methodology and Methods

The research was conducted within an interpretivist worldview and constructivist ontology. A qualitative research approach, conducting 12 semi-structured face-to-face interviews with key stakeholders, was followed. A non-probability, purposive sample was drawn from staff, volunteers, foster parents, and donors of Prolife Pet Rescue in the Nelspruit area, South Africa. The sample size was determined by theoretical saturation. The semi-structured interviews were conducted using an interview schedule, formulated to include relevant concepts and constructs derived from a conceptual analysis and literature review. Clarke and Braun's (2022) thematic analysis was used to analyze patterns of meaning within the qualitative data. An inductive approach was used to identify themes from the data, grounded in participants' experiences and views expressed in the semi-structured interviews. Deductive reasoning was also utilized to situate the findings within the broader theoretical context and to draw on uses and gratifications theory. The researcher triangulated multiple sources to justify the themes identified across participants. Furthermore,

member checking was conducted through a follow-up interview with participants to assess the accuracy of the interpretation.

Findings and contribution

The thematic analysis produced six main themes. The findings indicated that existing communication practices are fragmented, inconsistent, and reactive, resulting in missed opportunities for donor engagement, adoption processes, and foster parent support. Stakeholders called for transparent, centralized, and timely communication, explicitly stating that a mobile application is the preferred solution. The study concluded that mobile applications could support stakeholder engagement, strengthen organizational communication, and support sustainable growth in the nonprofit sector. Practical guidelines were proposed to support Prolife Pet Rescue or similar NPOs in implementing a mobile application as a distribution hub to direct users to events, rescue updates, donation appeals, and volunteer drives, integrated with the marketing communication strategy.

Originality and Value

The study provides recommendations for developing a practical mobile application for Prolife Pet Rescue, specifically, and for NPOs in general. Recommendations address the application's development and operational phases, as well as key performance indicators, to better utilize the mobile application and strengthen communication between an NPO and its stakeholders.

Theoretical and Practical Applications and Implications

The findings may help managers and PR practitioners improve marketing communication to support long-term stakeholder engagement in the NPO industry.

UNDERSTANDING SOCIAL MEDIA MARKETING ADOPTION IN INDUSTRIAL CONTEXTS: A QUANTITATIVE ANALYSIS OF PERCEIVED BENEFITS AND BARRIERS

Chroni, Zoe Maria

School of Business & Creative Industries, University of the West of Scotland, Paisley, United Kingdom

Keywords: B2B social media marketing, technology adoption, benefits, barriers, Greece

Introduction

Traditional industrial marketing is undergoing a digital transformation, moving from personal selling to digital engagement. While social media marketing is primarily a Business-to-Consumer (B2C) tool (Katona and Sarvary, 2014), its strategic importance in B2B is now recognised (Balaji *et al.*, 2023). However, there is a scarcity of empirical evidence (Dwivedi *et al.*, 2021) in the B2B context, leaving a gap regarding organisational enablers and challenges of adoption. This study addresses this gap by examining perceived benefits and barriers in the Greek B2B sector.

Purpose, Aim and Objectives

This study examines the perceived benefits and barriers influencing B2B Greek companies to adopt social media marketing. The main research objectives are: 1) to examine key benefits of adoption; 2) to identify main barriers hindering adoption; and 3) to provide practical insights for Greek B2B practitioners.

Literature Review

Benefits include new customers attraction, brand awareness, enhanced customer relationships (Michaelidou, Siamagka and Christodoulides, 2011), and lead generation (Itani, 2024). Barriers include lack of knowledge and technical skills (Asamoah, Dinsmore and Swani, 2024), inadequate financial resources (Gazal *et al.*, 2016) and lack of ROI measurement (Dwivedi *et al.*, 2021).

Methodology and Methods

The study adopted a quantitative research design using an online survey with managers and business owners from Greek B2B companies. Participants were recruited via simple random sampling from an official Greek business directory. A total of 72 participants completed the survey, with measurement scales adapted from previous literature. Descriptive statistics and ANOVA were used to analyse the data.

Findings and Contribution

Greek B2B companies rated advertising (M=4.39), marketing (M=4.34), and brand reputation (M=4.07) as the most significant benefits, with no significant differences between adopters and non-adopters. Lack of financial resources was the most significant barrier (M=3.82). ANOVA revealed significant differences between adopters and non-adopters for lack of time, company size, ROI measurement, and lack of social media strategy (all $p<0.5$), with non-adopters rating these barriers significantly higher.

Originality and Value

This study focuses on Greece, a country that has been in a prolonged recession since 2010 and traditionally resistant to technology adoption (Giotopoulos *et al.*, 2017), contributing empirical evidence to an underexplored B2B context. The findings provide a foundation for future cross-national comparisons across European countries.

Research Limitations

The sample size (n=72) and single-country focus limits generalisability of the findings. Future research could expand to other European markets.

Theoretical and Practical Applications and Implications

The findings suggest organisations should recognise social media's potential for brand building while addressing financial and strategic planning barriers. Practitioners could develop targeted interventions for non-adopters, focusing on ROI measurement training and resource allocation strategies to overcome the identified barriers.

THE IMPACT OF SOCIAL MEDIA PLATFORMS ON INFLUENCER-FOLLOWER RELATIONSHIPS

Silva, Patrícia[1]; Mendes, Mafalda[2]

[1]BRU, ISCTE, Lisbon, Portugal

[2]BRU, ISCTE, Lisbon, Portugal

Keywords: Influencer Marketing, Parasocial Relationships, Sponsored Posts, Trust, Social Media Platforms, Content Length.

Introduction

Influencer marketing relies on opinion leaders to drive brand awareness and purchase intention (Lou and Yuan, 2019). Sponsorship-disclosure laws require influencers to flag paid content, which can erode trust in an influencer previously perceived as authentic, although followers may instead see sponsorships as a trusted influencer recommending brands they genuinely enjoy. Prior research links sponsorship reception to relationship depth and to congruence between a sponsored post and an influencer's usual content (De Cicco et al., 2020; Belanche et al., 2021), largely independently of platform, despite platforms differing substantially in format, pacing and content length. This study addresses that gap, asking whether platform characteristics, and content length specifically, shape relationship strength and, in turn, follower reception of sponsored posts.

Purpose, aim and objectives

The study aimed to understand whether platform characteristics influence follower reception of sponsored beauty content, and how the influencer-follower relationship affects that reception: "What impact does the platform on which sponsored beauty content is posted have on followers' perceptions of the influencer and the sponsored post?". The premise is that fast-paced, short-form platforms may not elicit the emotional engagement that longer formats can.

Literature review and theoretical framework

Influencer marketing "uses the influence of key individuals or opinion leaders to drive consumers' brand awareness and/or purchasing decisions" (Lou and Yuan, 2019, p. 59). Authors have flagged platform differences as a likely factor shaping empirical results, calling

for further research (Jiménez-Castillo and Sánchez-Fernández, 2019). Drawing on parasocial relationship theory and source credibility literature, this study treats platform and content length as contextual affordances conditioning parasocial bond depth and, consequently, trust resilience once a sponsorship is disclosed, extending congruence and disclosure-transparency research (Belanche et al., 2021; De Cicco et al., 2020) by treating disclosure reception as platform-contingent, not platform-neutral.

Methodology and methods

This exploratory study used an asynchronous online survey to examine platform characteristics (content length), influencer-follower relationships, and follower reception of sponsored posts across Instagram, TikTok and YouTube. Hosted on Google Forms and distributed mainly through online forums, the survey included three multiple-choice and five open-ended questions, taking roughly ten minutes. Data were collected from 22 November 2022 to 7 January 2023 from 55 participants who consumed beauty content across multiple platforms. Multiple-choice items were analysed descriptively; open-ended responses were examined through thematic content analysis to identify recurring patterns around trust, authenticity and platform format. Given the modest, predominantly female sample, findings are indicative patterns, not statistically generalisable effects.

Main findings and contribution

Descriptive and thematic patterns point to platform characteristics shaping the influencer-follower relationship. Trust emerged as the central mechanism linking format to receptiveness: longer-form content appeared to foster greater intimacy and authenticity, sustaining trust once sponsorship was disclosed. Most participants reported researching products further to verify quality; reputable brands left the relationship largely unaffected, whereas low credibility and inauthentic-seeming posts were linked to declining trust. These patterns suggest disclosure effectiveness is platform-contingent rather than platform-neutral.

Originality and value

The contribution lies in reframing platform and content length as theoretically meaningful contextual conditions, not incidental features, in parasocial relationship and disclosure research, offering an exploratory account of how content format can sustain or erode trust under sponsorship.

Research limitations

As an exploratory, qualitative-leaning study with 55 participants, predominantly women, and a deliberate focus on the beauty niche, findings are not statistically generalisable; these scoping choices allowed depth into an underexamined relationship. Larger, more diverse samples can test the mechanism proposed.

Theoretical and practical applications/implications

Theoretically, the study links platform format to trust resilience under sponsorship, extending parasocial relationship and disclosure literature. Practically, brands may find longer-form-content influencers, particularly on YouTube, better positioned to sustain follower trust when disclosing sponsorships, with the mechanism potentially extending to other influencer marketing sectors beyond beauty.

SHOULD BRANDS TAKE A STAND? THE IMPACT OF BRAND ACTIVISM ON CONSUMER RESPONSES: THE ROLE OF MESSAGE SOURCE AND PERCEIVED AUTHENTICITY

Ezerskyte, Auguste[1]; Venciute, Dominyka[1]; Correia, Ricardo[2]; Kuslys, Marius[1]

[1]ISM University of Management and Economics, Vilnius, Lithuania

[2]Polytechnic Institute of Bragança, Bragança, Portugal

Keywords: Brand Activism, Brand Attitude, Brand Trust, Purchase Intention, Perceived Authenticity

Introduction and Theoretical Background

In today's competitive market industry, consumers are expecting brands to take a stand on various social and political issues, making brand activism an increasingly important element of contemporary marketing strategies (Wang and Bouroncle, 2024). Brand activism occurs when companies align their communication and corporate actions with specific sociopolitical causes, aiming to create social change and improve brand equity (Vredenburg et al., 2020; Key et al., 2023). While brand activism is a multifaceted concept, existing research primarily focuses on environmental and socio-cultural issues tied to specific societal contexts. As a result, high-intensity and globally relevant forms of brand activism, such as war, societal equality, and human rights, remain underexplored. Previous research has also emphasized the importance of the message source in brand activism, as communication by different representatives of the brand yields different results in consumer responses and behavior (Nam et al., 2023). However, in the context of sensitive causes such as war, a research gap remains.

The aim of this research was to examine the effect of brand activism on brand attitude, brand trust, and purchase intention, while also analyzing the mediating role of perceived authenticity and the moderating effects of message source and generation, using the war in Ukraine as the contextual case.

The key constructs used in this research were: brand activism as the independent variable, represented as Facebook posts with a specific stand on war in Ukraine; brand attitude, analyzing whether exposure to brand activism changes the way consumers perceive the brand

in question; brand trust, analyzing the impact of brand activism on changes in the level of trust from the consumer to the brand; purchase intention, analyzing how exposure to brand activism changes the willingness to buy products from the brand; perceived authenticity, included as a possible mediator variable to analyze whether any connection between brand activism and consumer responses are affected by how authentic the brand is perceived by the customer; message source and generation, chosen as variables that might have moderating effects on the relationships between the independent and dependent variables.

Methodology

An online experiment was performed in 3 separate stages. In Stage 1, the pre-test identified war in Ukraine and threats to independency as the most concerning issue for the sample, which was later used as a context for Studies 1 and 2. Study 1 further analyzed the effect of separate brand activism scenarios on the sample. Study 2 was performed on a separate sample to analyze the moderation effects of the message source and generation. The data was processed and analyzed using non-parametric tests and PROCESS Macro in SPSS software.

Results

The results of the study did not support the hypotheses raised, although additional analysis imposed perceived authenticity to be the main predictor of consumer responses. Additionally, the analysis revealed the importance of the appropriate choice of context for brand activism, as war in Ukraine resulted to be too emotionally charged and sensitive issue, which shifts consumer focus and decision-making process to a more survival-based approach.

Theoretical and Managerial Contributions

This is the first study to acknowledge the possible impact of brand activism in the context of an ongoing war in Ukraine. It connects the analysis of consumer responses and reactions with the growing concept of brand inclusion in social activities and communications. Given the study’s limitations, future research should replicate the study in different geographical contexts, increase the sample size, and further clarify the brand activism message.

The discovered results underscore the importance for brands to have long-term strategies for transparency, communicating values and building brand trust.

TRUST, TRANSPARENCY, AND CONSUMER LEARNING IN BIOECONOMY MARKETS: EXPLAINING THE GAP BETWEEN ECOLOGICAL AWARENESS AND PURCHASE DECISIONS IN AGRIFOOD SYSTEMS

Chkoniya, Valentina[1]; Abreu, Madalena[1,2]; Quintas Medina da Silva, Inês[1]; Alturas, Bráulio[3]

[1]Polytechnic University of Coimbra, Coimbra, Portugal

[2]CEOS.PP Coimbra, Polytechnic University of Coimbra, Coimbra, Portugal

[3]Information Science and Technology, University Institute of Lisbon (ISCTE-IUL), ISTAR-ISCTE, Lisbon, Portugal

Keywords: Bioeconomy, Sustainable Consumption, Agrifood Business, Consumer Learning, Trust, Transparency, Greenwashing, Purchase Decision

Introduction

The transition towards a bioeconomy is reshaping agrifood markets by embedding sustainability attributes into product value propositions. However, the proliferation of environmental claims can increase consumer scepticism where sustainability information is difficult to verify or perceived as greenwashing. Consequently, a persistent gap remains between ecological awareness and actual purchasing behaviour.

Purpose, Aim and Objectives

This study examines how consumers interpret, evaluate and act upon sustainability information in agrifood markets. It aims to explain how consumer learning, transparency and trust influence the translation of ecological awareness into purchasing decisions. Specifically, it explores how consumers evaluate sustainability signals, develop trust, identify potentially misleading claims, and reconcile sustainability preferences with price considerations.

Literature Review and Theoretical Framework

The study integrates sustainable consumption theory with perspectives on information asymmetry, consumer learning, and greenwashing. Akerlof (1970) demonstrates that consumers rely on market signals when product quality cannot be directly verified. In sustainable consumption, labels, certifications and brands therefore become important signals, while greenwashing can undermine their credibility (Delmas and Burbano, 2011). Consumer learning provides a complementary perspective, positioning consumers as active evaluators of sustainability information, with trust acting as a key mechanism in decision-making (Grunert, 2019).

Methodology and Methods

A qualitative design was adopted using semi-structured interviews with agrifood consumers representing diverse socio-demographic profiles. Data were analysed through systematic thematic analysis, focusing on trust formation, perceived authenticity, interpretation of sustainability signals, greenwashing and price sensitivity.

Findings and Contribution

The findings indicate that ecological awareness alone does not consistently generate sustainable purchasing. Trust emerges as a central mechanism linking awareness to behaviour and is strengthened by transparent, credible and verifiable information. Consumers with higher education and greater travel experience demonstrate more sophisticated evaluative strategies, whereas vague or unverifiable claims reinforce perceptions of greenwashing. Price sensitivity remains an important constraint. These findings integrate information asymmetry, consumer learning and trust into an explanation of the awareness–behaviour gap (Anisimova and Vrontis, 2024; Chaudhuri *et al.*, 2025; Chkoniya, 2025).

Originality and Value

The study contributes a learning-based perspective to sustainable consumption by conceptualising transparency as an enabling condition for consumer learning and trust. It extends understanding of how bioeconomy-oriented markets can facilitate informed consumer participation (Sabbagh *et al.*, 2024).

Research Limitations

The qualitative design and reliance on reported perceptions limit the generalisability of the statistical findings. Future research should quantitatively test the proposed relationships across consumer groups and agrifood categories.

Theoretical and Practical Applications and Implications

The findings suggest that firms should move beyond symbolic sustainability positioning towards transparent, accessible and verifiable communication. Policymakers should strengthen environmental-claim regulation and sustainability literacy to reduce information asymmetries and support informed participation in bioeconomy transitions.

HUMAN-AI INTERACTION TYPES IN ACADEMIC KNOWLEDGE CREATION: EVIDENCE FROM SYSTEMATIC LITERATURE REVIEWS

Tomczyk, Przemysław[1]; Vrontis, Demetris[2]

[1]Department of Marketing, Kozminski University, Warsaw, Poland

[2]Department of Management, School of Business, University of Nicosia, Nicosia, Cyprus

Keywords: Human-AI Interaction, Knowledge Co-creation, Generative AI, Systematic Literature Reviews, Epistemic Agency, Knowledge Management, Academic Writing, Governance.

Introduction

Generative artificial intelligence (GenAI) is reshaping academic knowledge production by supporting retrieval, screening, synthesis and writing. Systematic literature reviews (SLRs) are an appropriate context for examining this change because they combine procedural transparency with interpretive judgement.

Purpose, Aim and Objectives

The purpose of this study is to examine GenAI-enabled knowledge co-creation in SLR-based academic writing. The aim is to develop a typology of human-AI interaction based on decision-making delegation, iterative dialogue and epistemic responsibility. The research question is: How can human-AI interaction in SLRs be typologised from a knowledge co-creation perspective?

Literature Review and Theoretical Framework

The framework integrates knowledge creation theory (Nonaka, 1994), evidence-informed SLR methodology (Tranfield et al., 2003; Page et al., 2021), and research on human-AI interaction, trust, delegation and augmentation (Jarrahi, 2018; Amershi et al., 2019; Glikson and Woolley,

2020; Baird and Maruping, 2021; Raisch and Krakowski, 2021; Dwivedi et al., 2023; Dell'Acqua et al., 2026).

Methodology and Methods

The study adopted a systematic literature review design. Peer-reviewed publications indexed in Scopus and Web of Science were identified through keyword searches and citation tracking. The material was analysed using deductive thematic analysis guided by two dimensions: delegation to AI and bidirectional human-AI dialogue.

Findings and Contribution

The analysis identifies three interaction types. The AI-supported type describes automation of repetitive tasks under full human control. The collaborative type involves iterative prompting, critique and refinement without transferring decision authority. The partner-like type involves partial delegation of analytical or synthesis-related decisions under human oversight. The types form a continuum from instrumental assistance to quasi-epistemic partnership.

Originality and Value

The study conceptualises SLRs as sites of human-AI knowledge co-creation rather than merely AI-assisted workflows. The typology clarifies how GenAI changes the distribution of agency, responsibility and judgement in academic writing.

Research Limitations

The study is limited by its reliance on English-language publications indexed in Scopus and Web of Science and by uneven transparency in reporting AI use.

Theoretical and Practical Applications and Implications

Theoretically, the findings extend knowledge co-creation theory by incorporating non-human agents into epistemic processes. Practically, the typology can support researchers, universities

and journal editors in developing transparent reporting standards and responsible governance mechanisms for GenAI-assisted research.

FROM QUESTIONNAIRES TO QUERIES: TESTING THE EQUIVALENCE OF HUMAN AND LLM-GENERATED SURVEY DATA

Tirrel, Henning[1]; Fröbel, Daniel[2]

[1]Faculty of Business, Ostfalia University of Applied Sciences, Wolfsburg, Germany

[2]IU International University of Applied Sciences, Münster, Germany

Keywords: Silicon Sampling, Large Language Model, LLM, Generative Artificial Intelligence, AI, Sampling, Synthetic Datasets, Survey

LLMs are founded on large databases, including texts, and analyse data based on a priori trainings (OpenAI, 2023; Sarstedt *et al.*, 2024). Furthermore, human behaviour can be imitated by LLMs (Hermann and Puntoni, 2025; Jeon *et al.*, 2024; Luo *et al.*, 2022). Consequently, LLMs have the power to re-order researcher processes. LLMs are used as dataset suppliers, instead of humans (Argyle *et al.*, 2023; Dillion *et al.*, 2023; Hermann and Puntoni, 2025; Sarstedt *et al.*, 2024). These are called synthetic datasets (Sarstedt *et al.*, 2024) or silicon sampling methodology (Argyle *et al.*, 2023). If demographic data is included as an input, i.e., informing the LLM about which characteristics the sample should comprise, it is called silicon sampling and without these information it is called random silicon sampling (Sun *et al.*, 2024).

Besides first promising analysis, showing that LLMs are capable of replacing humans (cf. Argyle *et al.*, 2023; Dillion *et al.*, 2023; Li *et al.*, 2024; Sarstedt *et al.*, 2024), there is also the other empirical evidence (Schröder *et al.*, 2025). Thus, this innovative and important topic leads to open calls for more knowledge on how silicon sampling works in various research settings (Sarstedt *et al.*, 2024; Sun *et al.*, 2024). This study, therefore, aims at discovering if (random) silicon samples from different LLMs are comparable to humans fulfilling a questionnaire as a follow up study of Tirrel (2025). This leads to the following research question: How do results from (random) silicon sampling data and data generated from real participants differ?

A previously traditionally generated dataset will be used as a foundation for answering the research question. Additionally, various LLMs will be used for generating (random) silicon samples. Thus, various datasets will be compared via multivariate analysis, e.g., Kruskal-Wallis test. As a result, it is possible to identify differences or similarities between two or more

different samples, i.e., to determine whether synthetic datasets are comparable to human-generated data.

This study contributes to knowledge by analysing if (random) silicon samples differ from traditional samples or if they can substitute the original ones. Thus, implications of whether (random) silicon samples can change the way of data generation in the future can be drawn in this highly innovative research area. Potential practical implications of the study include a more efficient design of empirical research processes through the use of LLMs for generating synthetic samples. In particular, time and cost issues associated with traditional data generation may be reduced. Furthermore, (random) silicon samples could be used as a practical complement to conventional data generation, especially in early research stages such as pretest, pilot studies or exploratory analyses, as long as they deliver results that are comparable to those generated by humans.

DO ESG SCORES MOVE MONEY? EVIDENCE FROM U.S. EQUITY ETFS

Sapuric, Svetlana[1]; Georgiou, Ifigenia[2]; Repousis, Spyridon[3]; Lois, Petros[4]

[1]Associate Professor, Department of Accounting, Economics and Finance, School of Business, University of Nicosia, Cyprus

[4]Professor, Department of Accounting, Economics and Finance, School of Business, University of Nicosia, Cyprus

Keywords: ESG, Exchange-Traded Funds, Fund Flows, Holdings-Based ESG, ESG Ratings, Controversies, Sustainable Investing, Investor Behaviour

Introduction

Interest in environmental, social and governance (ESG) investing continues to expand, yet it remains uncertain whether investors respond to the actual ESG characteristics of portfolios or primarily to labels and marketing narratives (Riedl and Smeets, 2017; Baker et al., 2022). A key challenge highlighted in the literature is the substantial divergence among ESG rating providers, which limits comparability and raises questions about what ESG measures truly capture (Berg, Kölbel and Rigobon, 2022). At the same time, evidence suggests that sustainability-related classifications can strongly influence capital flows, often independent of performance metrics (Hartzmark and Sussman, 2019).

To advance this discussion, our study investigates whether investor flows into U.S. equity exchange-traded funds (ETFs) respond to holdings-based ESG levels, changes in ESG, and controversy exposure, rather than solely to branding. ETFs are well suited to this question because they operate under a transparent framework with frequent holdings disclosure, facilitating precise measurement of portfolio attributes over time (Madhavan, 2016).

Literature Review and Theoretical Framework

Research on ESG ratings documents large methodological differences across major providers, driven by variation in measurement choices, indicator scope and weighting schemes (Berg, Kölbel and Rigobon, 2022, Gibson Brandon et al., 2022). These discrepancies complicate inference about whether ESG quality influences investor decisions and reinforce the need for transparent, portfolio-level measurement.

Meanwhile, work on sustainable fund flows shows that investors do react to changes in perceived sustainability (Hartzmark and Sussman, 2019; Bauer, Ruof and Smeets, 2021). In the U.S. mutual fund market, sustainability classifications have been shown to trigger large scale reallocation of capital, even when the classifications do not predict better performance (Hartzmark and Sussman, 2019). This evidence motivates our focus on whether investors respond to changes in the underlying ESG composition of portfolios.

Methodology and Methods

Our analysis uses U.S. equity ETFs and combines three categories of data: (1) fund-level net flows and assets under management; (2) periodic ETF holdings including constituent weights; and (3) issuer-level ESG information, including overall ESG scores, pillar scores and controversy indicators (Dorfleitner et al., 2015).

For each ETF at each holdings date, we construct a set of portfolio ESG measures by weighting the ESG assessments of constituent companies by their portfolio weights. We then track how shifts in these portfolio characteristics relate to subsequent investor flows. By aligning ESG measurement as of the portfolio disclosure date and analysing flows after that date, we ensure a meaningful temporal sequence suitable for inference.

Our empirical approach relies on a panel design that adjusts for key fund attributes such as size, past returns and product characteristics. The transparency of the ETF regulatory framework, established through the modernised rules governing ETF operations, supports consistent measurement by promoting frequent disclosure of holdings and standardising operational practices (Securities and Exchange Commission, 2019). This setting allows us to test whether investors genuinely respond to measured ESG quality rather than labels alone.

Expected Findings and Contribution

We expect several patterns to emerge. First, ETFs with higher portfolio ESG levels are likely to experience increased subsequent inflows, reflecting the growing appeal of sustainability-aligned portfolios. Second, improvements in portfolio ESG are expected to attract inflows, while deteriorations and higher controversy exposure are expected to prompt outflows (Krüger, 2015). Prior work suggests that negative ESG events often have a stronger effect than positive ones, implying that investor responses may be asymmetric (Krüger, 2015; Capelle-Blancard and Petit, 2019).

We also anticipate stronger ESG-related flow sensitivities for ETFs that explicitly position themselves as sustainable. This would suggest that label salience amplifies investor attention to underlying ESG characteristics.

The key contribution of this study lies in using dynamic, holdings-based ESG measurements to assess whether investors respond to measured portfolio ESG quality. This approach directly addresses calls for more transparent, comparable and time-sensitive ESG metrics and provides evidence on how ESG considerations influence investor behaviour within a highly transparent investment structure.

Research Limitations

Some ETFs disclose holdings less frequently than others, which may introduce mild timing noise. Nevertheless, ETFs remain substantially more transparent than mutual funds, enhancing the reliability of portfolio-level ESG measurement.

Theoretical and Practical Implications

Theoretically, the study contributes to understanding how investors interpret and respond to sustainability information, especially when measured at the portfolio level. Practically, the findings have implications for fund managers, regulators and data providers. If investors respond meaningfully to measured ESG quality, this underscores the importance of transparent ESG reporting and supports efforts to improve ESG data comparability and disclosure standards (Christensen, Serafeim and Sikochi, 2022).

DO LIMITED TRAFFIC ZONES DECONGEST OR DISPLACE URBAN TOURISM PRESSURE? HOURLY ZONE-LEVEL EVIDENCE FROM MOBILE NETWORK IN ITALY

[1]Sinatra, Alessandro Francesco

[1]Dicar, University of Catania, Catania, Italy

Keywords: Limited Traffic Zones (ZTLs), Network Data, Destination Governance, Urban Mobility Policy

Purpose, Aim and Objectives

Limited Traffic Zones (ZTLs) are increasingly used in European cities to improve liveability and manage access to historic centres, yet destination governance still lacks high-frequency, spatially explicit evidence on whether these measures reduce tourism-related pressure or primarily relocate it to neighbouring areas. This study evaluates the introduction of a ZTL in a Mediterranean city (Italy).

Literature Review and Theoretical Framework

The study builds on the use of passive mobile positioning data for tourism measurement and recent advances in smart destination analytics (Ahas, 2008; Gretzel et al., 2015; Xiang et al., 2015). It also engages with emerging evidence on intra-urban tourism spillover dynamics (Camatti et al., 2024).

Methodology and Methods

The analysis uses two years of hourly, zone-level mobile network aggregates that describe the population present and its composition by origin (Italians vs foreigners; intra- vs extra-region visitors), purpose (consumers vs business), and socio-demographics (gender and age groups). We implement a difference-in-differences design with zone fixed effects and granular temporal controls for hour-of-day, day-of-week, and seasonality. Treated zones within the ZTL perimeter are compared to (i) a neighbouring buffer ring of adjacent zones and (ii) matched control zones elsewhere in the city. Outcomes include consumer-oriented presence, foreign presence, extra-region visitor presence, and a composition-based tourism pressure index contrasting visitor segments against residents and commuters.

Findings and Contribution

Descriptive patterns around the policy change indicate reduced peak-hour consumer and foreign presence within treated zones alongside contemporaneous increases in adjacent zones, consistent with spatial spillovers rather than pure decongestion. These findings mirror emerging evidence on intra-urban tourism spillover dynamics (Camatti et al., 2024).

Originality and Value

By moving beyond overnight-based indicators, the study advances the use of mobile network data for tourism statistics and policy evaluation. It provides high-frequency, spatially explicit evidence on whether access restrictions reduce tourism-related pressure or relocate it to neighbouring urban areas.

Research Limitations

The study focuses on the introduction of a single ZTL in a Mediterranean city (Italy) and relies on two years of hourly, zone-level mobile network aggregates. The findings should therefore be interpreted in relation to the specific spatial, temporal, and policy context examined.

Theoretical and Practical Applications and Implications

The study contributes to smart destination analytics and to the evaluation of place-based urban mobility policies by showing the importance of accounting for intra-urban spatial spillovers. It offers actionable guidance on coordinating enforcement and urban services beyond restricted perimeters (Cavallo et al., 2022).

EMOTIONAL INTELLIGENCE IN LARGE LANGUAGE MODELS: CAPABILITIES, LIMITATIONS, AND GOVERNANCE IMPERATIVES

Halawi, Ali[1]; Fadel, Kholoud[2]

1Faculty of Business Studies, Arab Open University, Muscat, Oman

2School of Business and Management, UClan University, Larnaca, Cyprus

Keywords: Emotional intelligence, large language models, affective computing, theory of mind, human-AI interaction, AI governance, algorithmic empathy, EU AI Act.

Abstract

This paper examines how far large language models (LLMs) can approximate human emotional intelligence (EQ), and what that approximation means for organisational and regulatory governance. It asks where the boundary lies between affective performance that is convincing in language and the embodied, relational understanding that underpins human empathy. A conceptual research design was adopted because the phenomenon is too emergent for large-scale empirical measurement and because governance frameworks require conceptual clarity before they can be operationalised. To address this, the analysis integrates emotional intelligence theory, theory of mind research, affective computing, and recent scholarship on anthropomorphism, mental-health chatbots, and the EU Artificial Intelligence Act, four strands that converge on a shared problem: what happens when systems that cannot feel become capable enough at the language of feeling to influence how people disclose, trust, and seek help. Health, education, and consumer service were selected as illustrative domains because each combines emotional vulnerability with high deployment rates of conversational AI. From this, the paper develops the SRI framework, a three-level model of emotionally adaptive AI: Signal, Relation, and Influence. Signal refers to the detection of affective cues; Relation refers to context-sensitive adaptation during an interaction; and Influence refers to longitudinal modelling that can shape user behaviour over time. The paper argues that most deployed systems remain concentrated at Signal and early Relation, while Influence is emerging through engagement-driven optimisation rather than through genuine emotional understanding, as evidence from companion applications and personalised retention systems increasingly suggests.

The SRI framework translates an abstract debate about whether AI has empathy into a practical governance map, showing which risk becomes dominant at each level and linking that risk to a specific instrument: measurement validation, disclosure and design restraint, data minimisation, a non-manipulation duty, and independent affective auditing. The result is a decision-ready contribution, grounded in audit-facing criteria and design constraints, for researchers, designers, reviewers, and policy actors who need to evaluate emotionally adaptive AI without either exaggerating or dismissing its capabilities.

Introduction

Consider two near-identical encounters. In the first, a barista greets a regular customer by name, notices that the customer looks tired, and adjusts the conversation with a small act of warmth. In the second, an AI-mediated service does something similar: it recognises the user, recalls previous preferences, reads emotional cues in text or voice, and adapts its response. From the outside, the encounters are beginning to converge. From the inside, they remain fundamentally different. One involves a person who can care, misread, remember, and be morally accountable. The other involves a system that can produce the signs of emotional competence without having emotions at all.

This distinction now matters beyond philosophy. LLMs increasingly mediate customer service, tutoring, health triage, workplace tools, companion applications, and decision support. As systems are tuned to sound patient, attentive, and empathic, organisations face a difficult question: when does emotional responsiveness become a valuable interface feature, and when does it become a misleading simulation of care? The answer is not simply technical. It concerns trust, dependence, vulnerability, and the governance of data about users' inner states.

Recent evidence makes the question sharper. LLMs can perform strongly on tasks that resemble social reasoning, theory of mind, and emotional intelligence testing (Bubeck *et al.*, 2023; Kosinski, 2024; Wang *et al.*, 2023). Schlegel, Sommer and Mortillaro (2025) further show that several LLMs perform very well on ability-based emotional intelligence tests and can generate new test items with psychometric properties comparable to those of human-designed items. At the same time, benchmark work such as EmoBench shows that LLM performance remains uneven when tasks require integrated emotional understanding and application rather than surface-level recognition (Sabour *et al.*, 2024).

The central paradox is therefore clear: LLMs are becoming better at emotional performance before society has agreed how that performance should be interpreted, constrained, or audited.

This paper responds to two gaps. The first is conceptual. Public and scholarly debate often treats machine empathy as a binary question: either systems possess it or they merely fake it. That framing is too blunt for governance. A system that classifies user sentiment once, a tutor that adapts tone over a session, and a companion application that models a user's vulnerability across months do not raise the same risks and cannot be governed by the same instruments. The second gap is practical. Governance discussions frequently restate high-level principles such as transparency, fairness, and accountability, but offer designers and reviewers few tools for deciding which obligation should apply to which emotional capability. Principles without operationalisation leave the hardest decisions unmade.

The paper makes three contributions. First, it proposes the SRI framework. Signal denotes detection of affective cues; Relation denotes adaptive response within an interaction; and Influence denotes longitudinal modelling that can shape future affect and behaviour. Second, it links each level to its dominant risk. Signal is primarily a measurement and bias problem; Relation is primarily an empathy-illusion problem; Influence is primarily a manipulation and dependency problem. Third, it derives a compact set of governance instruments aligned with those risks, including validation of affective measurement, emotional disclosure, design restraint, emotional-data minimisation, a non-manipulation duty, and independent affective auditing. The framework is designed to be useful in product review, ethics review, regulatory assessment, and policy analysis.

Theoretical Framework

The paper draws on four strands of literature: emotional intelligence theory, theory of mind, affective computing, and AI ethics. These strands are not treated as parallel summaries. Each one contributes a different analytical layer to the central problem: what emotionally adaptive AI can do, what it cannot honestly claim to be, and what follows from that gap for governance.

Emotional intelligence theory

Salovey and Mayer (1990) define emotional intelligence as the capacity to perceive, use, understand, and manage emotions. Goleman (1995) later extended the construct into

organisational and leadership contexts, where emotional intelligence is associated with self-awareness, self-regulation, motivation, empathy, and social skill.

In human beings, these capacities are not merely classificatory. They are connected to subjective feeling, bodily feedback, memory, moral development, and social accountability. LLMs are different kinds of systems. They can produce text that resembles emotional insight, but they do not have a body, affective states, or a life history through which emotions gain meaning (Crawford, 2021). This does not make their outputs useless. It does mean that the phrase artificial emotional intelligence should be handled carefully. A safer formulation, and the one used throughout this paper, is functional emotional competence: the ability to produce outputs that are appropriate to emotionally charged situations, without assuming inner experience. This distinction matters for governance because it shifts the evaluative question from what the system feels to what the system does, and to whom.

Theory of mind and apparent mentalising

Theory of mind refers to the ability to attribute beliefs, intentions, and mental states to others and use those attributions to predict behaviour (Premack and Woodruff, 1978). Kosinski (2024) reports that frontier LLMs can perform surprisingly well on classical false-belief tasks. Wang *et al.* (2023) similarly find that LLMs can reach or exceed average human performance on some emotional understanding tasks while diverging from human patterns on others. These findings are important, but they do not prove that LLMs possess human-like mentalising. They show that language models can often infer the answer expected in social-reasoning tasks, which is a different and more limited achievement.

For governance, the philosophical question is less urgent than the functional one. If a system behaves as if it understands a user's emotions, and if users respond as if it understands them, then organisations must govern the consequences of that appearance. Apparent mentalising can be socially powerful even when it is computationally shallow, and that social power is where the regulatory risk resides.

Affective computing and anthropomorphism

Affective computing, as articulated by Picard (1997), seeks to enable computers to recognise, interpret, and respond to human affect. The field now includes facial emotion recognition, sentiment analysis, speech emotion detection, multimodal affect modelling, and adaptive dialogue (Ballesteros et al., 2024). These methods can be useful in care, accessibility,

education, and customer support, but they also translate ambiguous emotional life into measurable categories, a compression that carries its own risks of distortion and misuse.

Anthropomorphism intensifies the governance challenge that affective computing creates. Salles, Evers and Farisco (2020) argue that anthropomorphic language shapes how AI systems are understood and can create conceptual and ethical confusion. Deshpande et al. (2023) show that human-like design cues can encourage users to attribute more understanding to AI systems than the systems warrant. Carter, Loft and Visser (2023) add a critical nuance: anthropomorphic cues support trust calibration only when they communicate meaningful contextual information, not when they merely make a system seem human. This distinction is central to the argument developed in this paper. The governance question is not whether emotional design should exist, but whether it helps users understand the system more accurately or leads them to misread it. The four strands of literature converge on this point, and it is from this convergence that the SRI framework is constructed.

The SRI Framework: Signal, Relation, Influence

The SRI framework organises emotionally adaptive AI into three operational levels. It is not a claim that systems naturally progress through these levels. Rather, it is a diagnostic tool for locating capability, risk, and governance obligation. A single product may operate at different levels in different features, and the framework is designed to make that variation visible rather than flatten it.

Signal: detecting affective cues

At the Signal level, a system identifies affective cues in text, voice, facial expression, gesture, or other behavioural data. Examples include sentiment analysis, facial emotion recognition, distress flagging, and tone classification. This is the most common level of emotionally adaptive AI because it can be added to existing workflows without requiring a sustained relationship with the user.

The value of Signal lies in early detection. A support system may flag frustration before a customer leaves; a learning platform may detect confusion; a clinical triage tool may identify language associated with distress. The risk is that emotional signals are treated as more stable and objective than they are. Emotions are culturally mediated, context-sensitive, and sometimes strategically hidden. A smile, silence, hesitation, or abrupt sentence can mean

different things depending on the user and setting. Signal systems should therefore be governed as measurement instruments, subject to validation, subgroup performance testing, documented error rates, and clear limits on use. The analogy to medical or financial measurement is deliberate: an unvalidated emotional measurement tool should be held to the same standard of scrutiny as an unvalidated diagnostic one.

Relation: adapting within interaction

At the Relation level, the system adapts tone, content, pacing, and conversational strategy within an interaction. A Relation-level customer service agent may soften its language when a user appears frustrated. A tutoring system may slow down when a learner seems confused. A health chatbot may acknowledge distress and offer support resources. The system does not merely detect emotion; it acts on that detection in real time.

Relation is where the empathy illusion becomes most acute. A well-timed acknowledgement, a first-person phrase, or a reassuring conversational rhythm can lead users to feel seen by a system that has no inner concern for them. Fairweather, Montemayor and Halpern (2021) argue that AI cannot replace human empathy in healthcare because empathy is not only a response pattern but also a relational and moral practice. Leins et al. (2023) make a similar point in mental-health chatbots, where transparency, escalation routes, and safe boundaries are essential. Governance at this level should therefore focus on disclosure, design restraint, and human handover. The goal is not to make systems cold but to prevent warmth from becoming deception.

Influence: modelling and shaping over time

At the Influence level, the system builds a longitudinal model of the user and uses that model to anticipate or shape future behaviour. Influence is still limited in current LLM systems, but partial forms already exist in companion applications, personalised recommender systems, and retention-oriented interfaces. The system remembers enough about the user to predict when they are likely to engage, withdraw, disclose, purchase, comply, or become emotionally dependent.

The dominant risk at Influence is asymmetric persuasion. A system with a long memory of a user's emotional patterns can identify which message, tone, timing, or offer is most likely to move that user, and it can do so without the user's awareness of how much is known or how it is being used. Cheong (2024) frames such systems as accountability challenges because

algorithmic decisions can affect wellbeing while remaining opaque to the user. Weber-Guskar (2021) argues that emotionalised AI creates relational responsibilities even when the system is not genuinely relational. At Influence, consent and disclosure are not sufficient. Users cannot meaningfully consent to every future inference made from a growing emotional profile. Governance must therefore include emotional-data minimisation, a non-manipulation duty, and independent review of optimisation targets.

Table 1: The SRI framework as a governance map

Each level carries a distinct risk profile and a corresponding set of governance obligations. The diagnostic question in the final row identifies the practical evaluative test the framework is designed to answer at each level.

Level	Capability	Example deployments	Dominant risk	Primary governance instrument	Diagnostic question
Signal	Detecting and classifying affective cues in text, voice, image, or behavioural data.	Sentiment analytics; distress flagging; emotion recognition; service-quality monitoring.	Biased misclassification; covert measurement; false certainty.	Context-specific validation; documented error rates; subgroup testing; data minimisation.	Is this measurement valid?
Relation	Adapting tone, register, content, and pacing during an interaction.	Customer-service agents; adaptive tutors; therapy-adjacent chatbots.	Empathy illusion; over-attribution of understanding; unsafe reliance.	Machine-status disclosure; design restraint; bounded affective language; human escalation.	Is this adaptation honest?
Influence	Building longitudinal emotional	Companion apps; personalised retention systems;	Asymmetric persuasion; dependency;	Non-manipulation duty;	Is this influence manipulative?

Level	Capability	Example deployments	Dominant risk	Primary governance instrument	Diagnostic question
	profiles and shaping future behaviour.	emotionally targeted recommendations.	exploitation of vulnerability.	affective auditing; optimisation-target transparency; strict retention limits.	

Table 1: The SRI framework. Levels of emotionally adaptive AI, dominant risks, and primary governance instruments

Discussion and Governance Implications

The SRI framework shows that emotionally adaptive AI should not be governed as a single category. The risks change as systems move from measurement to interaction to longitudinal steering, and that change matters practically: a generic transparency statement cannot solve a measurement bias problem, and a bias audit cannot by itself prevent dependency or manipulation. Governance must follow the capability, not the category.

The EU Artificial Intelligence Act provides an important regulatory anchor. It defines emotion recognition systems, raises concerns about their scientific reliability and generalisability, prohibits certain emotion-inference uses in workplace and educational settings, and requires disclosure for many emotion-recognition deployments (European Parliament and Council of the European Union, 2024). These provisions are significant, but they still leave organisations with difficult implementation questions about which systems are affected, what disclosure must contain, and how compliance is demonstrated.

The SRI framework helps translate that legal direction into operational choices by giving each regulatory concern a level, a risk, and an instrument.

Governance instrument one: validation before deployment

Signal-level systems should not be deployed merely because they produce plausible labels. They should be validated against the context in which they will operate. Affective inference in

a retail chatbot, a school, a workplace, and a mental-health intake process cannot be treated as the same task, and a model validated in one setting carries no automatic authority in another. Validation should include subgroup analysis, false-positive and false-negative rates, human review thresholds, and documentation of what the model is not able to infer. The governing principle is simple: if an organisation would not accept an unvalidated medical, educational, or financial measurement tool, it should not accept an unvalidated emotional measurement tool.

Governance instrument two: disclosure and design restraint

Relation-level systems require plain-language disclosure at the point of interaction. Users should know when a system is detecting emotional cues, adapting responses based on inferred state, or simulating empathic language. Disclosure alone, however, is insufficient if design choices contradict it. A chatbot that says it is not human while using constant first-person intimacy, therapeutic phrasing, and memory-based flattery still pushes the user toward misattribution. Design restraint means using warmth where it supports comprehension and service quality, but avoiding cues that imply care, friendship, therapeutic competence, or personal concern that the system cannot possess. Disclosure and design must be consistent; one cannot substitute for the other.

Governance instrument three: emotional-data minimisation

Emotional profiles are a particularly sensitive form of data because they describe not only what users did but how they may have felt or been influenced. Organisations should minimise collection, retention, and secondary use of inferred affect. A reasonable design default is short retention for raw affective signals, strict separation between service delivery and marketing use, and explicit justification for any longitudinal emotional profile. The principle at stake is straightforward: emotional data collected to support a user should not silently migrate into systems designed to persuade one.

Governance instrument four: a non-manipulation duty

Influence-level systems require a stronger obligation than disclosure or minimisation. A non-manipulation duty would prohibit operators from using inferred emotional vulnerability to push decisions that primarily benefit the organisation at the user's expense. It would apply especially in mental health, education, employment, finance, care for older adults, and services used by children. This instrument is necessary because the most serious harms at the Influence level do not arise from inaccurate emotion recognition. They arise when accurate or partially accurate

inferences are used to steer users at moments of vulnerability, in directions chosen by the system's optimisation target rather than the user's own interests.

Governance instrument five: independent affective auditing

Independent affective auditing should evaluate not only model accuracy but also interaction outcomes. Audits should test whether systems induce dependency, over-disclosure, inappropriate trust, emotional targeting, or differential treatment across user groups. They should examine the optimisation target directly, because a system optimised for engagement may learn to prolong emotional reliance even when the stated service goal is support. Auditors should include technical experts, psychologists, ethicists, and domain specialists. In sensitive settings, user representatives should also have a role. Without independent review of what systems are actually optimising for, the other four instruments remain vulnerable to circumvention.

Implications for Organisations and Researchers

For organisations, three implications follow from the framework. The first is to choose the lowest sufficient level. Many use cases that appear to require Relation can be served adequately by Signal plus human handover. A mental-health triage tool may need to detect distress and route the user to appropriate support; it does not necessarily need to simulate a therapeutic relationship, and simulating one may create more risk than it resolves. The second is to align metrics with user welfare rather than engagement. A user who returns daily to a companion application may be receiving genuine support, or may be developing dependency; engagement figures cannot distinguish between the two. The third is to treat affective design as part of risk management, not only as user experience. Decisions about tone, memory, and conversational warmth are governance decisions, and they should be made with the same scrutiny applied to data architecture or access controls.

For researchers, the framework points to four priorities. Emotional intelligence benchmarks should be revised to distinguish recognition, explanation, regulation, and ethically appropriate response, since current benchmarks conflate these and overstate functional competence. Longitudinal studies are needed to understand how users form trust, attachment, and dependency over time, as most existing evidence is cross-sectional. More work is required on culturally specific emotional interpretation, because affective signals do not travel cleanly across languages and social norms, and governance instruments designed in one cultural

context may not transfer reliably to another. Finally, governance research should move from abstract principles to testable audit protocols, producing criteria that regulators, ethics boards, and product reviewers can apply in practice.

Conclusion

Emotionally adaptive AI is becoming part of ordinary digital life. The key question is not whether LLMs truly feel. They do not. The practical question is what happens when systems that do not feel become capable enough at the language of feeling to influence how people disclose, trust, learn, buy, and seek help.

This paper has proposed the SRI framework as a way to make that question governable. Signal, Relation, and Influence name three different levels of capability, each with a distinct risk profile and a distinct governance response. Signal requires validation. Relation requires disclosure and design restraint. Influence requires data minimisation, a non-manipulation duty, and independent affective auditing. The framework shifts debate away from the unproductive binary of real versus fake empathy and toward a more precise and actionable question: what is the system doing, to whom, over what time horizon, and under whose accountability?

The value of emotionally adaptive AI will depend on whether organisations can use affective capability without exploiting emotional vulnerability. Used carefully, these systems can improve accessibility, triage, learning support, and service quality. Used carelessly, they can turn emotional life into an optimisation surface. Future research should refine the SRI framework through empirical studies in specific domains, particularly mental health, education, customer service, and care for older adults. The aim should not be to remove emotional responsiveness from AI, but to make it honest, limited, auditable, and aligned with human welfare.

TEACHING FEMINISM IN A POST-FEMINIST ERA: CULTIVATING ACADEMIC GRADUATES AS AGENTS OF GENDER MAINSTREAMING AND ORGANIZATIONAL CHANGE

Dr. Michal Gross (Adv.)
The Max Stern Jezreel Valley Academic College
Department of Human Services
Department of Social Work
Department of Nursing Science

Prof. Dalit Yasour-Borochovitch

Department of Social Work (Head)

Keywords: Gender mainstreaming, Organizational change, Agents of change, Feminist pedagogy, Gender training, Resistance, Post-feminism, Emotional labor, Masculinities.

Introduction

Organizations are central arenas in which gender inequality is reproduced and can be transformed. Feminist teaching promotes critical awareness, professional responsibility, and sensitivity to the power relations embedded within social systems and organizations, and it has contributed significantly to organizational reform and social activism (Abrams, 2021; Casas et al., 2024). By cultivating gender sensitivity, awareness and competence, gender education prepares graduates to advance equality from within the workplaces and institutions they will later join. However, in the current socio-political climate, characterized by democratic erosion, challenges to human rights, and resistance to gender-equality initiatives in organizations and society alike (Sosa, 2021), feminist teaching increasingly operates in contested environments shaped by a post-feminist sense that assumes equality has already been achieved (Gill, 2017; Kenney, 2021).

Purpose, Aim, and Objectives

Feminist courses are essential for developing critical thinking and implementational skills and for facilitating the interface between academia, the labor market, family life, and political involvement. This ongoing research examines classroom processes and student responses from the lecturers' perspective, identifies strategies that reduce student resistance, offers practical recommendations for effective feminist training, and draws lessons transferable to gender training, diversity work, and gender mainstreaming in organizations more broadly.

Theoretical Framework

Feminism views knowledge as power; feminist teaching is therefore not the neutral transmission of information but a political act that challenges patriarchal "truth regimes" and the hegemony of "objective knowledge" (Harding, 1991; Hooks, 1994), while amplifying silenced perspectives (standpoint theory; Hekman, 1997). It favors dialogical, consciousness-raising teaching over Freire's (1970) "banking model," and draws on Hooks's (1994) "engaged pedagogy," in which lived experience and emotion are legitimate forms of knowledge. Intersectional approaches further insist that gender be analyzed alongside race, class, and nationality (Crenshaw, 1991; Case, 2016). Such teaching also demands gendered, largely unrecognized emotional labor (Hochschild, 1983; Morley, 1998), intensified by the neoliberal, post-feminist context (Gill, 2017; McRobbie, 2009). Crucially, gender education cultivates graduates as agents of change, equipping them to promote equality and diversity and to support gender mainstreaming, an organizational-change strategy whose implementation routinely meets resistance (Lombardo & Mergaert, 2013).

Methodology

The participants are around twenty lecturers committed to teaching from a feminist perspective. They hold various ranks (e.g., senior lecturers and professors) and come from diverse disciplines, including social sciences, humanities, and applied professions such as social work, medicine, and law, spanning distinct professional and organizational fields. Using a phenomenological-descriptive approach, the study employed open-ended, in-depth interviews that encouraged participants to describe, in their own words, their teaching experience and feelings in the classroom, the difficulties they face, including student resistance, institutional tensions, and pedagogical dilemmas, and their coping strategies and sources of support.

Main Findings, Novelty, and Contribution

Preliminary findings identify feminist courses as sites of social struggle and feminist lecturers as "academic warriors" against conservative forces seeking to reverse hard-won feminist achievements. This struggle unfolds on several levels: curricular (insisting on gender mainstreaming), institutional (defending courses, departments, and budgets), personal (sustaining a feminist identity under pressure to restrain controversy), and pedagogical (coping with strong student opposition that mirrors the wider social backlash). Lecturers describe learning as a "shattering experience" in which students cling to a protective "blindness" and react with denial, anger, and hostility. The study reframes this resistance as an indicator of success rather than something to fear; it is a signal of deep engagement and of the disruption of students' worldviews that can give rise to change-oriented agency. This contribution speaks directly to organizations: the resistance lecturers navigate parallels the resistance that gender-mainstreaming initiatives meet in workplaces, and these courses produce the future agents who will carry equality into their organizations.

Research Limitations

These are preliminary insights from ongoing work and interviews. The research is limited to a local context with specific socio-political characteristics, which makes broader generalization difficult. Future research could include a larger, cross-national sample, students' perspectives, and the longitudinal tracking of graduates' efforts to advance gender equality and mainstreaming within their own workplaces and organizations.

Practical Implications

In practice, the findings offer ways to cultivate critical feminist consciousness without provoking defensive closure: gradualism in introducing difficult content; emotional inclusion and delivering sharp messages gently; heavy reliance on robust data; embedding gender teaching at the systemic level so its influence "trickles" outward; and incorporating the study of masculinities to broaden participation while guarding against co-optation. A lecturer's explicit refusal to "convert" students, paired with clearly owned positions, further lowers resistance. Because they address the same defensive dynamics, these strategies transfer to gender training, diversity work, and mainstreaming initiatives in organizations. Above all, the research recasts gender education as a praxis that equips students to become sensitive, equality-oriented agents capable of advancing gender mainstreaming and organizational change.

GLOBAL MINDS, LOCAL HANDS: HOW DOES CULTURAL CONTEXT SHAPE EMPLOYEE EXPERIENCES OF DEI IN MULTINATIONAL CORPORATIONS (MNCS)?

Georgiadou, Andri[1]; Jentjens, Sabine[2]

[1]University of Nottingham, Nottingham, United Kingdom

[2]ISC Paris, Paris, France

Keywords: Inclusion, Exclusion, Optimal Distinctiveness, Cultural Context, Multinational Corporations, DEI, Belongingness, Uniqueness

Introduction

Multinational corporations face a persistent tension when rolling out diversity, equity and inclusion (DEI) initiatives across global operations. Recent work shows they learn continuously, sharing, transferring and adapting practices to local realities (Jentjens, Georgiadou and Hennekam, 2026), yet how employees experience inclusion and exclusion once these locally adapted policies reach them remains unexplored.

Purpose, Aim and Objectives

This study examines the psychological mechanisms through which employees interpret DEI initiatives across cultural settings. Drawing on optimal distinctiveness theory, which holds that inclusion requires satisfying both a need to belong and a need to be valued as unique (Brewer, 2012; Shore et al., 2011), we ask how employees experience inclusion and exclusion across organisational levels when global policies meet diverse cultures, what mechanisms link cultural readings of belonging and uniqueness to those experiences, and how these experiences unfold over time.

Literature Review and Theoretical Framework

Optimal distinctiveness theory has been developed largely in Western, individualist settings, yet cultural dimensions such as individualism-collectivism and power distance reshape what belonging and uniqueness feel like, and so what makes an initiative inclusive. We adopt a multi-level lens in which inclusion signals reach employees from the organisation, leaders, work group and their own identity, and culture shapes which level carries most weight. Recent work theorises inclusion as a multilevel, relational phenomenon beyond demographic

representation (Georgiadou et al., 2024) and shows cultural values conditioning how inclusion translates into belonging and well-being (Georgiadou et al., 2025). Extant empirical studies further substantiate this positioning: cross-cultural research on inclusion experiences documents substantial variation in how employees from collectivist versus individualist societies perceive organisational belonging cues (Mor Barak et al., 2016), while quantitative work on DEI programme outcomes confirms that locally calibrated initiatives yield stronger well-being effects than standardised global ones (Nishii and Leroy, 2022) and that cross-border institutional differences impact perceived priorities (Leone et al., 2025). Integrating these findings anchors the present study within a growing body of evidence and reinforces the contemporary relevance of a culturally sensitive, multilevel approach to inclusion.

Methodology and Methods

We conducted a qualitative, multi-case study combining expert interviews with sixteen DEI professionals across five French MNCs. Participants held global, regional and local responsibilities spanning diverse cultural contexts. Semi-structured interviews of 45 to 60 minutes, conducted in English, French or German, were analysed using Braun and Clarke's (2006) thematic analysis, with both authors coding independently before converging through iterative discussion, negative-case analysis and peer debriefing. It is acknowledged that intermediate conclusions are based on DEI professionals' recollections and expert knowledge rather than on first-hand employee accounts. This design choice reflects the exploratory, process-oriented aims of the study and is addressed as a limitation below. However, interviewed experts worked in close contact with various stakeholder such as Employee Resource Groups (ERG) that allowed them to collect direct employee feedback that helped nourish their work. The aim of our overarching research project is to triangulate, in a second step, DEI professionals' perceptions with primary data on employee perceptions.

Findings and Contribution

We identify four psychological mechanisms, each operating differently across cultures and organisational levels. (1) Culturally contingent belonging: what signals belonging varies, from interpersonal respect to formal recognition, with international mobility creating identities that transcend local definitions. (2) The uniqueness–othering paradox: recognising difference can affirm uniqueness or instead mark people as different, as when language accommodation left employees feeling singled out. (3) Cross-level signal conflict: cues from the organisation, leader, work group and self can pull in different directions, with cultural values, including

power distance, determining which level dominates. (4) Temporal-institutional legitimation: legal and institutional frameworks shape how safely employees express identity over time, and inclusion is consequently experienced as an evolving rather than a static condition. We therefore propose a culturally contingent model in which cultural context does not merely moderate the belonging-uniqueness-inclusion relationship but reconfigures it.

Originality and Value

Complementing the organisational-learning account of how DEI travels across borders (Jentjens et al., 2026), the study shows that even well-functioning learning leaves the psychological reception of practices filtered through cultural meaning systems. Standardised global programmes therefore cannot produce uniform psychological outcomes; MNCs need culturally adaptive frameworks attentive to local meanings of belonging and uniqueness.

Research Limitations

The findings draw on DEI professionals' process knowledge rather than employees' direct accounts, which may filter employee experience; future research should collect employee data directly. The sample under-represents Asian and African contexts, and the retrospective design limits claims about real-time processes. As a qualitative study, it offers transferability rather than statistical generalisation.

THE ITALIAN CAPITAL OF CULTURE APPLICATION DOSSIER AS A TOOL FOR TERRITORIAL ENHANCEMENT: THE CASE OF VALEGGIO SUL MINCIO

Davide Gaeta[1], Daniela Cavallo[2]

1. Associate Professor, Department of Management, University of Verona
[2] Architect, Adjunct Professor of Territorial Marketing, Territory Coach, Project Leader

Keywords

Italian Capital of Culture; territorial enhancement; cultural governance; bottom-up participation; strategic assets; territorial analysis; territorial networks; local development; cultural planning

Abstract

This paper examines the preparation of the application dossier for the Italian Capital of Culture as a tool for territorial enhancement and the activation of long-term cultural development processes. Through the case study of Valeggio sul Mincio, the contribution highlights how an integrated territorial analysis, grounded in quantitative and qualitative data, fosters collective awareness that translates into consciousness, responsibility, and action. Central to this process is the identification of strategic assets as interpretative devices for managing territorial complexity, along with bottom-up participation in the construction of a shared vision. The paper also underscores the potential of the dossier to function as a model of cultural governance grounded in collaboration among institutions, partners, and stakeholders, and in the creation of stable territorial networks, regardless of the final outcome of the application.

Introduction

The application for the title of Italian Capital of Culture represents an opportunity of extraordinary relevance for territories, not only in terms of visibility but, above all, as a structured process of analysis, planning, and community activation. The value of the dossier lies not exclusively in the outcome, but in the path leading to its construction: a process that enables territories to be interpreted in their complexity, activates new forms of participation, and experiments with shared models of cultural governance. The systemic crises characterizing the current global scenario—environmental, geopolitical, and economic—require governance systems and enterprises to undertake profound strategic rethinking. In this context, the enhancement of territorial and cultural resources becomes a

crucial lever for organizational excellence, particularly in rural areas with strong productive and identity-based vocations, such as wine and food appellations of origin (Alston, Gaeta 2021; Gaeta, Perali 2025). The Italian Capital of Culture call thus emerges not merely as an instrument of cultural promotion, but as a platform for territorial innovation capable of activating networks among institutions, businesses, and local communities. The work carried out for the Valeggio sul Mincio dossier fully aligns with this perspective, configuring itself as a laboratory for strategic reflection and vision-building, in which culture becomes a driver of integrated territorial development.

Territorial Analysis as a Foundational Act

The first qualifying element of the Valeggio sul Mincio process was an in-depth study of the territory, conceived not as a simple descriptive survey but as a genuine critical investigation. The collection of quantitative data (demographic indicators, tourism flows, economic data, infrastructure, services) was complemented by qualitative analysis based on listening to local actors, mapping cultural practices, and interpreting historical, landscape, and productive identities.

This work revealed a plurality of dimensions: Valeggio village as a place of historical and architectural heritage; a riverine and agricultural landscape; a tourism hub and a living community shaped by complex social and economic dynamics. The knowledge thus constructed fostered a process of collective awareness, transforming data and information into shared consciousness.

Managing Complexity through Strategic Assets, Bottom-Up Participation, and Vision Building

One of the most significant aspects of dossier work was the identification of strategic assets as a key to interpreting and governing territorial complexity. In a context such as Valeggio sul Mincio, characterized by the coexistence of environmental, cultural, tourism, and productive values, there is a risk of fragmentation in policy and projects. The identification of assets, rather than their focus, enabled synthesis and strategic orientation. Strategic assets were not conceived as individual attractions, but as integrated systems of value capable of linking heritage, community, economies, and future visions. In this way, the dossier constructed a coherent narrative that connected past, present, and development perspectives, offering a compass for strategic decision-making.

The Valeggio sul Mincio application process assigned a central role to bottom-up participation, recognizing that no cultural strategy can be effective if it is not shared. Through moments of dialogue, working tables, and the involvement of associations, cultural operators, businesses, and citizens, the dossier became a space for dialogue and co-design. This process strengthened the territory's social capital, facilitating the transition from a sum of individual interests to a collective vision. Participation

also enabled the identification of latent needs, informal energies, and widespread skills that often remain invisible in traditional decision-making processes. Within the dossier, the SWOT analysis played a central role in transforming knowledge into strategy: As Strengths: the landscape identity linked to the Mincio River, historical heritage, tourism recognition, and local expertise. As Weaknesses: fragmentation among actors, tourism seasonality, and difficulties in coordinating cultural, environmental, and economic policies. As Opportunities: the application as a catalyst for resources, innovation in cultural consumption models, and the possibility of experimenting with new forms of governance. Finally, as Threats, we find the risk of a simplified territorial narrative, unmanaged tourism pressure, and loss of continuity after the application process. This analysis enabled the construction of a dossier that was both realistic and ambitious, grounded in a critical engagement with territorial fragilities.

The research has some limitations. The analysis focuses on a single case study. The qualitative nature of the study limits the statistical generalizability of the results. Some effects of the candidacy can only be assessed over the long term. Finally, the direct involvement of local stakeholders may influence the perception of the results. However, these limitations do not compromise the paper's interpretative value, which remains strong in terms of exploratory and methodological relevance.

Conclusions

The Valeggio sul Mincio case demonstrates that preparing the application dossier for the Italian Capital of Culture can be a powerful tool for territorial enhancement, regardless of the final outcome. Through territorial analysis, the identification of strategic assets, bottom-up participation, and network building, the dossier becomes a process of cultural transformation capable of generating awareness, responsibility, and action. From this perspective, culture emerges not only as content but as a method for governing complexity and fostering sustainable territorial development. A true instrument of awareness, responsibility, and collective care of the community towards its territory and its future. One of the most relevant outcomes of the work carried out for Valeggio sul Mincio is the potential to transform the application method into a model of cultural governance. The dossier functioned as a platform for strategic sharing, based on the involvement of partners and stakeholders and on the construction of a stable territorial network. In this sense, the application becomes a permanent coordination device capable of guiding public policies, private initiatives, and civil society actions.

THE SUSTAINABILITY AND MODERNIZATION GAP IN TOURISM PERFORMANCE MANAGEMENT: A BIBLIOMETRIC PERSPECTIVE (1979-2025)

Aggelopoulos, Eleftherios[1] Kalogera, Maria[1] Paraschi, Elen Paraskevi[2] Lampropoulos, Ioannis[1]

Keywords: Performance Management Systems, Management Accounting, Tourism and Hospitality Industry, Bibliometric Analysis, Management Control Systems, VOSviewer, Sustainability, Strategic Management Accounting

Abstract

Introduction

The tourism and hospitality sector operates under intense competition and environmental uncertainty, complicating managerial decision-making (Darvishmotevali et al., 2020; Pappas, 2018). Under these conditions, effective performance management systems support organizational sustainability, while management accounting and control systems enable planning, evaluation, and benchmarking, particularly in low-margin, highly differentiated enterprises (Fatima & Elbanna, 2020; Harris & Brander Brown, 1998).

Purpose, aim and objectives

The purpose of this study is to systematically map international research on performance management systems in tourism and hospitality from a management accounting perspective. Specifically, the study aims to identify the dominant thematic clusters, examine their temporal evolution, analyse international scientific collaboration, and reveal research gaps related to sustainability and digital transformation.

Literature review and research gap

Existing studies emphasize performance measurement, management control, budgeting, benchmarking, and tools such as the Balanced Scorecard in tourism and hospitality organizations (Fatima & Elbanna, 2020). However, the literature remains fragmented, lacks an integrated conceptual framework (Sainaghi et al., 2017; Sainaghi et al., 2019), and has frequently relied on econometric productivity models (e.g., DEA and SFA) without incorporating management accounting perspectives (Assaf & Tsionas, 2019). Although sustainability and strategic management accounting are increasingly discussed, they remain peripheral to the core structure of tourism performance management research, a gap not addressed by previous bibliometric reviews and examined through this bibliometric mapping.

Methodology and methods

A structured Scopus search using predefined keywords and predefined search criteria up to December 2025 identified 116 peer-reviewed articles, analyzed with VOSviewer, following keyword cleaning procedures, to examine keyword co-occurrence, thematic clusters, temporal trends, and international co-authorship patterns (van Eck & Waltman, 2010; 2014).

Main findings and contribution

The analysis identified four thematic clusters, with a dominant focus on management control and budgeting in hotel enterprises (Harris & Brander Brown, 1998; Fatima & Elbanna, 2020), while strategic and sustainability-oriented themes remain weakly consolidated, and international scientific collaboration is limited.

Originality, limitations and implications

Unlike previous reviews focusing on performance measurement or productivity modelling, this study provides a management accounting-oriented bibliometric synthesis of tourism performance management research. The findings reveal a persistent modernization gap, defined as the limited integration of sustainability, ESG-oriented accounting, digital transformation, and artificial intelligence within the field's core intellectual structure. The findings provide a research agenda for integrating these emerging themes into future tourism performance management research.

GEOPOLITICAL INSTABILITY IN ISRAEL AND ITS IMPACT ON HOTEL SECTOR PERFORMANCE IN NEIGHBOURING COUNTRIES: EVIDENCE FROM CYPRUS AND GREECE USING MONTHLY TOURISM DATA

Markou, Chrystalla[1]; Christodoulides, Costas[2]

[1]School of Business and Hospitality Studies, Alexander College, Larnaca, Cyprus

[2]Faculty of Business, Alexander College, Larnaca, Cyprus

Abstract

This study examines the impact of geopolitical instability in Israel specifically the 2023 to 2024 Israel Hamas conflict on hotel sector performance in neighbouring tourism dependent economies, namely Cyprus and Greece. The research investigates whether severe disruptions to Israel's inbound tourism generate measurable spillover or substitution effects across proximate destinations.

The study adopts a high-frequency, data-driven approach and pursues three main objectives: (i) to analyse long-term tourism dynamics across Israel, Cyprus, and Greece; (ii) to compare tourism performance across pre-conflict, conflict, and post-conflict periods; and (iii) to assess the extent to which fluctuations in Israel's inbound tourism can predict changes in hotel nights in Cyprus and Greece. The central research question explores whether geopolitical shocks in one destination translate into demand shifts in neighbouring markets. Theoretically, the study contributes to the literature on political instability and tourism by engaging with debates on spillover versus substitution effects, while addressing a key gap related to the limited use of high-frequency (monthly) tourism data in existing research. Methodologically, the study employs a quantitative longitudinal design using monthly secondary data. Analytical techniques include descriptive statistics, mean comparison tests, correlation analysis, and regression modelling to capture dynamic relationships across the three countries.The findings indicate a significant contraction in Israel's inbound tourism during the conflict period, accompanied by observable impacts on hotel sector performance in Cyprus and Greece. The results suggest that geopolitical instability generates complex regional effects, highlighting both vulnerability and interdependence among neighbouring destinations. The study further underscores the strategic importance of regional cooperation frameworks such as the Cyprus, Greece, and Israel trilateral partnership in enhancing resilience through coordinated marketing and adaptive tourism strategies.

Keywords

Geopolitical risk; Israel–Hamas conflict; tourism spillover effects; hotel sector performance; Cyprus; Greece; Eastern Mediterranean; regional tourism interdependence; crisis impacts; time-ordered tourism data.

1. Introduction

Tourism in the Eastern Mediterranean operates within a complex environment shaped by geopolitical tensions, regional conflicts and shifting traveller perceptions of safety. Israel, Cyprus and Greece constitute an interconnected tourism zone in which disruptions in one destination can generate ripple effects across neighbouring economies. The outbreak of the Israel and Hamas conflict in October 2023 resulted in a dramatic collapse in inbound tourism to Israel, raising concerns about broader regional impacts (Hazbun, 2024). Although media and policy reports describe substantial cancellations and weakened demand across the Middle East during the conflict, systematic empirical evidence on how these shocks affect nearby non-conflict destinations remains limited. The trilateral partnership between Cyprus, Greece, and Israel is considered to have played a pivotal role in shaping the region's tourism dynamics and resilience to shocks. As argued by Koukakis (2023) and Tziarras (2023), the partnership has facilitated coordinated approaches to tourism development, crisis response, and the promotion of the Eastern Mediterranean as a unified destination. This institutional collaboration is relevant to the topic under discussion as it is thought that the partnership can be particularly significant during periods of instability, enabling Cyprus and Greece to absorb and manage spillover effects from Israeli tourism disruptions more effectively. Existing research acknowledges that tourism is highly sensitive to geopolitical instability, yet most academic studies focus on individual destinations rather than examining regional spillover patterns (Hazbun, 2024; Gelbman, 2008; Dogan, Ghosh, Tiwari, & Abakah, 2023). Furthermore, tourism impacts of crises are frequently assessed using annual data, which conceal short-term fluctuations that are critical in sudden, high intensity geopolitical events (Duan, Xie, & Morrison, 2022). Hotel sector performance measured through nights spent in hotels is rarely used as the primary indicator despite its direct relevance to revenue management and operational decision making in hospitality. This study addresses these gaps by analysing monthly data from 2015 to 2024 to assess whether geopolitical shocks in Israel generate measurable effects on hotel nights in Cyprus and Greece. Using descriptive statistics, mean comparisons across pre-war, war and post-war periods, t-tests, correlations and multivariate regression models adjusting for time and seasonality, the study provides a comprehensive examination of geopolitical spillover in the Eastern Mediterranean hotel sector.

2. Literature Review

Tourism is widely recognised as one of the economic sectors most vulnerable to political instability, conflict and crisis events (Cheer, Lapointe, Mostafanezhad, & Jamal, 2021; Grigoriadis, Salepaki, Angelou, & Kourkouridis, 2025; Jaisinghani, Kaur, Joshi, Sharma, &

Ahmed, 2024). A substantial body of research demonstrates that perceived or actual insecurity leads to rapid declines in visitor arrivals, travel cancellations and reduced hotel occupancy (Talukder, Hoque, & Miah, 2025; Kumar, 2024; Mohammad, 2014). Studies of conflict affected destinations across regions including the Middle East and Eastern Europe show that even localised violence can have national level tourism repercussions, often extending into long term reputational harm (Butler, 2018; Morakabati, 2013). These patterns are supported by Risk Perception Theory, which argues that tourists respond primarily to *perceived* rather than objective risk, often generalising security concerns across whole regions (Seabra, Dolnicar, Abrantes, & Kastenholz, 2013; Cui, Liu, Chang, Duan, & Li, 2016). Such perceptions intensify during conflicts in places like Israel, where media attention amplifies perceived regional instability, leading travellers to avoid not only the conflict site but neighbouring destinations as well. The trilateral partnership literature further supports the notion of regional interdependence and risk transmission. As Koukakis (2023) and Lindenstrauss & Gavrielides (2019) have suggested, the cooperation between Cyprus, Greece, and Israel has established mechanisms for managing shared risks, including those affecting the tourism sector. These include joint crisis communication, coordinated marketing efforts, and the development of alternative tourism flows in response to disruptions. Tziarras (2020, 2023) highlights that such collaboration not only strengthens the resilience of each country's tourism industry but also creates opportunities for demand substitution and joint recovery initiatives during periods of instability. In the Eastern Mediterranean, several contributions highlight the region's high dependence on international tourism and its susceptibility to geopolitical disruptions (Tkachuk, 2019; Akamavi, Ibrahim, & Swaray, 2023). Research indicates that travellers often evaluate safety at the regional rather than national scale, consequently, conflict in one country may create risk spillovers for neighbouring destinations such as Cyprus and Greece (Theocharous, Zopiatis, Lambertides, Savva, & Mansfeld, 2020). Crisis Spillover Theory provides the conceptual basis for this process, suggesting that destabilising events in one destination can produce indirect consequences in other interconnected destinations through shared air routes, overlapping source markets, or regional media framing (Duan, Xie, & Morrison, 2022; Seyfi, Afsari, & Hosseini, 2026). This means that even when Cyprus or Greece remain physically safe, travellers may reduce or cancel trips due to perceived proximity to conflict. Despite this recognition, empirical studies examining cross-border spillover effects remain limited. Much of the literature either focuses on individual destinations or relies on annual data, which masks short-run volatility and immediate crisis reactions (Duan, Xie, & Morrison, 2022; Kazakova & Kim, 2021). The trilateral partnership is thus highly relevant to the present study, as it provides a structural explanation for the observed tourism interdependencies and spillover

effects. The partnership's emphasis on cooperative economic and tourism strategies, as documented by Koukakis (2023) and Tziarras (2023), aligns with the empirical findings of this study. This institutional context helps explain why spillover effects are not only present but are also shaped by the degree of cooperation and integration among the three countries

Another research gap concerns the choice of performance indicators. Most studies rely on tourist arrivals rather than accommodation-based metrics, even though hotel nights directly reflect demand for lodging, occupancy revenue and operational pressures faced by hotel management (Ortega, 2016; Lima Santos, Gomes, Malheiros, Crespo, & Bento, 2024; Cetin, Demirciftci, & Bilgihan, 2016). This gap can be further explained by Tourism Demand Substitution Theory, which proposes that travellers may shift demand from high-risk destinations toward perceived safer substitutes (Cakar, Morrison, & Gowreesunkar, 2025; Fuchs & Reichel, 2011). In principle, destinations like Cyprus or Greece could absorb diverted demand when Israel faces instability; however, substitution depends on travellers'confidence in regional safety. Severe conflicts can suppress not only demand for the affected country but for the wider region, weakening potential substitution benefits. This underscores the need to examine actual hotel sector outcomes, not only arrival numbers.

Furthermore, at the macro level, Geopolitical Risk Theory supports that conflict, instability and uncertainty generate measurable economic shocks that extend across borders (Balli, Balli, Hasan, & Gregory-Allen, 2022; Caldara & Iacoviello, 2022). Destinations embedded in a shared regional system are therefore affected not only by direct crisis exposure but also by region' wide increases in geopolitical risk (Ehteshami, 2007). This theoretical perspective aligns with research showing that geopolitical tensions reduce travel confidence, reshape mobility patterns and weaken tourism flows even in non-conflict jurisdictions (Grudtsyn, 2024; Kazakova & Kim, 2021). Applying this lens to the Eastern Mediterranean suggests that geopolitical shocks in Israel may operate as regional risk signals that influence hotel performance in neighbouring tourism economies. This study addresses the above gaps by examining whether Israeli tourism disruptions during the 2023-2024 conflict predict changes in hotel nights in Cyprus and Greece. By using monthly data across a long period and focusing on hotel-specific indicators, the research advances understanding of regional tourism interdependencies and provides practical insight into how geopolitical instability affects hotel performance in proximate non-conflict destinations. The integration of Risk Perception Theory, Crisis Spillover Theory, Tourism Demand Substitution Theory, and Geopolitical Risk Theory provides a coherent conceptual foundation for interpreting these spillover dynamics and for understanding why geopolitical crises originating in one destination can have significant economic impacts across the wider region.

3. Methodology

This research adopts a quantitative, longitudinal design to examine the effects of Israel's geopolitical instability on hotel sector performance in Cyprus and Greece. The study draws on monthly secondary data collected between January 2015 and December 2024. To evaluate whether the Israel–Hamas conflict was associated with changes in hotel performance, the monthly dataset was divided into three distinct periods based on the timing of the geopolitical event. The pre-war period comprised all monthly observations from January 2015 to September 2023, representing tourism activity before the outbreak of the conflict. The war period covered the months from October 2023 to March 2024, corresponding to the initial phase of the Israel–Hamas conflict when tourism demand was expected to experience its greatest disruption. The post-war period included observations from April 2024 to May 2025, capturing the period following the initial conflict phase and enabling an assessment of whether hotel demand showed signs of recovery or continued to be affected by the geopolitical shock. These three periods formed the basis for the mean comparison analysis and independent-samples t-tests conducted to identify statistically significant differences in hotel nights before, during and after the conflict. Tourism arrivals to Israel were sourced from the Israel Central Bureau of Statistics (Central Bureau of Statistics Israel, 2026) while hotel nights in Cyprus and Greece were obtained from Eurostat
(European Commission Eurostat, 2026). These datasets were harmonised to ensure temporal alignment. Differences in sample size across models result from one missing monthly observation in Eurostat. SPSS uses listwise deletion, resulting in N=113 in regression analyses. A quantitative, longitudinal design is a research approach that uses numerical data collected repeatedly over a defined period to analyse changes, trends and causal relationships across time. Unlike cross-sectional designs that capture information at a single point, longitudinal studies observe the same units such as countries, firms or populations across multiple time intervals (Rindfleisch, Malter, Ganesan, & Moorman, 2008). This allows researchers to examine how variables evolve, how external shocks influence outcomes and whether patterns remain consistent or shift over time (Cohen, Manion, & Morrison, 2017). Because the focus is on systematically tracking temporal dynamics, the design is appropriate for studying tourism demand, geopolitical disruptions and other phenomena where timing and sequence play a critical role. In the context of this study, the quantitative, longitudinal design enables a detailed assessment of how monthly tourism indicators in Israel, Cyprus and Greece changed over the 2015-2024 period and how these patterns were affected by the 2023-2024 conflict. By analysing repeated monthly observations, the study identifies both short-term shocks during the war

period and longer-term tourism trends, offering a more precise and sensitive evaluation than those based on annual data or single time-point comparisons.

The dependent variables are monthly hotel nights in Cyprus and Greee, representing hotel sector performance. The primary independent variable is monthly inbound tourism to Israel. To isolate the impact of the 2023-2024 conflict, a binary war dummy variable was constructed (1 = war months October 2023-March 2024; 0 = non-war months). Two control variables were included: a linear time trend to account for underlying long-term growth in tourism and a month variable to reflect seasonality. Data preparation included converting date variables into SPSS-recognised formats, creating trend and seasonal indicators, and screening for missing values. Natural log transformations were computed for robustness checks, although unlogged values were used for the primary analysis due to their managerial interpretability. The analysis proceeded through descriptive statistics, mean comparisons, t-tests, correlation analysis, and regression modelling. Descriptive statistics, mean comparisons, t-tests, correlation analysis and regression modelling are commonly used in quantitative, longitudinal research because together they provide a systematic, layered approach to examining how variables change over time and how those changes relate to external events or conditions (Almusaed, Almssad, & Yitmen, 2025). Descriptive statistics establish baseline patterns and reveal overall trends, enabling researchers to understand the magnitude, variability and distribution of key measures before conducting more complex analyses (Cooksey, 2020). Descriptive statistics were required for this study in order to provide a clear overview of the data, establish baseline levels of tourism activity, and identify major fluctuations across the pre-war, war, and post-war periods, otherwise this would not be possible to interpret subsequent inferential results or understand the scale of disruption. Mean comparisons and t-tests allow researchers to evaluate whether changes across specific time periods such as before, during or after a major event are statistically meaningful rather than random fluctuations (Niiler, 2020). Mean comparisons across the three periods allowed the study to detect directional changes associated with the geopolitical shock, offering initial evidence of whether the hotel sectors of Cyprus and Greece experienced measurable shifts during Israel's conflict period. Independent-samples t-tests were critical for statistically evaluating whether the differences observed between war and non-war months were significant rather than random fluctuations. These tests provide a formal assessment of whether the war period constituted a genuine structural change in regional tourism patterns. Correlation analysis is essential for identifying the degree to which variables move together over time, providing insight into potential interdependencies or spillover relationships across

units being studied (Rigobon, 2019). Correlation analysis further clarified the strength and direction of relationships between Israeli inbound tourism and hotel demand in Cyprus and Greece. This step was necessary to identify whether co-movement existed across destinations and to establish preliminary evidence of spillover effects prior to multivariate modelling. Regression modelling builds on these earlier steps by isolating the effect of one variable while controlling for temporal patterns, seasonality or other confounding factors that often appear in longitudinal data (Jebb & Tay, 2017). Regression modelling was essential for isolating the effect of Israel's geopolitical instability while controlling for underlying time trends and seasonal patterns. Simple regressions assessed the direct association between Israeli arrivals and hotel nights, while multiple regressions enabled a more robust examination by separating geopolitical effects from temporal dynamics. This progression from descriptive to inferential to multivariate analysis ensures that the study's conclusions are empirically grounded, statistically validated, and capable of distinguishing direct crisis impacts from background tourism trends. Together, these methods allow longitudinal studies to combine sensitivity to time-based changes with rigorous statistical testing, establishing both descriptive clarity and causal insight in environments where trends, shocks and time- dependent patterns interact (Sliwinski & Mogle, 2008; Zhao, Shipp, Carter, Gonzalez-Mulé, & Xu, 2024). Simple linear regressions examined the direct effect of Israel's tourism fluctuations on Cyprus and Greece. Multiple regression models adjusted for time trends, seasonality and the geopolitical dummy to assess whether Israeli tourism remained a significant predictor of regional hotel performance after controlling for temporal dynamics. This approach uses time-ordered data. Ethical considerations were addressed throughout the research process. The study relies solely on publicly available, aggregate-level secondary data from official statistical agencies, with no involvement of human participants, personal data, or confidential sources. As such, the analysis poses no ethical risk and does not require institutional ethics approval. All data were used in accordance with open-access usage guidelines from Eurostat and the Israel Central Bureau of Statistics. The research complies with general academic integrity standards, ensuring transparency, replicability, and responsible use of publicly available information (Kishan & Gupta, 2024; Tripathy, 2013).

a. Dependent Variable: Cyprus

Potential multicollinearity among the explanatory variables was examined using tolerance and Variance Inflation Factor (VIF) statistics. The tolerance values ranged from 0.669 to 0.923, while the corresponding VIF values ranged from 1.083 to 1.494 across both regression models. These values are well within the commonly accepted thresholds (Tolerance > 0.20; VIF < 5.0), indicating that multicollinearity was not present and that the explanatory variables contributed independently to the estimated models.

The independence of residuals was assessed using the Durbin Watson statistic. The values obtained were 0.410 for the Greece model and 0.356 for the Cyprus model, indicating the presence of positive autocorrelation in the residuals. This outcome is not unexpected given the longitudinal nature of the dataset, which consists of consecutive monthly observations over a ten-year period. Time-series tourism data frequently exhibit serial dependence because tourism demand tends to persist across successive months (Chen, Li, Wu, & Shen, 2019).

Consequently, the Durbin Watson results should be interpreted as a characteristic of the temporal structure of the data rather than evidence of model misspecification.

Potential endogeneity represents a common challenge in observational tourism research, particularly when using secondary longitudinal data. Changes in hotel demand may be influenced by omitted factors such as global tourism recovery, macroeconomic conditions, airline capacity, exchange rate fluctuations, fuel prices and destination-specific marketing activities. To reduce the likelihood of omitted-variable bias, the regression models incorporated a linear time trend to capture long-term tourism growth and a war dummy variable representing the geopolitical shock associated with the 2023–2024 Israel–Hamas conflict. These controls were intended to account for temporal changes and isolate the association between Israeli inbound tourism and hotel performance in Cyprus and Greece. Nevertheless, as with most observational studies, endogeneity cannot be completely eliminated and the estimated relationships should therefore be interpreted as statistically robust associations rather than definitive causal effects.

Table 1 Descriptive Statistics

The descriptive statistics provide an initial overview of tourism activity in the Eastern Mediterranean over the period 2015 to 2025 and highlight the markedly different volatility patterns between Israel, Greece, and Cyprus. Israel records an average of 203,394 monthly tourist arrivals, with values ranging from as low as 600 to as high as 485,500 arrivals. This exceptionally wide range, coupled with a large standard deviation of 138,610, reflects the country's acute vulnerability to geopolitical disruptions, which can trigger abrupt collapses in inbound tourism. In contrast, tourism activity in Greece is substantially larger in scale, averaging 10.26 million nights per month, with figures ranging from 66,553 to 33.94 million nights. The very high standard deviation (10.12 million) is expected for a destination characterised by strong seasonality, but it also suggests that Greece's hotel sector experiences pronounced fluctuations that may be partially amplified during regional crises. Cyprus displays

a similar but more moderate pattern, with monthly hotel nights averaging 1.24 million and ranging between 1,103 and 2.95 million, accompanied by a standard deviation of 906,569. Overall, these figures indicate that while Israel shows extreme volatility driven largely by geopolitical shocks, Greece and Cyprus also exhibit substantial fluctuations in accommodation demand, suggesting that regional instability including conflict events centred in Israel may exert broader spillover effects across neighbouring tourism-dependent economies.

Mean Comparisons (Pre, War, Post)

The mean comparison results reveal substantial shifts in tourism patterns during the 2023 to 2024 Israel and Hamas conflict. Prior to the war (pre-period), Israel received on average 231,248 tourists per month, while Greece and Cyprus recorded mean monthly hotel nights of 9.39 million and 1.16 million, respectively. During the war period (October 2023– March 2024), Israel's inbound tourism collapsed to an average of only 80,141 tourists per month, representing

a decline of approximately 65% relative to pre-war levels. This dramatic contraction reflects the immediate sensitivity of Israel's tourism sector to geopolitical instability.

Greece and Cyprus also experienced notable reductions during the war period, although to a lesser extent. Average monthly hotel nights in Greece dropped from 9.39 million to 3.45 million, a fall of around 63%, while Cyprus saw a reduction from 1.16 million to 1.49 million (approximately –29%), capturing the wider regional spillover of the geopolitical shock. These results indicate that although the conflict was territorially concentrated in Israel, nearby Mediterranean destinations were indirectly affected through intensified risk perception and travel uncertainty. In the post-war period, all three destinations show signs of recovery. Israel rebounded to an average of 107,418 tourists per month, while Greece and Cyprus
experienced sharp rebounds to 15.16 million and 1.73 million hotel nights respectively. The particularly strong post-war performance of Greece and Cyprus suggests a compensatory or delayed tourism surge, potentially driven by pent-up travel demand, diversion from riskier zones, and renewed market confidence. Overall, the pattern supports the conclusion that major geopolitical shocks in Israel trigger immediate and severe declines in inbound tourism to Israel, accompanied by observable though more moderate spillover effects in neighbouring tourism-dependent economies such as Cyprus and Greece.

The independent-samples t-tests reveal statistically meaningful (significant as well or only meaningful) differences between war and non-war periods in regional tourism activity. Israel experienced the strongest effects: average monthly tourist arrivals declined from 211,124 during non-war months to 64,250 during the war period, a reduction of approximately 69%, which is statistically significant ($t = 2.589$, $p = 0.011$). Greece also shows a significant reduction in hotel nights during the conflict, falling from 10.64 million to 3.46 million nights on average ($t = 4.166$, $p = 0.002$, unequal variances assumed). This confirms that the Israel–Hamas war generated regional spillover impacts,

depressing tourism demand beyond Israel itself. Cyprus exhibits a similar negative pattern, with hotel nights decreasing from 1.27 million to 0.70 million, although this difference is only marginally significant (t = 2.198, p = 0.068). Overall, the results support the conclusion that geopolitical instability centred in Israel significantly disrupts tourism flows across the Eastern Mediterranean, with particularly pronounced consequences for Israel but also substantial effects for neighbouring Greece and Cyprus.

Correlations

Correlations

		Israel_arrivals_actual	Greece	Cyprus

	Sig. (2-tailed)		.169	.004
	N	114	113	113
Greece	Pearson Correlation	.130	1	.923**
	Sig. (2-tailed)	.169		.000
	N	113	113	113
Cyprus	Pearson Correlation	.268**	.923**	1
	Sig. (2-tailed)	.004	.000	
	N	113	113	113

**. Correlation is significant at the 0.01 level (2-tailed).

The correlation analysis provides *valuable insight into the co-movement of tourism activity* across the Eastern Mediterranean. Israel's inbound tourism shows no significant correlation with hotel nights in Greece (r = .130, p = .169), indicating that fluctuations in Israel do not typically align with those in Greece during *non-crisis periods*.. However, Israel exhibits a weak but statistically significant positive correlation with Cyprus (r = .268, p = .004), suggesting that both destinations *are partially influenced by common regional demand drivers* and may respond similarly to broader geopolitical conditions.The strongest relationship emerges between Greece and Cyprus, which display an exceptionally high positive correlation (r = .923, p <.001), reflecting their *highly synchronised seasonality patterns*, shared tourism markets, and similar exposure to regional travel dynamics. Collectively, these results show that while Israel's tourism behaves more independently and is is *particularly sensitive to geopolitical shocks*, Greece and Cyprus move together as part of a *highly integrated regional tourism system*. This supports the broader interpretation that geopolitical instability centered in Israel produces not only direct disruptions within Israel but also *significant spillover effects* across its neighbouring

Mediterranean destinations.

	Israel_arrivals_actual	1.745	.596	.268	2.926	.004

a. Dependent Variable: Cyprus

The regression analyses highlight important differences in how Israel's tourism trends influence nearby Eastern Mediterranean destinations. For Greece, the effect of Israel's inbound arrivals is weak and statistically insignificant (B = 9.478, p = .169), with the model explaining only 1.7% of variance (R^2 = .017), indicating that Israeli tourism fluctuations do not meaningfully predict hotel demand in Greece. In contrast, Israel's arrivals have a significant positive effect on hotel activity in Cyprus (B = 1.745, p = .004), with the model accounting for 7.2% of variance (R^2 = .072). This demonstrates that Cyprus is more sensitive to Israel's tourism patterns, likely due to greater geographical proximity and shared regional travel dynamics. Overall, the results suggest that while Israel's geopolitical shocks do not directly transmit to Greece through regular tourism flows, they have a measurable and statistically significant effect on Cyprus.

	trend	106948.897	34031.139	.346	3.143	.002

a. Dependent Variable: Greece

The multiple regression model examining the determinants of hotel nights in Greece is statistically significant ($F(3,109) = 4.708$, $p = .004$), explaining 11.5% of the variance ($R^2 =$ .115). When controlling for seasonality (month_num) and long-term trends (trend), Israel's inbound tourism emerges as a significant positive predictor of hotel nights in Greece ($B = 20.534$, $p = .012$). This indicates that increases in Israeli tourist arrivals are associated with higher accommodation demand in Greece, even after adjusting for time effects. The war dummy variable is negative and marginally significant ($B = –8046837.973$, $p = .059$), suggesting that the 2023–2024 conflict exerted a downward pressure on Greek hotel

performance, although the effect is weaker once controls are included. The trend variable is positive and statistically significant (B = 1,069,488.897, p = .002), confirming a long-term upward pattern in Greek tourism independent of geopolitical disturbances. The conflict in Israel affects Greece modestly but detectably. Israeli tourism flows contribute positively to Greek hotel demand, while the war period depresses activity somewhat although long-term upward trends mitigate this effect. This indicates that Greece experiences regional spillover, but the relationship is less direct than in Cyprus.

b. Predictors: (Constant), trend, WAR_DUMMY_ISRAEL, Israel_arrivals_actual

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	68691.447	281962.686		.244	.808
	Israel_arrivals_actual	2.943	.691	.451	4.259	.000
	WAR_DUMMY_ISRAEL	-527355.073	364237.238	-.131	-1.448	.151
	trend	10577.345	2940.047	.382	3.598	.000

a. Dependent Variable: Cyprus

The model for Cyprus shows a stronger fit, explaining 17.6% of the variance (R^2 = .176) and is highly significant (F(3,109) = 7.765, p < .001). Israel's inbound tourism exerts a strong, statistically significant positive effect on Cyprus hotel nights (B = 2.943, p < .001). The war dummy variable is negative but not statistically significant (B = –5,273,555.073, p = .151), indicating that once controls are added, the war itself does not independently predict Cyprus hotel activity as strongly as the general collapse in Israel's tourism does. The trend variable is again significant and positive (B = 10,577.345, p < .001), suggesting long-term growth in the Cypriot hotel sector. Cyprus shows a clear and robust linkage with Israeli tourism trends. When Israel experiences a tourism decline, Cyprus hotel demand also decreases consistent with close geographical ties, overlapping source markets, and shared regional risk exposure. The significant coefficient for Israel arrivals confirms a direct measurable spillover effect of Israel's geopolitical instability on Cyprus.

The multiple regression models provide strong evidence that Israel's geopolitical instability reshapes tourism patterns across the Eastern Mediterranean. Israel's inbound arrivals significantly predict hotel demand in both Greece and Cyprus, but the effect is substantially stronger in Cyprus. The war dummy variable negatively affects both destinations, though it is marginal in Greece and not independently significant for Cyprus once controls are considered. Importantly, long-term trends remain positive for both countries, indicating that while geopolitical crises create short-term disruptions, underlying tourism growth trajectories persist. Overall, the results confirm that Israel's geopolitical shocks generate measurable regional spillover effects, with Cyprus being the most directly affected and Greece experiencing secondary but still detectable influences.

a. Based on the assumption that the series are not cross correlated and that one of the series is white noise.

Israel tourist arrivals towards Greece hotel nights

The highest cross-correlation occurs at Lag = +2 (r = 0.143), although the correlation is relatively weak. The contemporaneous relationship (Lag = 0) is r = 0.130, which is identical to the Pearson correlation reported earlier. This suggests that changes in Israeli tourist arrivals are only weakly associated with hotel nights in Greece, with a possible delay of approximately two months. However, the magnitude of the correlation remains low throughout the lag structure, indicating that Greece's hotel market is relatively

resilient to fluctuations in Israeli tourism demand. This finding is consistent with the regression analysis, which showed that Israeli arrivals did not significantly predict hotel nights in Greece in the simple regression model ($p = .169$), although the relationship became significant after controlling for the war period and long-term trend.

Israel tourist arrivals towards Cyprus hotel nights

The strongest relationship is observed at Lag = 0 ($r = 0.268$), representing the highest cross-correlation across all examined lags. The correlations at Lag = +1 ($r = 0.245$) and Lag = −1 ($r = 0.228$) are also relatively strong, indicating that the relationship is concentrated around the same period rather than occurring after a prolonged delay. These findings suggest that changes in Israeli tourism are reflected almost immediately in Cyprus's hotel market, supporting the hypothesis that Cyprus is more directly exposed to geopolitical spillover effects because of its geographical proximity and stronger tourism linkages with Israel. This result also reinforces the regression findings, where Israeli tourist arrivals remained a statistically significant predictor of hotel nights in Cyprus in both the simple regression ($\beta = .268$, $p = .004$) and the multiple regression model ($\beta = .451$, $p < .001$).

5. Discussion of Findings

The findings of the present study reveal *systematic and differentiated effects* of the 2023–2024 Israel–Hamas conflict on tourism and hotel performance across the Eastern Mediterranean, reinforcing the *structural sensitivity* of tourism systems to geopolitical instability. Israel experienced the most pronounced shock, with inbound tourism collapsing during the conflict period, reflecting *well-documented crisis-response patterns in tourism demand*. This outcome provides strong empirical support for Risk Perception Theory, which posits that tourist behaviour is highly elastic to perceived risk, particularly in high-visibility conflict environments where global media amplification intensifies uncertainty (Seabra et al., 2013; Cui et al., 2016). *Importantly, the findings suggest that perceived risk operates as a leading indicator of demand contraction, often preceding the full dissemination of objective information* (Grigoriadis et al., 2025).

The observed contraction in hotel nights in Cyprus and Greece demonstrates that the consequences of the conflict extend beyond the immediate conflict zone. Both the mean

comparisons and t-test results indicate statistically significant declines—*more pronounced in Greece and moderately transmitted to Cyprus*—during the conflict period. These findings are consistent with Crisis Spillover Theory, which conceptualises crises as *regionally transmitted shocks mediated through perception, connectivity, and information flows* (Duan et al., 2022; Seyfi et al., 2026). The results further align with the broader literature suggesting that tourists assess risk at a *regional rather than national level*, particularly in geopolitically sensitive contexts such as the Eastern Mediterranean.

However, the differential magnitude of decline between Cyprus and Greece suggests that spillover effects are *heterogeneous and structurally conditioned*. This finding extends Crisis Spillover Theory by demonstrating that *spillover intensity is not solely a function of geographic proximity, but of destination-specific absorptive capacity, market diversification, and structural resilience* (Kazakova & Kim, 2021). In this respect, the study contributes to the literature by introducing a *differentiated spillover framework* that accounts for variation in impact across neighbouring destinations.

The regression results provide further insight into the transmission mechanisms underlying these dynamics. The strong association between Israeli inbound tourism and hotel nights in Cyprus indicates a *high degree of bilateral tourism interdependence*, suggesting that Cyprus functions as a *proximate demand-linked system* to Israel. This is partially consistent with Tourism Demand Substitution Theory; however, the findings reveal important boundary conditions. While substitution may occur under conditions of moderate instability, *the present results demonstrate that under high-intensity geopolitical shocks, substitution effects are attenuated or reversed*, leading instead to *regional demand contraction*. This nuance advances the theoretical literature by identifying *threshold effects in substitution behaviour*, where perceived regional risk surpasses a critical level.

In contrast, Greece exhibits a weaker dependence on Israeli tourism flows, reflecting a *more diversified and structurally resilient tourism economy*. This supports existing research indicating that *destination size, market diversification, and global demand integration act as buffers against geographically concentrated shocks* (Papagianni et al., 2024; Lee et al., 2021). The persistence of Israeli tourism as a statistically significant

predictor in the multivariate models, even after controlling for trend and seasonality, reinforces the interpretation that *geopolitical instability operates as a systemic regional risk signal*.

From a macro-perspective, these findings align with Geopolitical Risk Theory, which posits that heightened geopolitical tensions generate *broad-based economic and mobility disruptions that extend beyond national borders* (Caldara & Iacoviello, 2022). The statistically significant war dummy variable confirms the presence of a *structural break*, indicating that the conflict exerted an independent and negative effect on hotel performance, beyond cyclical or seasonal influences.

At the same time, the positive trend coefficients for Cyprus and Greece confirm the presence of *underlying structural growth trajectories in Mediterranean tourism*, suggesting that while geopolitical shocks induce sharp short-term contractions, the system retains *adaptive capacity and recovery potential*. This dual dynamic *short-term vulnerability coupled with long-term resilience* is central to understanding tourism system behaviour under crisis conditions.

Overall, the findings demonstrate that geopolitical shocks in Israel *propagate through interconnected regional tourism systems rather than remaining spatially contained*. Cyprus, as a closely linked destination, exhibits higher sensitivity, whereas Greece demonstrates moderated but still significant exposure. By employing *high-frequency, destination-level data*, the study addresses a critical gap in the literature, which has predominantly relied on aggregated or annual data.

The integration of Risk Perception Theory, Crisis Spillover Theory, Tourism Demand Substitution Theory, and Geopolitical Risk Theory provides a *multi-layered theoretical framework* for interpreting these findings. *Rather than operating in isolation, these theoretical lenses interact to explain the non-linear, threshold-based, and spatially differentiated mechanisms through which geopolitical instability reshapes regional tourism demand.*

6. Conclusion

Using high-frequency monthly data and a longitudinal analytical framework, the research demonstrates that the 2023–2024 Israel–Hamas conflict generated

substantial and statistically significant disruptions in tourism demand, both within Israel and across neighbouring destinations.

The findings extend beyond descriptive analysis by revealing *systemic interdependencies and asymmetric spillover effects* between Israel, Cyprus, and Greece. The results confirm that geopolitical shocks are transmitted through *regional perception mechanisms and structural tourism linkages*, rather than being confined to the origin of the conflict.

Importantly, the study advances theoretical understanding by demonstrating that *tourism demand substitution is conditional and non-linear*, occurring only under limited levels of perceived risk, while severe geopolitical crises produce *region-wide demand suppression*. Furthermore, the persistence of positive trend effects highlights the *long-term resilience of Mediterranean tourism systems*, despite exposure to recurrent external shocks.

By combining multiple theoretical perspectives with high-frequency empirical analysis, the study provides a *comprehensive and integrative explanation of regional tourism dynamics under geopolitical stress*. It thus contributes to both the *theoretical advancement* and the *empirical refinement* of tourism crisis literature.

7. Research Recommendations

Building on the current study's findings, several avenues for future research emerge. First, although this analysis used monthly secondary data, future studies could incorporate *higher-frequency and real-time datasets* such as weekly flight occupancy, search engine trends, or booking platform data to more precisely capture traveller responsiveness during conflict escalation phases. Incorporating airline route changes, seat capacity data, and regional connectivity metrics could further illuminate how *supply-side adjustments and network disruptions* mediate spillover effects.

Second, future research should explore traveller sentiment and behavioural intention data, including social media analytics, news sentiment modelling, or survey-based measures of perceived risk. Such work would strengthen the

empirical operationalisation of Risk Perception Theory and provide a more direct linkage between perceived risk and observed behavioural outcomes.

Third, extending the geographic scope of analysis to include Turkey, Egypt, Lebanon, and Jordan would provide a broader understanding of *multi-country regional interdependencies*. Comparative analysis could reveal whether spillover intensity differs across *institutional contexts, geopolitical alignments, or cultural proximity*.

Fourth, applying advanced time-series econometric techniques such as structural break models and *interrupted time-series analysis* could deepen causal inference and clarify temporal lag effects. This would enable researchers to determine whether spillover impacts emerge immediately, gradually, or persist beyond conflict periods, thereby identifying *dynamic adjustment mechanisms in tourism demand*.

Finally, qualitative or mixed-methods studies involving hotel managers, tourism boards, and airlines could complement quantitative findings by uncovering *adaptive strategies, managerial decision-making processes, and crisis-response mechanisms* that are not directly observable in numerical datasets. This would enhance the *managerial and policy relevance* of future research.

8. Managerial (Corporate) Recommendations

The findings of this study offer several practical insights for hotel managers and tourism authorities in Cyprus and Greece. First, the significant regression relationships between Israel's inbound tourism and hotel nights—*particularly in the case of Cyprus*—suggest that geopolitical developments should be systematically integrated into forecasting models, pricing strategies, and capacity planning. Hotels should incorporate *geopolitical risk monitoring* into revenue management systems, using early warning indicators to anticipate demand fluctuations.

Second, given the demonstrated spillover effects, tourism stakeholders should prioritise *source market diversification strategies* to reduce

vulnerability to geographically concentrated shocks. Greece already benefits from a diversified demand structure, while Cyprus could enhance resilience by expanding its presence in Northern and Western European markets and strengthening long-haul segments.

Third, enhancing crisis communication strategies is critical. Clear and consistent messaging regarding safety, accessibility, and operational continuity can mitigate *regional risk generalisation effects*. Tourism authorities should coordinate with international stakeholders to ensure that *conflict narratives do not disproportionately affect destination image*.

Fourth, hotels and tourism authorities should invest in *operational flexibility and adaptive capacity*, including dynamic pricing, flexible staffing models, and targeted short-term promotional campaigns to stabilise demand during periods of uncertainty.

Fifth, collaboration across the tourism value chain—*including hotels, airlines, tour operators, and destination management organisations*—should be strengthened. Joint marketing initiatives, coordinated crisis-response mechanisms, and shared risk-management strategies can accelerate recovery and reduce volatility.

Beyond these general strategies, the empirical findings suggest more targeted actions. For hotel managers, the significant relationship between Israeli arrivals and Cyprus hotel demand ($\beta = .451$, $p < .001$) indicates that geopolitical indicators should be incorporated into *real-time occupancy forecasting and revenue optimisation models*. For national tourism organisations, reducing dependence on regionally concentrated markets is essential. Cyprus, which exhibits the strongest spillover sensitivity, should pursue *strategic market rebalancing*, while Greece should continue leveraging its diversified portfolio.

Destination management organisations should establish *integrated and rapid-response communication frameworks* capable of addressing shifts in

international risk perception. Because the findings demonstrate that risk perceptions extend beyond the conflict zone, coordinated communication among ministries, airports, airlines, and industry stakeholders is essential.

Finally, policymakers should incorporate *systematic geopolitical risk assessment* into national tourism resilience strategies. Continuous monitoring of geopolitical risk indices, airline capacity, booking behaviour, and regional tourism flows would enable earlier intervention and more effective strategic planning.

Proposed Conceptual Model: Geopolitical Spillover Framework

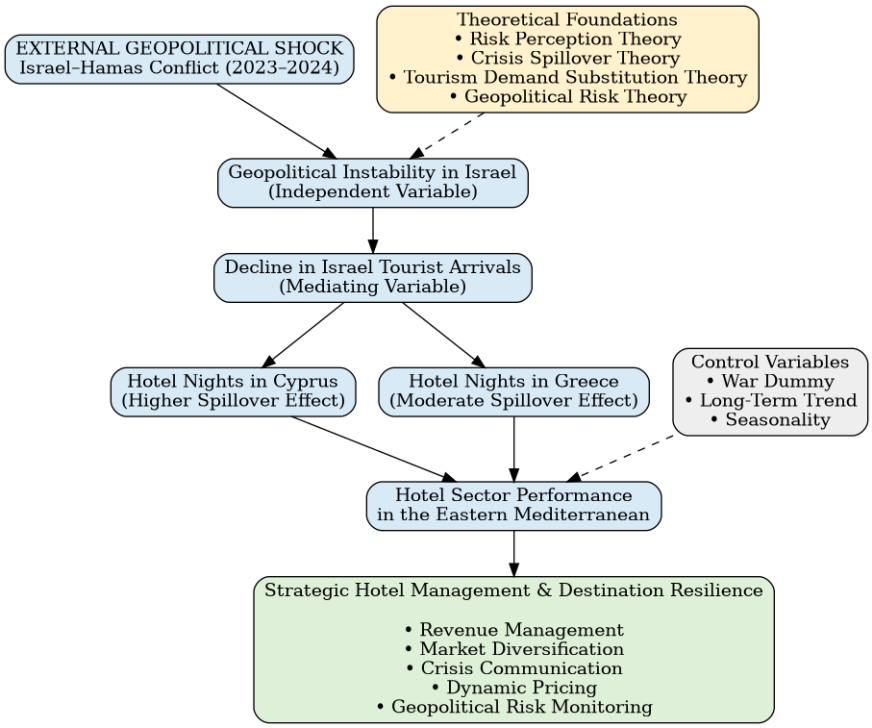

Figure 1. Proposed Conceptual Framework of Geopolitical Spillover Effects on Hotel Performance in the Eastern Mediterranean (Developed by the Authors).
The figure presents the conceptual framework developed from the empirical findings of this study.

The proposed conceptual framework *integrates empirical findings with theoretical*

perspectives to model the transmission of geopolitical shocks across interconnected tourism systems. It conceptualises the Israel–Hamas conflict as an *exogenous geopolitical shock* that reduces inbound tourism in Israel and generates *differentiated spillover effects* in Cyprus and Greece.

The framework incorporates key moderating variables, including *seasonality, long-term trends, and structural characteristics of destinations*, which influence the magnitude of impact. It is grounded in Risk Perception Theory, Crisis Spillover Theory, Tourism Demand Substitution Theory, and Geopolitical Risk Theory, which collectively explain the behavioural and systemic mechanisms underlying tourism demand shifts.

Importantly, the framework extends existing theory by introducing a *multi-layered and non-linear interpretation of spillover dynamics*, highlighting that spillover intensity depends on *destination resilience, interdependence, and perceived regional risk thresholds*. It also identifies managerial implications related to *risk monitoring, diversification, and adaptive strategy development*, thereby linking theory with practice.

9. Limitations

The independence of residuals was evaluated using the Durbin–Watson statistic, with values of 0.410 (Greece) and 0.356 (Cyprus), indicating the presence of positive autocorrelation. This is *consistent with the temporal structure of longitudinal tourism data*, where demand exhibits persistence across time periods. While this does not necessarily indicate model misspecification, it highlights the limitations of ordinary least squares estimation in time-series contexts.

A further limitation concerns potential endogeneity arising from omitted variables not captured in the dataset. Factors such as macroeconomic conditions, airline connectivity, exchange rates, and destination marketing may also influence hotel demand. Although trend and conflict-period controls partially address this issue, future studies should incorporate *broader explanatory variables or advanced econometric techniques* to

improve causal inference.

The relatively modest explanatory power of the models further suggests that tourism demand is influenced by *a complex set of interacting determinants*. Accordingly, the results should be interpreted as evidence of *significant but partial spillover effects*, rather than a singular causal mechanism.

Future research could employ *Vector Autoregression (VAR), Granger causality, or panel data models* to capture dynamic interdependencies and reciprocal relationships between variables. Expanding the model to include additional macroeconomic and tourism-specific indicators would further strengthen robustness.

LUXURY HOSPITALITY IN SOUTHERN FRANCE: NAVIGATING THE SUSTAINABLE TRANSITION

Travasi, Alessio[1]; Musso, Fabio[1]; Mayrhofer, Ulrike[2]

[1]Department of Economics, Society, Politics, University of Urbino Carlo Bo, Urbino, Italy

[2]IAE Nice, Université Côte d'Azur, Nice, France

Keywords: Luxury Hospitality, Sustainable Hospitality Management, Multiple Case Study, French Riviera.

Introduction

In the realm of luxury hospitality, sustainability has evolved from a niche preference to a critical indicator of quality and prestige. Historically associated with excess and abundance, the luxury sector is now under intense scrutiny to reconcile exclusivity with environmental responsibility; high-end travellers increasingly demand ethical transparency without compromising comfort, forcing luxury hotels to innovate. Given that luxury properties typically have a higher carbon footprint per guest compared to standard accommodation, the shift towards sustainable operations is imperative for maintaining social license and brand equity.

Purpose, Aim and Objectives

This study aims to investigate how the luxury hotel sector on the French Riviera is integrating sustainability into its value proposition. The research is driven by three key objectives: *i)* to explore how luxury hotel managers perceive the trade-off between opulence and eco-efficiency; *ii)* to identify specific barriers hindering sustainable practices in high-end environments; and *iii)* to determine whether sustainability initiatives act as a genuine competitive differentiator in the luxury market. A central focus is placed on comparing the strategies of independent luxury boutique hotels versus those belonging to international luxury chains.

Literature Review and Theoretical Framework

The study draws upon the triple bottom line sustainability framework – environmental, social, and economic – adapted for the luxury context. Literature highlights a tension in luxury hospitality: while guests expect premium services, they also seek meaningful, responsible

experiences. In terms of economic and environmental sustainability, technological advancements – including AI, IoT, and renewable energy systems – are cited as key enablers for both reducing waste and costs without diminishing the guest experience; social sustainability (e.g., fair labour, community engagement etc.) is equally critical for the human-centric service model of luxury hotels (Juvan et al., 2026).

Methodology and Methods

A qualitative multiple-case study design was employed to enable an in-depth analysis of the sector (Yin, 2009). Data were collected through semi-structured interviews with general managers of 14 luxury hotels located on the French Riviera. Using purposeful sampling (Suri, 2011), the study focused on five-star and palace hotels with established environmental commitments, including both properties managed by international luxury groups and independent family-owned establishments. Data were analysed following a grounded theory approach (Gioia et al., 2013), allowing the identification of distinct patterns in luxury management practices.

Main/Expected Findings and Contribution

The findings reveal that while sustainability is a priority across the board, the implementation strategies diverge significantly. Luxury hotels belonging to major groups leverage significant capital to deploy high-tech solutions, such as AI-driven energy management systems and advanced water recycling plants, effectively hiding sustainability behind technology to maintain seamless service. Conversely, independent luxury hotels, lacking comparable financial muscle, focus on artisanal sustainability. They emphasize exclusivity through deep ties with local culture, such as sourcing hyper-local organic food and eliminating single-use plastics in favour of bespoke, locally crafted amenities. The study finds that while groups use sustainability to meet corporate compliance, independent luxury hotels use it to narrate a story of authenticity and heritage.

Originality and Value

This research contributes to hospitality literature by dissecting the ownership luxury paradox of the French Riviera: global brands pursue eco-technological efficiency, while independent icons pursue eco-cultural authenticity. This distinction provides a novel framework for understanding how different ownership structures interpret luxury in the age of sustainability.

Research Limitations

The study is geographically confined to the French Riviera, a mature luxury destination, which may limit the applicability of the findings to emerging luxury markets. Nevertheless, the framework of eco-technological efficiency and eco-cultural authenticity may be conceptually transferable to other established high-end coastal destinations facing similar sustainability pressures. Furthermore, the focus on top-tier luxury properties may restrict the transferability of the findings to broader upscale and premium hospitality segments.

Theoretical and Practical Implications

Theoretically, the study challenges the notion that luxury and sustainability are incompatible, proposing a model where sustainability enhances rather than dilutes exclusivity. In the long term, these sustainability-driven positioning strategies are likely to dictate brand survivability and resilience, transforming corporate compliance into market-leading brand equity for chains, and cementing deep-rooted guest loyalty for independent hotels. Practically, the findings suggest that independent luxury hoteliers should double down on their unique asset – i.e. local identity – rather than trying to compete with chains on technological infrastructure. For policymakers, the results highlight a need to support independent luxury properties through incentives for heritage preservation and energy retrofitting, which are often more complex in historic independent buildings than in modern chain hotels.

PERCEIVED SOCIAL PRESENCE AND TRUST IN AI-ENABLED HOSPITALITY SERVICES:

BEYOND TECHNOLOGY ACCEPTANCE MODELS

Wahbi, Marwan[1]; El Sahili, Hanine[2]

[1]Management, Marketing, and Entrepreneurship Track, Suliman Olayan School of Business, American University of Beirut, Beirut, Lebanon

[2]Management, Marketing, and Entrepreneurship Track, Suliman Olayan School of Business, American University of Beirut, Beirut, Lebanon

Abstract

Artificial intelligence (AI)-enabled services can improve the efficiency and personalisation of hotel experiences, yet their adoption remains challenging in a service context traditionally characterised by human interaction. Drawing on the technology acceptance models and social presence theory, this study examines how functional, cognitive, normative, trust-based, and socio-relational evaluations shape behavioural intention to use AI-enabled hotel services. A cross-sectional online survey generated 111 usable responses from Millennial and Generation Z consumers.

The proposed model was tested using partial least squares structural equation modelling (PLS-SEM) in SmartPLS 4. It explained 83.9% of the variance in behavioural intention. Perceived social presence was its only significant direct predictor ($\beta = .592$, $p < .001$). Perceived usefulness had the largest total effect ($\beta = .609$, $p < .001$), but its influence operated predominantly through social presence. Perceived trust strongly influenced perceived usefulness, while ease of use, subjective norm, and cognitive instrumental process contributed through sequential indirect pathways involving usefulness and social presence.

The study extends technology-acceptance research by positioning social presence as the proximal mechanism through which functional value translates into behavioural intention. Managerially, the findings indicate that hotels should combine demonstrable functional benefits and trustworthy performance with appropriately designed social responsiveness and accessible human support.

Keywords: Artificial intelligence, Hotel services, Technology Acceptance Model, Perceived social presence, Perceived trust, Perceived usefulness, Behavioural intention, PLS-SEM.

Introduction

The hotel sector is increasingly integrating AI-enabled services, including chatbots, virtual assistants, and service robots, to improve efficiency, personalisation, and guest experience (Liao et al., 2025). Nevertheless, the hospitality industry is historically rooted in interpersonal relationships and the overall guest experience, with the standard of service determined by the quality of human interaction and emotional connection (Kandampully et al., 2018). An AI service may therefore be technically valuable yet remain unattractive when the interaction feels difficult, unreliable, impersonal, or socially unresponsive (Jayawardena et al., 2023).

Technology acceptance research has traditionally explained adoption through perceived usefulness (PU) and perceived ease of use (PEOU). Later extensions incorporated social, cognitive, and trust-related factors that shape users' attitudes and behavioural intention (BI) toward technology use (Davis, 1989; Venkatesh and Davis, 2000). Recent hospitality research has introduced perceived trust (PT) and perceived social presence (PSP) to account for the relational qualities of AI-mediated service encounters (Al-Oraini, 2025; Prakash et al., 2023).

In AI-enabled hospitality, these constructs are often treated as parallel predictors, offering a limited explanation of how functional value becomes translated into behavioural intention within a socially sensitive service encounter. Comparatively little attention has been given to PSP as a mechanism linking usefulness with willingness to use AI-enabled service, while PT's role in strengthening usefulness remains insufficiently integrated into this process.

This study examines an extended technology acceptance model using survey data from 111 Millennial and Generation Z consumers and PLS-SEM. It contributes by positioning PSP as a proximal socio-relational mechanism through which functional value translates into behavioural intention, while clarifying perceived trust's upstream role in strengthening usefulness.

Background of Study and Research Objectives

Established technology acceptance models in hospitality: Theoretical underpinnings and challenges

The Technology Acceptance Model explains technology adoption primarily through perceived usefulness (PU) and perceived ease of use (PEOU). PU concerns whether a technology enhances performance or service outcomes, whereas PEOU concerns whether its use requires

minimal effort. Both shape behavioural intention (BI), and ease of use can enhance usefulness by allowing users to recognise and obtain the technology’s benefits (Davis, 1989).

Subsequent framework extensions integrated dimensions of social impact, cognitive-instrumental mechanisms, and the underlying drivers of user-friendliness (Venkatesh & Davis, 2000; Venkatesh & Bala, 2008). They were designed to clarify how societal norms and individual assessments of a system's performance dictate its behavioural intention. Collectively, these developments acknowledge that the decision to embrace technology is shaped by factors beyond simple utility. The user's mental processing, their social context, and their prior hands-on experience with the tool also affect their behavioural intention.

Nevertheless, hospitality AI research often examines these variables through fragmented or parallel configurations rather than as interdependent mechanisms (Kong et al., 2023; Begum et al., 2025). This is limiting in hotel services. Users evaluate chatbots, virtual assistants, and robots based on their efficiency and the quality of the interaction they create. For example, AI-enabled systems may offer speed, improved service accuracy, and a user-friendly interface, but fail in interacting and communicating with guests (Al-Hyari et al., 2023).

This study examines subjective norm (SN) and cognitive instrumental process (CIP) as antecedents of PEOU. While social validation can provide the necessary legitimacy for a novel system, a user’s mental self-assurance and conceptual grasp typically minimise the friction associated with learning and implementation. This enhanced PEOU then serves to improve perceived usefulness (PU). Furthermore, perceived trust (PT) introduces a relational dimension: users may overlook an AI system's utility if they doubt its reliability, accuracy, or data security. Consequently, trust is theorised to amplify PU by lending credibility to the service's actual functional worth (Mou et al., 2017; Prakash et al., 2023).

Modern AI platforms often utilise conversational dialogue and vocal expressions to create a sense of "perceived social presence" (PSP) through human-like cues (Prakash et al., 2023). These features shift the criteria for technology adoption beyond strictly practical assessments, such as utility or ease of use, toward whether the encounter feels socially interactive and emotionally responsive. These cues can evoke feelings of warmth and engagement when tuned effectively. However, if a system mimics humans too closely, it might trigger unease or a defensive response (Mende et al., 2019). Consequently, perceived trust (PT) and PSP serve distinct roles: PT deals with a system's dependability and credibility, while PSP focuses on the interpersonal quality of the interaction.

The potential role of perceived social presence in AI acceptance in the hotel industry

Social presence refers to the extent to which another actor is perceived as salient within an interaction (Short et al., 1976). Within AI-enabled services, it reflects whether an artificial agent is experienced as attentive, responsive, engaging, and socially present (Kreijns et al., 2022; Prakash et al., 2023). For example, a hotel chatbot that provides contextually relevant responses or a concierge robot that communicates through appropriate verbal and non-verbal cues may create a stronger sense of social interaction.

The “Computers Are Social Actors” perspective similarly proposes that people apply interpersonal expectations to technological agents (Nass and Moon, 2000). Ferdig and Mishra (2004) further show that users may experience emotional reactions, such as frustration or dissatisfaction, toward computers resembling those arising in interpersonal encounters. Furthermore, Yoganathan et al. (2021) and Prakash et al. (2023) have linked social presence in hospitality with trust, emotional responses, service evaluations, loyalty, and behavioural intention. These findings demonstrate that users respond to AI-enabled hotel services socially, particularly when the technology occupies a service role traditionally performed through interpersonal interactions.

However, PSP has been frequently treated as an outcome of anthropomorphic design or as an additional predictor operating alongside established technology-acceptance variables (Al-Oraini, 2025). Less attention has been devoted to whether it explains how functional usefulness becomes translated into BI. An accurate and helpful AI service may be experienced not only as useful but also as attentive and socially responsive (Yoganathan et al., 2021). PSP may, therefore, be the proximal mechanism connecting functional value with willingness to use the service.

This study, therefore, integrates TAM with trust and social-presence mechanisms. It assesses the antecedents of PEOU, PU, and PSP; their direct relationships with BI; and the mediating and sequential indirect pathways through which the constructs contribute to AI-service acceptance.

Methodology

Conceptual model and hypotheses

The conceptual model integrates the fundamental beliefs of the Technology Acceptance Model (TAM) with cognitive, normative, trust-based, and socio-relational mechanisms

relevant to AI-enabled hotel services. Perceived usefulness (PU) refers to the degree to which a guest feels that an AI-driven service elevates the overall standard or efficiency of their stay at a hotel. In contrast, perceived ease of use (PEOU) reflects the expectation that interacting with the technology will be straightforward and demand little mental or physical exertion. Together, these two dimensions serve as indicators of a system's practical utility, operational success, and inherent simplicity (Begum et al., 2025). Consistent with TAM, both constructs are expected to contribute to behavioural intention (BI), while PEOU is also expected to strengthen PU because technologies that are easier to operate are more likely to be perceived as functionally valuable (Davis, 1989; Venkatesh and Davis, 2000).

Being particularly important in AI-enabled service encounters, the model further incorporates perceived trust (PT) and perceived social presence (PSP) to account for relational and social dimensions. PT reflects users' confidence that an AI-enabled service is reliable, secure, and capable of performing as expected, given how AI systems handle personal data, make recommendations, or mimic human decision-making (Bhuiyan et al., 2024). Trust may strengthen PU by reducing uncertainty surrounding the technology and increasing the credibility of its functional benefits (Mou et al., 2017; Prakash et al., 2023).

Rooted in social presence theory, Perceived Social Presence (PSP) refers to the extent to which an interaction with an AI system is perceived as socially interactive, engaging, and personified (Kreijns et al., 2022). This dimension illustrates how anthropomorphic encounters, affective synchronisation, and empathic connections collectively shape a user's intention to use the technology. In the proposed model, PU is expected to strengthen PSP because an AI service that responds accurately and provides relevant assistance may be experienced as more attentive and socially engaging. PSP is subsequently expected to enhance BI.

Drawing on later extensions of technology-acceptance research, the model also incorporates subjective norm (SN) and cognitive instrumental process (CIP). SN represents perceived social expectations or support concerning the use of AI-enabled hotel services. CIP captures users' self-efficacy and effort-related cognitive evaluations of these services. Both constructs are expected to enhance PEOU by reducing the perceived cognitive effort associated with understanding and using AI-enabled service technologies (Begum et al., 2025). Therefore, the model suggests that BI is influenced by functional, cognitive, normative, relational, and social evaluations through both direct and sequential indirect pathways.

The conceptual model positions PSP as a central mechanism through which the functional value of AI-enabled hotel services may translate into a socially enriched hotel experience and stronger behavioural intention. Accordingly, the following table demonstrates our research hypotheses:

H1a	PSP positively influences BI toward using AI-enabled hotel services.
H1b	PU positively influences BI toward using AI-enabled hotel services.
H1c	PEOU positively influences BI toward using AI-enabled hotel services.
H2a	PT positively influences PU of AI-enabled hotel services.
H2b	PEOU positively influences PU of AI-enabled hotel services.
H3	PU positively influences PSP of AI-enabled hotel services.
H4a	CIP positively influences PEOU of AI-enabled hotel services.
H4b	SN positively influences PEOU of AI-enabled hotel services.
H5	PSP mediates the relationship between PU and BI toward using AI-enabled hotel services.
H6a	PU and PSP sequentially mediate the relationship between PT and BI toward using AI-enabled hotel services.
H6b	PU and PSP sequentially mediate the relationship between PEOU and BI toward using AI-enabled hotel services.

Table 1: Research Hypotheses

The model also examines the downstream indirect effects of CIP and SN on PU, PSP, and BI through the theoretically specified sequence of relationships. Accordingly, our proposed conceptual model is presented in Figure 1 below.

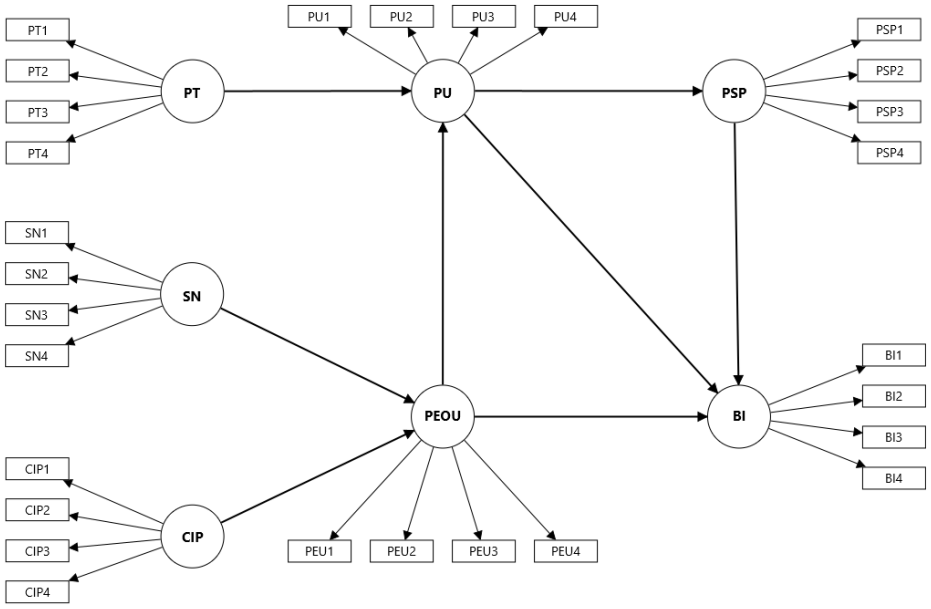

Figure 1: Proposed Conceptual Model

Data collection and sampling techniques

A quantitative, cross-sectional online survey was used to examine the technological, cognitive, relational, and social factors associated with consumers' intention to use AI-enabled hotel services. Convenience and snowball sampling recruited Millennial and Generation Z respondents, who were selected because of their familiarity with digital and AI-enabled services (Chin et al., 2024). Initial participants shared the survey with eligible members of their networks. Although this approach facilitated access to the target population while ensuring consistent questionnaire presentation, it was non-probability-based and may overrepresent digitally connected respondents, limiting representativeness and population-level generalisability (Emerson, 2015; Evans and Mathur, 2018). The findings should therefore be interpreted as exploratory concerning the relationships among the constructs within the sampled population rather than as population-level estimates for all hotel consumers.

The questionnaire contained 28 reflective indicators measuring the seven constructs in the conceptual model. The measurement items were adapted from established scales: PU and PEOU from Davis (1989); BI from Davis et al. (1989); SN from Venkatesh and Davis (2000) and Kaushik et al. (2015). CIP was operationalised through items measuring respondents' self-efficacy and effort-related cognitive evaluations of AI-enabled customer service, adapted from Venkatesh (2000) and Venkatesh et al. (2003). PT items were adapted from Gefen (2002), Kim et al. (2011), and Prakash et al. (2023), while PSP items were adapted from Gefen and Straub (2004), Toader et al. (2020), and Al-Oraini (2025). All items were contextualised to AI-enabled hotel customer service.

Responses were gathered using a five-point Likert scale, ranging from 1 = "strongly disagree" to 5 = "strongly agree." To ensure ethical standards, participation was entirely voluntary and anonymous, with all respondents providing informed consent before starting. A preliminary pilot study with ten participants confirmed the instrument's viability, leading only to minor phrasing adjustments for better readability. The data collection window lasted for one month. The study required that participants had interacted with or were aware of AI-powered customer service and had stayed in a hotel within the past year. Once collected, the data were checked for outliers and completeness before the PLS-SEM modelling. In total, 111 usable responses were included in the final analysis, with a clean dataset showing no missing values across the 28 indicators.

Data analysis approach

The model was analysed using PLS-SEM in SmartPLS 4 because the study was explanatory and theory-extending (Ringle et al., 2024). The proposed research model sought to explain variance in BI while estimating a model containing multiple latent constructs and sequential indirect relationships among technological, cognitive, normative, relational, and social variables (Ramayah et al., 2018). All seven constructs were specified as reflective measurement models.

The measurement model was evaluated through indicator loadings, Cronbach's alpha, rho_A, composite reliability, and average variance extracted (AVE). Discriminant validity was assessed through the heterotrait–monotrait ratio of correlations (HTMT). The structural model was evaluated using inner variance inflation factors (VIF), path coefficients, and coefficients of determination (R^2), along with effect sizes (f^2), total effects, and specific indirect effects. Additionally, the standardised root mean square residual (SRMR) was calculated to provide a supplementary measure of the overall model fit. Significance was evaluated through 5,000 bias-corrected and accelerated bootstrap samples using two-tailed tests at .05. Because PLSpredict was not conducted, R^2 is interpreted as in-sample explanatory power rather than out-of-sample predictive performance.

Main Findings and Results

Measurement-model assessment

The measurement-model results demonstrated satisfactory reliability and convergent validity. All indicator loadings were significant and ranged from .524 to .945. Two PEOU indicators loaded below .70 but were retained because PEOU demonstrated acceptable composite reliability, AVE, and content coverage. Cronbach's alpha ranged from .825 to .942, rho_A from .847 to .943, composite reliability from .820 to .942, and AVE from .541 to .801. HTMT values ranged from .311 to .896, and no bootstrapped interval included 1.00, although the PT–PU value approached .90. Inner VIF values ranged from 1.000 to 3.335. The saturated and estimated SRMR values were .063 and .086, respectively; accordingly, interpretation emphasises measurement quality, structural relationships, and explanatory power.

Structural-model results and direct effects

The structural model explained substantial variance in its principal endogenous constructs. The R^2 values were .761 for PEOU, .851 for PU, .453 for PSP, and .839 for BI. PSP was the

only significant direct predictor of BI (β = .592, p < .001), whereas the direct effects of PU (β = .211, p = .152) and that of PEOU (β = .216, p = .102) on BI were nonsignificant. PT positively predicted PU (β = .661, p < .001), PEOU positively predicted PU (β = .321, p = .008), and PU positively predicted PSP (β = .673, p < .001). CIP (β = .671, p < .001) and SN (β = .327, p < .001) both positively predicted PEOU. $H1_a$, $H2_a$, $H2_b$, H3, $H4_a$, and $H4_b$ were therefore supported, whereas $H1_b$ and $H1_c$ were not.

Figure 2 below shows the complete structural model results.

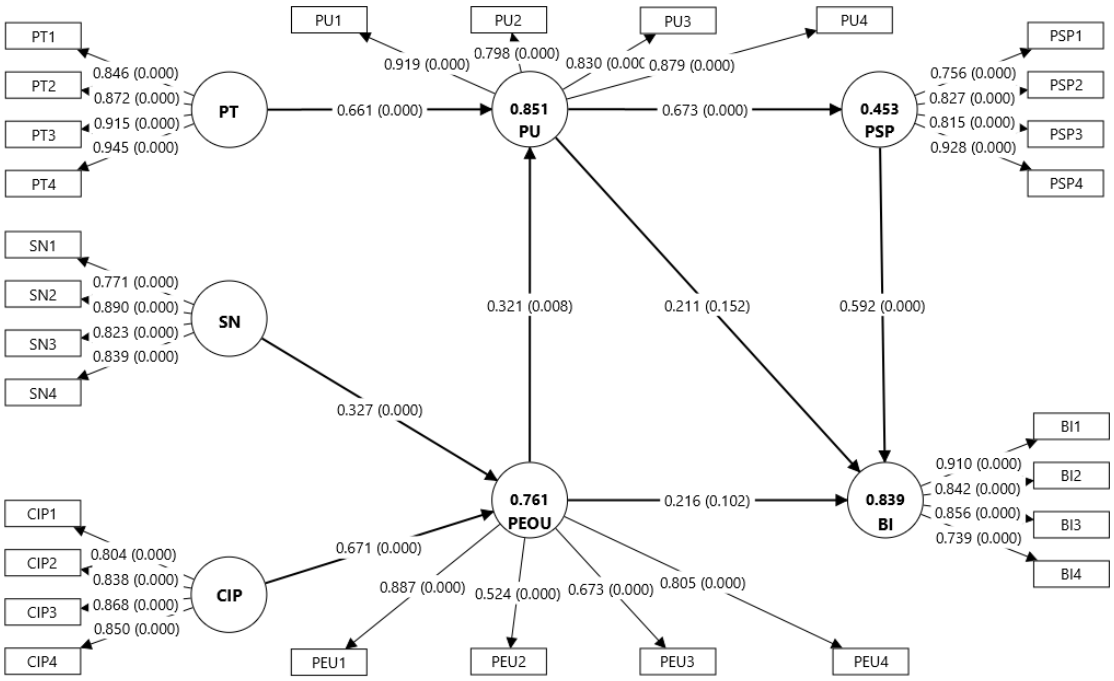

Figure 2: Structural model results (SmartPLS 4)

Indirect and total effects

PSP mediated the PU–BI relationship (β = .398, p < .001), supporting H5. PEOU had a significant sequential indirect effect through PU and PSP (β = .128, p = .010), supporting $H6_b$. PT also influenced BI through PU and PSP (β = .263, p < .001), supporting $H6_a$, whereas its shorter indirect effect through PU alone was nonsignificant (β = .139, p = .151). Trust, therefore, appears to influence behavioural intention not merely by increasing perceptions of usefulness, but by enabling usefulness to be experienced as a more socially engaging AI interaction.

CIP and SN also exerted significant downstream effects on BI through PEOU. Their total indirect effects were β = .276 (p = .001) and β = .134 (p = .010), respectively, while their corresponding serial pathways through PEOU, PU, and PSP were β = .086 (p = .015) and β =

.042 (p = .050), respectively. Collectively, these results suggest that cognitive instrumental evaluations and normative influences contribute to behavioural intention indirectly: they enhance PEOU, which strengthens PU and subsequently PSP before influencing BI. The findings therefore reinforce the central role of PSP as the proximal mechanism through which these supporting TAM-related antecedents translate into behavioural intention.

The total effects further illustrate these mechanisms. PU had the largest total effect on BI (β = .609, p < .001), followed by PSP (β = .592, p < .001), PEOU (β = .411, p < .001), PT (β = .402, p < .001), CIP (β = .276, p = .001), and SN (β = .134, p = .010). Taken together, the findings identify PSP as the principal direct predictor of BI and as the central mediating mechanism through which PU influences behavioural intention. PT, PEOU, CIP, and SN also contribute to BI through sequential indirect pathways that ultimately operate through PSP. These findings suggest that social presence acts as the proximal mechanism transforming users' functional, cognitive, relational, and normative evaluations of AI-enabled hotel services into their behavioural intention.

Theoretical Contribution and Managerial Implications

Theoretical contribution

Prior research has established PU, PEOU, PT, SN, and CIP as central explanations of BI (Davis, 1989; Venkatesh and Davis, 2000; Mou et al., 2017). Hospitality research has also recognised perceived social presence (PSP) as relevant to guests' responses to service robots, chatbots, and other AI-enabled interfaces (Yoganathan et al., 2021; Prakash et al., 2023). However, these constructs have frequently been examined as parallel or additive predictors, offering a limited explanation of how functional, cognitive, normative, and relational evaluations combine to produce acceptance in a service context traditionally characterised by interpersonal interaction. This study offers a more process-oriented account.

First, within the estimated model, neither PU nor PEOU directly predicted BI; PSP was the only significant direct predictor. This finding challenges an exclusively functional interpretation of technology acceptance and indicates that, within AI-enabled hotel services, perceptions of usefulness and ease may be insufficient to generate behavioural intention unless the interaction is also experienced as socially responsive, engaging, and human-like.

Second, although PU had the largest total effect, it operated predominantly through PSP. Thus, usefulness should not be viewed only as a terminal belief that directly generates intention. In

human-centred service settings, functional value may need to be translated into a socially meaningful interaction before it produces willingness to use the technology. This positions PSP as a proximal socio-relational mechanism connecting the instrumental value of AI-enabled services with behavioural intention.

Third, the findings clarify the theoretically distinct roles of perceived trust (PT) and PSP. PT strongly enhanced PU but did not influence BI through PU alone. Its effect became significant through the sequential pathway PT → PU → PSP → BI. Trust, therefore, appears to validate the credibility and functional value of the AI service, whereas PSP converts that value into a socially engaging experience that supports intention. This distinction integrates trust-based extensions of TAM with social presence theory without treating trust and social presence as interchangeable constructs.

Finally, subjective norm (SN) and cognitive instrumental process (CIP) emerged as distal antecedents rather than immediate drivers of BI. Both enhanced PEOU and subsequently influenced PU, PSP, and BI through sequential indirect pathways. The study therefore advances a process-oriented account of acceptance in which normative and cognitive evaluations facilitate ease of use, ease strengthens usefulness, and usefulness contributes to intention through social presence.

The study, therefore, integrates TAM and social presence theory by positioning PSP as the proximal mechanism linking instrumental evaluations with behavioural intention. This contribution is bounded by the cross-sectional, non-probability sample of digitally familiar Millennial and Generation Z respondents and is most applicable where AI supplements or replaces traditionally interpersonal hotel services.

Managerial implications

Hotel executives, customer-experience managers, and technology providers should jointly manage usefulness, trust, and social presence. Chatbots, virtual assistants, and service robots should deliver clear practical value through faster replies, reliable information, personalised support, and continuous assistance. They should also use context-aware wording, conversational continuity, and prompt acknowledgement of requests to convey measured social responsiveness. However, human-like cues should communicate responsiveness rather than imitate employees excessively, because exaggerated anthropomorphism may create discomfort or appear manipulative.

Trust in AI-enabled hotel services should be reinforced through clear data-governance practices, consistent system performance, explainable recommendations, and straightforward routes to human assistance. Guests need to understand what data are gathered, why they are used, and under what conditions an automated response can be reconsidered by staff. The key managerial tension lies in balancing personalisation with privacy: richer data may enhance usefulness and social responsiveness, but it can also heighten perceived risk.

Finally, onboarding instructions, demonstrations, staff endorsement, and intuitive interfaces should be adapted to guests' digital familiarity and task sensitivity. Operationally, the strongest strategy is therefore not to replace human service indiscriminately, but to combine functional efficiency, calibrated social interaction, transparent trust-building, and human support. This approach can increase adoption while protecting the relational character of the hotel experience.

Conclusion

This study shows that AI-service acceptance in hotels depends on more than functional value. PSP directly predicted BI and mediated the influence of PU, while PT, PEOU, SN, and CIP contributed through sequential indirect mechanisms. The findings distinguish trust as an antecedent of usefulness from social presence as the mechanism translating usefulness into adoption intention. This suggests that the functional value of AI-enabled hotel services may be insufficient to generate behavioural intention unless it is translated into an interaction that users perceive as responsive, engaging, and socially present.

Several limitations qualify these conclusions. The cross-sectional, self-reported design cannot establish temporal or causal ordering and may be affected by common-method variance and social-desirability bias. The non-probability sample of 111 Millennial and Generation Z respondents limits representativeness, while BI does not establish actual use. Treating chatbots, virtual assistants, and robots as one category may conceal differences in embodiment, task sensitivity, privacy risk, and interpersonal intensity. Two PEOU indicators had comparatively low loadings, suggesting that the measurement of this construct could be refined. The reflective specifications, causal ordering, and lack of out-of-sample prediction also constrain interpretation.

Future research may use longitudinal, experimental, and field designs, link perceptions with actual usage or booking behaviour, and employ broader probability-based samples. Studies

should compare specific AI technologies and manipulate social cues, transparency, privacy risk, task sensitivity, and human-escalation options to identify when social presence supports or undermines acceptance. Alternative specifications, measurement invariance, improved PEOU and CIP measures, endogeneity remedies, and out-of-sample prediction would further test the robustness and boundaries of the model.

ADVANCING RURAL WOMEN'S SOCIAL ENTREPRENEURSHIP: HOW INNOVATION PROCESSES SHAPE STRATEGIC DECISION-MAKING

Georgios Afxentiou[1]

[1] Georgios Afxentiou Research Laboratory, Larnaca, Cyprus

Keywords: Innovation processes, strategic decision-making, women social entrepreneurs, rural development.

Abstract

This research examines how innovation processes and strategic decision-making are fundamental to rural venture creation. Drawing on the Get Ready to Innovate (GRTI) model, this conceptual study adapts its innovation framework to assess the significance of women entrepreneurs' strategic decision-making during the proposed Session 5 in designing and implementing social ventures to support rural development. It contributes to the literature on rural entrepreneurship and women's social innovation by advancing a process-based understanding of how strategic thinking evolves under conditions of institutional constraints, resource scarcity, and socio-economic uncertainty. Furthermore, it offers theoretical implications for innovation research and practical insights for practitioners aiming to enhance rural women-led social ventures.

Introduction

Social innovation initiated by women in local communities is critical for ensuring long-term sustainability and future development. Women-led initiatives depend on processes that enable the generation and development of new ideas within local contexts. This conceptual study examines how social innovation processes enhance women entrepreneurs' strategic decision making in rural venture creation. Pozzebon and Fontenelle (2018) explained that social entrepreneurship and innovation meet social challenges and contribute to sustainable development. Bezerra-de-Sousa et al. (2022) explained that social innovation evolves through a complex process (Cloutier, 2003; Westley & Antadze, 2010), engaging many actors (Kolk & Lenfant, 2015; Phillips, Lee, Ghobadian, O'Regan, & James, 2015; Saji & Ellingstad, 2016) to meet social objectives. Belayutham et al. (2019), Vézina, Ben Selma, and Malo (2019), and

Foroudi, Akarsu, Marvi, and Balakrishnan (2020) argued that further research is necessary to examine social processes, whereas Carl (2020) emphasised the importance of understanding the phenomenon from a goal-oriented perspective.

The objectives are:

1. To examine the role of innovation processes in enhancing the strategic decision-making capabilities of women entrepreneurs engaged in rural social venture creation.
2. To develop the Get Ready to Innovate (GRTI) model by incorporating strategic decision-making into the proposed Session 5 as a fundamental component of the innovation process, thereby strengthening its application to rural social venture creation.

Research gap

While the original GRTI model provides a structured understanding of innovation processes, it does not explicitly explain how strategic decisions concerning institutional constraints, resource scarcity, and socio-economic uncertainty affect rural venture formation.

Literature review and theoretical framework

Biehle and Wilpert (2023) defined social innovation as an initiative of members of a civic society to meet the needs of a group or community that existing policies and public services do not adequately address (Moulaert and Mac-Callum 2019). A few examples of social issues include employment, poverty, housing, climate, and health care, and is targeted toward groups in great need (Zulkefly, 2021; Engelke et al., 2015; Kostetska and Berezyak, 2014; Mulgan, 2006).

The Get Ready to Innovate (GRTI) model is adopted in this study to examine how women's strategic decision-making during the proposed Session 5 can support the development of social ventures.

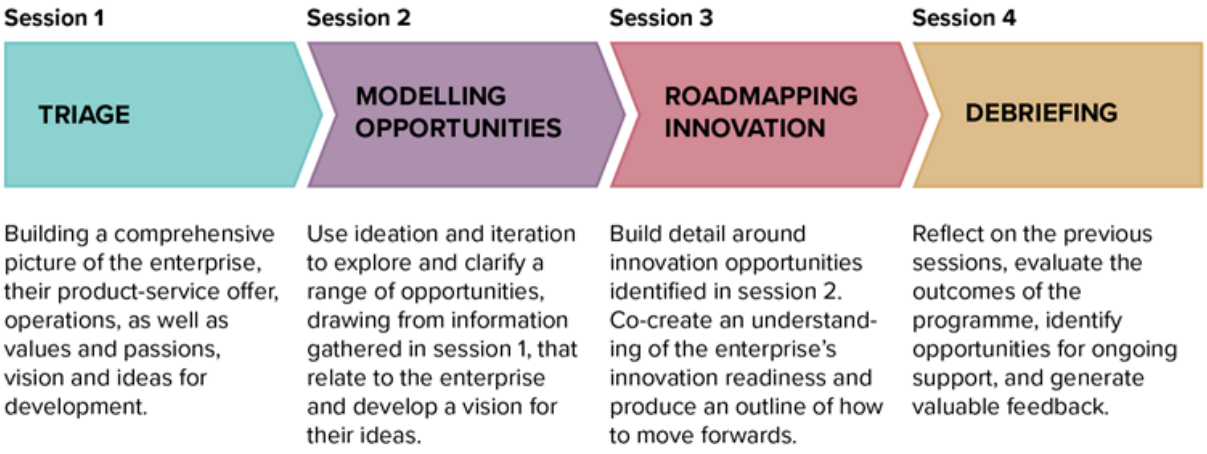

Figure 1: GRTI model, Source: Hemstock et al. (2022)

Methodology and methods

The GRTI model and literature on social innovation and strategic decision-making constitute the theoretical foundation of this study. The model has been designed and validated by the School of Design at Northumbria University. It was implemented in the North East UK, Yerevan, Armenia and Birmingham, United States. During these phases, the design facilitators and participants had the opportunity to analyze business profiles, trace their needs, identify innovation opportunities, and reflect on the outcomes of the sessions (Hemstock, 2022).

Expected findings and contribution

The expected findings should provide both a theoretical and practical framework for understanding the significance of strategic decision-making on the formulation of social ventures while addressing the pressing needs of a community.

Originality and value

The study's originality is grounded in the significance of strategic-decision making within the innovation processes using a validated model to enhance the sustainability of social ventures.

Research limitations

An empirical testing of the impact of strategic decision-making in the innovation phases could provide valuable insights about the social venture development.

STRATEGIC RISK ABSORPTION THROUGH CONSULTING IN INNOVATION PROCESSES

Turgut, Gokhan
Université du Québec à Montréal, Montréal, Canada

Keywords: Strategic risk, management consulting, innovation, dynamic capabilities, risk governance, uncertainty, knowledge brokerage

Introduction

Innovation initiatives expose firms to technological, market, organisational and reputational risks. While innovation is essential for long-term competitiveness, many organisations struggle to balance opportunity seeking behaviour with disciplined risk management. Recent research emphasises the growing importance of strategic flexibility, adaptability and resilience in environments characterised by disruption and uncertainty.

Purpose, Aim and Objectives

This study aims to conceptualise management consulting as a strategic risk absorption and mitigation mechanism within innovation processes. The research addresses a gap in strategic management and risk governance literature by examining how external consultants contribute to innovation success beyond their traditional role as expertise providers. The central research question is: Through which mechanisms do consulting interventions reduce strategic risk and enhance strategic adaptability during innovation initiatives?

Literature Review and Theoretical Framework

The framework integrates dynamic capabilities theory, the knowledge-based view, institutional theory and risk governance literature. Dynamic capabilities research suggests organisations must sense opportunities, seize them and reconfigure resources under changing conditions. Recent work on strategic innovation and flexibility highlights the importance of adaptation capabilities in turbulent environments. Consulting research further identifies consultants as knowledge brokers, sensemaking agents and facilitators of organisational learning. Building on these streams, the study

argues that consultants operate as external risk governance actors who absorb uncertainty, legitimise strategic choices and structure experimentation processes.

Methodology and Methods

This paper adopts a conceptual theory-building methodology. A structured review and synthesis of literature from strategic management, innovation management, risk governance and management consulting are used to develop an integrative framework. The framework development process identifies recurring mechanisms discussed across theoretical perspectives and synthesises them into a set of conceptual propositions. Specifically, the analysis focuses on how consulting engagements contribute to innovation risk assessment, uncertainty reduction, organisational learning, strategic legitimacy and adaptive capability development.

Main Findings and Contribution

The conceptual analysis identifies four primary consulting-based risk absorption mechanisms: knowledge transfer, legitimacy creation, structured experimentation and adaptive capability development. Consultants reduce uncertainty by introducing specialised knowledge and external perspectives. They legitimise innovation decisions before internal and external stakeholders, thereby reducing political and organisational resistance. Through scenario planning, prototyping and pilot projects, consultants support structured experimentation that limits downside exposure. Finally, consultants contribute to organisational learning and capability development, improving firms' ability to manage future innovation risks. The study proposes that these mechanisms collectively transform consultants from advisory actors into strategic risk buffers.

Originality and Value

The originality of the study lies in reframing management consulting as an externalised strategic risk governance function. Rather than viewing consultants solely as providers of expertise, the framework positions them as absorbers and moderators of innovation-related uncertainty. This perspective integrates previously fragmented literature streams into a unified explanation of consulting value creation.

Research Limitations

The paper is conceptual and does not empirically test the proposed framework. Future research should examine the framework through qualitative case studies, comparative consulting engagements and quantitative testing across different innovation contexts. Boundary conditions including radical versus incremental innovation and consultant dependence should also be explored.

Theoretical and Practical Applications and Implications

The study contributes to theory by extending innovation and risk governance research to include external actors within strategic risk management processes. For practitioners, the framework provides guidance on designing consulting engagements that enhance innovation performance while controlling uncertainty. It highlights the governance structures and intervention mechanisms through which consulting can support responsible innovation and strategic adaptation.

AI ADOPTION IN SMES: A FRAMEWORK FOR PRACTITIONERS

Bounti, Antigoni-Josephina; Farmakis, Timoleon

Athens University of Economics and Business, Athens, Greece

Keywords: AI Adoption, SMEs, Digital Transformation, AI Automation, AI Augmentation, Design Science Research, Organisational Readiness.

Abstract

Digital transformation is a strategic priority for contemporary organisations, extending beyond technology adoption to changes in business processes and decision-making. Artificial Intelligence (AI) is widely recognised as a key enabler of this transformation, yet its adoption in small and medium-sized enterprises (SMEs) remains limited, constrained by scarce resources, fragmented data, limited expertise, and a lack of structured guidance. Established adoption theories explain why adoption occurs but offer little direction on how SMEs should operationalise it. This study develops and evaluates the AI Adoption Framework for SMEs, a structured, process-oriented methodology for adopting AI-enabled automation in resource-constrained environments. Grounded in a Design Science Research approach, the framework guides organisations through five phases: readiness assessment; process discovery and prioritisation; AI solution design and implementation; implementation planning and organisational embedding; and deployment, evaluation, and continuous improvement. Its applicability is demonstrated through a case study in a Greek SME and evaluated through structured expert feedback, illustrating its value for evidence-based decision-making, incremental adoption, and sustainable digital transformation.

Introduction

Digital transformation (DT) has become a strategic priority for contemporary organisations, extending beyond technology adoption to changes in processes, business models, and decision-making (Warner and Wäger, 2019; Doukidis et al., 2020). Artificial Intelligence (AI) is widely recognised as a central enabler of this transformation, shifting from isolated applications to integrated capabilities that reshape how work is performed and value is created (Davenport and Ronanki, 2018; Mikalef et al., 2019). This matters disproportionately for small and medium-sized enterprises (SMEs), which account for roughly 90% of businesses and over half of global employment (Sánchez et al., 2025); even incremental gains in their core processes carry substantial aggregate economic weight.

A substantial body of research explains why organisations adopt, or fail to adopt, AI. Established theories such as the Technology, Organization and Environment (TOE) framework and the Diffusion of Innovations (DOI) perspective identify the technological, organisational, and environmental

determinants of adoption (Zhu et al., 2006; Moore and Benbasat, 1991). In SMEs specifically, the literature consistently documents the barriers that constrain uptake: limited financial resources, scarce specialised skills, low data quality and fragmentation, legacy systems, and resistance to change (Ghobakhloo et al., 2012; Doukidis et al., 2024; Mohib et al., 2025; Sánchez et al., 2025).

What remains far less understood is how SMEs should operationalise adoption, how to move from a state of readiness to AI that is implemented, embedded in workflows, and generating measurable value. Despite increasingly accessible cloud-based and low-code tools (Farmakis, 2025), adoption in SMEs remains confined to isolated experimentation rather than systematic integration (Mikalef et al., 2019; Oludapo et al., 2024). Crucially, the dominant theoretical lenses are explanatory: TOE and DOI describe the conditions and perceptions surrounding adoption but offer limited prescriptive guidance on how AI-enabled automation should be designed, implemented, and scaled (Enholm et al., 2022). They are not constructed to be "tested" into an implementation method; re-applying them would, at best, re-confirm known determinants. The result is a structural gap between explanation and execution, and an absence of process-oriented methodologies covering the full adoption lifecycle in resource-constrained settings (Rai et al., 2019).

This gap has practical consequences. Without structured guidance, SMEs initiate AI projects without a clear understanding of their readiness or implementation requirements, which increases failure risk and leaves AI peripheral rather than transformative (Enholm et al., 2022; Oludapo et al., 2024). Access to AI technology alone is therefore insufficient; what is missing is a means of translating availability into integration and sustained value.

To address this gap, this study develops and evaluates the AI Adoption Framework for SMEs, a structured, process-oriented methodology that guides SMEs through AI-enabled automation under resource constraints, from readiness assessment through to continuous improvement. Rather than replacing TOE and DOI, the framework builds on them, translating their explanatory constructs into a prescriptive adoption pathway. The study adopts a Design Science Research (DSR) approach (Hevner et al., 2004; Peffers et al., 2007), demonstrating the artefact through a case study in a Greek SME and evaluating it through structured expert feedback. The research is guided by an overarching question, how can resource-constrained SMEs systematically adopt AI-enabled automation across the full lifecycle?, addressed through two sub-questions:

RQ1. How can SMEs assess their organisational, technical, data, and human readiness for AI-enabled automation and, on that basis, identify and prioritise the business processes most suitable for it, in a structured, evidence-based way?

RQ2. How can SMEs design, pilot, and evaluate AI solutions under uncertainty and limited tolerance for failure, balancing feasibility and managerial priorities across the adoption lifecycle to support staged, low-risk implementation and continuous improvement?

Theoretical Background and Related Work

AI adoption in SMEs

AI adoption in SMEs is increasingly characterised by experimentation, enabled by accessible cloud-based and user-friendly tools (Schwaeke et al., 2025). However, adoption remains fragmented, with technologies often introduced as stand-alone solutions that limit their digital transformation potential (Doukidis et al., 2020). Despite accounting for around 90% of businesses and over 50% of global employment, SMEs exhibit limited and uneven AI use in core processes (Sánchez et al., 2025). Only 6% of Greek SMEs and 8% across the EU have adopted AI in a structured way, although approximately 31% interact with AI tools; adoption rises with firm size, from 23% in micro-enterprises to 40% in medium-sized firms, reflecting differences in resources (National Bank of Greece Group, 2025). In practice, AI applications are concentrated in low-risk areas such as marketing and customer interaction, delivering incremental gains while remaining weakly embedded in workflows. Adoption therefore remains largely peripheral rather than transformative, exposing a persistent gap between technological availability and effective organisational integration, the gap this study addresses.

Barriers to AI adoption in SMEs

The literature identifies interrelated organisational, financial, data-related, technical, and infrastructural barriers that constrain AI adoption in SMEs (Ayinaddis, 2025). Organisational factors such as resistance to change, limited managerial awareness, and weak process ownership impede integration into core processes (Doukidis et al., 2020; Ghobakhloo and Iranmanesh, 2021). Financial constraints, limited capital, scarce human resources, and uncertainty regarding return on investment, reinforce cautious adoption (Mohib et al., 2025). Data-related challenges, including low data quality, fragmentation, and weak governance, limit feasibility and erode trust in AI outputs (Sánchez et al., 2025; Bianchini and Lasheras Sancho, 2025). Technical and integration constraints, such as legacy systems and poor interoperability, increase complexity (Farmakis et al., 2025), while insufficient infrastructure in data storage, cloud maturity, cybersecurity, and computational capacity further restricts deployment and scalability (Schwaeke et al., 2025). Critically, these barriers are interdependent rather than isolated: addressing them requires a sequenced, lifecycle approach rather than one-off interventions, a requirement that motivates the framework developed in this study.

Existing frameworks and the gap between explanation and execution

Research on AI adoption has drawn extensively on established technology-adoption theories, most prominently the Technology, Organization and Environment (TOE) framework and the Diffusion of Innovations (DOI) perspective (Tornatzky and Fleischer, 1990; Rogers, 2003; Zhu et al., 2006; Moore

and Benbasat, 1991). Together they offer complementary structural and behavioural explanations of adoption.

TOE conceptualises adoption as the outcome of interactions between three contextual dimensions, technological, organisational, and environmental conditions (Zhu et al., 2006). Applied to AI in SMEs, the technological dimension captures data availability and quality, system compatibility, and infrastructure; the organisational dimension encompasses leadership support, skills, financial capacity, and readiness for change; and the environmental dimension reflects regulatory requirements, competitive pressure, and access to innovation ecosystems (Sánchez et al., 2025; Mohib et al., 2025). TOE thus provides a systematic lens for explaining why adoption is more or less likely and why outcomes vary across firms.

Complementing this structural focus, DOI explains adoption as a behavioural and temporal process shaped by managerial perceptions, learning, and experience, emphasising innovation attributes such as relative advantage, compatibility, complexity, trialability, and observability (Moore and Benbasat, 1991; Rogers, 2003). In SMEs, where decisions are closely tied to the attitudes of owners and managers and to limited risk tolerance, trialability and observability are particularly influential, encouraging pilots and proofs-of-concept rather than large-scale commitment (Ghobakhloo et al., 2012; Mohib et al., 2025). DOI therefore helps explain why AI adoption often progresses incrementally and stalls at early experimentation.

Despite their explanatory power, both perspectives share a fundamental limitation: they describe the determinants and dynamics of adoption but offer little guidance on how organisations should move from readiness and experimentation toward structured implementation, process integration, and systematic evaluation (Enholm et al., 2022; Sánchez et al., 2025). They are explanatory rather than prescriptive, and are not designed to be operationalised, or "tested", into an implementation method. This gap between explanation and execution is especially consequential for AI, where value depends on coordinated changes across workflows, decision routines, and governance rather than on the adoption decision itself (Oludapo et al., 2024). Although prior research recognises the importance of experimentation, pilot implementation, and iterative learning (Rai et al., 2019), it does not connect these elements into a coherent adoption pathway. This distinction has a direct methodological implication. Empirically retesting TOE or DOI, for instance by confirming which contextual factors predict adoption in a given sample (Sánchez et al., 2025), would clarify why adoption varies but would not, in itself, tell an SME how to assess its readiness, select processes, design pilots, or embed solutions. Retesting is therefore a legitimate but different research objective: it produces explanatory knowledge, whereas the problem identified here calls for prescriptive, design knowledge. This study therefore treats TOE and DOI as a tested diagnostic foundation and, through a Design Science Research approach, operationalises their constructs, such as contextual readiness conditions and

diffusion mechanisms like trialability and observability, into an actionable, sequenced methodology for the full AI adoption lifecycle in SMEs.

Research Methodology

This study adopts a Design Science Research (DSR) approach (Hevner et al., 2004; Peffers et al., 2007). DSR is well suited to the research problem because the gap identified is prescriptive rather than explanatory: the objective is not to explain the determinants of AI adoption, which TOE and DOI already do, but to design and evaluate an artefact that helps SMEs act on those determinants. DSR addresses real-world problems through the construction and evaluation of artefacts (constructs, models, methods, or instantiations), balancing practical relevance with scientific rigour (vom Brocke et al., 2020). The artefact developed here is a method artefact: the AI Adoption Framework for SMEs. Accordingly, the study does not test hypotheses derived from TOE or DOI; it constructs and evaluates an artefact that operationalises their insights. This is a design problem rather than an explanatory one, and selecting the paradigm that fits the question is itself a condition of rigour (Hevner et al., 2004).

The research follows the canonical DSR process, problem identification and motivation, definition of objectives, design and development, demonstration, evaluation, and communication. Table 1 maps each phase to the methods and activities applied and the corresponding outputs, providing a transparent account of how theoretical insights, empirical evidence, and design decisions were integrated.

DSR Phase	Activities	Outputs
Problem Identification & Motivation	Literature review; analysis of SME constraints; exploratory interviews and observations	Defined problem; identified gaps; justification for methodology
Definition of Objectives	Research questions; artefact requirements; key components (readiness, prioritisation, implementation, evaluation)	Framework objectives, expected outcomes, and success criteria
Design & Development	Framework design; structuring of phases and activities; development of tools (e.g., scorecards, templates)	AI adoption framework; structured methodology; supporting tools
Demonstration	Application in the SME context; execution of selected phases; use of empirical data	Application in the SME context; execution of selected phases; use of empirical data
Evaluation	Case-based demonstration; evidence of feasibility and applicability	Evaluation results: strengths, limitations, and refinement insights
Communication	Documentation and presentation of the framework and findings	Communicated framework; academic and practical contributions

Table 1: Research Approach & Methodology

Generating the framework

The framework was not derived deductively from a single theory but synthesised from multiple inputs through the DSR cycle. In the problem-identification phase, a review of AI-adoption and digital-transformation literature, combined with analysis of SME-specific constraints and exploratory

observation in the case organisation, established the design problem and its boundary conditions. These insights were translated into artefact requirements: the framework had to be process-oriented, incremental, technology-agnostic, and explicitly constrained by typical SME limitations, limited resources, fragmented data, informal processes, and scarce expertise, which were embedded as design assumptions rather than treated as exceptions.

The framework's structure follows directly from these requirements. Each of the five phases was designed to address a distinct class of challenge identified in the literature and to produce well-defined intermediate outputs that serve as inputs to the next phase, ensuring traceability between diagnosed problems, design decisions, and evaluation activities. Supporting tools, the AI readiness scorecard, the pain-point and task-suitability templates, the prioritisation criteria, and the governance and roadmap templates, were developed to make each phase operational. The artefact was then refined iteratively: case demonstration surfaced practical adjustments, while structured expert feedback informed targeted clarifications, consistent with the cycle of relevance and rigour central to DSR.

Case selection and data collection

The framework was demonstrated through a single in-depth case study in a Greek SME operating in the automotive retail sector. The organisation was selected because it exhibits constraints typical of many SMEs, low digital maturity, heavy reliance on manual data handling, fragmented information systems, and limited automation, making it a representative, information-rich setting in which to instantiate and observe the framework. Within DSR, a single demonstration case is an accepted means of establishing the feasibility and applicability of an artefact; the aim is analytical insight into how the framework operates in context, not statistical generalisation (Peffers et al., 2007; vom Brocke et al., 2020).

Evidence was collected through triangulated qualitative methods: analysis of process documentation and workflows, direct observation of operations, and semi-structured interviews with leadership and operational staff. Selected phases were instantiated in practice, including a bounded proof-of-concept pilot used to evaluate feasibility, usability, and organisational fit. Because the later phases depend on longer-term, post-deployment conditions that exceeded the study's timeframe, their evaluation was complemented by structured feedback from three experienced practitioners, a Head of Technology and AI, a senior consultant at a global professional-services firm, and an SME-focused transformation consultant. This expert evaluation provides an additional, independent assessment of the framework's realism and transferability, partially mitigating the limitations of a single case.

Results and Discussion

The primary artefact is the AI Adoption Framework for SMEs (Figure 1): a five-phase, iterative methodology that guides SMEs through AI-enabled automation while progressively building

capability and minimising risk. Each phase produces outputs that feed the next, ensuring traceability from problems to evaluation. It was demonstrated in the case organisation, with observations reported alongside each phase.

Figure 1: AI Adoption Framework for SMEs (iterative five-phase methodology)

Phase 1: Readiness assessment

Phase 1 establishes an evidence-based view of the SME's preparedness through four activities: maturity assessment across organisational, technical, and data dimensions from triangulated evidence; leadership and employee interviews or surveys to capture perceptions not visible in structural analysis; strategic goals and resources to translate priorities into automation objectives within resource constraints; and the AI Readiness Scorecard (Table 2), which yields a differentiated readiness profile. In the case, this profile showed a fragmented environment with low data maturity and limited advanced skills, defining the scope for later phases.

Dimension	Criteria	Key Indicators	Rating (1 to 5)
Organisational	Leadership commitment	Executive support, AI vision, resource allocation	1 to 2: ad hoc / 3: limited / 4 to 5: strong, consistent
	Strategic alignment	AI linked to strategy, roadmap, automation priorities	1 to 2: none / 3: partial / 4 to 5: fully integrated
	Governance & policy	Roles, accountability, compliance	1 to 2: informal / 3: inconsistent / 4 to 5: clear governance
	Change management	Communication, employee involvement	1 to 2: high resistance / 3: basic / 4 to 5: strong capability
Technical	System integration	ERP/CRM integration, APIs, data flows	1 to 2: legacy/manual / 3: partial / 4 to 5: highly integrated
	Infrastructure maturity	Cloud, cybersecurity, scalability	1 to 2: outdated / 3: adequate / 4 to 5: stable, secure
	Automation capabilities	RPA/workflows, analytics usage	1 to 2: manual / 3: partial / 4 to 5: advanced
	Technology investment	Lifecycle, innovation budget	1 to 2: none / 3: ad hoc / 4 to 5: proactive
Data	Availability	Digital records, historical coverage	1 to 2: fragmented / 3: partial / 4 to 5: comprehensive
	Quality	Accuracy, completeness, structure	1 to 2: low / 3: mixed / 4 to 5: high-quality
	Accessibility	Retrieval, sharing, centralisation	1 to 2: siloed / 3: partial / 4 to 5: centralised
	Governance	Policies, GDPR, ownership	1 to 2: none / 3: partial / 4 to 5: strong
Human	Digital literacy	Basic tools, ERP/CRM usage	1 to 2: low / 3: moderate / 4 to 5: high
	Technical skills	IT, analytics, AI expertise	1 to 2: none / 3: limited / 4 to 5: strong
	Training & development	Programs, participation	1 to 2: none / 3: occasional / 4 to 5: structured
	Cultural openness	Attitudes, trust, job impact	1 to 2: resistance / 3: mixed / 4 to 5: high openness

Table 2: AI Readiness Scorecard

Phase 2: Process discovery and prioritisation

Phase 2 identifies, assesses, and prioritises automation opportunities at the process level. Process mapping documents core end-to-end processes through a high-level inventory and detailed “as-is” models. Pain-point identification then surfaces inefficiencies; in the case these were largely systemic, with spreadsheet-based coordination acting as an informal integration layer. Task-level suitability assessment judges whether the activities behind each pain point suit AI (Table 3), and prioritisation (Table 4) ranks suitable candidates across strategic alignment, organisational support, expected success, and deliverability into a ranked pilot portfolio.

Process	Observed pain point (inefficiency type)	Repet.	Data avail. & structure	Tech. feasib.	Org. readiness	AI suitability	Justification
Supplier invoice handling	Manual validation, reconciliation, cross-checking (error-prone; rework)	High	Medium	High	Medium	Suitable	Repetitive, rule-based; subject to data quality
Monthly market analysis	Spreadsheet tracking replacing system integration (duplication; no real-time visibility)	Medium	Medium	Medium	Medium	Conditionally feasible	Analytical decision support on structured data
Payment execution	Email-based approvals, informal coordination (delays; bottlenecks)	Medium	Low	Medium	Low	Not suitable (conventional automation)	Needs process redesign/integration before AI

Table 3: Combined pain-point and task-level AI suitability assessment

Dimension	Key question to answer	Examples of evaluation criteria
Strategic alignment	To what extent does this opportunity support core business objectives?	Contribution to revenue, efficiency, competitiveness, or strategic goals
Organisational support	Is there sufficient ownership and willingness to adopt this initiative?	Leadership commitment, stakeholder buy-in, change readiness
Expected success	Can the initiative deliver clear and measurable value?	Clarity of outcomes, ability to define KPIs, likelihood of results
Deliverability	Can it be implemented under current constraints?	Effort, complexity, integration needs, time to implement

Table 4: Guide for prioritising AI automation opportunities

Phase 3: AI solution design and implementation

Phase 3 translates prioritised opportunities into bounded, pilot-based solutions, validating feasibility before broader deployment. Use case specification defines each opportunity's business problem, process scope, target task or decision point, intended AI role, and success criteria, remaining technology-agnostic. Prerequisite validation acts as a feasibility gate on data, process stability, technical feasibility, and ownership. Pilot development and deployment implements use cases as prototypes or proofs-of-concept within existing workflows, favouring low-code, spreadsheet-compatible tools and human-in-the-loop configurations, with pilot evaluation judging usability, organisational fit, and decision-support value. In the case, a simple analytical proof-of-concept improved information structure, accessibility, and decision confidence, while revealing limitations such as manual data preparation that informed refinement.

Phase 4: Implementation planning and organisational embedding

Phase 4 marks the transition from experimentation to structured preparation for integration, translating pilot insights into realistic, constraint-grounded decisions. The definition of target-state processes specifies how validated AI interventions are embedded in workflows, clarifying task allocation between AI and humans and accountability. The identification of data, integration, and governance requirements documents data inputs, system interactions, and proportionate governance (ownership, accountability, the role of AI, access rights, and output validation). Change management and capability development provides training suited to SME constraints, while the phased roadmap (Table 5) sequences embedding from preparation to scaling, with dependencies, ownership, and decision gates.

Stage	Timeframe	Focus	Key actions	Decision gate
Stage 1	Month 1	Preparation	Data consolidation; clarify data ownership; confirm governance structures	Target-state conditions validated
Stage 2	Months 2 to 3	Initial embedding	Stable use of AI-supported analysis within existing decision routines	Usage quality and decision-support value confirmed
Stage 3	Month 4	Stabilisation	Monitor usage; refine outputs; clarify interpretation guidelines	Readiness for controlled extension assessed
Stage 4	Month 5	Controlled extension	Extend insights to additional roles under defined governance	Governance approval for expanded access

Table 5: Phased implementation and adoption roadmap (illustrative)

Phase 5: Deployment, evaluation, and continuous improvement

Phase 5 puts AI-enabled solutions into real use and sustains their value through monitoring, learning, and gradual improvement, treating deployment as the start of a learning process. Controlled deployment introduces solutions gradually within the roadmap scope, with minimal disruption and early stabilisation. Monitoring and evaluation assess whether solutions perform as intended and are used appropriately, through lightweight methods such as usage logs and managerial observation rather than complex KPI systems. Collection and analysis of user feedback captures how users interpret AI outputs and perceive usefulness, limitations, and trust. Refinement, scaling, and continuous improvement adjusts solutions on the evidence, treating scaling as conditional on demonstrated stability and readiness, and legitimising staying at pilot scale or pausing. Because the case did not reach live deployment, Phase 5 was evaluated through expert feedback, which confirmed its learning- and governance-oriented design and suggested clearer decision checkpoints.

Conclusions

Theoretical contributions

This study contributes to research on digital transformation and AI adoption in SMEs by shifting the analytical focus from the determinants of adoption to its process. Whereas TOE and DOI explain why adoption occurs, this study develops and evaluates a prescriptive, process-oriented artefact, the AI Adoption Framework for SMEs, that specifies how resource-constrained SMEs can progress from readiness assessment to implementation and continuous improvement (RQ1 and RQ2). In doing so, it addresses the gap between explanation and execution identified in the literature and conceptualises AI adoption as a staged, learning-driven progression rather than a single decision (Hussain and Rizwan, 2024; vom Brocke et al., 2020).

A central contribution concerns the reconceptualisation of organisational readiness. Rather than treating readiness as a fixed label produced by a one-time diagnosis, the framework frames it as a dynamic, observable construct that organisations can assess and act upon across organisational, technical, data, and human dimensions (RQ1). This makes readiness measurable and decision-relevant, translating a general notion into concrete, feasibility-defining constraints that guide subsequent phases.

The framework also contributes a structured account of how SMEs can move from readiness to a prioritised set of automation opportunities (RQ1) and how they can design, pilot, and evaluate AI solutions under uncertainty (RQ2). By separating organisational feasibility (Phase 1) from process-level suitability (Phase 2), the framework reduces a common weakness in both academic and practitioner approaches, selecting use cases because a technology is available rather than because a process genuinely warrants it. Treating implementation planning and organisational embedding as a distinct phase (RQ2) further extends existing frameworks, which often assume a linear transition from pilot success to full deployment and leave embedding underdeveloped (Oludapo et al., 2024). Relatedly, the framework foregrounds augmentation over full automation: by emphasising configurations that keep a human in the loop, together with decision support, it conceptualises AI in SMEs as a collaborative capability that complements rather than replaces human judgement (Mikalef et al., 2019; Mollick, 2024).

Methodologically, the study demonstrates how DSR principles can be applied in an SME digital-transformation context, maintaining academic rigour while remaining practically relevant by grounding the artefact in both theory and real organisational conditions. The combination of case-based demonstration and structured expert feedback shows how meaningful evaluation is possible even when full-scale, long-term deployment is not. Positioned against established digital-

transformation models, the framework operationalises transformation primarily at the business-process level, while functioning as an enabling mechanism for longer-term business-model change (Doukidis et al., 2020).

Business implications

The findings have practical implications for several audiences. For SME owners and managers, the framework offers an adoption path that does not presuppose deep technical expertise or large upfront investment; it emphasises that value depends less on selecting advanced tools and more on organisational readiness, process stability, and reliable data. Sequencing investment according to readiness helps managers avoid common and costly mistakes, investing in AI tools before foundational systems are in place, or automating poorly understood processes, and supports evidence-based prioritisation.

For consultants and advisors, the framework provides a repeatable structure for engaging SME clients: explicit phase boundaries, defined outputs, and clear decision points help steer conversations away from technology-led discussions toward business goals and processes, and help set realistic expectations. At the policy level, the findings indicate that access to AI technologies alone is insufficient; realising value in SMEs also requires structured methodologies, capability development, and support for low-risk experimentation.

Limitations

Several limitations should be acknowledged. First, the empirical assessment relies on a single case study, which limits statistical generalisability; although the case is typical of many SMEs, the findings should be read as evidence of feasibility and applicability rather than as broadly representative outcomes. Second, the final phase of the framework was not deployed in a live setting within the study's timeframe; its evaluation rests on structured expert feedback rather than longitudinal evidence of sustained use. Third, the framework is deliberately technology-agnostic, which increases transferability across sectors but may require additional technical guidance in organisations with very limited in-house AI and data expertise, a trade-off between general applicability and case-specific depth.

Directions for future research

Future research should apply the framework across multiple sectors and organisational contexts to examine how industry characteristics shape readiness, process fit, prioritisation, and implementation, and to assess its transferability through comparative case studies. Longitudinal studies that follow Phases 4 and 5 over time would provide stronger evidence on post-pilot value realisation, scaling decisions, and organisational learning. Further work could integrate quantitative performance metrics

into the later phases, examine how SMEs should decide between building internal capabilities and sourcing external expertise, and compare the framework directly with established AI-adoption and digital-transformation frameworks.

CAN ARTIFICIAL INTELLIGENCE SUPPORT MANAGEMENT LEARNING? VALIDATING AN AI-DRIVEN STUDY ASSISTANT IN ENTREPRENEURSHIP EDUCATION

Žemaitis, Eigirdas[1]

[1]ISM University of Management and Economics, Vilnius, Lithuania

Keywords: Artificial Intelligence in Education, AI Study Assistant, Sentiment Analysis, Learning Analytics, Management Education, Exam Preparation

Introduction and Theoretical Background

AI study assistants provide instant explanations, practice questions and iterative feedback that support self-regulated learning, yet their effectiveness needs empirical validation. Research has focused on capabilities or perceptions rather than outcomes, and evidence linking students' experience of AI tools to objective performance is scarce (Zawacki-Richter et al., 2019). The study draws on experiential learning theory, in which experimentation, reflection and feedback drive learning (Kolb, 1984), and on entrepreneurial cognition research emphasising reflective reasoning (Mitchell et al., 2007).

Research Aim

This study evaluates an AI study assistant used for exam preparation in an undergraduate Principles of Management course. It asks how students perceive the assistant, whether perceptions, sentiment and use are associated with exam performance, and whether sentiment analysis of open-ended feedback adds insight beyond a rating item.

Methodology

A quantitative design combines learning analytics with sentiment analysis. All 262 students who used the assistant and completed a post-exam survey (helpfulness rating 1–10, five open-ended questions) were matched to their exam scores (0–10). Comparison groups comprised 65 non-users who completed a parallel survey and 52 students who completed neither. Open-ended responses were scored with the VADER sentiment lexicon (Hutto and Gilbert, 2014) and coded by keyword. Non-parametric tests were used.

Results

Perceptions were strongly positive: mean helpfulness was 8.1 (median 8), 73% rated the tool 8 or above, and 97% wanted similar support in other courses. Free-text sentiment was positive in 94% of responses. Students valued practice questions (71%), explanations of theory (61%) and time savings (29%). Criticism concentrated on technical performance: 53% reported lag or crashes at peak usage, 29% found questions too simple or repetitive and 23% noted inaccuracies.

Critically, the helpfulness rating was unrelated to exam performance ($\rho = 0.05$, $p = 0.38$); performance tertiles gave near-identical ratings (8.0, 8.1, 8.2). Free-text sentiment correlated with exam score ($\rho = 0.24$, $p < 0.001$), but the association vanished once response length was controlled (partial $r = 0.06$, $p = 0.37$); length itself, an engagement proxy, predicted performance ($\rho = 0.35$, $p < 0.001$). Users scored higher than non-users who completed the parallel survey (6.6 versus 6.0, $p = 0.007$, $d = 0.40$), mainly in multiple-choice items; non-respondents scored lowest (5.1). This gradient is consistent with a learning benefit but equally with self-selection; 72% of non-users used general-purpose AI such as ChatGPT instead.

Theoretical and Practical Implications

The findings reveal a perception–performance gap: satisfaction with an AI assistant is not a reliable indicator of learning, consistent with evidence that self-assessed learning weakly reflects actual knowledge (Sitzmann et al., 2010). The apparent signal in free-text sentiment reflected how much students wrote rather than how they felt: engagement, not affect, tracks performance, so evaluations of AI tools should pair feedback analytics with behavioural and performance data. For educators, satisfaction surveys alone cannot evaluate learning outcomes. The findings also offer preliminary evidence that course-specific AI assistance may benefit students beyond general-purpose tools, and highlight three design priorities: reliable infrastructure, adaptive difficulty and semester-long availability.

Limitations and Future Research

The study covers one course and cohort, uses a non-randomised comparison group without controls for prior ability, and relies on a general-purpose sentiment lexicon. Future research should incorporate usage logs and prior grades, and test causal effects through quasi-experimental designs across courses.

Keywords*: sponsorship, social media, expatriate fans; patriotism*

Introduction- Aim of Research

As the sports sponsorship industry expands significantly, multinational companies should actively engage with expatriate fans—those who support their national teams while residing abroad (Van Bakel and Salzbrenner, 2019). Nevertheless, the majority of sponsorship studies mostly relies on local audiences, providing little insight into the factors influencing sponsorship responses among these globally dispersed "satellite" supporters. This research formulates and evaluates a model that elucidates expatriate supporters' reactions to a national-team sponsors, using a series of fan- and sponsor-related determinants. This study examines the impact of team attachment and event involvement, alongside perceived sponsor-team congruence, on sponsorship response, while also evaluating the influence of social media usage in modern fan engagement contexts. Moreover, the model identifies patriotism as a moderating variable (Ličen, 2019), indicating that heightened national identity affects the influence of these antecedents on sponsorship response. The research elucidates the direct determinants and the contextual parameters that enhance the efficacy of sponsorship initiatives for expatriate fan groups.

Theoretical Background

Team attachment denotes a fan's lasting psychological and emotional connection to a team, integrating cognitive affiliation and affective commitment cultivated by favorable team-related experiences (David et al., 2020). Based on social identity theory, this connection integrates into the fan's self-concept, influencing positive assessments of entities associated with the in-group (Koronios et al, 2025). In sponsorship contexts, sponsors may be seen as genuine collaborators inside the team's symbolic network, fostering a more favorable sponsorship reaction. Significantly, distance does not inherently diminish connection, making it particularly pertinent for expatriate enthusiasts (Takamatsu, 2021).

Event involvement refers to participants' inclination to engage with an event, shaped by factors such as the environment, overall atmosphere, and the demographic profile of attendees (Sung et al., 2021). Sports marketing research further suggests that greater involvement in sport events fosters favourable behaviours and supports the development of vivid event-related memories, which in turn increases motivation to engage in event-related activities, including interactions with the event's sponsors (Sung et al., 2021).

In sport sponsorship, sponsor–team congruence captures fans' perceived fit between a sponsor and a sponsored team in terms of image, values, mission, or target audience, and it is consistently identified as a key predictor of sponsorship outcomes (Rutter et al., 2020). Drawing on balance theory and associative learning perspectives, congruence supports cognitive consistency and facilitates the transfer of positive team associations to the sponsoring brand, strengthening favourable evaluations (Rutter et al., 2020). Empirically, higher congruence enhances brand recall, favourability, trust, and behavioural intentions, making it a central antecedent of sponsorship response, particularly among expatriate fans who interpret sponsors as part of the team's symbolic identity (Henderson et al., 2019).

For expatriate and non-local supporters, social media usage has become a key channel through which shared sport consumption, fan socialization, and collective belonging are preserved across geographic distance and limited physical proximity (Wakefield and Bennett, 2018). Digital platforms function as virtual gathering spaces that enable real-time interaction, information exchange, and ongoing team-related discussions, helping geographically dispersed fans maintain psychological closeness to their national teams. Beyond fan-to-fan engagement, social media also increases the frequency and immediacy of exposure to sponsor messages embedded in team content and online communities, enabling interactive responses (e.g., commenting, sharing) that can strengthen sponsorship response among expatriate fans.

Within expatriate fandom, patriotism can act as a contextual force that shapes how strongly fans respond to sponsors linked to their national team. Expatriate supporters often follow a team that symbolizes their country of origin while living abroad, positioning their consumption at the intersection of national identity and an international marketplace (Kaplanidou, 2021). In this setting, heightened patriotic pride may make team-related meanings more salient and intensify in-group orientations, thereby strengthening the extent to which key drivers translate into sponsorship response. Accordingly, this study conceptualizes patriotism as a moderating variable that conditions the relationships between aforementioned antecedent and expatriate fans' sponsorship response, capturing when these antecedents become more influential in cross-national contexts.

Based on the literature, the following model and hypotheses are proposed:

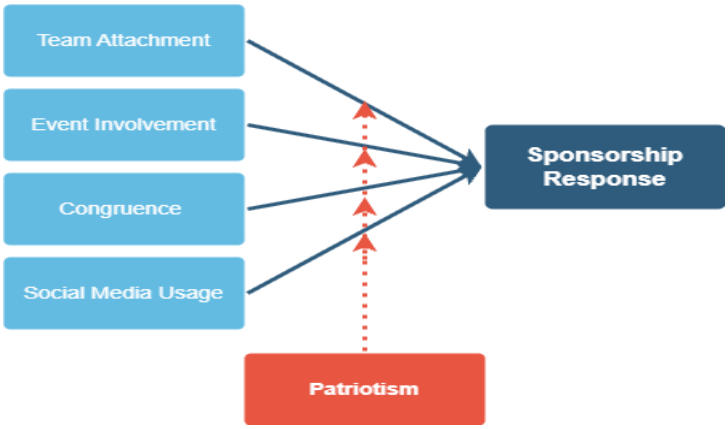

Figure 1. Proposed model

Hypotheses:

H_1: Expatriate fans' attachment to a national basketball team is expected to affect their response to sponsorship

H_2: Expatriate fans' involvement with the event is expected to affect their response to sponsorship

H3: Perceived sponsor–team congruence is expected to affect expatriate fans' response to sponsorship

H_4: Expatriate fans' social media usage is expected to affect their response to sponsorship

$H_{5\text{-}8}$: Expatriate fans' patriotism moderates the relationships (a) team attachment, (b) event involvement, (c) sponsor–team congruence, (d) social media usage and expatriate fans' response to sponsorship

Methodology

A quantitative research design was employed for the purposes of this study. Data were collected through an online questionnaire administered to Greek expatriate fans supporting the Greek national basketball team during the EuroBasket 2025 tournament. A total of 1,238 valid responses were obtained and subsequently analyzed using SPSS and AMOS to test the proposed conceptual model and hypotheses.

Results and Discussion

The proposed relationships among the constructs were examined through Structural Equation Modeling (SEM). Initially, Exploratory Factor Analysis (EFA) confirmed satisfactory construct validity, with Kaiser–Meyer–Olkin (KMO) values exceeding 0.80 for all measurement scales, indicating strong sampling adequacy and suitability for hypothesis testing. The extracted factors explained between 31.9% and 91.2% of the total variance across the six variables, demonstrating considerable explanatory capacity. Subsequently, Confirmatory Factor Analysis (CFA) supported the robustness of the measurement model, as reflected by favorable fit indices. Specifically, normed chi-square (χ^2/df) values were below 1, the Root Mean Square Error of Approximation (RMSEA) remained under 0.10, the Normed Fit Index (NFI) consistently exceeded 0.95, and the Comparative Fit Index (CFI) was above 0.90 across all constructs. These indicators collectively suggest an acceptable model fit. A strong positive correlation (r = 0.817) emerged between the mediator Patriotism and Sponsorship Response, while correlations among other variables ranged from 0.401 to 0.697. Overall, SEM findings provided substantial empirical support for hypotheses H_1–H_8, strengthening the study's theoretical framework.

Table 1: Structural Equation Model Weights

Affect			b	p	Result
Direct Effects					
H1: Team Attachment	→	Sponshorship Response	0.551	<.001	S
H2: Event Involvement	→	Sponshorship Response	0.654	<.001	S
H3: Congruence	→	Sponshorship Response	0.715	<.001	S
H4: Social Media Use	→	Sponshorship Response	0.518	<.001	S
Indirect Effects (Mediated by Patriotism)					
H5: Patriotism mediates Team Attachment	→	Sponshorship Response	0.705	<.001	S
H6: Patriotism mediates Event Involvement	→	Sponshorship Response	0.742	<.001	S

H7: Patriotism mediates Congruence	→	Sponshorship Response	0.889	<.001	S
H8: Patriotism mediates Social Media Usage	→	Sponshorship Response	0.771	<.001	S

S=Supported, R=Rejected, SE=Standard Error, NNFI = .982; CFI = .981; SRMR = .024; RMSEA = .085

FROM SHORT-TERM GAINS TO SUSTAINABLE LEGACY: THE NEW APPROACH OF OLYMPIC GAMES

Nicoliello, Mario [1] Zampatti, Davide [1]

[1] Department of Economics and Management, University of Brescia, Italy

Keywords: Olympic legacy; mega-events; Summer Olympic Games; Winter Olympic Games; systematic literature review; sustainability; urban development

Introduction

Since the 1990s, legacy has been a formal requirement in the IOC host city selection process. Despite this, it remains contested: frequently used to justify large public spending without independent verification (Tomlinson, 2014). Research has expanded since 2008, but there is still no shared definition or measurement standard (Scheu et al., 2019).

Purpose, Aim and Objectives

This paper applies Preuss's multidimensional framework to seven host cities: Rio 2016, Tokyo 2020, and Paris 2024 for Summer Games; Vancouver 2010, Sochi 2014, PyeongChang 2018, and Beijing 2022 for Winter Games. The study asks: How is legacy defined and measured within this framework? What outcomes emerge across editions? How do results vary across contexts?

Literature Review and Theoretical Framework

Preuss (2007) defined legacy as planned and unplanned, positive and negative, tangible and intangible structures created for and by a sport event that remain longer than the event itself. Gratton and Preuss (2008) organised the framework across six dimensions: economy, infrastructure, society, environment, sport, and governance, arguing that outcomes must be actively planned before the event. Preuss (2018) formalised this into a measurement model requiring longitudinal data and counterfactual baselines. Key complementary work includes Leopkey and Parent (2012) on multi-actor governance, Gold and Gold (2021) on the convergence of legacy and sustainability in IOC policy, and Chen and Henry (2019) on the weakness of causal evidence.

Methodology

The study follows PRISMA guidelines. Sources were retrieved from Scopus, Web of Science, SPORTDiscus, Google Scholar, and Taylor and Francis Online. The search covered peer-reviewed

articles, book chapters, and conference papers from 2000 to 2024 in English. From approximately 500 records, 112 were assessed. The final sample is 55 sources, synthesised thematically using Preuss's six dimensions.

Main Findings and Contribution

Four findings emerge. First, Preuss's framework remains the most complete tool for studying Olympic legacy. Second, a gap between objectives and outcomes appears in every case, widest in Rio 2016, Sochi 2014, and PyeongChang 2018. Third, signs of improvement appear over time in venue planning and environmental strategies, but core constraints remain: cost pressure and unequal distribution of benefits. Fourth, Winter Games form a structurally distinct case. Remote locations and specialised facilities produce an infrastructure legacy paradox: the most expensive venues tend to have the least long-term local use (Leopkey and Parent, 2016). None of the four Winter editions examined resolved this fully.

Originality and Value

This is one of the few studies to apply Preuss's framework consistently across both Summer and Winter Games in a single review, introducing the infrastructure legacy paradox as a structural feature of Winter editions.

Research Limitations

Paris 2024 analysis relies on pre-Games data. English-language sources may exclude relevant work in Portuguese and Japanese or other local languages. Long-term studies covering 10 to 20 years post-event remain rare.

Theoretical and Practical Implications

Four priorities follow for future hosts: plan legacy early within wider urban strategies; keep monitoring independent beyond the Games; involve local communities where displacement risks exist; align expectations with what mega-events can realistically deliver.

THEORISING AI-DRIVEN FAN ENGAGEMENT IN MEGA-EVENTS: INTEGRATING BEHAVIOURAL AND EMOTIONAL DIMENSIONS

Korellis, Georgios[1]; Yiapanas, George[1]; Markatos, Georgios[2]

[1]Department of Management, University of Nicosia, Nicosia, Cyprus

[2]Global College, Nicosia, Cyprus

Keywords: Artificial intelligence, Fan engagement, Mega-events, Olympic Games, Consumer engagement marketing, Personalisation, Gamification, Community building

Introduction

Artificial intelligence (AI) is increasingly embedded in sport mega-events, yet the mechanisms through which AI-enabled applications may shape fan engagement remain under-theorised. This matters in the Olympic Games, where globally dispersed audiences navigate dense information within compressed event windows and depend on digital platforms (Müller, 2015).

Purpose, Aim and Objectives

This study develops a conceptual framework explaining how AI-enabled mechanisms may stimulate fans' voluntary contributions and engagement outcomes in sport mega-events. Using the Paris 2024 Olympic Games as an illustrative documentary case, the study identifies AI applications, theorises five engagement mechanisms, distinguishes consumer-to-brand from consumer-to-consumer contributions, and derives propositions for empirical testing

Literature Review and Theoretical Framework

Consumer engagement marketing conceptualises engagement as voluntary, value-creating contributions stimulated by deliberate organisational initiatives (Harmeling et al., 2017; Cheung et al., 2024), while sport research frames fan engagement as extra-role behaviour and emotionally charged participation (Yoshida et al., 2014; Shuv-Ami et al., 2020). However, these frameworks largely emerged when technology functioned mainly as a communication or distribution channel and offer limited explanation of how adaptive AI systems shape exposure, interaction and participation. This gap is amplified in time-bounded, globally dispersed and platform-mediated mega-events. Building on AI-mediated engagement research (Perez-Vega et al., 2021), the framework theorises AI as a constitutive mediator linking five AI-enabled mechanisms to fans' voluntary contributions and engagement outcomes.

Methodology and Methods

A three-stage conceptual theory-building design was adopted. A structured literature synthesis established the theoretical anchors and then engagement-marketing dimensions were mapped deductively to AI capability families and consolidated into five mechanisms. Finally, publicly available Paris 2024 materials from Olympic organisations and technology partners were purposively analysed and coded by capability, mechanism, voluntary contribution type and reported engagement-related outcome.

Findings and Contribution

The analysis identifies five AI-enabled mechanisms: personalisation, interactive participation, immersive experiences, gamification and community building. Paris 2024 most clearly operationalised personalisation and interactive participation. The other mechanisms appeared more contingent on design, data governance and moderation. Together, they explain how AI may reduce discovery friction, enable responsive exchange, intensify mediated presence, encourage repeated participation and support social connection, linking organisational initiatives to consumer-to-brand and consumer-to-consumer voluntary contributions.

Originality and Value

The study moves beyond generic claims that AI improves engagement by specifying mechanism-level pathways under mega-event conditions. It integrates behavioural and emotional dimensions of sport engagement with AI-enabled mediation and generates propositions for testing across future Olympic Games and other mega-events.

Research Limitations

The framework is conceptual and relies on one illustrative mega-event and public organisational and partner documents. Without comparison data showing what engagement would have looked like in the absence of these AI-enabled features, the proposed relationships represent theoretically grounded pathways rather than validated causal effects.

Theoretical and Practical Applications and Implications

The framework extends consumer engagement marketing by explaining how AI configures exposure, interaction and social connection in mega-events. Organising committees should align AI investments with explicit engagement objectives and assess mechanism-specific outcomes. Personalisation and interactive participation appear most operationally mature,

while immersive, gamified and community initiatives require stronger coordination across technology, rights, privacy, safeguarding and moderation.

ESG, TRANSPARENCY AND ACCESSIBILITY IN EUROPEAN FOOTBALL: A SYSTEMIC APPROACH TO THE EVALUATION OF CLUBS

Stefanizzi, Pasquale[1]; Cretì, Chiara[2]; Cavallo, Federica[1]; Maizza, Amedeo[2]

[1]Department of Management and Economics, Pegaso Telematic University, Naples, Italy

[2]Department of Economics, University of Salento, Lecce, Italy

Keywords: ESG disclosure, Non-financial reporting, Professional football, Information accessibility, Comparative analysis, Sustainability in sport, Governance, Transparency.

Introduction

ESG criteria are entering sports management under growing regulatory and societal pressure for accountable behaviour. Given their economic and social relevance, European football clubs are increasingly expected to align governance, environmental practices and social responsibility with international standards such as UEFA's sustainability strategy (UEFA, 2021) and the UN 2030 Agenda (United Nations General Assembly, 2015).

Purpose, Aim and Objectives

The study assesses ESG maturity in the major European leagues, examining not only whether non-financial information is disclosed but also how accessible it is to stakeholders. It asks how much ESG content clubs publish online, how visible and accessible it is, and what differences in transparency emerge across the six leagues.

Literature Review and Theoretical Framework

Sustainability in sport has largely been examined through CSR-based models emphasising stakeholder engagement and reputation (Ráthonyi-Ódor et al., 2020; Fernández-Villarino, 2021; Metelski, 2024), while institutional pressures increasingly shape practices through licensing requirements (Adam et al., 2025) and external benchmarking (Global Sustainability Benchmark in Sports, 2024). Systemic contributions instead frame football as an ecosystem of interacting clubs, governing bodies, sponsors and communities (Yiapanas et al., 2024). Transparency, however, is typically measured as disclosure volume, leaving stakeholder access underexplored.

Methodology and Methods

The sample comprises 114 clubs in the top divisions of six European leagues (England, Germany, Italy, Spain, France, Portugal) in 2024/2025. A structured content analysis of official websites examined three disclosure dimensions: general ESG information, codes of ethics or equivalent documents, and sustainability reports. Availability and placement were scored 0–3 and operational accessibility 0–2, producing a composite indicator from 0 to 15. Inter-rater reliability across three coders ranged between 0.75 and 0.85 (Jakobsson and Westergren, 2005). Standardised quality and accessibility scores segmented clubs into four profiles via cluster analysis.

Findings and Contribution

Results reveal marked heterogeneity across and within leagues. The Silent profile, combining limited content with poor accessibility, prevails everywhere, especially in the Primeira Liga and Serie A. Leader clubs, pairing structured disclosure with rapid access, concentrate in the Premier League and Bundesliga. Formal-but-hidden clubs publish rich documentation that is hard to retrieve, whereas Light communicators offer easy access to thin content, indicating a systematic gap between disclosure and effective stakeholder usability (Iazzi et al., 2025).

Originality and Value

The study treats informational accessibility as a constitutive dimension of ESG maturity rather than a secondary attribute of disclosure. Distinguishing content quality from digital usability, it offers a replicable framework reframing transparency as both disclosure and access.

Research Limitations

The analysis covers only public online information and may underestimate practices implemented but not disclosed. Residual interpretative subjectivity cannot be excluded despite cross-validation among independent coders, and the cross-sectional design does not assess the impact of disclosure on financial or sporting performance.

Theoretical and Practical Applications and Implications

Theoretically, the study separates informational substance from usability. Practically, implications differ by profile: Leaders should preserve continuity; Formal-but-hidden clubs

should simplify website architecture; Light communicators should deepen content; and Silent clubs should establish a basic, visible disclosure structure.

GREEN AND DIGITAL SKILL BUNDLES IN THE CONVERGENCE OF AGRIFOOD, MARKETING AND ICT: MARKETING AS A COORDINATION MECHANISM BETWEEN JOB ADS AND EU POLICY DOCUMENTS

Stergiou, Anastasia[1]; Papadopoulos, Ioannis[1]; Georgiou, Konstantinos[2]; Angelis, Lefteris[2]

[1]Department of Forestry, Wood Sciences and Design, School of Technology, University of Thessaly, Karditsa, Greece

[2]School of Informatics, Aristotle University of Thessaloniki, Thessaloniki, Greece

Keywords: Green skills, Digital skills, Agrifood sector, Marketing and branding, Online job advertisements, Policy documents, NLP, Skill profiles

Introduction

The twin green and digital transition is reshaping how agrifood firms create, document and communicate value. Sustainability increasingly affects differentiation, reputation and consumer trust, while digital traceability, analytics and information systems expand the evidence available to firms. These changes broaden skill requirements beyond narrowly specialised roles and increase demand for combinations of agrifood knowledge, market-facing capabilities and digital competence. Online job advertisements offer a dynamic view of employer demand, whereas European frameworks such as GreenComp, DigComp and ESCO provide institutional reference points for sustainability, digital competences and occupational skills (Bianchi et al., 2022; Vuorikari et al., 2022; Chiarello et al., 2021).

Purpose, Aim and Objectives

This study examines two questions: which recurring skill profiles appear at the convergence of agrifood, marketing and digital technologies, and how closely these profiles align with skills emphasised in European Union policy documents. It also evaluates whether marketing functions as a coordination mechanism linking sustainability evidence, digital capability and market-facing activity.

Methodology and Methods

Using data from the European SKILLAB project, the analysis compares 1,041 online job advertisements with 392 EU policy documents. Skills were cleaned and standardised,

represented through binary features and weighted using TF-IDF. Job profiles were grouped with the BIRCH algorithm into eight skills-based clusters. In parallel, each advertisement was scored on agrifood, marketing and digital/IT axes; scores were normalised to sum to 1 and a 0.25 threshold was used to distinguish primary, dual and triple convergence. Policy documents were grouped into three thematic clusters, and market-policy alignment was assessed using cosine similarity between weighted skill-profile prototypes (Zhang et al., 1996).

Findings and Contribution

Marketing was the largest average axis across all eight job clusters, although the balance among domains varied. Digital Transformation showed the highest digital share (44.5%), while Agrifood Core and Agrifood-Market Interface showed the highest agrifood shares (36.6% and 32.8%). Dual convergence dominated most clusters, reaching 93.7% in Digital Transformation, whereas triple convergence was concentrated in smaller profiles, including Agrifood Core (41.4%) and Circular/Resource Sustainability (36.6%). Policy-market alignment was measurable but uneven. The strongest cosine similarity was 0.26 between Digital Transformation and Green Governance and Circular Economy, followed by 0.21 for Circular/Resource Sustainability with the same policy cluster. The results reveal multiple hybrid profiles rather than one standard green-digital occupation.

Originality and Value

The study combines labour-market and policy evidence in a common skill space and adds an interpretable three-axis framework for identifying hybridisation. The findings support the interpretation of marketing as a coordination mechanism connecting operational evidence, digital information and customer-facing value rather than only as a communication function.

Research Limitations

The analysis depends on skills extracted from job advertisements and policy documents and on deliberately focused axis vocabularies. Online vacancies do not represent the entire labour market, and part of the observed divergence may reflect differences in text genre and level of abstraction rather than substantive policy gaps.

Theoretical and Practical Applications and Implications

The results suggest that stable competence frameworks should be complemented by dynamic labour-market intelligence. Educational programmes can integrate green, digital and marketing capabilities in applied pathways, while firms can use the identified profiles for

workforce planning and cross-functional role design. Future research could use longitudinal data, embedding-based matching and stronger ESCO normalisation to test how these profiles evolve over time.

ALGORITHMIC AUTHORITY AS STRATEGIC INFORMATION INFRASTRUCTURE

Sabag-Ben Porat, Chen[1]; Kol, Ofrit[1]; Zimand-Sheiner, Dorit[1]; Levy, Shalom[2]

[1] The Moskowitz School of Communication, Ariel University, Ariel, Israel

[2] The Department of Economics and Business Administration, Ariel University, Ariel, Israel

Keywords: Public Relations, Algorithmic Authority, Generative AI, Trust, Knowledge Sources, FinTech, Earned Media

Abstract

Introduction and Background

Over the past decade, public relations has been increasingly sidelined in favor of advertising, paid promotion, and search engine optimization strategies that focus on visibility and clicks. In this environment, PR has often been framed as a supplementary reputational activity rather than a core mechanism for shaping public knowledge. The rapid rise of generative artificial intelligence and large language model-based search systems marks a fundamental shift. Users are no longer primarily exposed to ranked lists of links, but to synthesized answers presented as authoritative knowledge. In this context, public relations returns to its historical core function: mediating knowledge, building trust, and shaping which actors are recognized as legitimate sources of information. The key question is no longer how brands are framed, but who is selected to appear in AI-generated answers, and which knowledge sources underpin that selection.

Purpose, Aim, and Research Question

The purpose of this study is to examine how trust-based public relations practices shape algorithmic authority in generative AI systems, with a focus on epistemic selection processes. Rather than focusing solely on branding or message framing, the study investigates which organizations are included or excluded from AI-generated answers and which types of sources generative systems rely on when constructing authoritative

responses. The central research question is: What are the determinants of algorithmic authority in public relations, and how do PR-based trust-building practices influence the selection of brands and knowledge sources in generative AI outputs?

Literature Review and Theoretical Framework

The study builds on public relations scholarship that conceptualizes PR as a mechanism for building legitimacy, trust, and epistemic authority rather than merely managing visibility. Recent research highlights how artificial intelligence is increasingly embedded in communication management, reshaping how organizations establish credibility and public relevance (Zerfass et al., 2020; Cusnir, 2024). To account for the role of generative AI, the study integrates research on algorithmic gatekeeping, emphasizing how automated systems perform institutional functions traditionally associated with human intermediaries (Napoli, 2014). Research on responsible innovation in AI further underscores the importance of legitimacy, accountability, and deliberation in AI-mediated decision-making (Buhmann & Fieseler, 2021). Framing theory within public relations explains how organizations are positioned as credible or authoritative through sustained interpretive patterns rather than isolated messages (Hallahan, 1999).

Methodology and Methods

The study proposes a novel methodological approach based on the development of a dedicated algorithm designed to systematically analyze the outputs of generative AI. The algorithm performs multiple standardized queries runs across leading generative AI systems using identical prompts related to trust, expertise, and comparative evaluation within the FinTech domain. For each run, the system captures the full AI-generated response, identifies the included organizations, assesses their relative prominence, extracts and maps the knowledge sources underlying the AI-generated information, and identifies referenced or implied source types. Repeated iterations enable the assessment of stability and variation in source selection. The empirical focus on FinTech reflects the sector’s reliance on trust, regulatory legitimacy, and third-party validation.

Main and Expected Findings and Contribution

The study is expected to demonstrate that algorithmic authority is closely associated with trust-based public relations practices rather than promotional visibility. Organizations supported by high-quality earned media, expert-oriented content, and consistent entity representation are expected to be more frequently included and more prominently positioned in AI-generated answers. Organizations relying primarily on advertising or owned media are expected to be excluded or framed with greater caution.

Originality and Value

The study contributes a novel conceptualization of algorithmic authority as an epistemic outcome of public relations practices and introduces a repeatable computational method for analyzing AI-based knowledge selection.

Research Limitations

The analysis is based on observable AI outputs and inferred source signals rather than direct access to proprietary model architectures and therefore captures algorithmic selection as it manifests externally rather than its internal logic.

Theoretical and Practical Implications

Theoretically, the study brings public relations back to the center of scholarly debate by positioning the field as a key factor in the governance of algorithmic knowledge and the construction of authority in the age of artificial intelligence. Practically, it offers public relations professionals a new framework for evaluating success in AI-mediated information environments, where influence is no longer measured by exposure or clicks, but by inclusion and perceived authority within AI-generated answers.

FROM SUSTAINABILITY TO BRAND POSITIVITY IN LUXURY INDUSTRY: THE MEDIATING ROLES OF SELF-CONGRUENCE AND BRAND ENGAGEMENT

Dekoulou Paraskevi[1], Kyriakos Riskos[2], Ioanna Papasolomou[3]

[1]School of Journalism and Mass Communications, Faculty of Social and Economic Science, Aristotle University of Thessaloniki, Thessaloniki, Greece

[2]Department of Media and Communication, Erasmus School of History, Culture and Communication, Erasmus University Rotterdam, Rotterdam, Netherlands

[3]Department of Management, School of Business, University of Nicosia, Nicosia, Cyprus

Keywords: Sustainable Marketing Activities, Self-Congruence, Brand Engagement, Brand Positivity, Consumer Behavior, Sustainability, Branding

Despite the growing emphasis on sustainability as a central pillar of long-term organizational growth, the luxury industry is often perceived as less responsive to concerns surrounding environmental impact, human rights, and animal welfare (Dekhili et al., 2019). However, due to the greater feasibility and resources that luxury companies have, consumers expect luxury brands to act responsibly (Janssen et al., 2019; Kwon et al., 2024). In response, the integration of sustainability into luxury branding has emerged as a strategic imperative, as luxury brands increasingly strive to align exclusivity and symbolic meaning with principles of responsible business conduct (Kim et al., 2022). This tension reflects a central paradox within the luxury industry. Luxury is traditionally associated with rarity, prestige, and exclusivity, attributes that often conflict with sustainability principles such as accessibility and efficient resource use. This paradox may, in turn, influence luxury consumers' willingness to purchase sustainable luxury brands (Vergura et al., 2023).

Empirical research on the relationship between luxury and sustainability has produced inconsistent findings and remains relatively limited, (Eastman et al., 2024), as sustainability research has largely concentrated on mass-market and mid-market brands, leaving luxury contexts underexplored (Broccardo et al., 2023). To address this gap, this research explores how sustainable marketing activities (SMAs) implemented by luxury brands influence consumer behavior in Greece. Unlike previous studies, the present research offers a more nuanced perspective by

investigating how each of the four dimensions of SMAs, environmental, economic, social, and cultural, affects consumer outcomes in the context of luxury brands. More specifically, this study examines the effects of perceived SMAs on consumers' actual and ideal self-congruence, as well as the influence of these two forms of self-congruence on cognitive, emotional, and behavioral brand engagement. It further investigates the impact of these engagement dimensions on brand positivity, conceptualized as an overall favorable evaluative orientation toward the brand that encompasses affective, cognitive, and behavioral tendencies beyond mere positive word-of-mouth or advocacy (Wilk et al., 2020).

Drawing on self-congruity theory, the study argues that alignment between brands and consumers' actual and ideal self-concepts fosters favorable consumer responses by strengthening identity-brand fit (Ivanauskaitė et al., 2025). Complementing this perspective, social identity theory suggests that brands act as symbolic references for consumers' self-concept. When a brand resonates with consumers' identity, it fosters a deeper psychological connection that promotes engagement with the brand through cognitive processing, emotional attachment, and behavioral involvement, ultimately leading to positive brand-related outcomes (Zhang et al., 2020).

Methodologically, the study adopts a quantitative approach based on survey data from 323 consumers familiar with luxury brands that communicate sustainable marketing initiatives in the Greek market, collected through both online and offline procedures. Established and validated measurement scales are adapted for the study's context, and the hypothesized relationships are empirically tested using structural equation modeling (SEM).

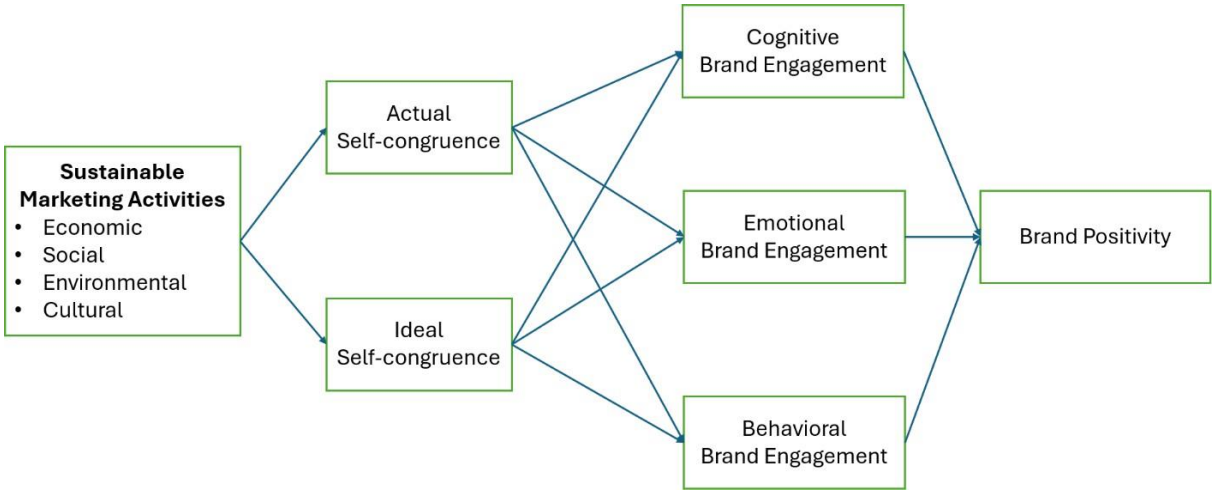

Figure I: The Conceptual Model

The findings indicate that SMAs exert differentiated effects on actual and ideal self-congruence. Specifically, the economic, social and cultural dimensions of sustainability positively influence both forms of self-congruence, whereas the environmental dimension does not exhibit a significant effect, possibly reflecting a misalignment between environmental sustainability and the symbolic and status-oriented nature of luxury consumption (Mancusi et al., 2025). These findings further highlight the relevance of cultural sustainability in the luxury context, where heritage, craftsmanship, and symbolic value are core elements of brand identity (Reddy et al., 2026). The results also reveal distinct pathways through which self-congruence shapes brand engagement. Actual self-congruence significantly strengthens cognitive and behavioral engagement, but not emotional engagement, suggesting that alignment with consumers' current self-concept primarily encourages cognitive processing and active participation. In contrast, ideal self-congruence has a strong positive impact on emotional engagement and also enhances cognitive engagement, underscoring the importance of aspirational identity alignment in cultivating emotional attachment to the brand. All three dimensions of brand engagement positively and significantly influence brand positivity, with emotional engagement emerging as the most influential predictor.

The findings contribute to the growing sustainability literature by addressing the persistent paradox between sustainability and luxury consumption, demonstrating that sustainability can positively shape consumer perceptions when it aligns with consumers' identity. By adopting a multidimensional approach, the study demonstrates that sustainability should not be treated as a

uniform construct in the luxury context and extends existing frameworks by incorporating the cultural dimension. From a managerial perspective, the results suggest that luxury brands should emphasize culturally and socially embedded sustainability initiatives, such as heritage preservation and responsible sourcing, to strengthen consumer-brand connections. Moreover, the study proposes a three-path mediation model linking sustainable marketing activities to brand positivity through self-congruence and multidimensional brand engagement, while offering managerial implications and directions for future research. Finally, the study acknowledges limitations related to the use of self-reported and cross-sectional data, which may affect causal inference and generalizability.

CAN CONSUMERS DETECT GREENWASHING? THE ROLE OF ENVIRONMENTAL KNOWLEDGE IN BRAND TRUST

Gadeikiene, Agne[1]; Dobilaite, Audra[1,2]

[1]School of Economics and Business, Kaunas University of Technology, Kaunas, Lithuania

[2]UAB Baltic Transline, Kaunas, Lithuania

Keywords: Sustainable Consumption, Greenwashing, Environmental Knowledge, Brand Trust

Introduction

Growing concern about sustainability and environmental issues increasingly motivate consumers to search for greener products (e.g., Timmons et al., 2024). Brands have responded to this rising demand by expanding green product offerings and promoting them as environmentally friendly. To attract green consumers, brands often use green claims. Even though they sound environmentally friendly but often are vague, misleading, or even false (Correa et al., 2017). This practice, commonly referred to as greenwashing, has become a significant challenge in the context of sustainable consumption, as misleading environmental claims can distort consumer perceptions and complicate the development of trust in brands. In this context, it is essential to understand how consumers interpret such claims and whether their environmental knowledge enables them to distinguish between honest green practices, honest non-green practices, and greenwashing.

The main aim is to determine whether higher levels of environmental knowledge improve consumers' ability to identify greenwashing and how these perceptions influence trust in brands. The study focuses on three product conditions: an honest green product, an honest non-green product, and a product applying greenwashing practices.

Theoretical Background

Green marketing and Greenwashing literature suggest that misleading environmental claims can negatively affect consumer trust (Chen et al., 2019). Prior research indicates that consumers with higher environmental knowledge may be better equipped to recognize greenwashing; however, findings remain inconsistent and context-dependent (Isac et al., 2024). Other studies emphasize the role of emotional marketing cues, such as nature imagery and green colours, which can reduce critical thinking even among knowledgeable consumers (Schmuck et al., 2018). Furthermore, limited consumer awareness of misleading environmental claims has been identified as a barrier to effective greenwashing detection (Timmons et al., 2024).

Methodology and Methods

The empirical study adopts a quantitative survey-based design. 415 respondents from Lithuania were exposed to products representing three conditions – an honest green product, an honest non-green product, and a product applying greenwashing – and were asked to evaluate perceived greenwashing and brand trust. Cosmetic product packaging was specifically designed for this study to reflect each of these three conditions.

Findings

The findings reveal that higher level of consumers' environmental knowledge does not universally lead to better recognition of greenwashing. Knowledge effects were dependent on product condition: knowledgeable consumers most accurately evaluated the honest green product, while no statistically significant differences were found in the greenwashing condition. This suggests that emotional and visual cues may weaken the ability to detect misleading claims. Additionally, although the greenwashing brand was perceived as applying the most greenwashing, trust in this brand was not the lowest. Contrary to earlier studies (e.g., Isac et al., 2024), perceived greenwashing did not necessarily reduce brand trust, possibly due to the use of unfamiliar brands and the absence of prior consumer-brand relationships.

Contribution and Limitations

This research addresses an important gap by examining how environmental knowledge, perceived greenwashing, and brand trust interact within different product conditions, contributing to the broader discussion on sustainable marketing and consumer decision-making. Overall, the findings contribute to green marketing research stream by demonstrating that environmental knowledge alone is insufficient for consistent greenwashing detection. Practically, the results underline the need for improved consumer education to increase of consumer eco-literacy and more transparent green marketing practices to support informed and sustainable consumption.

THE PERSUASIVENESS OF EWOM: MESSAGE AND SENDER EFFECTS ON BRAND CREDIBILITY AND REPUTATION

Hopeniene, Rimante[1]; Salciuviene, Laura[2]

[1]School of Economics and Business, Kaunas University of Technology, Kaunas, Lithuania

[2]Birmingham Business School, University of Birmingham, Birmingham, United Kingdom

Keywords: eWOM Persuasiveness, Sender Credibility, Brand Credibility, Brand Reputation,

Introduction

Prior eWOM research has largely focused on consumer responses, while brand-level outcomes remain under-theorised and brand credibility and reputation are often examined separately (Liu et al., 2024; Chiu et al., 2025). Emerging evidence further suggests that eWOM effects vary depending on how communication cues are interpreted within online communities (Chiu et al., 2025). This creates a need to better understand how eWOM persuasiveness shapes brand-level evaluations.

Purpose, Aim and Objectives

This study examines how eWOM persuasiveness, shaped by message characteristics and sender credibility, influences brand credibility and reputation across comparable brands within the same online community. The study further investigates whether identical message and sender cues may produce divergent brand evaluations.

Literature Review and Theoretical Framework

Drawing on the Persuasion Knowledge Model (Friestad and Wright, 1994; Rahmani, 2023), the study conceptualises eWOM persuasiveness as a mechanism linking communication cues to brand credibility and reputation. Recent research further highlights the socially embedded nature of eWOM environments shaped by user interaction (Liu et al., 2024). Based on the Persuasion Knowledge Model and prior eWOM research, hypotheses were formulated linking message and sender cues to eWOM persuasiveness and subsequent brand-level outcomes. This perspective is particularly relevant in anonymous online communities, where consumers continuously evaluate the credibility and persuasiveness of communication cues.

Methodology and Methods

A non-experimental cross-sectional survey was conducted among Lithuanian consumers (n = 419) exposed to brand-related eWOM on the Discord server "Gossip". Two comparable natural cosmetics brands (Brand A and Brand B) were examined within the same communication environment. Message characteristics, sender credibility, eWOM persuasiveness, brand credibility and reputation were measured using established multi-item scales (Lopez and Sicilia, 2014). All measures exceeded acceptable reliability thresholds (Cronbach's $\alpha > 0.70$). Data were analysed using factor analysis, regression, mediation and non-parametric tests.

Main Findings and Contribution

The findings demonstrate that eWOM persuasiveness shapes brand-level outcomes differently across brands within the same online community, suggesting that identical message and sender cues may produce divergent brand evaluations. For Brand A, eWOM persuasiveness negatively influenced brand credibility ($\beta = -0.267$) and brand reputation ($\beta = -0.364$), whereas positive effects were identified for Brand B ($\beta = 0.298$ and $\beta = 0.309$ respectively).

eWOM persuasiveness was primarily driven by message characteristics ($\beta = 0.680$, $p < 0.001$) and sender credibility ($\beta = 0.638$, $p < 0.001$), while receiver experience exerted a weaker influence ($\beta = 0.137$, $p < 0.001$). Consistent with the Persuasion Knowledge Model (Friestad and Wright, 1994), consumers actively evaluate communication credibility. These findings demonstrate that eWOM operates as a conditional mechanism rather than a uniformly positive driver of brand outcomes.

Originality and Value

This study extends eWOM research by demonstrating that identical persuasion cues can generate divergent brand credibility and reputation outcomes within the same online community, challenging assumptions of uniformly positive eWOM effects. By highlighting the interpretive role of consumers in anonymous online communities, the study positions eWOM as a conditional persuasion mechanism rather than a universally positive driver of brand outcomes.

Theoretical and Practical Implications

The findings suggest that anonymous platforms such as Discord may significantly influence brand evaluations through eWOM communication. Marketers should therefore monitor anonymous online communities alongside traditional social media.

Research Limitations

The study focused on Lithuanian natural cosmetics brands, which may explain the predominance of female respondents. Future research should investigate more diverse product categories. Another limitation concerns the focus on anonymous eWOM channels. Future studies should further examine trust formation in anonymous online communities and compare anonymous platforms, such as Discord and Reddit, with non-anonymous platforms, including Facebook and LinkedIn.

THE FINANCIAL LITERACY PARADOX IN DIGITAL PAYMENTS: RISK PERCEPTION AND CONSUMER BEHAVIOUR

Drago, Carlo[1]; Graziano, Elvira Anna[2], Graziano; Petroccione, Gerardo[3]

[1] Department of Economic, Psychological, Communication, Educational and Movement Sciences, University Niccolò Cusano, Rome, Italy

[2] Department of Human Science, Link Campus University, Rome, Italy

[3] Department of Experimental and Clinical Medicine, Polytechnic University of Marche, Ancona, Italy

Keywords: Digital Payments, Financial Literacy, Fraud Perception, Scam Susceptibility, Payment Behaviour, Consumer Finance, Fintech Adoption.

Introduction

Payment behaviours have evolved rapidly, even in cash-reliant countries, driven by technological innovation and fintech expansion (Cotugno et al., 2024). COVID-19 accelerated digital payment adoption, while digitalization also increased exposure to fraud, cybercrime, and identity theft (Graziano et al., 2025). Payment choices are shaped not only by convenience but also by fear of fraud, scam susceptibility, and financial literacy (Brands & Van Doorn, 2022).

Purpose and Research Objectives

This study examines how fraud perception, scam vulnerability, and financial literacy influence digital payment attitudes and cash preference. It explores whether financially literate consumers may also display stronger risk awareness and distrust toward digital payments, creating a potential “financial literacy paradox”. The study also identifies latent consumer profiles combining financial literacy, perceived risk, and payment attitudes.

Literature Review and Theoretical Framework

Digital payment adoption depends on trust and risk perceptions (Shree et al., 2021). Fear of fraud represents a major barrier to digital transactions (Brands & Van Doorn, 2022). The growing diffusion of AI-based scams, phishing systems, and deepfake technologies may further increase distrust toward digital financial ecosystems. Financial literacy is generally associated with better financial decisions, yet greater knowledge may also increase awareness of cyber risks and fraud exposure (Klapper &

Lusardi, 2020). This creates a paradox in which financially literate consumers may simultaneously display higher technological competence and stronger risk aversion toward digital payments. Scam vulnerability also depends on socio-demographic and behavioural factors (DeLiema et al., 2020). Integrating behavioural and financial literacy perspectives is therefore crucial to understanding payment choices.

Methodology

The study uses a CAWI survey conducted in Italy between November 2025 and January 2026. The sample includes 350 respondents recruited through social media, university networks, and hospital facilities. The questionnaire covered socio-demographics, fraud experience, perceived risk, payment attitudes, and financial literacy. The analysis followed two stages (see Drago et al., 2025): Multiple Correspondence Analysis (MCA) identified latent dimensions, while hierarchical cluster analysis identified homogeneous consumer profiles. This approach captures behavioural patterns that may not emerge through conventional regression methods.

Expected Findings and Contribution

The study expects to identify consumer segments differentiated by financial literacy, fraud perception, and payment preferences. Greater perceived vulnerability to scams may correlate with stronger cash preference and lower trust in digital payments. Findings are expected to show that payment choices depend not only on financial knowledge but also on subjective perceptions of cyber risk, particularly in the context of AI-enabled fraud. The study contributes to the debate on the non-linear relationship between financial literacy and digital payment adoption, highlighting the coexistence of technological competence and risk aversion.

Research Limitations and Implications

The cross-sectional design and self-reported measures limit causal inference and generalizability. Future research could expand data collection through international online panels such as Prolific or Qualtrics. The findings suggest that policies promoting digital payments should combine financial education with strategies aimed at strengthening trust, cybersecurity awareness, and fraud prevention.

NEW STANDARDS FOR SUSTAINABILITY REPORTING: AN ANALYSIS OF THE EUROPEAN AVIATION SECTOR

Marques, José[1]; Gois, Cristina[2]

[1]Polytechnic University of Coimbra, Coimbra, Portugal.

[2]Polytechnic University of Coimbra, CEOS.PP Coimbra, ,Coimbra, Portugal.

Keywords: Sustainability, IFRS S1 And S2 Standards, Aviation Sector, Transparency

Abstract

Sustainability has taken on a fundamental role in disseminating corporate information, with entities showing greater concern and showing society their commitment to the environment. More critical sectors, including the aviation industry, face major challenges in reducing their environmental footprint and achieving carbon neutrality.

The growing demand for greater transparency and consistency in the disclosure of non-financial information, specifically related to sustainability and the climate, led the International Sustainability Standards Board (ISSB) to publish two new standards in 2023: IFRS S1 and IFRS S2. The main objective of this new standard is to standardize the disclosure of sustainability and climate risk information.

In addition to contributing to a better understanding of the adoption of IFRS S1 and IFRS S2, this article aims to analyze the compliance of sustainability reporting by various entities in the aviation sector with the new ISSB standards, seeking to identify areas for improvement in the future.

In a sector strongly challenged by the transition to greater energy efficiency, which is seeking to be increasingly sustainable, it is important to keep up with the new international sustainability reporting requirements, which contribute to the adoption of more transparent, responsible, and truthful practices.

Introduction

Growing awareness of ESG issues has transformed the reporting of financial and nonfinancial information. In the high-impact aviation sector, this requires structured, transparent disclosure.

The ISSB introduced IFRS S1 and S2 to harmonise and improve the quality of sustainability reporting.

The adoption of IFRS S1 and S2 advances the standardisation of sustainability disclosures, enhancing transparency and comparability across companies and sectors. However, implementation challenges remain, particularly in integrating with existing regulations and ensuring compliance.

In the case of European airlines, the application of these standards takes on added importance, as the sector faces increasing pressure to reduce carbon emissions and adopt sustainable practices. Thus, this article aims to analyse the application of IFRS S1 and IFRS S2 standards in the sustainability reports of major European airlines.

The study comprises five parts: an introduction, a literature review focusing on key sustainability reporting standards and the emergence of international standards developed by the International Sustainability Standards Board (ISSB), comparing them with the recent standards developed by the European Commission, the Corporate Sustainability Reporting Directive (CSRD). The third part focuses on the methodology adopted. The fourth part presents and discusses the results obtained, and finally, the last part of this study presents its main conclusions, highlighting its limitations and possible directions for future research.

Literature Review

Growing global concern about climate change, carbon footprints, fossil fuel use, pollution, and waste has led organisations to implement mechanisms to minimise the environmental impacts of their core activities. Increased stakeholder pressure for more detailed information on environmental, social, and corporate governance performance has driven the production of sustainability reports, previously known as social responsibility reports, which have become increasingly common over recent decades (Friske, Nikolov, and Morgan, 2023). Sustainability reporting has resulted from growing awareness of environmental and social issues and stakeholder demand for ESG information. According to Brogonzoli (2005), sustainability reporting “combines accounting information with ethical and social aspects to effectively communicate how an entity seeks to achieve its objectives”. As Waris and Din (2023) reiterate, transparent sustainability reporting and sound environmental management practices reinforce corporate legitimacy by demonstrating regulatory compliance and commitment to sustainability.

Given the growing importance of non-financial reporting for stakeholders, coupled with increased interest in information on corporate sustainability, two new sets of standards for sustainability reporting emerged in 2023: International Financial Reporting Standards (IFRS S1 and IFRS S2) and European Sustainability Reporting Standards (ESRS).

In June 2023, IFRS S1 and S2 were published. According to Liikanen (2023), they provide investors with globally comparable sustainability disclosures and may guide market prices without restricting additional jurisdictional requirements. The ISSB aims to harmonise reporting, reduce duplication, and integrate sustainability information with financial statements. IFRS S1 addresses short-, medium-, and long-term sustainability risks and opportunities, while IFRS S2 provides climate-related guidelines for identifying, measuring, and disclosing information for resource allocation.

In the European context, and in line with the European Green Deal, the European Sustainability Reporting Standards (ESRS) were published in 2023. On 31 July 2023, the European Commission released the first set, covering 12 key topics (Suta, Molnár, Limbach, and Tóth, 2025). The directive gives equal weight to financial and non-financial information, introduces mandatory external assurance, and adopts a dual materiality perspective, integrating sustainability reports into the management report (EFRAG, 2023).

This approach gives entities a broader view of sustainable performance beyond financial reporting. Sectors with high energy use and environmental impact, such as commercial aviation, are especially relevant. Despite its recent development, aviation has grown rapidly, with traffic increases driving higher fossil fuel use and greenhouse gas emissions.

Chapman (2007) notes that fuel consumption is highest during take-off, so short-haul flights use disproportionately more fuel per kilometre. As oil dominates transport fuel, aviation is a major contributor to global warming, accounting for about 2.6% of CO_2 emissions and 3.5% of the anthropogenic greenhouse effect (Staples, Malina, Suresh, Hileman, and Barret, 2018). With evolving legislation and non-financial reporting standards, companies face growing pressure to disclose information that reflects their sustainability commitments and impacts on financial and strategic planning.

Research Methodology

This study aims to analyse the applicability of ISSB standards requirements and demands in the sustainability reports of European airlines. In order to conduct an in-depth analysis of the

application of IFRS S1 and S2 standards, the most relevant items were listed in a checklist to assess their application in the sustainability reporting of airlines. With a particular focus on issues related to sustainability and its risks and opportunities, we first have the following topics arising from the application of IFRS S1 (Table 1):

#	Standard	Topics
1	IFRS S1	Identification of sustainability-related risks and opportunities
2	IFRS S1	Identification of governance processes, controls and procedures used to monitor, manage and oversee sustainability-related risks and opportunities
3	IFRS S1	Identification of the strategy implemented to manage sustainability-related risks and opportunities
4	IFRS S1	Identification of processes to identify, assess, prioritise and monitor sustainability-related risks and opportunities
5	IRFS S1	Reporting calendar
6	IFRS S1	Comparative information

Table 1 - Topics to be addressed under IFRS S1

Next, and within the scope of climate information disclosure, the following topics relevant to addressing climate-related risks and opportunities arise from IFRS S2 (Table 2):

#	Standard	Topics
1	IFRS S2	Identification of climate-related risks and opportunities
2	IFRS S2	Identification of governance processes, controls and procedures used to monitor, manage and oversee climate-related risks and opportunities
3	IFRS S2	Identification of the strategy implemented to manage climate-related risks and opportunities
4	IFRS S2	Identification of the entity's strategy and decision-making in addressing the effects of climate-related risks and opportunities
5	IRFS S2	Disclosure of information relevant to cross-sectoral climate-related metric categories

Table 2 - Topics to be addressed under IFRS S2

Six European airlines were selected for this case study to ensure consistent analysis, based on comparable turnover, activity, target markets, and workforce. They belong to recognised sustainability and transport indices, including the S&P Dow Jones Index, Stoxx’s DAXsector All Transportation & Logistics, Morningstar’s Sustainalytic, and Skytrax’s World Airline Awards, enabling comparative analysis of operational efficiency, regulatory policies, and

market trends. Companies in the S&P Dow Jones Index (S&P Global, 2023) and DAXsector All Transportation & Logistics (STOXX, 2023) typically lead in technological innovation, sustainability, and environmental practices. Morningstar's Sustainalytics ranking (Sustainalytics, 2023) assesses ESG performance, while Skytrax's World Airline Awards (Skytrax, 2024) use annual surveys, such as the 'World Airline Survey' and 'World Airport Survey', to enable quantitative airline performance comparisons. Accordingly, the selected entities were Royal Dutch Airlines – KLM and Société Air France from the S&P Dow Jones Index (S&P Global, 2023), Lufthansa from the DAXsector All Transportation & Logistics (STOXX, 2023), Finnair from the Sustainalytics ranking (Sustainalytics, 2023), and Iberia and British Airways from the Skytrax ranking (Skytrax, 2024), both affiliated with the International Airlines Group (IAG). Thus, in conjunction with the central question of the study, the following research questions arise:

1. To what extent are the sustainability reports of the main European airlines aligned with the requirements defined by IFRS S1 and IFRS S2?
2. Which requirements of IFRS S1 and IFRS S2 are most frequently met by the main European airlines?
3. Are there significant differences in the degree of compliance with IFRS S1 and IFRS S2 standards among the main European airlines?

As a starting point, this study analyses the sustainable initiatives implemented prior to the adoption of IFRS standards. Table 3 presents the common and differentiating initiatives, enabling a structured assessment of the degree of homogeneity in practices before the analysis of compliance with IFRS S1 and IFRS S2. Accordingly, patterns of airline performance and alignment with the sustainability guidelines discussed above are identified (Table 3).

Sustainability Measure	Lufhtansa	Air France-KLM	Iberia	British Airways	Finnair
Renewal and modernisation of the fleet	✓	✓	✓	✓	✓
Use of SAF	✓	✓	✓	✓	✓
Carbon neutrality target by 2050	✓	✓	✓	✓	✓
Reduction in emissions per passenger by 2030	✗	✓	✓	✓	✗
Eco-piloting and efficient flying methods	✗	✓	✗	✗	✓
Carbon offsetting	✗	✗	✗	✗	✓
Customer involvement in reducing emissions	✗	✗	✗	✗	✓

✓ Refers initiatives ✗ Does not refers initiatives

Table 3 - Sustainability initiatives identified in the entities under analysis

This systematisation shows that, although there are strategic specificities between different airlines, there is a core set of measures that cut across all entities, namely fleet renewal, the use of sustainable aviation fuels (SAF) and a commitment to carbon neutrality by 2050. Following the analysis of pre-IFRS initiatives, the study aims to analyse how entities adopt and apply sustainability reporting in accordance with IFRS S1 and IFRS S2, and the benefits of such adoption. Following the establishment of the theoretical framework, the research adopts a practical approach by analysing airline sustainability reports, using the proposed checklist to assess the extent of compliance with ISSB standards.

In the context of this study, the identification of sustainability-related risks and opportunities that may affect an entity's prospects is conducted in accordance with the IFRS Sustainability Disclosure Standards (§54, IFRS S1).There is broad uniformity in risk identification. Air France and KLM adopt a structured approach, categorising transition risks across political, legal, reputational, market, and technological dimensions. Finnair integrates sustainability risks into its ERM system, incorporating climate risks into strategic and operational risks. Lufthansa links regulatory, reputational, and technological risks to innovation and energy transition. Iberia and British Airways identify risks and opportunities with specificity, emphasising technological transition, legal aspects of decarbonisation, sustainable fuels, and green financing. The analysis of governance focuses on the processes, controls and procedures used to monitor, manage and oversee sustainability-related risks and opportunities. In this

context, financial disclosures related to sustainability should "enable users of general purpose financial statements to understand the governance processes, controls and procedures that an entity uses to monitor, manage and oversee sustainability-related risks and opportunities" (§26, IFRS S1). In summary, Table 4 below lists the bodies responsible for monitoring, managing and supervising sustainability-related risks and opportunities in each of the entities analysed:

Entity	Name
Air France/KLM	Sustainable Development and Compliance Committee; Board of Directors/Supervisory Board;
British Airways/Iberia (Grupo IAG)	Safety, Environment and Corporate Responsibility Committee;
Finnair	Board of Directors; Support Committees (Audit Committee and People and Remuneration Committee);
Lufthansa	Sustainability Committee; Executive Board;

Table 4 - Committees responsible for sustainability-related risks and opportunities

All entities recognise the importance of governance in managing sustainability risks, with varying formalisation. Air France and KLM rely on the Sustainable Development and Compliance Committee alongside the Board to oversee ESG strategy and performance. The IAG Group (British Airways and Iberia) uses interconnected committees for integrated sustainability management. Lufthansa combines Executive Board leadership with a Sustainability Committee for technical support and risk monitoring. Finnair delegates ESG responsibilities to the Board and support committees. While all comply with IFRS S1, governance structures differ in specialisation.

The strategic dimension of sustainability reporting concerns the identification of the approaches adopted to manage sustainability-related risks and opportunities. Accordingly, financial disclosures in sustainability reports should provide a clear understanding of the strategy to manage such risks and opportunities, in accordance with IFRS S1 (§28 to §42). The analysed airlines demonstrate ongoing efforts. Finnair targets carbon neutrality by 2045; Air France and KLM focus on technological innovation, progressive decarbonisation, and sustainable value creation. Iberia and British Airways (IAG Group) aim for carbon neutrality by 2050, integrating ESG dimensions. Lufthansa emphasises resilience and competitiveness, leveraging innovation,

partnerships, energy optimisation, and digitalisation to manage ESG risks and opportunities, including sustainable finance. Overall, all entities adopt proactive sustainability strategies, differing in ambition, perspective, and sectoral integration. From a process-oriented perspective, the identification, assessment, prioritisation and monitoring of sustainability-related risks and opportunities are essential to ensure the reliability of disclosures. Accordingly, IFRS S1 (§43 and §44) emphasises the importance of understanding these processes, and all analysed airlines comply with these requirements. Finnair integrates ESG materiality analyses and climate scenarios into its risk management. Iberia and British Airways (IAG Group) adopt a multidisciplinary approach across Sustainability, Risk, Finance, and Strategy. Air France and KLM embed sustainability risk management within ERM, with periodic strategic reviews. Lufthansa systematically integrates risks into corporate management, assessed by probability and impact. Overall, materiality analyses, climate scenarios, and ESG integration reflect organisational maturity and strategic transparency. Differences reside mainly in process detail and stakeholder involvement, reflecting internal development and regulatory adaptation.

Financial disclosures related to sustainability must be reported by the entity at the same time as the respective financial statements, thus covering the same disclosure period (§64, IFRS S1). For practical reasons, an entity may present a report for a 52-week period instead of the conventional 12 months (§65, IFRS S1). The choice will depend on the entity's operational needs. All airlines analysed use the conventional 12-month (calendar year) annual reporting model, ending on 31 December, and do not adopt the alternative 52-week model (Table 5).

Entity	Evidence Reporting Calendar
Air France/KLM	“Consolidated financial statements for the year ended December 31, 2023”
British Airways/Iberia (Grupo IAG)	“Consolidated financial statements for the year ended 31 December 2023”
Finnair	“Financial Statements Bulletin 2023 – January 1 to December 31, 2023”
Lufthansa	“Financial statements for the financial year ended 31 December 2023”

Table 5 - Evidence from the reporting calendar of target companies

To ensure a proper understanding of sustainability-related financial disclosures, entities should disclose comparative information for the same period, including not only quantitative data but also comparative narrative and descriptive information, in accordance with IFRS S1 (§70). Thus, Table 6 suggests evidence, taken from the annual and sustainability reports of the entities under analysis, of what is reported:

Entity	Evidence Reporting Calendar
Air France/KLM	Environmental and social data with data from the same period last year. It also includes the percentage change and the respective explanation.
British Airways/Iberia (Grupo IAG)	Tables showing ESG targets for the last two years, namely carbon dioxide emissions and use of SAF.
Finnair	Environmental, social and governance data with comparison between the reporting period and the same period last year.
Lufthansa	Comparisons of all key metrics with the previous year.

Table 6 - Evidence of comparative information on target companies

In summary, the analysis indicates that the main European airlines assessed largely comply with IFRS S1 requirements for sustainability reporting. They consistently adopt structured processes for identifying and monitoring risks and opportunities, provide comparative information, and align reporting with financial statement calendars. These practices demonstrate a commitment to transparency and data quality, as well as readiness for full CSRD implementation, reflecting the increasing integration of ESG factors into strategic management and stakeholder communication.

In order to assess the degree of compliance of the entities analysed with the requirements established in IFRS S1, Table 7 was prepared, structured on the basis of the checklist developed.

Checklist IFRS S1	Lufhtansa	Air France-KLM	Iberia	British Airways	Finnair
Identification of sustainability-related risks and opportunities	✓	✓	✓	✓	✓
Identification of governance processes, controls and procedures	✓	✓	✓	✓	◯
Identification of the strategy for managing risks and opportunities	✓	✓	✓	✓	✓
Identification of evaluation and monitoring processes	✓	✓	✓	✓	✓
Reporting calendar	✓	✓	✓	✓	✓
Comparative information	✓	✓	✓	✓	✓

✓ High Compliance ◯ Partial Compliance

Table 7 - Summary table showing the degree of compliance of the entities under review with IFRS S1

The table should be interpreted according to the legend: green indicates full compliance with the standard, while yellow denotes partial compliance, reflecting generic or insufficiently detailed approaches. Overall, the analysis shows a high degree of compliance among the entities, particularly regarding risk and opportunity identification, strategy, and reporting schedule. Finnair, however, stands out for having a less specialised governance structure, reflecting a less formalised approach to sustainability oversight despite meeting most requirements.

The identification of climate-related risks and opportunities is central to sustainability reporting, and entities shall disclose information enabling users of financial statements to understand these risks and opportunities (§10, IFRS S2). Airline disclosures on climate risks and opportunities align with IFRS S2 (§10), with varying detail. Finnair uses a structured ERM system integrating physical risks and transition opportunities. Air France and KLM differentiate acute and chronic risks, linking them to mitigation and opportunities. The IAG Group (British Airways and Iberia) identifies key risks and opportunities, focusing on carbon neutrality. Lufthansa emphasises physical risks and opportunities in innovation and fleet decarbonisation. All companies recognise climate issues as central to their business models, increasingly integrating them into strategy and reporting.

The governance of climate-related risks and opportunities requires entities to clearly present information on the processes, controls, and procedures in place. This includes identifying the governance body and its responsibilities (§6, a, IFRS S2), as well as detailing management's role in implementing these processes, including delegation and effective control mechanisms (§6, b, IFRS S2). Air France and KLM rely on the Sustainable Development and Compliance Committee to support the Board in environmental and social integration. The IAG Group (British Airways and Iberia) assigns climate oversight to the Safety, Environment and Corporate Responsibility Committee. Finnair uses a dual structure with the Board and specialised committees, while Lufthansa involves the Executive Board and Sustainability Committee to integrate climate considerations into strategy.

Understanding an entity's strategy for managing climate-related risks and opportunities is central to climate-related financial disclosure. These disclosures should cover impacts on the business model, value chain, decision-making, financial planning, and the resilience of the overall strategy (§9, IFRS S2). Airline strategies converge on fleet renewal, sustainable fuels, digitalisation, and innovation. Finnair proactively mitigates risks and capitalises on opportunities, positioning as a green aviation benchmark. Air France and KLM focus on

regulatory adaptation, energy efficiency, and integrated risk management via a Climate Action Plan. Iberia and British Airways (IAG Group) integrate climate into financial and planning structures, investing in SAF, fleet renewal, operational optimisation, and partnerships. Lufthansa structures its strategy around fleet renewal, SAF, operational optimisation, and innovation, with technological partnerships for alternative propulsion.

Understanding the entity's strategy and decision-making in addressing climate-related risks and opportunities requires clear disclosure in corporate reports. This includes how such risks and opportunities affect strategy, business model adjustments, mitigation and adaptation efforts, transition plans, environmental targets, supply chain restructuring, and the progress of prior initiatives (§14, IFRS S2). The airlines' strategies align with guidelines. Finnair focuses on operational and fleet efficiency, SAF, and technological partnerships. Air France and KLM implement the Climate Action Plan, prioritising fleet modernisation, fuel optimisation, and emerging technologies. British Airways and Iberia (IAG Group) pursue decarbonisation with 2030 and 2050 targets, emphasising fleet renewal, eco-piloting, SAF, technology, and governance. Lufthansa adopts a holistic strategy on fleet renewal, SAF, innovation, and residual emissions compensation.

Disclosure of information relevant to cross-sectoral climate-related metric categories involves reporting quantitative and qualitative targets, including voluntary and regulatory goals.

Entities should specify metrics, objectives, organisational scope, application period, benchmarks, intermediate milestones, and indicate whether targets are absolute or intensitybased (§33, IFRS S2). The airlines show commitment to climate mitigation and IFRS S2 compliance (§33–34). Lufthansa targets carbon neutrality by 2050, with a 50% emissions reduction by 2030. Iberia and British Airways (IAG Group) track fuel efficiency, SAF use, and carbon offsets, also monitoring climate adaptation. Air France and KLM implement robust decarbonisation strategies, exceeding SAF requirements. Finnair aims for carbon neutrality by 2045 and a 50% emissions reduction by 2025.

Overall, all airlines report climate targets aligned with IFRS S2, with specific metrics, showing a common trend of integrating climate considerations into strategy and adopting transparent, comparable reporting practices. Similar to IFRS S1, a table was constructed to assess the degree of compliance of entities with the requirements stipulated in IFRS S2 (Table 8).

Checklist IFRS S2	Lufhtansa	Air France-KLM	Iberia	British Airways	Finnair
Identification of climaterelated risks and opportunities	✓	✓	✓	✓	✓
Governance of climate risks and opportunities Strategy for managing climate risks and opportunities	✓	✓	✓	✓	○
Decision-making and strategic response to climate risks	✓	✓	✓	✓	✓
Reporting calendar Disclosure of climate metrics and targets	✓	✓	✓	✓	✓
	✓	✓	✓	✓	✓
	✓	✓	✓	✓	✓

✓ High Compliance ○ Partial Compliance

Table 8 - Summary table showing the degree of compliance of the entities under review with IFRS S2 When reading the table, the criteria defined for assessing compliance must be taken into account: the green symbol corresponds to high compliance, indicating that the entity meets the regulatory requirements in a structured and detailed manner; and the yellow symbol indicates partial compliance, where the issues are addressed, but in a generic or incomplete manner.

In examining and discussing the results, it is evident that none of the studied entities formally apply IFRS S1 or S2, nor is there evidence of imminent adoption. Despite this, their disclosures generally reflect most of the standards' requirements. Reports remain concise and occasionally repetitive, while highlighting commitments to ESG improvement, decarbonisation, ongoing SAF use, and operational efficiency.

From the analysis of sustainability reports, it is important to assess whether emissions have decreased and regulatory and financial requirements are being met. Airlines disclose 2030 decarbonisation targets, which should be compared with 2023 CO_2 emissions, themselves based on 2019 levels. A gradual decline is expected, aiming for net zero by 2050 (Graph 1):

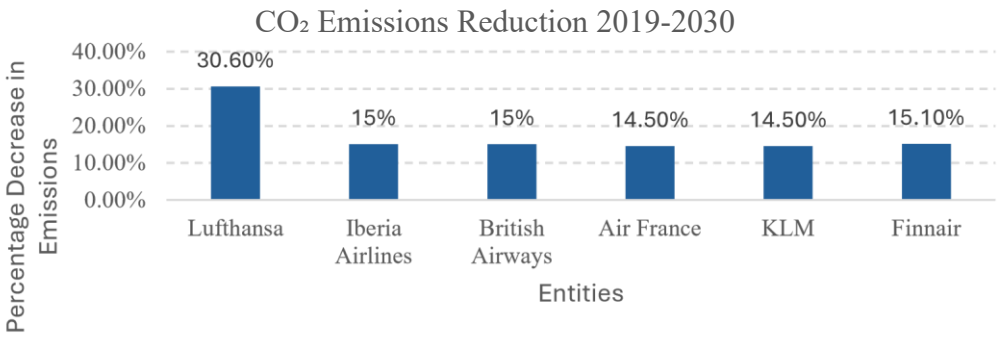

Chart 1 – Reduction in carbon dioxide emissions by 2030 for target companies, compared to 2019

The variation between the current percentage of emissions and the target set for 2030 highlights different challenges for each entity. Lufthansa has recorded a significant reduction in its emissions, rapidly approaching its interim targets, while the others will have to intensify their strategies to ensure that the objectives are met (Chart 2).

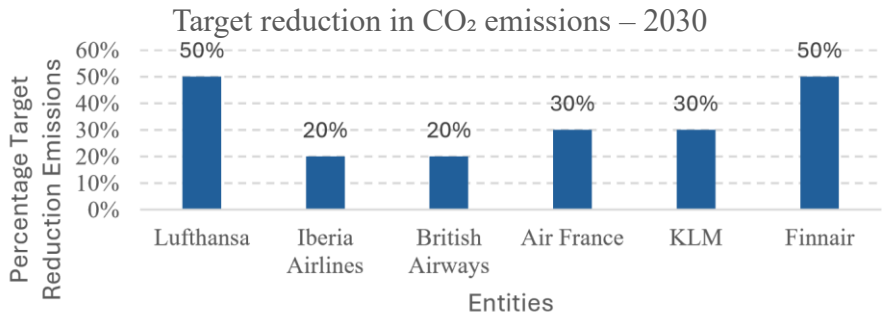

Chart 2 – Target for reducing carbon dioxide emissions by 2030 for target companies

The pace of decarbonisation depends on fleet renewal and sustainable aviation fuel (SAF) use. Chart 3 presents the current and 2030 SAF incorporation targets disclosed by the airlines.

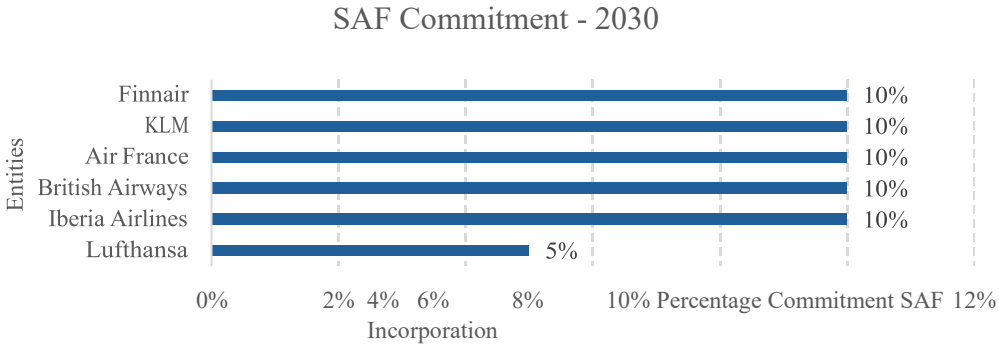

Chart 3 – Commitment to implement SAF by target companies by 2030

Similarly, with the exception of Lufthansa, all airlines report quantitative data on current SAF consumption, enabling assessment of actual compliance with proposed measures (Chart 4).

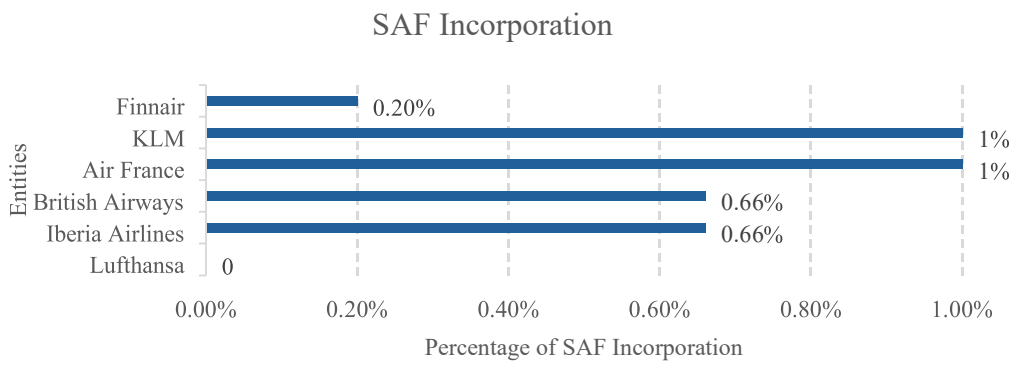

Chart 4 – Incorporation of SAF into the fuel consumption of target companies

Fleet renewal, as part of climate strategy, constitutes a material action in managing related risks and opportunities. To assess implementation, the average fleet age of each airline is shown in Chart 5.

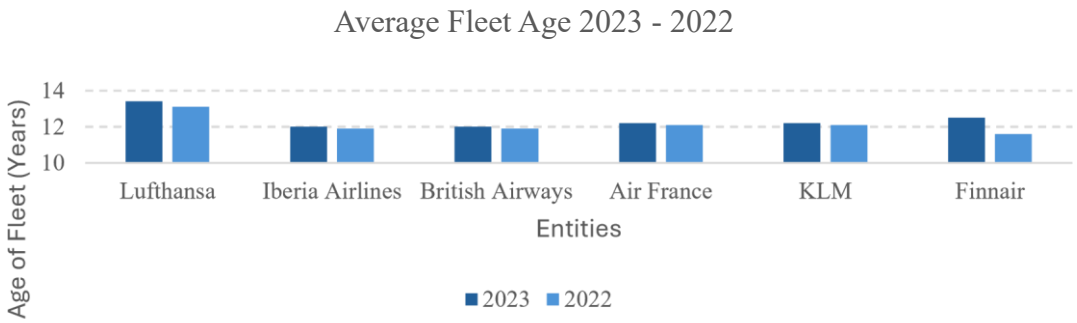

Chart 5 – Comparison of the average age of the target companies' fleets between 2023 and 2022

There is a rising trend in average fleet age compared to the previous year, reflecting operational and strategic challenges with potential future impacts.

Beyond assessing IFRS S1 and S2 reporting, it is essential to use quantitative data to verify whether entities implement the measures they report. Since these standards are not yet mandatory, the study's findings can be viewed positively. The primary objective of the standards is to improve the environmental impact of operations, enhancing process sustainability. Despite being highly exposed to sustainability challenges, the sector has opportunities to balance operational development with sustainable practices.

Conclusion

This study examined IFRS S1 and S2 application in the sustainability reports of Lufthansa, Iberia, British Airways, Air France, KLM, and Finnair, analysing ISSB compliance. Reports

generally show moderate to high alignment, with climate targets, reporting schedules, and strategic governance most consistently met, while governance specialisation and metric systematisation show lower compliance. Differences reflect organisational model, climate maturity, and regulatory anticipation. In conclusion, while IFRS S1 and S2 advance the standardisation of sustainability disclosures, their widespread adoption remains limited. Implementation and regulatory oversight contribute to a more responsible and transparent aviation sector, aligned with global sustainable development goals.

The limitations of the study include, first and foremost, the fact that IFRS S1 and IFRS S2 were only published in 2023. In addition, although the checklist-based methodology allows for a general assessment of compliance with IFRS S1 and IFRS S2, it does not capture all the qualitative nuances of the reporting practices adopted by entities. For future studies, it would be interesting to carry out a comparative approach that includes airlines from different continents, allowing for a comprehensive approach to the variations in the adoption of these standards and how they may impact the sustainable reporting of entities in the aviation sector. Additionally, it would be relevant to assess the impact of the adoption of IFRS S1 and IFRS S2 on the perception of stakeholders and other users of sustainable information, analysing the transparency and reliability of reporting and the financial performance of companies.

ACCOUNTING STANDARDISATION UNDER SALAZAR'S CORPORATIST REGIME: THE PIONEERING ROLE OF THE INSURANCE INSPECTORATE, 1929–1949

Ventura, Joana[1]; Azevedo, Graça[2]; Góis, Cristina[3]

Keywords: Accounting Standardisation, Insurance Industry, Public-Interest Theory, Portugal, Corporatist

Abstract

This study examines the paradox of early accounting standardisation in the Portuguese insurance industry during the interwar period within a corporatist political context. Although Portugal remained one of Western Europe's most economically backward (Lains, 2003) countries, the State introduced compulsory uniform accounting rules for insurance companies as early as 1929. The new regulatory framework required insurers to adopt standardised accounts, calculate technical reserves according to prescribed methods, and submit uniform financial statements to the Insurance Inspectorate. These measures preceded Portugal's first general accounting plan by several decades and constitute one of the earliest examples of industry-specific accounting regulation in Europe. The study addresses the question why did the insurance industry become the pioneer sector for accounting standardisation?

The research follows a traditional accounting history approach, observing accounting as a technical administrative instrument embedded within broader institutional and regulatory developments. A qualitative documentary analysis was conducted using primary sources preserved in the Insurance Inspectorate's Historical Archive in Lisbon, including legislation, circulars, inspection reports, technical opinions, and official correspondence. The analysis traces regulatory developments between 1929 and 1949, identifying changes in accounting recognition, measurement and presentation requirements. Public Interest Theory (Posner, 1974) provides the principal theoretical framework, interpreting accounting regulation as a

governmental response to market failures arising from insurer insolvencies, information asymmetries and the need to protect policyholders.

The study demonstrates that the introduction of compulsory accounting uniformisation cannot be understood without considering the economic and institutional weaknesses of the Portuguese insurance market (Mendes, 2014). Insurance activity expanded under limited regulatory oversight while accounting practices remained highly heterogeneous. Insurers applied different valuation methods, reserve calculations techniques as well as reporting formats. The absence of comparable financial information significantly constrained the Insurance Inspectorate' ability to assess insurers' solvency and financial soundness (Garcia, 1935).

The situation deteriorated after the First World War. Several insurers experienced financial distress owing to inadequate technical reserves, speculative investments and excessive dividend distributions, undermining public confidence in the insurance market (Mendes, 2014). Earlier legislation had introduced minimum capital requirements and licensing procedures, but the Insurance Council lacked the technical expertise and legal authority required to ensure effective supervision. The creation of the Insurance Inspectorate in 1929 therefore represented a fundamental institutional reform that transformed accounting from a private organisational practice into an instrument of prudential regulation.

The findings show that accounting standardisation formed part of a broader oversight strategy designed to improve market discipline and strengthen administrative control. The Insurance Inspectorate required all insurance companies to adopt uniform accounting classifications, standardised financial statements and prescribed methods for measuring technical reserves. These requirements enabled the Insurance Inspectorate to compare insurers consistently, monitor financial performance, evaluate solvency and identify potential weaknesses before they threatened policyholders. Unlike its predecessor, the Insurance Inspectorate possessed effective enforcement powers, including on-site inspections, mandatory reporting requirements, requests for additional accounting information and, where necessary, the suspension or withdrawal of operating licences (Garcia, 1935). Compliance therefore depended not only on the technical design of accounting rules but also on the development of an administrative apparatus capable of enforcing them.

The analysis further argues that insurance became the first sector to experience compulsory accounting standardisation because of its distinctive economic characteristics. Insurance contracts involve long-term obligations whose fulfilment depends upon insurers' future financial capacity, creating substantial information asymmetries between companies and policyholders. Reliable accounting information was therefore essential for financial oversight

and consumer protection. Furthermore, the significant presence of foreign insurance companies raised concerns regarding market stability, competitive conditions and capital outflows, reinforcing the state's incentive to establish uniform accounting requirements that could be consistently applied across domestic and foreign firms.

The Portuguese case challenges dominant explanations (Camfferman and Detzen, 2018), that associate accounting standardisation primarily with the development of capital markets, professional accounting bodies or investor demand. Instead, it demonstrates that accounting uniformisation may emerge through state intervention in response to market failures and broader projects of administrative modernisation. Sector-specific regulation therefore preceded, and arguably facilitated, the later development of general accounting regulation in Portugal.

PANDEMIC CONTEXT AND IMPLICATIONS FOR PORTUGUESE SMES' INTERNATIONALISATION

Mendes, Mafalda[1]; Silva, Patrícia[2]

[1] Business Research Unit (BRU-IUL), Iscte-Instituto Universitário de Lisboa, Lisbon, Portugal

[2] Business Research Unit (BRU-IUL), Iscte-Instituto Universitário de Lisboa, Lisbon, Portugal

Keywords: Internationalisation, SMEs, Portuguese SMEs, Pandemic, Covid-19

Introduction

SMEs support Europe's economy, representing 99.8% of all enterprises, employing 65% of all workforces and being responsible for 52.8% of the value added (European Commission, 2014; Eurostat, 2021).

SMEs who were internationalised outperformed those which had not, proving that internationalisation, performance, competitiveness and growth are linked (European Commission, 2014).

Literature Review

According to the last SBA Fact Sheet of Portugal from 2019, the country is considered one of the worst members in the EU in terms of internationalisation. Portugal's small and pressured market and unfavorable economic conditions make internationalisation essential for SMEs to remain competitive and ensure long-term continuity of operations (Portugal Global, 2013). Additionally, some authors have highlighted how valuable it has been for SMEs to increase their activities across national boundaries after periods of recession like the past economic and financial crisis (Pacheco, 2019).

Purpose, Aim and Objectives

The most recent event which could be compared to previous recession periods is the pandemic of Covid-19, impacting companies and economies.

With the pandemic shutting down companies and suppressing countries' economies, it is important to, mainly, comprehend what are the impacts of this pandemic context for SMEs and the role of internationalisation in this process.

Methodology and Methods

A questionnaire was developed and distributed via an online platform, Google Forms. The form was closed after three months with a sample size of 309 responses valid responses. The analysis of the data collected was completed with resort to the software program SPSS.

Findings and Contribution

Internationalisation was more advantageous for firms before the pandemic while during this period, SMEs had a decrease in international sales, contrarily to what occurred during the economic crisis of 2008 when for some firms, internationalisation was the key for their survival (Éltető, 2018).

Internationalised smaller firms are known to have more restrictions than larger firms (LeMay and McMahon, 2026), indeed, it has been verified that larger internationalised SMEs had better outcomes than smaller ones. Digitalization and the number of years a firm operates abroad are still regarded as important factors which helped companies overcome the pandemic. As firms keep internationalising over the years, they acquire more experience resulting in an increase in turnover. Furthermore, internationalised SMEs having a global network was another important resource to tackle the hardships of the pandemic which facilitates the internationalisation process (Han, Goxe and Freeman, 2024).

Originality and Value

The study adds to the existing literature by addressing the most recent global crisis, the pandemic which impacted SMEs' internationalisation and highlights how firms should develop contingency plans to prevent future events like this.

Research Limitations

The main limitation of the study is that not all aspects of the pandemic were analyzed due to the diverse list of implications. The method used to collect data was a lengthy online survey due to the nature of the research, but these usually have lower response rates since being external to the participant firms reduces the trust when answering the form. Finally, the dataset lacks sector representativeness and is heavily clustered in major cities.

Theoretical and Practical Applications and Implications

By better understanding the underlying implications and the methods used to approach the pandemic, firms can pay more attention to certain resources. Investing in partnerships can provide valuable information and resources which can improve performance and turnover. Digitalization should be accelerated to help SMEs overcome physical trade barriers. Through experiential knowledge, managers can be better prepared for challenges ahead and manage their resources more effectively.

In terms of theoretical implications, research should gear towards the interplay between different factors instead of focusing on isolated elements considering that more than one component influences the process of Internationalisation. Additionally, these findings add to the knowledge of context-specific scenarios, in this case, the pandemic which can be compared to other crisis of economic nature or geopolitical conflicts.

THE PRICE OF CARBONWASHING: STOCK MARKET REACTIONS TO CLIMATE SIGNALING FAILURES

El Alfy, Amr[1]; Nassar, Mohamed[1]

[1]School of Environment, Enterprise and Development (SEED), University of Waterloo, Waterloo, Canada

Keywords: Carbonwashing, Greenwashing, ESG Controversies, Climate Disclosure Credibility, Signalling Theory, Event Study, GHG Emissions, Market Reaction.

Introduction

Climate change has transformed corporate environmental disclosure from a voluntary communication exercise into a central component of governance, risk management, and capital market valuation. Regulatory frameworks, including the Task Force on Climate-related Financial Disclosures (TCFD), the International Sustainability Standards Board (ISSB), and the EU Corporate Sustainability Reporting Directive (CSRD), have elevated carbon reporting as a core accountability mechanism. Yet the growing strategic importance of climate disclosure also creates incentives for firms to engage in carbonwashing, which reflects the selective disclosure, omission, or exaggeration of greenhouse gas (GHG) emissions data and climate commitments, posing significant risks to market credibility and investor decision-making.

Purpose, Aim and Objectives

This study examines whether capital markets penalise firms for carbonwashing-related controversies and under what conditions such penalties occur. Specifically, it investigates how the visibility of carbonwashing incidents moderates investor reactions to misleading or selective corporate GHG disclosures among S&P 500 firms. The study aims to advance understanding of when carbonwashing becomes financially material and to extend signalling theory to the context of carbon disclosure credibility.

Literature Review and Theoretical Framework

Prior research shows that transparent carbon disclosure reduces information asymmetry, strengthens investor confidence, and lowers cost of capital (Matsumura et al., 2014). Conversely, greenwashing undermines consumer and investor trust (Santos et al., 2024). Carbonwashing, which is a carbon-specific form of greenwashing, encompasses misleading emissions reporting, overstated reduction targets, and symbolic climate commitments without substantive action (In & Schumacher, 2021). Grounded in signalling theory (Spence, 1978), this study conceptualises carbon disclosures as credibility signals; when carbonwashing is exposed, these signals lose integrity, triggering investor uncertainty and valuation corrections. Media visibility amplifies this process by broadening information diffusion (Tetlock, 2007).

Methodology and Methods

The study analyses 29,567 firm-incident observations from 191 S&P 500 firms over 2010-2023, using ESG controversy data from RepRisk. A standard market-model event study estimates cumulative abnormal returns (CARs) over a [-2, +2] event window, with a 120-day pre-event estimation window. Non-parametric tests -- including a CHAID decision tree and Mann-Whitney U test -- complement panel regressions incorporating firm and time fixed effects. Key interaction terms (Reach x GHG; Environment x GHG) capture the joint effect of media visibility and carbon salience on investor reactions.

Main Findings and Contribution

Capital markets do not uniformly penalise ESG controversies. The CHAID analysis identifies media reach as the primary determinant of CAR variation (chi-squared = 45.33, $p < 0.001$). High-reach GHG-related events exhibit significantly more negative CARs than other incidents (Mann-Whitney U, $p = 0.015$), with greater return dispersion and heavier downside tails. Panel regression confirms that Reach ($b = -0.0054$***), Reach x GHG ($b = -0.0105$**), and Environment x GHG ($b = -0.0128$**) are the key drivers of negative market reactions. Generic greenwashing allegations produce no significant standalone market penalty. Carbonwashing becomes financially material only when it is carbon-salient and widely disseminated.

Originality and Value

This study is among the first to empirically distinguish carbonwashing from broader greenwashing and examine its distinct financial consequences. It extends signalling theory by demonstrating that capital markets price not only carbon performance but also the credibility

of carbon disclosures. The findings reconcile previously mixed evidence on the financial impact of greenwashing by identifying media visibility as the critical contingency, with particular relevance for firms operating under CSRD and ISSB frameworks.

Research Limitations

The study focuses on short-term market reactions and relies on RepRisk data, which may not capture all instances of misleading climate disclosure. The sample is limited to S&P 500 firms, constraining generalisability. Future research could explore long-term financial consequences, cost of capital effects, and cross-country comparisons under differing regulatory regimes, including the European CSRD environment.

Theoretical and Practical Applications and Implications

Theoretically, the findings extend signalling theory to the domain of carbon disclosure credibility. For managers, the results highlight the financial risks of misleading climate disclosures and underscore the need for robust emissions governance. For investors, disclosure credibility should be incorporated into climate risk assessments. For regulators, the findings support strengthening verification and assurance mechanisms under ISSB and CSRD to reduce information asymmetry and support efficient capital allocation.

IS THE ORCHESTRATOR BECOMING DIGITAL WITH AI IN INNOVATION ECOSYSTEMS? CONCEPTUAL INTEGRATION AND RESEARCH OPPORTUNITIES.

Folino, Giorgia[1]; Usai, Antonio[1]; Iesu, Michela[2]

[1]Department of Economics and Business Sciences, University of Sassari, Italy

[2]Department of Humanities and Social Sciences, University of Sassari, Italy

Keywords: Innovation Ecosystems, Artificial Intelligence, Ecosystem Orchestration, Digital Governance, Hybrid Orchestration, Conceptual Research.

In today's rapidly evolving business landscape, the concept of Innovation Ecosystems (IE) has emerged as a central framework for collaborative value co-creation and capture among interdependent actors (Adner, 2017; Gomes et al., 2018; Granstrand & Holgersson, 2020; Thomas & Autio, 2019). Within these ecosystems, orchestration plays a central role in coordinating actors, aligning incentives, and facilitating knowledge sharing (Autio, 2021; Ritala et al., 2013). Contemporarily, rapid advances in digital technologies, and in particular artificial intelligence (AI), are increasingly supporting communication, operational performance, and decision-making processes across organizational networks (Begeç & Akyuz, 2023; Beliaeva et al., 2019). Nevertheless, the implications for AI in shaping ecosystems development and orchestration remains underexplored (Marchese et al., 2025; Kindermann et al., 2022). Thus, this research-in-progress aims to investigate whether the integration of AI is yet merely supporting the human activity or is reshaping the logic of IE coordination.

From the methodological standpoint, the study adopts a conceptual research design based on integrative literature review (Torraco, 2016; Cronin & George, 2020), and synthesizes insights from innovation ecosystem orchestration, platform governance and digital innovation literature to identify conceptual convergences. Papers were scouted through searches in Google Scholar using combinations of key words including *innovation ecosystem*, *ecosystem orchestration*, *ecosystem governance*, *artificial intelligence*, *AI*, and *digital platforms*. Subsequently, contributions were analysed focusing on ecosystem coordination mechanisms, orchestration activities and AI-enable decision support. The preliminary results provided the foundation for developing an exploratory conceptualization of the notion of digital orchestrator.

Building on Souza et al. (2023), the analysis first examines how AI enhances the four orchestration activities of ecosystem emergence, namely *mapping*, *engaging*, *sense-making*, and *designing* (Souza et al., 2023). In the mapping phase, AI enables orchestrator to process large volumes of data (e.g., customer reviews, social media, and other textual sources) to detect needs, pain points, and evolving preferences (Chin et al., 2024). Similarly, by scanning large volumes of scientific publications, patent data, and online sources to uncover external talent, expertise, and complementary capabilities, AI strengthens the orchestrator's engaging activity consisting in partner identification, (Holgersson et al., 2024), thereby expanding opportunities to discover and match with previously unknown collaborators. Therefore, AI reinforces the sense-making task through predictive analytics and digital twin technologies that simulate scenarios and outcomes (Holgersson et al., 2024), thus supporting decision-making under uncertainty. Finally, during the designing phase, through the *generative*, *convergent*, and *combinatorial* properties of digital technologies that foster the creation of novel solutions, cross-domain integration, and modular recombination of resources (Marchese et al., 2025), AI facilitate the establishment of flexible governance mechanisms and value-sharing arrangements. These applications highlight how AI enhances the traditional orchestration activities. However, the present work suggests a more fundamental transformation, as three different models of orchestration can be detected. In particular, the traditional orchestrator model, where digital technologies only support the human-based coordination activities; the AI-supported orchestrator, where AI provides recommendations and forecasts supporting the decision-making, while the decisional authority remains with the focal firm; and lastly, the digital orchestrator model, where data-driven rules, automated processes, and learning algorithms autonomously shape partner selection, collaboration intensity, and knowledge flows across the ecosystem, increasingly decentralizing the coordination activity. In this emerging configuration, the decision-making authority is thus progressively redistributed between human orchestrators and AI systems. Subsequent implications become more evident in the more mature stages of the IE lifecycle, where multiple projects and overlapping networks constantly develop and dissolve overtime (Souza et al., 2023), requiring real-time orchestration mechanisms exceeding the capacity of the traditional models. In these contexts, AI-based approaches like multi-agent systems provide a decentralized way to coordinate, where autonomous agents follow predefined rules to align goals, allocate resources, and adapt as conditions change (Holgersson et al., 2024), enabling orchestration to emerge from distributed algorithmic interactions rather than relying on hierarchical control.

Accordingly, the present work places the digital orchestrator as an emerging governance system that reshape coordination, control, and value creation evolve in increasingly data-driven, rather than a mere technologically enhanced orchestrator. As a consequence, the study contributes to the current innovation ecosystem theory by proposing positioning the digital orchestrator as a foundational concept for understanding how coordination, control, and value creation evolve in increasingly data-driven and algorithmically mediated IE. Furthermore, it opens a research agenda for empirically investigating how hybrid orchestration influences power, governance, and collaboration dynamics within IE.

BRIDGING THE MIS IMPLEMENTATION GAP: CHANGE-ORIENTED LEADERSHIP AND TEAM REFLEXIVITY IN HEALTHCARE

Rashkovits, Sarit[1]; Erez, Miriam[2]

[1] Healthcare Systems Management, Yezreel Valley College, Yezreel Valley, Israel

[2] Faculty of Data and Decision Sciences, Technion – Israel Institute of Technology, Haifa, Israel

Keywords: management information systems, change-oriented leadership, team reflexivity, MIS implementation, healthcare management, performance feedback, team performance, digital transformation

Introduction

Organizations invest heavily in Management Information Systems (MIS) to enhance performance monitoring and improvement. Despite such investments, research demonstrates that providing performance feedback data alone often proves insufficient for performance improvement (Gabelica et al., 2014). This implementation gap—the disconnect between MIS provision and actual performance improvement—represents a critical challenge for healthcare organizations.

In healthcare settings, contemporary perspectives recognize that outcomes emerge from interdependent team processes rather than isolated individual actions. Yet the process through which teams translate performance feedback availability into performance improvement remains poorly understood. Drawing on goal-setting theory (Locke & Latham, 2019) and social information processing theory (Salancik & Pfeffer, 1978), we propose a first-stage moderated mediation model: MIS-enabled performance feedback availability enhances team performance through team reflexivity, but only when team leaders display change-initiating behavior.

Theoretical Framework and Hypotheses

Goal-setting theory suggests that in team settings, performance improvement requires adapting work strategies rather than merely increasing effort (Locke & Latham, 2019). Performance feedback may therefore improve performance only when teams use feedback information to reflect on and adapt their work strategies. Team reflexivity—the extent to which team members openly reflect on goals, strategies, and processes, and adapt them to current circumstances (West, 2000)—serves as this collective mechanism for strategy adjustment. Research demonstrates that team reflexivity enhances team performance across diverse settings (Le Blanc et al., 2024).

However, team reflexivity faces social-psychological barriers because it requires members to question existing practices and established routines (Morrison, 2011; Hackman, 2002). Team members rely on leader cues to determine whether reflexive behavior is appropriate and worthwhile.

Leaders who consistently demonstrate change-initiating behavior—persistently seeking improvement and challenging established routines—signal that reflection and adaptation are valued organizational behaviors (Salancik & Pfeffer, 1978). By signaling that questioning existing practices and adaptation are both valued and worthwhile, such leaders may reduce the social and psychological barriers associated with team reflexivity. Such leadership may be critical for enabling teams to engage reflexively with MIS data, thereby translating data access into performance improvement.

Method

We employed a quasi-experimental longitudinal design including all eligible primary healthcare clinic management teams within the largest district of a large healthcare organization. Fifty-six teams were measured at three time points over 18 months. At baseline, teams were naturally divided into high (n = 32) versus low (n = 24) feedback availability conditions based on organizational MIS implementation decisions, with no significant baseline differences in performance, clinic characteristics, or team leader characteristics. We implemented time-lagged measurements: team reflexivity and leadership were assessed at 14 months via surveys, and performance outcomes at 18 months via objective organizational records.

Team performance was measured using a composite diabetes care quality indicator based on HbA1c, LDL, and microalbumin testing rates. This composite provides a parsimonious and statistically stable measure of a central clinical domain on which teams received repeated MIS performance feedback. Team leader change-initiating behavior was rated by team members using an 8-item scale (Paglis & Green, 2002; $\alpha = .95$). Team reflexivity was assessed using a 5-item scale ($\alpha = .91$).

Analyses controlled for baseline team performance, allowing assessment of performance change over time.

Results

Moderated mediation analysis using Hayes's (2022) PROCESS macro supported both hypotheses. The interaction between feedback availability and leader change-initiating behavior significantly predicted team reflexivity ($B = 0.80$, $p < .05$, $R^2 = .15$). Simple slope analysis showed feedback availability positively related to reflexivity only when change-initiating behavior was high (+1SD: $B = 0.33$, $p < .01$), but not at average or low levels.

Team reflexivity significantly predicted subsequent team performance ($B = 0.02$, $p < .05$), contributing incremental variance beyond baseline performance ($\Delta R^2 = .05$, $p < .05$). In contrast, feedback availability alone did not significantly predict performance ($\Delta R^2 = .003$, ns), demonstrating data access without reflexive engagement proves insufficient for improvement.

The index of moderated mediation was significant ($B = 0.02$, 95% CI [0.002, 0.05]). The conditional indirect effect of feedback availability on performance via reflexivity was significant at high levels of team leader change-initiating behavior ($B = 0.02$, 95% CI [0.002, 0.05]), but not at average or low levels, confirming that feedback availability relates to performance only through team reflexivity under change-initiating leadership.

Originality and Value

This study explains the MIS implementation gap by identifying the leadership conditions under which performance feedback translates into team reflexivity and subsequent performance improvement. In doing so, it highlights that the value of MIS-enabled feedback depends not

only on data availability but also on team and leadership processes that enable teams to reflect on and adapt their work strategies.

Practical Implications

These findings identify change-oriented leadership as a critical factor in MIS implementation success. Organizations implementing performance management systems should recognize that technology provision represents an insufficient condition for performance improvement.

Healthcare organizations should integrate change-oriented leadership development into MIS implementation strategies. This integrated approach enables teams to engage reflexively with performance data, translating information access into sustained performance improvement.

THE EMOTIONAL DIMENSION OF HEALTHCARE : ENHANCING PATIENT EXPERIENCES THROUGH EMOTIONAL INTELLIGENCE

Al Khoury, Grace[1]

[1]Department of Marketing, Paris School of Business, Paris, France

Keywords: Emotional Intelligence, EI/EQ, Emotional Intelligence Models, WLEIS, Individual Resilience, Patient Experience, Patient

Abstract

This paper adopts a theoretical approach to exploring the existing literature on emotional intelligence models and patient experience, taking individual resilience as a mediating variable. The main research question is: How does patients' emotional intelligence influence their heathcare experience, with resilience acting as a mediating variable? The goal of this paper is to examine the role of emotional intelligence and its effect on patients' experience as well as to explore the mediating role of resilience in shaping this relationship. This research tends to deepen our understanding of how emotionally intelligent patients: perceive, process and engage with their care, and how resilience mediates this dynamic. This paper is patient-centered. Findings will benefit healthcare providers to better understand, communicate, and empower patients through fruitful and effective engagements. To address the research question, the researcher adopted a quantitative research approach. This methodological choice was made to systematically explore and measure the relationship between emotional intelligence (EI) skills, resilience and patient experience variables, as well as to assess their combined effect on organizational performance within the healthcare sector. Specifically, the study aims to determine how these variables influence patient service quality, a critical factor in healthcare settings where empathy and effective communication play pivotal roles.

Introduction

The concept of emotional intelligence (EI) has been extensively explored across a wide range of disciplines, reflecting its broad relevance and impact. The focus of the researchers is to investigate the influence of emotional intelligence on the outcome, in various contexts. Emotional intelligence can be researched in the field of education, studying its impact on academic performance and classroom engagement, or in health care, by exploring is impact on the patient care quality and provider-patient communication, and even its effect on the effectiveness of teamwork and leadership in engineering and technical fields. Having high

emotional intelligence has proved to enhance interpersonal relationships, decision-making, and adaptive functioning, resulting in enhanced and effective outcomes on both levels, the individual and organizational.

A multicenter cross-sectional study was conducted by Jabour A.M. (2024) in 2023-2024, studying 134 chronic hemodialysis patients used in the Trait Meta-Mood Scale (TMMS-24) to measure EI – note that there are several ways to examine the level of emotional intelligence, however, TMMS-24 was chosen as the mean of evaluation of EI in this research – alongside the Kidney Disease Quality of Life-Short Form (KDQOL-SF). The study concluded that patients with higher emotional intelligence, can better interpret and regulate their emotions, leading to an enhanced physocological and resilience and eventually, a more positive subjective health outcome (Jabour, A.M., 2024; Masià-Plana, A. et al, 2024).

Patients with high emotional intelligence are more skilled and capable of interpreting and expressing their own emotional state, which makes communication more effective with their providers.

Although most existing literature review focuses on the emotional competencies of the health care provides (clinical), a research conducted by Assiri et al (2024) focused on the patients' perspective and have highlighted the role of emotional intelligence in patients in sustaining relational quality across platforms. Moreover, the research has found that using specific telehealth communication techniques, such as: sustained eye contact, the use of open-ended questions, and deliberate emotional acknowledgment, help in strengthening the positive effects of patient emotional intelligence on trust, rapport, and overall satisfaction with care.

One of the most critical aspects of the healthcare sector is the ability to connect with patients and build healthy relationships between providers and patients. Establishing positive relationships fosters loyalty, trust, understanding, and greater patient satisfaction – all of which are essential for creating a strong provider-patient experience. These factors play a pivotal role in ensuring the long-term sustainability and success of the healthcare businesses (Anshari & Almunawar, 2011).

Patients in the healthcare sector have significantly higher expectations compared to those in other industries. This places additional pressure and responsibility on the healthcare professional, making it even more challenging to maintain a consistently positive impression with every patient. It is cruicial to proactively address patients' needs and understand their

expectations, as doing so is far more cost-effective than reacting to issues after they rise (Anshari & Almunawar, 2011).

Research Gap

Researchers have found that the concept of emotional intelligence (EI) plays a cririca l role in enhancing employee performance in the service sector, including healthcare (Ansari et al., 2016). Therefore, to improve the performance of healthcare professionals by fostering a deeper understanding of their patients and building stronger relationships, developing emotional intelligence skills is essential.

Moreover, a number of research papers studied the patient-provider interactions, stating that the emotional dynamics of these interactions are still vague, in particular when in comes to the role of emotional intelligence of the patients. Bodonhelyi et al. (2025) highlighted the need to research and focus on the 'authentic' patient communication styles in healthcare. Understanding patients' emotional intelligence will lead to better and more effective digital health interventions. Although Bodonhelyi et al. (2025) focus of research was on digital health, the implication of this research can be implemented on all levels and types of healthcare patient-provider interaction.

In order to enhance patient interactions and healthcare experiences, a number of researchers focused on artificial intelligence (AI) and studied its effect in the healthcare field. However, a study by Nag et al. (2024) stated that AI tools often overlook the emotional intelligence of patients. Studies discussing the use of AI in the healthcare field, did not 'address' the role of patient emotional intelligence and how it can/should be used and integrated in those 'new' systems to enhance patient experience.

Alzahrani at al. (2023) conducted a research studying the interrelationship between emotional intelligence and medication adherence, in other words, how patients react to treatment plans when dealing with a chronic disease. The research showed a positive correlation between EI and the adherence to treatment plans, as a result of higher emotional regulation and stress management. However, there is a need for more empirical studies interlinking the level of emotional intelligence of patients to health outcomes, such as the acceptance of treatments, hence resulting in an enhanced healthcare experience.

In a research paper by Martins et al. (2022), emotional intelligence was linked to mental health. The study showed that the higher the emotional intelligence, the lower the anxiety and depression in cardiac patients. This will result in an improved patient experience in the

healthcare field. However, although this was tested and there was a positive correlation, Marins et al. (2022) suggested that there is a need for more empirical studies to unravel the role of emotional intelligence in patients, focusing on their physchological adaptation and the perceived quality of care offered during the treatment of a chronic illness.

Most research papers study the role of the 'providers' emotional intelligence on patient experience. Al-Omrani et al. (2024) chose to focus on the patients' emotional intelligence instead and proposed a framework for patient EI training. In their research, they noted that although there are a number of EI training programs, there is a 'critical lack' of evidence and interventions that aim to enhance patients' emotional intelligence and use it as a 'pathway' to better engagements with healthcare professionals/providers and improved health outcomes and experiences.

Having that said, there is a clear need for a research to examine the role of patients' emotional intelligence and its effect on their healthcare experience. Despite the growing recognition of emotional intelligence of healthcare professionals, there is a need to examine patients' emotional intelligence since they received comparatively little scholarly attention.

Researching patients' emotional intelligence and its influence on their interaction with healthcare professionals/providers, their level of acceptance and adherence for treatment plans, their ability to adapt and cope with illness, their overall satisfaction with the care provided, is indeed, a valuable insight that can benefit patients outcomes and experience. Through insights will be used in designing new strategies aligned with the emotional need of patients and ultimately improve the level of care delivered.

Research Questions

This study is guided by the following two primary research questions.

Is it necessary to study to what extent emotional intelligence enhances patients' experience in the healthcare field?

What key role does emotional intelligence play in this context?

Before answering the following questions, consider the two quotes below. These quotes aim to highlight how and why emotional intelligence plays not just a significant role, but a crititical one, in dealing with patients in the healthcare sector.

"When dealing with people, remember you are not dealing with creatures of logic, but with creatures of emotion." – Dale Carnegie

"People will forget what you said, people will forget what you did, but people will never forget how you made them feel." – Maya Angelou

This **research aims** to explore the interrelation between Emotional Intelligence (EI) skills and patient experience in the healthcare sector by investing the impact of emotional intelligence skills on individual resilence, as a mediator leading to better perceived experience.

Today it's important to examine the key role emotional intelligence play in enhancing patient experience in healthcare. To address this research question, this **research aims** not only to explore, but also to analyze, examine and study the interrelation between emotional intelligence and patient experience in healthcare sector. We are interested in the impact of individual resilience as a mediator leading to better patient perceived experience.

Theoretically speaking, the term 'Emotional Intelligence' refers to the ability to understand, manage, control and motivate oneself and others (Goleman, 2001). In other words, it involves recognizing and regulating emotions, ultimately leading to more effective decision-making (Ciarrochi & Mayer, 2001).

There has always been a debate about whether human emotions should be considered when conducting business or simply overlooked. Before highlighting the positive role of emotional intelligence in business, the prevailing belief for the last two millennia was that "emotions are in the way, they keep us from making good decisions, and the keep us from focusing" (Warner, J. 2010). Over the last three decades, a growing body of research has demonstrated that emotions are critical for thriving and succeeding in life. Overlooking them hinders progress, making emotional intelligence a fundamental building block for success (Freedman., 2004).

Emotional intelligence (EI) plays a vital role in the healthcare sector, as physicians' interpersonal skills are just as important as their clinical skills when dealings with patients. It is crucial to prioritize the psychological well-being of patients (Stratton et al., 2005). To overcome the prevalent anxiety and stress in the healthcare sector, it is recommended that both healthcare professionals and patients develop strong emotional intelligence skills (Kedadi and Bharamanaikar, 2020). It has been proven that there is a strong relationship between a physicians' emotional intelligence (EI) and the healthcare outcomes. However, further research is needed to explore this relationship as the concept continues to gain popularity in the medical profession. Studies emphasize the need to identify and understand the role of EI skills in the healthcare industry (Kedadi & Bharamanaikar, 2020).

Literature Review

To explore how patient's level of emotional intelligence affects their healthcare experience, it is essential to gain deeper understanding of emotional intelligence (EI). This includes examining its definition, the role of brain science in processing emotions, and the most commonly-used existing models.

Defining Emotional Intelligence

The term emotional intelligence was first coined by Salovey and Mayer in 1990, defining as the "ability to monitor one's own and others' feelings and emotions, to discriminate among them and to use this information to guide ones' thinking and actions". Whereas other researchers, such as Travis Bradberry and Jane Greaves, defined emotional intelligence in their book Leadership 2.0 (2012) as "the ability to recognize and understand emotions in yourself and others, and your ability to use this awareness to manage your behavior and relationships".

Emotional intelligence was later popularized by psychologist Daniel Goleman when he stated in the Harvard Business Review why emotional intelligence (EI) also known as emotional quotient (EQ) is more important that IQ when it comes to performance and success. Daniel Goleman have stated in his book (1995) 'Emotional Intelligence: Why It Can Matter More Than IQ' that "only 20% of people with high IQs are high performers in real life, while 80% of those with high Emotional Quotient (EQ) are high performers".

Emotional Intelligence Existing Models

Some might argue that there should be a single 'correct' emotional intelligence (EI) theoretical framework to be used, but this is not the case (Emmerling & Goleman, 2003). A variety of frameworks and models exit, each designed to serve specific purposes. Additionally, some researchers adapt existing EI frameworks by making modifications to create new models tailored to their research needs.

While numerous emotional intelligence theoretical frameworks and models exist, they generally fall under three main approaches:

1. Ability Approach – Proposed by Mayer and Salovey
2. Trait Approach – Associated with Reuven Bar-On
3. Mixed Approach – Popularized by Daniel Goleman

These approaches provide a comprehensive foundation for understanding and studying emotional intelligence in various contexts (Dhani & Sharma, 2016).

Mayer and Salovey proposed the only existing ability model of emotional intelligence , defining it as a form of pure intelligence consisting solely of cognitive abilities. In contrast, Reuven Bar-On's model emphasizes personality dimensions, focusing on the interdependence between the ability aspects of emotional intelligence, personality traits, and overall well-being. Meanwhile, Daniel Goleman introduced a mixed model which integrates noth abilities and personality traits, highlighting their combined impact on performance, particulary in the workplace (Dhani & Sharma, 2016).

Wong & Law Emotional Intelligence Scale (WLEIS)

One of the most popular EI self-report instrument is the WLEIS created by Wong & Law (2002). This scale relied on the four-branch ability model. The scale contains 16 items and 4 sub-scales, with 4 items.

Based on Wong & Law (2002, p. 4):"…we have used the Mayer and Salovey (1997) definition of EI as a set of interrelated skills concerning ''the ability to perceive accurately, appraise, and express emotion; the ability to access and/or generate feelings when they facilitate thought; the ability to understand emotion and emotional knowledge; and the ability to regulate emotions to promote emotional and intellectual growth'' (p. 10). Salovey and Mayer (1990) and Mayer and Salovey conceptualized EI as composed of four distinct dimensions:

1. Appraisal and expression of emotion in the self (self emotional appraisal [**SEA**]). This relates to the individual's ability to understand their deep emotions and be able to express these emotions naturally. People who have great ability in this area will sense and acknowledge their emotions well before most people.

2. Appraisal and recognition of emotion in others (others' emotional appraisal [**OEA**]). This relates to peoples' ability to perceive and understand the emotions of those people around them. People who are high in this ability will be much more sensitive to the feelings and emotions of others as well as reading their minds.

3. Regulation of emotion in the self (regulation of emotion [**ROE**]). This relates to the ability of people to regulate their emotions, which will enable a more rapid recovery from psychological distress.

4. Use of emotion to facilitate performance (use of emotion [**UOE**]). This relates to the ability of individuals to make use of their emotions by directing them towards constructive activities and personal performance."

There are a set of questions to be asked to measure the level of emotional intelligence at a later stage once the research needs to be conducted.

Having stated the dimensions used to study the patients' level of emotional intelligence, now comes the part to study 'how' does this level of emotional intelligence impacts patients' resilience and hence leading to a better patients' experience.

Resilience, in this paper, is considered as the mediating variable between emotional intelligence skills and patient experience.

Resilience

According to Luthar & Zelazo (2003), Masten & Cicchetti (2016) and Ungar (2012, 2018):

"…resilience is (1) not a trait, although several traits may be important predictors of positive adaptation after adversity, (2) dynamic, in that it changes over time, and (3) multisystemic, in that it develops transactionally across persons and social systems" (Miller-Graff, L.E., 2020, p. 660)

Before defining resilience, it should be noted that there are different types of resilience: individual, community and national. For this research paper, we will focus on individual resilience, also referred to 'multidimensional taxonomy of individual resilience – MTIR' which is defined as: "the individual's ability to maintain a stable level of functioning following traumatic events and as a trajectory of healthy functioning across time". (Bonanno, p. 2005, p. 136)

According to Miller-Graff (2020) to measure individual resilience one should study the 'sense of coherence', which is comprised of three interrelated components:

1. Sense of meaningfulness
2. Comprehensibility
3. Manageability

Measuring the sense of coherence (SOS) reflects how individuals 'perceive' things and the world and what they have been through as well as how they perceive those events; if they are controllable or not. It is a way to test to which extent are individuals able to cope and adapt to harsh events and their 'rate of recovery' from such distressing events and be able to maintain a balanced and 'normal' life. Studies have shown that individuals with higher resilience and more prone to deal with various health conditions. (Miller-Graff, 2020)

Duică et al. (2024) conducted a large-scale study in Saudi Arabia examining the interrelation between resilience and emotional intelligence and have found that there is a strong positive correlation indicating the emotional intelligence serves as a foundation for individuals to adapt resilience. A study in 2022 among Romanian healthcare professionals and have used resilience as a mediating variable. Findings showed that individuals with higher resilience are more prone to directly 'buffer' stress in heathcare settings, affirming that resilience and emotional intelligence are both essential for healthcare wellness.

In order to study resilience and its correlation with emotional intelligence as well as with patient experience, there is a need to use a 'scale'. Hence, comes the role of The Conner-Davidson 10-item scale, known also as the 'CD-RISC 10" and is considered as the 'golden scale' of resilience.

The two measures discussed up till now, WLEIS (Wong & Law Emotional Intelligence Scale) for emotional intelligence and CD-RISC 10 (Connor-Davidson Resilience Scale) for individual resilience, will guarantee the collection extremely reliable and valid results that will help in discussing and analyzing the correlation between EI and resilience. However, the aim of this study is to examine the effect of patients' emotional intelligence on their healthcare experience, having resilience as a mediating variable. Hence comes the discussion of the literature of patient experience, its' scales, and which to be used in this study.

Patient Experience

Wolf et al. (2014) described patient experience as the 'range of interactions' and engagements patients have with their healthcare system; which includes: health plans, nurses, doctors, hospitals and clinics staff.

Patient experience is, without a doubt, deeply shaped by critical factors. Research papers have found that emotional and environmental factors are the most critical when dealing with patient experience, as they are considered 'pivotal' in enhancing the quality of healthcare service offered, resulting in better healthcare outcomes and higher patient satisfaction since they will receive and 'perceive' a better service. Altringer (2010) showed that the 'design' of the healthcare spaces itself, psychologically speaking, lowers the patients' level of stress and anxiety, which improves the patients' perception of the quality of care received. Oweidat et al. (2024) focused on the interpersonal level, showing in their research that individuals with higher emotional intelligence, with focus on perception and regulation, tend to have better provider-

patient experience, as they are more prone to having better communication and engagement as a result of showing empathy towards one another.

Mao et al. (2021) supported those findings stating that emotional intelligence trainings offered to healthcare providers, do not just help those individuals in improving their resilience and lowers burnout, but also yields to better inpatient experience and those results were based on randomized clinical trials. Boulougari et al. (2024) showed that patients with her emotional intelligence are more skilled in communicating and engaging with their providers, ensuring a better care quality and outcomes as well as improved subjective wellbeing.

Codier at al. (2010) found that patients with high emotional intelligence will have a better patient outcome simply because they have a healthier engagement with their care providers and their own care. Sánchez-Gómez et al. (2020) also studied the level of patients' emotional intelligence, but focused on the 'trait' and had the same results, showing that the higher the trait emotional intelligence scored by the patient, the better the perceived quality leading to a more positive experience.

As for resilience, Wells et al. (2013) and Dunn et al. (2011) research papers have shown that having resilience helps patients to better cope with their anxiety, depression and illnesses. Resilience also leads to lower their level of distress, making their healthcare experience a 'satisfactory' one.

Hence, in order to attain the ideal patient experience, there is a scientific need for individuals with high emotional intelligence as well as high resilience to have healthy interactions and guarantee that the patient will 'feel' heard, cared for, supported and confident throughout their healthcare journey.

In order to study the correlation between emotional intelligence and patient experience, having resilience as a mediator, there is a need to measure the level of patient experience; hence, comes the need to choose the right measure that suits best this research paper.

PREMs are tools used to capture patients' experiences with healthcare services, focusing on aspects like communication, coordination, and responsiveness.

For the research paper, choosing PPE-15 is the best relevant fit that will allow patients to assess their experience in the healthcare sector without limiting the research to the context of 'hospitals' or 'clinics' or even to specific illnesses.

With the detailed discussion of the emotional intelligence skills, resilience, and patient experience in the literature review, the foundation in now established to formulate the research question and design the study effectively.

Hypotheses Development

The main **research question** is:

How does patients' emotional intelligence influence their heathcare experience, with resilience acting as a mediating variable?

The **goal** of this paper: to examine the role of emotional intelligence and its effect on patients' experience as well as to explore the mediating role of resilience in shaping this relationship.

Intention: This research tends to deepen our understanding of how emotionally intelligent patients: perceive, process and engage with their care, and how resilience mediates this dynamic. This paper is patient-centered. Findings will benefit healthcare providers to better understand, communicate, and empower patients through fruitful and effective engagements.

The following hypotheses, derived from the literature review, will be tested:

H1. Patients with higher levels of self-emotion appraisal (SEA) are more likely to demonstrate empathy during the healthcare process.

H2. Patients with higher levels of others' emotion appraisal (OEA) tend to recognize and respond to emotional cues more effectively, contributing to greater resilience in healthcare interactions.

H3. Patients with a higher 'use of emotions' (UOE) ability are more likely to harness their emotions constructively, enhancing their resilience throughout the healthcare process.

H4. Patients with higher emotion regulation (ROE) abilities are better equipped to manage their emotional responses, which contributes to improved resilience in the face of healthcare challenges.

H5. Patients with higher resilience levels are more likely to report a positive and satisfying healthcare experience.

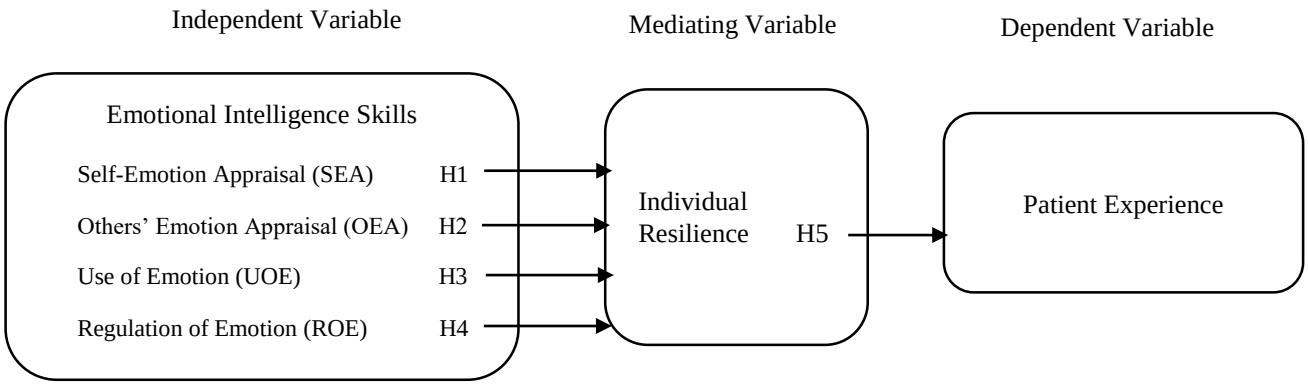

Figure 1: Conceptual Model to be tested (Author's Own Creation)

Research Methodology

To address the research question, *"How does patients' emotional intelligence influence their heathcare experience, with resilience acting as a mediating variable?"*, the researcher adopted a quantitative research approach. This methodological choice was made to systematically explore and measure the relationship between emotional intelligence (EI) skills, resilience and patient experience variables, as well as to assess their combined effect on organizational performance within the healthcare sector. Specifically, the study aims to determine how these variables influence patient service quality, a critical factor in healthcare settings where empathy and effective communication play pivotal roles.

Once the data collection is complete, the responses will systematically have inputted into SPSS software for statistical analysis. Through this process, correlations among the variables will be examined to identify relationships and patterns. To ensure robust findings, the researcher will continue gathering data until the study reaches maturity and consistent patterns emerge in the collected data. The final analysis will determine whether the proposed hypotheses are supported or rejected, providing valuable insights into the interplay between emotional intelligence, resilience, and patients' experience in the healthcare sector.

Keywords: Airport employees, occupational health management, respiratory health, musculoskeletal disorders, workplace interventions, airport policy, employee well-being, cross-sectional.

Introduction

Airport environments involve diverse occupational hazards associated with physical demands, ergonomic strain, shift work, operational pressures, and exposure to aircraft-related pollutants (Bulduk et al., 2017; Cavallo et al., 2006; Ganesan et al., 2018; Lecca et al., 2021; Møller et al., 2020; Ramlee et al., 2025; Stacey et al., 2020; Tafazzol et al., 2016; Tunnicliffe et al., 1999; Yang et al., 2003). Despite the economic importance of airports (Bevan et al., 2015), occupational health research remains limited and has largely focused on isolated occupational groups such as baggage handlers and maintenance personnel (Bulduk et al., 2017; Ramlee et al., 2025). Existing evidence suggests that airport employees may experience work-related musculoskeletal disorders (WMSDs), respiratory symptoms, and reduced health-related quality of life (HRQoL) (Bulduk et al., 2017; Ganesan et al., 2018; Tafazzol et al., 2016; Tunnicliffe et al., 1999; Yang et al., 2003), potentially affecting productivity, absenteeism, organisational performance, and workforce sustainability (Greggi et al., 2024; Smith et al., 2023).

Purpose, Aim and Objectives

This study investigated musculoskeletal and respiratory health outcomes among airport employees in South and Southeastern Europe and explored their implications for occupational health management. The objectives were to: (a) assess WMSD prevalence and respiratory HRQoL; (b) examine differences according to gender, occupational group, and work location; and (c) identify interventions that may improve workplace well-being and occupational health practices.

Literature Review and Theoretical Framework

The study was informed by occupational health management, ergonomics, and workplace well-being frameworks, suggesting that physical, organisational, and psychosocial exposures interact to influence employee health outcomes (Bulduk et al., 2017; Dobrowolska et al., 2020; Jing et al., 2023; Rau et al., 2020). Previous airport studies have reported elevated prevalence of neck, shoulder, and lower back disorders among baggage handlers and maintenance personnel (Bergsten et al., 2015; Ganesan et al., 2018; Ramlee et al., 2025), while studies investigating airport-related pollution have highlighted possible respiratory and cardiovascular risks linked to ultrafine particles and combustion-related pollutants (Cavallo et al., 2006; Møller et al., 2020; Tunnicliffe et al., 1999; Yang et al., 2003). Organisational factors, including workload pressures, limited ergonomic support, and insufficient occupational health services, may further affect employee well-being (Asadi et al., 2019; Bulduk et al., 2017; Nadeau et al., 2019; Ramlee et al., 2025). However, limited research has examined these issues across the wider airport workforce.

Methodology and Methods

A cross-sectional mixed-methods design was employed between February and May 2025 across airports in South and Southeastern Europe (Bryman, 2016). Due to confidentiality agreements, the names of airports and participating companies were not disclosed. The musculoskeletal component distributed questionnaires to 1,247 employees from 35 airport-related companies through internal company communication systems and onsite visits using a mixed-mode survey approach designed to improve participation and response quality. A total of 847 participants fulfilled the inclusion criteria and formed the final analytical sample (response rate: 68.8%) (Dillman et al., 2014). Employees working fewer than seven hours daily were excluded.

The respiratory component was conducted within the same survey population. Among respondents, 69 employees reported physician-diagnosed respiratory disease and completed the St George's Respiratory Questionnaire (SGRQ). Following exclusions according to SGRQ scoring guidance, the final respiratory sample included 65 participants (Jones and Forde, 2022).

Participants represented several occupational groups, including office staff, baggage handlers, passenger handling agents, operations employees, maintenance personnel, cleaners, dispatchers, warehouse employees, and airport operational staff. Musculoskeletal health was assessed using an adapted Nordic Musculoskeletal Questionnaire combined with a pain intensity scale (Antonopoulou et al., 2007; Ramdan et al., 2019), while respiratory HRQoL was assessed using the SGRQ (Jones and Forde, 2022). Statistical analysis was conducted using IBM SPSS Statistics version 30. Statistical analyses included descriptive statistics, chi-square tests, Mann-Whitney U tests, Kruskal-Wallis tests, ANOVA, general linear models, and multiple linear regression analyses.

The qualitative phase included 19 semi-structured interviews, one focus group involving seven health and safety practitioners, and consultations with human resources representatives (Bryman, 2016; Dillman et al., 2014). The qualitative findings were integrated with the quantitative results to contextualise airport environments, occupational groups, the effectiveness of existing interventions, workplace challenges, and other potential contributory factors.

Main Findings and Contribution

The most prevalent WMSDs were neck (49.7%), lower back (47.7%), and shoulder disorders (45.7%). Female employees generally reported higher symptom prevalence and pain intensity than males. Significant gender differences were observed for occupational groups, work locations, and several musculoskeletal body regions ($p < 0.05$). Employees working in physically demanding occupational groups, including baggage handling and maintenance operations, reported greater ergonomic strain and work limitations.

Respiratory findings showed that female employees reported significantly worse SGRQ Symptoms ($p = 0.038$), Impacts ($p = 0.019$), and Total scores ($p = 0.022$) than males. Although no statistically significant differences were identified between indoor and outdoor employees, moderate effect sizes indicated potential associations with occupational group, indoor working hours, physical exercise, and respiratory HRQoL.

Qualitative findings highlighted concerns regarding gender-related differences, age-related and biological susceptibility factors, pre-existing musculoskeletal injuries, workload pressures, inconsistent ergonomic awareness, and limited implementation of tailored occupational health interventions (Bajuaifer et al., 2025; Bergsten et al., 2015; Bryman, 2016; Kodete et al., 2024; Ma and Gao, 2025; Nogueira et al., 2012; Ramlee et al., 2025; Rasul et al., 2025; Schertzinger et al., 2018). Participants emphasised the importance of occupational physicians, ergonomic redesign, targeted training, and preventive measures.

Originality and Value

This study contributes to the limited airport occupational health literature by adopting a broader multi-occupational perspective integrating musculoskeletal, respiratory, and organisational dimensions. Unlike previous airport studies focusing on isolated occupational groups, the present research examined occupational health issues across the wider airport workforce.

Research Limitations

The study was limited by its cross-sectional design, self-reported data, lack of clinical confirmation of respiratory diagnoses, and underrepresentation of some occupational groups. Airport anonymity also restricted comparisons between operators and countries.

Theoretical and Practical Applications/Implications

The findings support the development of integrated occupational health management strategies within airport environments. Recommended interventions include ergonomic improvements, exposure reduction measures, occupational physician services, health surveillance, employee training, and workload management policies. Such approaches may improve employee well-being, reduce absenteeism, and support more sustainable airport workforce management.

EXCELLENCE IN CHALLENGING TIMES: PERSONAL AND ORGANISATIONAL ANTECEDENTS OF INNOVATIVE BEHAVIORS AMONG NURSES

Gillie Gabay,[1] Ilya Kagan,[2] Sigal Shafran-Tikva[3]

1. Achva Academic College, School of Sciences, Arugot, Israel.

2. Ashkelon Academic College, Nursing, Ashkelon, Israel.

3. The Academic College of Law and Science, Margoa 5, P.O. Box 261. Hod Hasharon,

Keywords: EntrepreNuring; Innovations; Innovative Behaviors; Leadership; Locus of Control; Nursing; Perceived Organizational Innovativeness.

Introduction

Nursing innovations enhance healthcare quality, service accessibility, and systemic costeffectiveness. Frontline nurse-led innovations are vital for care, but innovative practices remain underutilized by frontline nursing professionals, and empirical research explaining the precise drivers of nurse-led innovation remains scant.

Purpose, Aim, and Objectives

Framed within the conceptual lens of *EntrepreNursing*, the strategic integration of clinical nursing expertise with entrepreneurial thinking, this study examined internal locus of control [ILOC], and personal capacity to innovate, alongside perceived organizational innovativeness as drivers of innovative behaviors among nurses.

Literature Review and Theoretical Framework

Anchored in Social Learning Theory (Rotter, 1975), individuals with a high ILOC attribute outcomes to self-directed actions and solve problems proactively. While ILOC traditionally reflected internal psychological agency, it has been shown in complex clinical environments to extend to an individual's capacity to mobilize available external resources (Gabay, 2015).

Empirical evidence indicates that nurses display only moderate levels of innovative behaviors (Thepna et al., 2023). Individual innovativeness among nurses was associated with positive attitudes toward evidence-based practice, sound clinical decision-making, and creative solutions to complex patient-care challenges (Erol et al., 2022). Although authentic leadership and managerial support are acknowledged facilitators of workplace innovation (Stilgenbauer and Fitzpatrick, 2019), the specific personal traits and climate that trigger innovative behaviors in frontline nurses require further empirical clarification.

Methodology and Methods

A cross-sectional study among Israeli nurses (80 hospital, 16% community) using a 62-item online questionnaire distributed via professional networks was performed A final sample of 205 registered nurses completed the survey, exceeding the sample size calculated via G*Power analysis (n=104). Measurement relied on established, validated instruments: ILCO (Rotter, 1975), Individual Capacity to Innovate (Hurt, Joseph and Cook, 1977), perceived organizational innovativeness (Hurt and Teigen, 1977) and innovative behavior (Scott and Bruce, 1994). Pearson correlation analyses and multiple linear regression modeling were performed. Variance inflation factor (VIF) tests confirmed the absence of multicollinearity.

Main Findings and Contribution

Nurses reported moderate levels of ILOC, personal capacity to innovate, and innovative behaviors. Conversely, perceived organizational innovativeness was rated as poor. Comparative analysis revealed that nurse managers exhibited significantly higher personal innovativeness and higher levels of innovative behaviors compared to nurses. Pearson correlations demonstrated strong, positive associations among ILOC, personal innovativeness, and innovative behavior ($p < .001$). Multiple linear regression analysis indicated that ILOC ($\beta = .37$, $p < .001$), personal capacity to innovate ($\beta = .50$, $p < .001$), and perceived organizational innovativeness ($\beta = .12$, $p = .018$) collectively explained 54% of the total variance in reported innovative behaviors ($R^2 = .57$, $Adjusted\ R^2 = .54$, $f^2 = 1.124$).

Originality and Value

This study extends existing knowledge by establishing the combined personal and organizational antecedents of innovative behaviors in nursing. By bridging individual psychology and organizational climate within the *EntrepreNursing* framework, the findings demonstrate that ILOC and a supportive organizational culture serve as crucial, mutually reinforcing catalysts for innovative behaviors.

Study Limitations

The design does not support a claim of causality; convenience sampling may influence the results and hinder generalizability; data from a single source may be subject to common method variance bias.

Theoretical and Practical Implications

Recommendations include enhancing ILOC through innovative hackathons, leadership empowerment, and strategic academic-industry partnerships.

GENERATIONAL PERSPECTIVES IN SUSTAINABLE MARKETING: A BIBLIOMETRIC–SYSTEMATIC LITERATURE REVIEW OF CONSUMER BEHAVIOUR, BRAND AUTHENTICITY, AND TRUST

Sakka ,Georgia [1]; Theofanous, Giannis[2]; Voutsa, Maria[3]

[1]CIIM Business School, University of Limassol, Limassol, Cyprus
[2]School of Business, University of Nicosia, Nicosia, Cyprus

Keywords: baby boomers; bibliometric review; brand authenticity; consumer behaviour; ethical marketing; generation X; generation Y; generation Z; generational cohorts; generational differences; green marketing; greenwashing; millennials; scepticism; sustainability; systematic literature review; trust.

Sustainable marketing has evolved significantly over the past decade, transitioning from a primarily environmental communication tool to a broader strategic orientation encompassing ethical positioning, stakeholder expectations, consumer trust, and authenticity signalling. At the same time, increasing consumer awareness has initiated concerns about greenwashing practices, corporate credibility, and the authenticity of sustainability claims. While the literature on sustainable marketing and consumer behaviour has grown rapidly (Melanthiou and Voutsa, 2025), the intellectual structure of the field remains fragmented, particularly regarding how sustainability perceptions differ across generational cohorts and how these differences shape consumer responses to sustainability communication (Grimmer and Woolley, 2014; Peiró-Signes et al., 2025). Addressing this gap, this study adopts a bibliometric–systematic literature review (B-SLR) integrating bibliometric and co-citation analyses (via VOSviewer) of 83 peer-reviewed articles (2015–2025) from Scopus to identify dominant thematic areas, emerging research directions, and unexplored theoretical connections that can advance both academic understanding and managerial practice. The analysis of 83 peer-reviewed journal articles reveals nine major thematic areas structuring the field. The first and most dominant theme focuses on behavioural intention and decisionmaking models, which largely rely on established behavioural theories to explain sustainable consumption choices. A second theme explores persuasion, signalling, and green communication, highlighting how sustainability messages are constructed and interpreted by consumers. A third theme addresses greenwashing, scepticism, and environmental values, emphasising the risks associated with misleading sustainability claims and the resulting consumer distrust. A fourth theme examines authenticity, trust, and choice architecture, focusing on the mechanisms through which

sustainability claims are perceived as credible. Additional themes include the symbolic and experiential dimensions of sustainability in luxury consumption, the strategic integration of sustainability within marketing and CSR frameworks, sustainability challenges within fashion consumption systems, and the role of social influence and cross-generational learning processes. Finally, an emerging but still underdeveloped research stream connects sustainability with ethics, identity, and moral self-concept, highlighting the role of values and identity construction in shaping sustainable consumption. The review further demonstrates that while some relationships in the literature appear well established, particularly those linking behavioural intention models with sustainable consumption, other important connections remain fragmented. In particular, constructs related to authenticity, scepticism, and trust often appear as moderating variables rather than as central explanatory mechanisms. Similarly, generational differences remain under-theorised, as age is frequently treated as a demographic control variable rather than as a meaningful cohort factor shaping sustainability perceptions, values, and behavioural motivations. The findings suggest that younger generations, particularly Millennials and Generation Z, demonstrate stronger value alignment with sustainability, greater sensitivity to authenticity and transparency, and a stronger tendency to connect sustainability with identity expression. In contrast, older generations appear to prioritise functional value, product quality, and reliability, integrating sustainability considerations more selectively into their decision-making processes. By integrating these fragmented research dimensions, this study contributes to the literature by proposing a more coherent understanding of how generational identity may act as an important explanatory and exploratory mechanism connecting sustainability communication with consumer behavioural responses. At the same time, the review highlights important opportunities for future research, particularly regarding the role of ethical identity, intergenerational learning processes, and authenticity signalling in strengthening consumer trust. From a managerial perspective, the findings suggest that organisations should move beyond generic sustainability messaging and develop more targeted communication strategies that reflect the distinct values, expectations, and trust drivers of different generational cohorts (Papadopoulou, Papasolomou and Thrassou, 2022).

SUSTAINABLE CIRCULAR STRATEGIES AND SHORT SUPPLY CHAINS AMONG SMALLHOLDER PRODUCERS: FIELD OBSERVATIONS FROM PERU'S AGROFERIAS CAMPESINAS

Vásquez Neyra, Jessika Milagros[1,2]

[1] Pontificia Universidad Católica del Perú, Lima, Peru

[2] CENTRUM Católica Graduate Business School, Lima, Peru

Keywords: Circular economy, Short supply chains, Smallholder producers, Field observation, Sustainability transitions, Inclusive markets

Introduction. The transition toward a circular economy has increasingly emphasized the role of localized production systems and short supply chains in promoting sustainability and resilience. In emerging economies, smallholder producers represent critical actors in advancing inclusive circular strategies. However, empirical evidence grounded in direct field observation remains limited, particularly in Latin American contexts.

Purpose and Objectives. This study aims to examine how smallholder producers participating in Peru's Agroferias Campesinas implement sustainable and circular strategies within short supply chains. The research seeks to identify (1) the circular practices embedded in local market dynamics, (2) the governance mechanisms enabling these practices, and (3) the challenges and opportunities for scaling inclusive circular models.

Literature Review and Theoretical Framework. Drawing on circular economy theory and sustainability transition frameworks (Geels, 2002), the study integrates perspectives on short food supply chains, inclusive markets, and stakeholder-driven sustainability. Existing literature highlights the environmental and social benefits of localized systems but often relies on interviews or secondary data. There is limited research incorporating structured field observation to capture real-time practices, informal coordination mechanisms, and embedded sustainability behaviors.

Methodology and Methods. The study adopts a qualitative case study design centered on Peru's Agroferias Campesinas. Data collection includes direct field observation across multiple market sessions, semi-structured interviews with smallholder producers and coordinators, and

document analysis. Field observation enabled systematic recording of production practices, waste management routines, packaging choices, logistics coordination, and consumer–producer interactions. Data were coded thematically to identify recurring patterns of circularity and governance dynamics.

Main Findings and Contribution. The findings reveal that circular strategies among smallholder producers are embedded in three interconnected dimensions. First, responsible production practices include reduced chemical inputs, seasonal crop rotation, and low-waste packaging solutions. Second, short supply chains facilitate direct producer–consumer interaction, minimizing intermediaries and enhancing transparency. Third, informal governance mechanisms—such as peer monitoring, trust-based coordination, and collective norms—support circular behaviors without heavy regulatory structures. These practices demonstrate how localized ecosystems can operationalize circular principles through social capital and relational proximity.

However, structural constraints remain, including limited access to digital tools, financial barriers to scaling, and regulatory inconsistencies. Despite these challenges, Agroferias Campesinas illustrate how community-based governance and stakeholder collaboration can foster environmentally responsible and socially inclusive supply chains.

Originality and Value. This study builds on prior empirical research examining circular strategies and resilient food supply chains among smallholder producers in Peru (Vásquez Neyra et al., 2025a; Vásquez Neyra et al., 2025b). While previous work identified structural practices and systemic challenges at the supply chain level, the present study advances the literature by incorporating structured field observation to capture micro-level governance mechanisms, relational coordination, and embedded sustainability practices within short supply chains. By moving from structural analysis toward grounded field-based evidence, this research deepens understanding of how circular strategies are enacted in practice and contributes to stakeholder-driven sustainability debates within emerging economy contexts.

Research Limitations. The study focuses on a single national context and selected market sites, which may limit generalizability. Future research could expand comparative analyses across regions and incorporate longitudinal designs.

Theoretical and Practical Implications. The findings refine sustainability transition frameworks by highlighting the importance of micro-level governance, trust-based coordination, and embedded community norms in circular implementation. Practically, policymakers and development agencies can support scaling by facilitating access to infrastructure, digital traceability tools, and institutional recognition of short supply chains as viable circular models.

Keywords: Circular economy, timber construction, conceptual framework, architects and engineers, innovation adoption, sustainable construction.

Abstract

In recent years, the circular economy has emerged as a key policy and strategic framework for the sustainable transition of the construction sector, which is characterised by high resource consumption and a significant environmental footprint. Timber construction, due to the renewable nature of wood and its potential for reuse and life-cycle extension, offers important opportunities for integrating circularity principles. However, despite its well-documented environmental and technical advantages, the adoption of timber construction within a circular economy framework remains limited.

This paper addresses this gap by developing a conceptual framework for promoting the circular economy in timber construction. The study is based on a systematic review of recent international literature and a synthetic analysis of theoretical and empirical approaches related to the circular economy in the built environment, construction professionals, and innovation adoption processes.

The proposed framework is structured around three interrelated categories of factors: (a) external drivers, including institutional and regulatory conditions, economic mechanisms, and technological support; (b) internal dimensions of professional practice, encompassing the knowledge, skills, perceptions, and attitudes of architects and engineers as key stakeholders; and (c) the adoption of circular practices as the outcome. By emphasising the interaction between institutional conditions and professional practice, the study highlights the stakeholder-driven nature of sustainability-oriented business transitions and provides theoretical insights and practical directions for future empirical research and policy interventions.

Introduction

The transition towards sustainable development constitutes a major challenge for contemporary economies, with the construction sector at the centre of this debate due to its high levels of raw material consumption, energy use, and waste generation. In this context, the circular economy has emerged as a comprehensive model aiming to preserve the value of materials and resources while reducing the environmental impacts of economic activity.

The circular economy extends beyond conventional recycling by incorporating strategies such as circular design, reuse, life-cycle extension of materials, and waste valorisation. Its application in the construction sector can significantly reduce environmental impacts while improving economic efficiency and organisational resilience (Geissdoerfer et al., 2017; Pomponi and Moncaster, 2017). At the policy level, the circular economy has become a core priority within the European Union, as reflected in initiatives such as the European Green Deal and the Circular Economy Action Plan.

Within this framework, construction materials play a critical role. Wood, as a renewable and biodegradable material, aligns closely with circular economy principles due to its carbon storage capacity and potential for reuse and recycling, offering advantages over conventional materials such as concrete and steel (Leskinen et al., 2018; Gustavsson et al., 2021). Advances in modern timber construction technologies, including cross-laminated timber (CLT), have further expanded the applicability of wood in complex and multi-storey buildings.

Despite these advantages, the adoption of timber construction within a circular economy framework remains limited in many countries. The literature indicates that this is driven not only by technical constraints but also by institutional, organisational, economic, and cultural barriers, including regulatory frameworks, limited professional expertise, market acceptance, and the absence of coordinated promotion strategies (Harte, 2017; Markström et al., 2022). Similar patterns of fragmented and selective adoption have been observed even among leading firms, suggesting that sustainability transitions often remain confined to operational initiatives rather than integrated into broader business strategies (Trigkas et al., 2020).

These challenges highlight the need for integrated strategies that move beyond isolated practices and combine technological, policy-related, educational, and organisational dimensions. While existing studies provide valuable insights into circular economy principles, sustainable construction materials, and technological innovations, there remains a lack of synthetic conceptual frameworks that integrate these dimensions specifically in the context of timber construction (Kirchherr et al., 2017; Hart et al., 2021).

In response to this gap, the purpose of the present study is to develop a conceptual framework for promoting the circular economy in timber construction. Based on a systematic review of recent international literature and an analysis of dominant European policy directions, the study aims to map key theoretical approaches and strategies related to circular economy adoption in the construction sector, highlight the role of timber construction as a catalyst for circular practices, and synthesise critical strategic components that can support sustainable transition pathways and inform future empirical research.

Literature Review

Circular Economy in the Construction Sector: From Theory to Professional Practice

The circular economy has become firmly established in the international literature as a comprehensive framework for transitioning towards more sustainable and resource-efficient production and consumption patterns, particularly in resource-intensive sectors such as construction.

According to the literature, the circular economy seeks to preserve the value of materials and resources through strategies such as circular design, reuse, recycling, and the extension of the life cycle of buildings and construction systems (Kirchherr et al., 2017). In construction, these principles become operational through design decisions concerning durability, adaptability, disassembly and waste reduction.

Despite the broad theoretical acceptance of circular economy principles, their implementation within the construction sector remains uneven. The literature indicates that adoption is often limited to fragmented practices, rather than being embedded in comprehensive circular strategies at the project or organisational level (Hosseini et al., 2018; Adams et al., 2017).

This uneven implementation is linked to perceived cost barriers, limited specialised knowledge, uncertainty over long-term benefits and insufficient regulatory support (Markström et al., 2022; Rizos et al., 2016).

Overall, the literature shows that circular construction is shaped by the interaction between material strategies, professional practice and the institutional environment. Evidence from established firms also suggests that circular strategies often remain fragmented when they are not integrated into broader organisational strategies (Trigkas et al., 2020). This provides the basis for examining timber construction not only as a material solution, but also as a field of professional and organisational transition.

Wood as a Structural Material in the Circular Economy

Within the circular economy framework, wood is widely recognised as a structural material with strong potential to support sustainable and circular practices in the construction sector. Its renewable character, carbon storage capacity, and suitability for reuse and recycling align closely with circular economy principles. However, the effective circular utilisation of wood depends not only on its technical properties but also on the knowledge, perceptions, and professional practices of architects and engineers involved in design and construction processes. The literature provides robust evidence that timber construction can substantially reduce the environmental impacts of buildings through both material substitution and carbon sequestration (Leskinen et al., 2018; Gustavsson et al., 2021; Churkina et al., 2020).

A key dimension of circular timber construction is the potential for design for disassembly and component reuse. Prefabricated and standardised timber systems are especially conducive to extending building life cycles and reducing construction waste, provided that circular thinking is integrated at early design stages and supported by appropriate detailing and connection choices (Pomponi and Moncaster, 2017; Akanbi et al., 2019; Hart et al., 2021).

Despite these advantages, persistent concerns regarding fire safety, durability, maintenance, and regulatory compliance continue to influence professional and market acceptance of timber as a structural material, particularly in a circular context where long-term performance and reuse are critical (Harte, 2017; Markström et al., 2022; Hurmekoski et al., 2019).

Overall, the literature suggests that wood can act as a key enabler of circular economy implementation in construction when its technical potential is supported by adequate professional knowledge, institutional frameworks, and positive perceptions. Accordingly, the adoption of circular timber construction depends on the interaction between material advantages, professional confidence and institutional support.

Technological Enablers of the Circular Economy in Timber Construction

The implementation of the circular economy in the construction sector is closely linked to the adoption of technological tools that support integrated design, information management, and efficient material use across the building life cycle. Digital technologies are widely recognised as key enablers of the transition from linear to circular models, provided that they are systematically embedded in professional and organisational practice (Hart et al., 2021; Markström et al., 2022).

Building Information Modeling (BIM) plays a central role in this process, as it can support core circular economy principles such as design for disassembly, material traceability, and

documentation of building components, thereby facilitating future reuse and recycling (Eastman et al., 2018; Charef et al., 2018).

In the context of timber construction, technological progress is strongly associated with prefabricated systems and mass timber solutions, including Cross-Laminated Timber (CLT), which contribute to waste reduction, precision, and standardisation, enhancing the feasibility of circular practices (Hurmekoski et al., 2019; Churkina et al., 2020).

Life Cycle Assessment (LCA) represents a complementary tool that enables the quantitative evaluation of environmental impacts and supports informed decision-making at early design stages. Recent studies highlight that the combined use of BIM and LCA can strengthen the development of integrated circular strategies, especially in timber construction (Pomponi and Moncaster, 2017; Cabeza et al., 2014; Goh et al., 2023). In addition, emerging digital tools such as material passports enhance transparency and reuse potential by recording the properties and condition of building materials throughout their life cycle (Durmisevic, 2019; Munaro et al., 2023). However, the effectiveness of BIM, LCA, material passports and prefabricated timber systems depends on professional skills, organisational readiness and institutional support. Technology therefore constitutes a necessary but insufficient condition for circular transition, reinforcing the need to examine technological readiness within a broader strategic framework.

Barriers and Promotion Strategies for Circular Timber Construction

Despite the growing recognition of the circular economy as a key sustainability framework in the construction sector, the adoption of timber construction within a circular context remains limited in many countries. The literature attributes this outcome to the combined influence of institutional, economic, organisational, and socio-cultural factors that jointly shape barriers and opportunities for diffusion (Pomponi and Moncaster, 2017; Hart et al., 2021).

Regulatory and institutional constraints constitute a primary barrier, as building codes, fire safety regulations, and permitting procedures are largely based on conventional materials and linear construction logics, discouraging the wider application of timber systems, particularly in multi-storey and urban contexts.

Economic uncertainty, limited use of life-cycle cost assessment, lack of incentives, professional knowledge gaps and persistent risk perceptions further constrain adoption, even where modern timber systems are technically feasible (Adams et al., 2017; Harte, 2017; Hosseini et al., 2018; Markström et al., 2022; Rios et al., 2023).

Addressing these barriers requires a coordinated mix of institutional, economic, and educational strategies. Coherent regulatory frameworks, targeted incentives, and the integration of life-

cycle criteria into design regulations and public procurement can reduce uncertainty and support circular timber construction. In parallel, professional education, training, and organisational collaboration, supported by digital tools such as BIM, life-cycle assessment, and material passports, can facilitate the translation of circular principles into practice and strengthen stakeholder coordination (Rizos et al., 2016; Hart et al., 2021; Munaro et al., 2023). Overall, the literature suggests that promotion strategies should combine policy-driven, market-based, technological and educational interventions. This synthesis provides the direct foundation for the conceptual framework developed in the present study and is reinforced by evidence highlighting the role of institutional and knowledge-producing stakeholders in sustainability-oriented business transitions (Trigkas and Karagouni, 2023).

Conceptual Framework for Strategies Promoting the Circular Economy in Wooden Constructions

Purpose and Rationale of the Conceptual Framework

The international literature on the circular economy in the construction sector indicates that the transition from linear to circular models of production and consumption constitutes a multidimensional process that cannot be sufficiently explained through isolated technological or regulatory interventions (Pomponi and Moncaster, 2017; Hart et al., 2021). Although numerous studies examine individual aspects of this transition-such as materials, digital technologies, or institutional barriers-there remains a notable lack of integrated conceptual approaches capable of capturing the dynamic interactions among the factors influencing the adoption of circular practices in construction.

Particularly within the field of wooden constructions, the literature highlights a substantial potential for circularity, which often remains underexploited due to institutional, economic, and knowledge-related constraints (Markström et al., 2022). In this context, the present study proposes a framework that differs from more general circular construction models by focusing specifically on wooden constructions and by positioning architects and engineers as mediating actors between external conditions, technological tools and the adoption of circular practices (Adams et al., 2017; Hosseini et al., 2018).

Key Dimensions of the Conceptual Framework

Based on a systematic review of the literature, strategies for promoting the circular economy in wooden constructions emerge from the interaction of institutional, economic, technological,

and professional factors that jointly shape decision-making in design and construction processes (Pomponi and Moncaster, 2017; Hart et al., 2021). The institutional and regulatory framework plays a decisive role, as building regulations, fire safety standards, and sustainability policies can either enable or constrain the adoption of circular timber construction systems (Harte, 2017; Markström et al., 2022).

Economic mechanisms and incentives are equally critical, particularly the distinction between upfront investment costs and life-cycle cost considerations, which strongly influence the perceived feasibility of circular solutions, especially when supported by appropriate policy and financial instruments (Ghisellini et al., 2016; Rios et al., 2023). Technological support, such as BIM, life-cycle assessment, and material management systems, provides important enablers for circular practices; technology alone remains insufficient without organisational readiness and integration into professional decision-making (Eastman et al., 2018; Charef et al., 2018; Munaro et al., 2023).

Finally, the knowledge, skills, and professional readiness of architects and engineers significantly affect the integration of circular economy principles into design and construction workflows, while perceptions and attitudes related to safety, performance, and reliability continue to influence market acceptance of wooden constructions, often persisting despite strong empirical evidence of their environmental and technical advantages (Adams et al., 2017; Hosseini et al., 2018; Churkina et al., 2020; Markström et al., 2022).

Compared with broader circular construction models that mainly focus on material flows, technological tools or policy barriers, this framework emphasises the interaction between external conditions and professional practice in the specific context of wooden constructions (Pomponi and Moncaster, 2017; Hart et al., 2021; Markström et al., 2022). Its added value lies in positioning architects and engineers as the link between regulation, incentives, digital tools and the actual adoption of circular timber practices (Adams et al., 2017; Hosseini et al., 2018).

Dynamic Relationships and the Role of Professionals

The proposed conceptual framework is grounded in the assumption that the promotion of the circular economy in wooden constructions results from the combined interaction of the aforementioned dimensions rather than from the isolated effect of any single factor. The literature emphasizes that architects and engineers act as key “translators” of policies, technologies, and economic incentives into practical design and construction solutions (Pomponi and Moncaster, 2017; Hart et al., 2021). Decisions made at early design stages shape

the feasibility of circular strategies across the building life cycle, making professionals' attitudes and practices central to the adoption process (Markström et al., 2022).

The relationships among the framework dimensions are therefore not linear but mutually reinforcing. Regulatory clarity and economic incentives may increase professionals' willingness to consider circular timber solutions, while BIM, LCA and material management systems can make these options more visible, measurable and technically feasible (Eastman et al., 2018; Munaro et al., 2023; Rios et al., 2023). However, these external and technological factors influence adoption mainly through professional practice, since architects and engineers interpret regulations, evaluate costs and benefits, select design alternatives and communicate circular value to clients and other stakeholders (Pomponi and Moncaster, 2017; Hart et al., 2021; Markström et al., 2022).

Contribution of the Framework and Research Perspectives

The main contribution of this conceptual framework lies in synthesizing fragmented findings from the literature into a coherent model that highlights the interconnections among institutional, economic, technological, and human factors. While similar integrative approaches have been proposed to explain the circular economy in the built environment, they typically lack a specific focus on wooden constructions and on the role of professionals as key implementation actors (Pomponi and Moncaster, 2017; Hart et al., 2021).

The proposed framework may serve as a theoretical foundation for the development of research instruments and for future empirical validation of the relationships among its dimensions, thereby contributing both to academic debate and to the design of targeted strategies for promoting the circular economy in the construction sector. More specifically, the framework can guide the operationalisation of future empirical research by translating each dimension into measurable constructs, such as perceived regulatory support, economic feasibility, familiarity with BIM and LCA, professional knowledge, risk perceptions, and intention to adopt circular timber practices (Rogers, 2003; DeVellis, 2017; Hair et al., 2019).

Methodological and Theoretical Foundations

This study is positioned within an interpretive–pragmatist research paradigm, which is appropriate for examining complex socio-technical phenomena such as the circular economy in construction, where developments are shaped by institutional frameworks, professional perceptions, and socio-economic conditions (Creswell and Plano Clark, 2018). At the

theoretical level, the research draws on circular economy theory, which conceptualizes the built environment as a system of material and value flows, emphasizing reuse, life-cycle extension, and circular design principles (Kirchherr et al., 2017; Pomponi and Moncaster, 2017). In addition, insights from innovation adoption theories are incorporated, highlighting how the diffusion of new practices is influenced by professionals' perceptions, attitudes, and social contexts (Rogers, 2003).

Methodologically, the study adopts a qualitative, conceptual approach based on a systematic review and integrative synthesis of the international literature. This approach is particularly suitable for emerging research fields characterized by theoretical fragmentation and a need to consolidate dispersed findings into coherent analytical frameworks (Jabareen, 2009; Snyder, 2019). The development of the conceptual framework followed a structured synthesis process aimed at identifying recurring themes and key dimensions affecting the adoption of circular practices in wooden constructions (Pomponi and Moncaster, 2017; Hart et al., 2021).

At this stage, the study does not seek empirical hypothesis testing but focuses on theoretical grounding and the structured organization of critical factors identified in the literature. In a subsequent phase, the proposed framework may serve as a basis for empirical investigation, particularly through survey research targeting architects and engineers. Each dimension can be operationalised into measurable constructs, such as perceived regulatory support, economic feasibility, technological readiness, professional knowledge, risk perceptions and intention to adopt circular timber practices, enabling the examination of relationships among dimensions and the assessment of their relative importance (DeVellis, 2017; Hair et al., 2019).

Integration of the Conceptual Framework into Questionnaire Design

The proposed conceptual framework served as the primary theoretical reference for the design of the research instrument, ensuring coherence between the literature review, conceptual synthesis, and subsequent empirical investigation. Questionnaire development followed a structured process of operationalizing the framework's core dimensions into measurable variables, in line with established principles of scale development and quantitative research in the social and management sciences (DeVellis, 2017; Hair et al., 2019).

The external dimensions of the framework, namely institutional and regulatory context, economic mechanisms, and technological support, were captured through items examining the decision-making environment in which architects and engineers operate. This approach is consistent with the literature, which highlights the direct influence of regulations, financial

incentives, and available technologies on the adoption of circular practices in construction (Pomponi and Moncaster, 2017; Hart et al., 2021).

At the same time, the internal dimensions of the framework, relating to professionals' knowledge, skills, perceptions, and attitudes, were operationalized through Likert-scale items reflecting professional readiness and evaluative orientations toward wooden constructions and the circular economy. This emphasis on subjective perceptions aligns with innovation adoption theories, which stress that the diffusion of new practices largely depends on how they are perceived by the professionals responsible for their implementation (Rogers, 2003; Hosseini et al., 2018).

The adoption of circular practices in wooden constructions is conceptualized as the final outcome of the framework and is measured through items capturing both intention to adopt and self-reported implementation of circular strategies in design and construction. Distinguishing between intention and actual practice is considered critical in the literature, as it allows the identification of potential gaps between attitudes and professional behavior (Ajzen, 1991; Markström et al., 2022).

This alignment between the framework's dimensions and the questionnaire sections enables future empirical analysis of the relationships among institutional, economic, technological, and human factors. In a subsequent research phase, the framework can support multivariate techniques, such as factor analysis and structural equation modeling, to assess the relative importance of these dimensions in driving circular adoption (Hair et al., 2019).

Accordingly, the framework functions both as an interpretive model and as an operational foundation for future empirical research.

Figure 1 illustrates the proposed conceptual framework for promoting the circular economy in wooden constructions. The framework is structured across three interrelated levels. The upper level represents external factors shaping the decision-making environment: institutional and regulatory conditions, economic mechanisms, and technological support, which exert direct and indirect influences on professional practice. The central level captures the professional practice of architects and engineers as a mediating mechanism between external strategies and the adoption of circular practices, shaped by their knowledge, skills, perceptions, and attitudes. The lower level reflects the adoption of circular practices in wooden constructions as the outcome of these interactions, with directional arrows highlighting the dynamic relationships among levels and the pivotal role of professionals as key implementation agents.

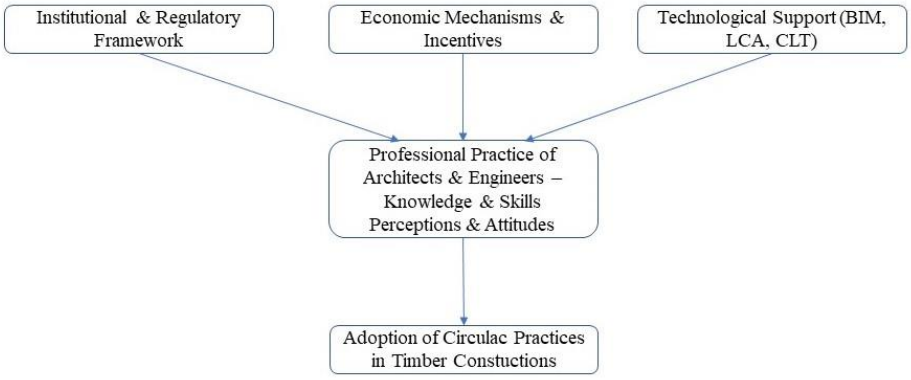

Figure 1. Conceptual framework for circular timber construction

Discussion and Conclusions

This study confirms, in line with international literature, that the promotion of the circular economy in wooden constructions constitutes a multifactorial and dynamic process that cannot be addressed through isolated technical or material choices. The transition from linear to circular construction models requires the combined interaction of institutional, economic, technological, and human factors (Pomponi and Moncaster, 2017; Hart et al., 2021).

Despite the well-documented environmental and technical advantages of wooden constructions, their adoption within a circular framework remains uneven and fragmented. The barriers identified extend beyond technological adequacy and include regulatory rigidity, economic uncertainty, limited professional readiness, and persistent risk perceptions regarding wood as a structural material (Harte, 2017; Markström et al., 2022). These findings reinforce the view that circular economy transitions in construction represent primarily a socio-technical challenge rather than a purely technological shift, as also observed in other sustainability-oriented business contexts (Trigkas et al., 2020).

Within this context, the proposed conceptual framework functions as a synthesising interpretive tool that highlights the central role of architects and engineers as mediators between external conditions, such as policies, regulations, markets, and technologies, and the practical adoption of circular strategies. Decisions taken at early design stages critically shape the feasibility of strategies such as design for disassembly, material reuse, and life-cycle assessment, underscoring the importance of professional knowledge, perceptions, and readiness (Adams et al., 2017; Hosseini et al., 2018). This emphasis differentiates the framework from broader circular construction models by focusing not only on material flows or technological enablers, but also on the professional actors who translate circular principles into design and construction decisions.

Technological enablers, including BIM, life-cycle assessment, and material passports, are shown to have significant potential to support circular economy principles in wooden constructions. However, their effectiveness depends largely on organisational readiness, professional competence, and institutional integration into design and decision-making processes, indicating that technology constitutes a necessary but insufficient condition for circular transition (Eastman et al., 2018; Munaro et al., 2023).

The main theoretical contribution of this study lies in the development of an integrated conceptual framework that synthesises fragmented insights from the literature into a coherent model for promoting the circular economy in wooden constructions. By adopting a dynamic perspective, the framework explains circular adoption as the outcome of interactions between external institutional, economic, and technological conditions and internal dimensions of professional practice, such as knowledge, skills, and perceptions (Hosseini et al., 2018; Hart et al., 2021). In this way, it offers a more actor-centred explanation of why circular timber practices remain unevenly adopted.

From a practical perspective, the findings highlight the importance of strengthening education and professional training in circular economy principles and wooden construction systems, with particular emphasis on the effective use of digital tools such as BIM and life-cycle assessment to support evidence-based design decisions (Eastman et al., 2018; Munaro et al., 2023). From a stakeholder-driven perspective, the results underline the need for coordinated action among businesses, policymakers, and knowledge institutions in order to strengthen sustainability and circular economy promotion strategies (Trigkas and Karagouni, 2023). At the policy level, coherent regulatory frameworks, targeted economic incentives, and effective knowledge-dissemination mechanisms are required to reduce professional uncertainty and enhance acceptance of circular solutions in the construction sector (Ghisellini et al., 2016; Rios et al., 2023). These implications may vary across national and regulatory contexts, since building codes, fire safety rules, public procurement criteria, certification systems and the maturity of timber construction markets can influence both professional acceptance and the diffusion of circular timber solutions.

Limitations and Directions for Future Research

This study is based on a systematic literature review and conceptual synthesis and does not include empirical validation at this stage, which constitutes a deliberate methodological limitation (Pomponi and Moncaster, 2017; Hart et al., 2021). Future research may apply the proposed framework in empirical studies, using quantitative approaches such as factor analysis

and structural equation modeling to examine architects' and engineers' perceptions and practices. More specifically, the framework could be operationalised through constructs such as perceived regulatory support, economic feasibility, technological readiness, professional knowledge, risk perceptions, and intention to adopt circular timber practices (DeVellis, 2017; Hair et al., 2019). Applying the framework across different institutional and geographical contexts could also enhance understanding of how building codes, fire-safety regulations, public procurement criteria, certification systems, and timber market maturity influence the adoption of circular practices in wooden constructions (Markström et al., 2022).

Keywords: Cross-border tourism, Short supply chains, Sustainable logistics, Tourism demand forecasting, Digital traceability

Abstract

Border tourism regions often face seasonality, fragmented logistics, limited producer access to tourism markets, and dependence on imported goods, reducing local economic benefits and increasing costs and environmental pressures. This study develops a conceptual, design-oriented cross-border short supply chain ecosystem connecting producers, tourism businesses, logistics providers, SMEs, service providers, and public authorities in two neighboring countries. Drawing on sustainable tourism, short supply chains, regional innovation systems, digital supply chain management, and circular economy principles, it addresses the lack of integrated approaches to these challenges. The model combines producer geo-mapping, AI-based tourism demand forecasting, low-carbon micro-distribution hubs, blockchain- and QR-supported traceability, and a Local Loop Index for sustainability monitoring, coordinated by a cross-border steering committee. The analysis suggests that the ecosystem can improve supply–demand alignment, procurement, inventory management, transparency, waste reduction, local sourcing, SME market access, resilience, and environmental performance. Its originality lies in integrating logistics, digital technologies, circularity, sustainability assessment, and cross-border governance within one tourism-focused framework. Future research should pilot the model and assess its economic, environmental, operational, and institutional impacts.

Introduction

Tourism has emerged as one of the largest and most dynamic sectors of the global economy fully rebounding from the pandemic to contribute approximately US$ 11.1 trillion to the global GDP in 2024, which represents roughly 10% of the total global economy (Dubakova, 2025). However, it faces several challenges. Amongst the most critical ones are the urgent sustainability pressures, particularly in regions with seasonal tourism demands and the over-reliance on imported goods (Gogonea et al., 2017). Coastal and island regions in particular, often struggle with logistical inefficiencies, limited market access, and fragmented cross-border trade, which undermine the efficiency and sustainability of tourism supply chains (Ranjitha et al., 2025). This research proposes the development of an integrated cross-border micro-supply-chain ecosystem that connects local producers with tourism destinations in an environmentally responsible and efficient manner. By leveraging advanced digital traceability tools, predictive analytics, and low-carbon micro-logistics solutions, the paper-seeks to develop and propose a short, efficient, and environmentally sustainable supply chain. Unlike conventional national supply chains, this transnational model fosters regional cooperation, promotes local production, and strengthens the sustainability credentials of tourism within cross-border regions.

Tourism Supply Chain Challenges and the Need for Regional Cooperation

Tourism in both coastal and inland areas is typically characterized by intense seasonality, geographic fragmentation, and a reliance on imported goods and services despite the availability of rich local resources. Seasonality remains a defining characteristic of tourism destinations, creating concentrated peaks and troughs in activity that limit economic expansion and underutilize facilities during off-peak periods (Alshuqaiqi & Omar, 2019; Baum & Hagen, 1999).

Moreover, tourism destinations often import a substantial share of the products and services used within the industry, leading to economic leakage and reduced local value capture even where strong local resources exist (Drakopoulos, 2011; Nowak, 2010). Producers in these regions often encounter difficulties such as fragmented logistics systems, limited market access, and a lack of coordination across borders, which significantly affect the efficiency of the tourism supply chain (Sifolo, 2020).

The hospitality sector also faces challenges, including unstable demand and supply, leading to an over-reliance on imports to meet the needs of hotels, restaurants, and resorts (Vu et al., 2025; Safaie, Nazeri and Mottakiani, 2025). This reliance increases operational costs, elevates environmental footprints, and compromises sustainability efforts (Mishra et al., 2024).

Moreover, geopolitical and environmental factors underscore the importance of developing innovative, low-carbon, and sustainable economic strategies to support local economies (Zhimeng et al., 2025). This study aims to address these challenges by developing a cross-border supply chain model that not only optimizes logistics but also promotes regional stability, economic diversification, and sustainable tourism practices (Wu & Ou, 2023).

Research Objectives

The primary aim of this research is to design and propose an integrated model for a short, cross-border supply chain ecosystem capable of effectively supporting and enhancing sustainable tourism in the two participating countries. The study seeks to conceptualize a collaborative and resilient framework that connects local producers, service providers, logistics actors, tourism enterprises, and public stakeholders across national boundaries, fostering economic, environmental, and social sustainability. By focusing on short supply chains, the model emphasizes proximity, reduced transportation distances, stronger local value creation, and closer relationships among stakeholders, all of which are aligned with the principles of sustainable regional development.

The key characteristics of the proposed ecosystem, along with the principal tasks required for its development and effective operation, are outlined as follows:

1. Mapping and profiling local producers. One of the first steps is to systematically map, classify, and profile local food producers, artisans, and agro-SMEs on both sides of the border. This detailed mapping will include data on product types, seasonal availability, logistical constraints, and sustainability practices. By creating a comprehensive geo-database of local producers, the project will facilitate the coordination between local producers and tourism businesses, ensuring the efficient sourcing of local goods while reducing dependence on imported products (Kaplan, 2020). This geo-database will also help businesses identify sustainable sourcing options and contribute to local economic growth by creating new market opportunities. Geographically referenced data enhances transparency and traceability in supply chains, enabling firms to locate eco-friendly suppliers, optimize procurement decisions, and strengthen linkages with local producers, which in turn can stimulate regional economic activity and sustainability (e.g., by promoting local products and fostering regional development through improved market access) (Khan et al., 2022). A similar approach is provided through the Caspian Policy Center (Figure 1).

***Figure 1**: An online map on cross-border supply chains (Source: Dayar et al., 2025)*

2. Estimating tourism demand. This task requires considering a number of factors, such as visitor flows, weather patterns and travel movements, to enable hotels, restaurants, and resorts to optimize procurement and ensure timely access to local products, while minimizing waste (Page & Connell, 2020). Accurate tourism demand forecasting helps businesses and destinations manage seasonal fluctuations in demand, improve overall supply chain efficiency, and reduce reliance on imported goods by aligning supply with anticipated visitor needs; such forecasting is essential for planning resource allocation, adjusting capacity, and designing strategies to meet changing demand patterns (Baker & Egger, 2019).
3. Another critical task is the design of the Local Loop Index (LLI). This index acts as a framework for measuring the sustainability of cross-border supply chains. It evaluates key factors such as carbon intensity, product freshness, local economic capture, and circularity within the supply chain (Saeed & Kersten, 2020). By offering a transparent and standardized metric, the LLI will allow tourism operators to assess and communicate the sustainability of their supply chains, thus promoting responsible sourcing practices and helping businesses align with sustainability certifications. It also serves as a valuable tool for consumers who are increasingly concerned with the environmental and social impact of their purchasing decisions (Jansson et al., 2018).
4. Establishing micro-distribution hubs. Micro-distribution hubs will be set up as modular logistics nodes that include cold storage, consolidation services, and low-carbon transport options (Katsela, 2022). These hubs serve as central points where local products can be stored and distributed to tourism businesses, ensuring efficient and timely delivery while reducing carbon emissions associated with transportation (European Commission, n.d.). By utilizing small boats, electric vans, and cargo bikes,

these hubs will offer a sustainable alternative to traditional trucking routes, which often contribute to congestion and environmental degradation in coastal and island regions (Barrett & Vassallo, 2020). This innovative approach will help streamline the movement of goods while promoting low-carbon logistics.

5. Integrating digital traceability systems: To enhance transparency and build consumer trust, the research will integrate digital traceability tools such as blockchain and QR-based systems into the supply chain (Tian, 2016). These systems will allow tourists and businesses to track the origin, production process, and environmental impact of the products they purchase (Kouhizadeh & Sarkis, 2018). By offering detailed insights into each product's journey (from the producer's story to the sustainability metrics) these tools will empower consumers to make more informed purchasing decisions and foster a greater sense of authenticity and trust in the supply chain (Gianotti et al., 2020).

Cross-Border Sustainable Tourism Supply Ecosystem Model

The following diagram illustrates a cross-border socio-technical regional innovation system that operationalizes sustainable supply chain principles through short supply chain structures and collaborative governance, enabled by digital technologies (Figure 2).

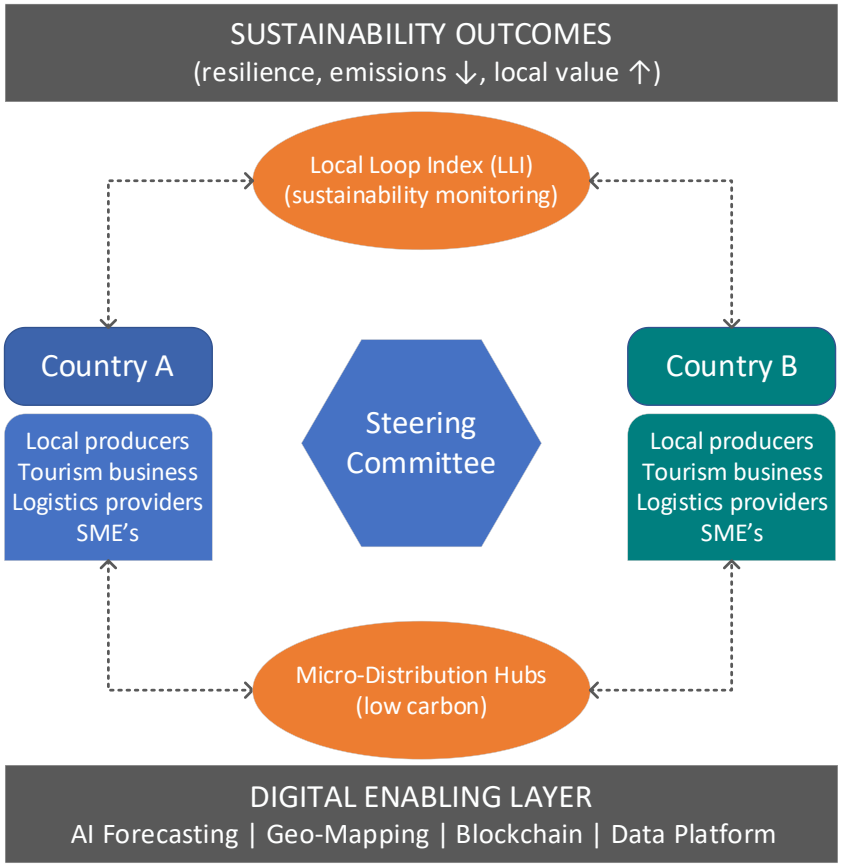

***Figure 2**: Cross-Border Sustainable Tourism Supply Ecosystem Model*

This above proposed model presents a digitally enabled, cross-border regional socio-technical supply ecosystem designed to strengthen sustainability, resilience, and local value creation in tourism-related supply chains. Its primary aim is to reorganize how goods flow between local producers and tourism businesses across two neighboring countries, shifting from import-dependent, fragmented systems to coordinated, short, and low-carbon supply networks governed collaboratively and monitored through sustainability metrics. At the highest level, the system seeks to reduce emissions, enhance regional economic multipliers, improve supply chain resilience, and increase the share of locally sourced products.

At the core of the ecosystem are the actors in the two countries. On both sides of the border, local producers, tourism businesses (such as hotels and restaurants), logistics providers, and SMEs form the social and economic base of the system. These actors represent the productive and demand sides of the tourism supply chain. Their interaction is not isolated within national boundaries; instead, they are connected through cross-border flows of goods and information, supported by shared infrastructure and governance structures.

Between these national actor groups operates the micro-distribution hub layer, which constitutes the main physical logistics interface. These hubs consolidate products from local producers, provide storage (including cold-chain capacity), and distribute goods to tourism enterprises using low-carbon transport solutions. By shortening distances and improving coordination, the hubs reduce transport emissions, fragmentation, and waste, while enabling smaller producers to access tourism markets more effectively.

Overseeing the entire system is the cross-border Steering Committee, which represents the collaborative governance mechanism. This body coordinates rules, standards, and strategic decisions between the two countries, ensuring alignment of policies, data sharing, and operational practices. It connects institutional actors with market participants and enables joint management of the ecosystem.

The Digital Enabling Layer underpins all components. Tools such as AI-based demand forecasting, producer geo-mapping, blockchain-enabled traceability, and a shared data platform enhance transparency, predictability, and coordination. These technologies link social actors with technical systems, enabling real-time information flows that optimize procurement and logistics decisions. Surrounding and monitoring the system is the Local Loop Index (LLI), which functions as a sustainability control mechanism. LLI evaluates factors such as carbon intensity, local sourcing, and circularity, feeding performance information back into the system. Together, these interconnected layers drive the overarching sustainability outcomes shown at the top of the diagram.

Innovative Aspects of the Research

This research introduces several innovative aspects that set it apart from traditional supply chain models. The most notable innovation is the development of the first cross-border short supply chain model for tourism, which links producers across national borders to create a collaborative supply chain ecosystem. Additionally, the project incorporates maritime micro-logistics solutions, which reduce reliance on road transport and minimize carbon emissions associated with the transportation of goods. The integration of circular supply loops that recycle waste into new value chains, such as composting, biogas, and upcycled packaging, is another key innovation. This ecosystem also fosters a bi-national governance system, with a cross-border steering committee that will oversee the development and management of the supply chain model, ensuring that all stakeholders are represented and that decisions are made collaboratively (Badulescu et al., 2014; Singh & Chandra, 2025). By leveraging technologies such as AI, blockchain, and IoT, this local supply chain ecosystem will optimize supply chain management, improve demand forecasting, and enhance traceability, supporting the goals of sustainable tourism (Timmermans et al., 2020).

Expected Impact and Contributions

The analysis demonstrates that the development of a localized, cross-border supply chain ecosystem between two neighboring countries can generate substantial benefits for the sustainability, resilience, and competitiveness of the tourism sector, while developing further collaborating partnerships and bilateral projects with further perspectives in the targeted sectors. An example is the Interreg Hungary-Slovakia project “InterregHUSK” on Short Supply Chains, (interreghusk.eu, n.d.). Rather than being limited to theoretical implications, the proposed ecosystem model produces a set of practical and technological contributions that illustrate how regional cooperation and short supply chain structures can transform tourism-related logistics and sourcing practices.

First, the establishment of a geo-database of local producers emerges as a foundational component of the ecosystem. Such a geo-referenced information system enhances visibility of regional production capacity and enables tourism operators to make more informed sourcing decisions. By systematically mapping local suppliers, the system reduces dependency on imported goods, shortens supply distances, and strengthens linkages between tourism businesses and local economies. This contributes not only to reduced environmental impact but

also to local value creation, income diversification, and the stimulation of small and medium-sized enterprises in rural and border regions.

Second, the integration of an AI-driven tourism demand-forecasting platform significantly improves the alignment between supply and demand. By incorporating variables such as visitor flows, seasonal patterns, and mobility trends, predictive tools allow hotels, restaurants, and resorts to optimize procurement planning. The expected outcomes include lower levels of food and product waste, more efficient inventory management, and reduced emergency sourcing from distant markets. This data-driven coordination enhances supply chain efficiency while simultaneously supporting environmental sustainability through minimized overproduction and transportation emissions.

A further key contribution is the development of a Local Loop Index (LLI) certification framework, which functions as a structured mechanism for assessing the sustainability performance of tourism supply chains. The LLI provides measurable criteria related to local sourcing intensity, environmental footprint, and socio-economic contribution. By offering a transparent evaluation tool, the framework supports responsible sourcing practices and encourages businesses to increase the proportion of locally sourced goods. In doing so, it strengthens accountability, facilitates benchmarking, and fosters trust among stakeholders, including consumers, suppliers, and policymakers.

The implementation of micro-logistics hubs represents another important operational outcome. These modular nodes, equipped with consolidation services, cold storage, and low-carbon transport options, demonstrate how localized distribution infrastructures can support short supply chains. Their role in aggregating goods from local producers and distributing them efficiently to tourism establishments reduces transport fragmentation, traffic congestion, and emissions. Moreover, the pilot application of such hubs provides a scalable model for other cross-border regions facing similar logistical constraints, particularly in areas with dispersed production and seasonal tourism demand.

Equally significant is the integration of a digital traceability system, which enhances transparency across the supply chain. Through technologies such as block chain and QR-based interfaces, stakeholders and end consumers can access reliable information regarding product origin, handling, and sustainability attributes. This increased visibility reduces information asymmetry, combats greenwashing risks, and strengthens consumer confidence in local and sustainable products. For tourism destinations, such transparency contributes to reputation building and differentiation in increasingly sustainability-oriented markets.

Beyond these core components, the study also highlights broader systemic benefits. The ecosystem supports capacity building among local producers and tourism enterprises by promoting knowledge transfer, digital adoption, and improved logistics practices. It also offers a replicable governance and coordination model for cross-border sustainable supply chains, demonstrating how institutional cooperation between neighboring countries can overcome administrative and market barriers. Such insights provide a basis for policy development aimed at integrating regional economic planning with sustainability and tourism strategies.

Overall, the findings indicate that a coordinated, technology-enabled local supply chain ecosystem can simultaneously enhance economic resilience, reduce environmental pressures, and improve transparency and efficiency in tourism supply networks. The cross-border dimension further amplifies these benefits by expanding market access, fostering regional cohesion, and creating shared value between neighboring countries.

Conclusion

This research advances the discourse on sustainable tourism logistics by moving beyond incremental efficiency improvements toward the conceptualization of a digitally enabled, cross-border socio-technical supply ecosystem tailored to tourism-dependent regions. Rather than treating supply chain optimization, sustainability, and regional cooperation as separate objectives, the study integrates them within a single systemic framework that links producers, tourism enterprises, logistics actors, technologies, and governance institutions across national boundaries. In doing so, the paper contributes a structured model for reconfiguring tourism supply systems from fragmented, import-dependent structures into coordinated, short, and low-carbon regional networks.

The proposed Cross-Border Sustainable Tourism Supply Ecosystem Model demonstrates how sustainability transitions in tourism supply chains require the simultaneous alignment of social actors, physical logistics infrastructure, digital technologies, and governance mechanisms. At the operational level, micro-distribution hubs shorten physical distances and enable low-carbon last-mile delivery, directly addressing emissions, congestion, and waste. At the informational level, AI-based demand forecasting and geo-mapping reduce uncertainty and seasonality-driven inefficiencies by synchronizing supply with tourism demand. At the transparency level, digital traceability tools enhance trust, accountability, and informed consumption. These technological layers are not standalone solutions; they function as enablers within a broader socio-technical system shaped by cross-border collaboration.

A central contribution of the model is the introduction of the Local Loop Index (LLI) as a sustainability control mechanism. By embedding performance monitoring within the ecosystem, the LLI transforms sustainability from an abstract objective into a measurable and comparable operational parameter, guiding sourcing decisions, certification processes, and policy evaluation. This closes the loop between data, governance, and practice, ensuring that environmental and socio-economic outcomes, such as reduced carbon intensity, higher local value capture, and increased circularity, are systematically reinforced.

Importantly, the cross-border Steering Committee institutionalizes collaborative governance, demonstrating how regional innovation systems can overcome administrative fragmentation and market barriers. The model thus illustrates that resilient tourism supply chains depend not only on logistics redesign but also on shared institutional frameworks and digital integration.

Overall, the study offers a replicable blueprint for sustainable regional tourism development, showing that localized, technology-enabled supply ecosystems can enhance resilience, reduce environmental pressures, empower SMEs, and strengthen regional cohesion. The framework provides both a theoretical contribution to sustainable supply chain and regional systems literature and a practical pathway for policymakers and destination managers seeking to operationalize cross-border sustainability transitions in tourism.

AN INNOVATION INTELLIGENCE MODEL: INTEGRATING INTERNAL COGNITIVE RESOURCES, DYNAMIC CAPABILITIES, AND ORGANIZATIONAL ROUTINES

Georgios Afxentiou[1]

[1] Georgios Afxentiou Research Laboratory, Larnaca, Cyprus

Keywords: Innovation, internal cognitive resources, capabilities, routines, innovative behavior.

Abstract

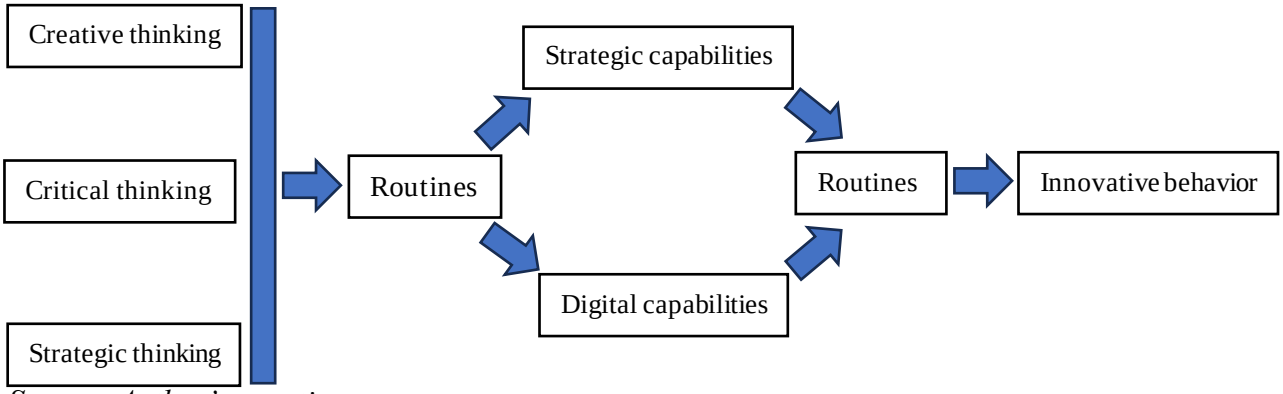
This conceptual study explores how entrepreneurs' internal cognitive resources, including creative, critical, and strategic thinking, shape innovative behaviour in business environments. Addressing the theoretical gap between the dynamic capabilities and organizational routines theories in examining innovative behavior, the study proposes an innovation intelligence (II) model. Drawing on a conceptual synthesis approach, the researcher develops a conceptual framework, reflecting diverse ways of thinking about the research theme and prior literature review. The analysis demonstrates how internal cognitive resources enable strategic and digital capabilities while deploying organizational routines to formulate innovative behaviour. A theoretical and practical framework presents the dynamic relationships of the main research constructs.

Introduction

Innovation intelligence empowers entrepreneurs to identify, develop, and pursue emerging opportunities that drive innovation, organizational growth, and competitiveness. The radical changes in market conditions create an uneven competitive environment, requiring strategic and agile management. This study examines how entrepreneurs' internal cognitive resources, including creative, critical, and strategic thinking, enable dynamic capabilities through organizational routines, thereby facilitating innovative behavior.

The objectives are:

1. To explore how entrepreneurs' creative, critical and strategic thinking build organizational strategic and digital capabilities.



2. To examine how organizational routines enhance entrepreneurs' internal cognitive resources and capabilities for innovative behavior.

Research gap

The dynamic capabilities theory describes how dynamic capabilities balance the exploitation of existing competencies with the exploration of new opportunities (Nayernia, 2025). In contrast, the organizational routines theory examines how the internal dynamics of routines connect inputs with outputs and facilitate the emergence of practices in organizations (Feldman & Orlikowski, 2011). However, neither theory addresses how entrepreneurs' internal cognitive resources shape innovative behavior through the leveraging of capabilities and routines, revealing an emerging theoretical gap.

Literature review and theoretical framework

Innovation is defined as the creation or adoption of an object or practice (Nasiri et al., 2023; Rogers, 1983). The utilization of resources and implementation of routines in organizations enhances innovative behavior. This study draws on dynamic capabilities and organizational routines theories to develop a theoretical framework explaining innovative behavior. Dynamic capabilities theory highlights the significance of specialized capabilities in supporting organizations' adaptation to a rapidly changing environment (Teece, 2014; Teece et al., 1997). Organizational routines emphasize their role in connecting inputs and outputs within organizations (Feldman & Orlikowski, 2011). Although, dynamic capabilities enhance an organization in sensing, seizing, and transforming opportunities, the organizational routines facilitate the process in building creativity. Moreover, entrepreneurs' creative, critical and strategic thinking enable organizational capabilities to develop innovative behavior through routines. The **Innovation Intelligence (II) model** presents the relationship of internal cognitive resources, capabilities, routines, and innovative behavior.

Source: Author's creation

Thus, this study aims to answer the following research questions:

1. How does entrepreneurs' creative, critical, and strategic thinking enhance organizational strategic and digital capabilities?

2. How do organizational routines enable entrepreneurs to foster innovative behavior?

Methodology and methods

This study employs a conceptual synthesis approach to construct an integrative explanatory framework for innovative behavior in entrepreneurial contexts. Conceptual synthesis is appropriate when there is fragmented research, and particularly where theories do not address the phenomenon under investigation (Torraco, 2016). Instead of testing a hypothesis, this study systematically reviews and integrates insights from the literatures on entrepreneurial cognition, dynamic capabilities, organizational routines, and innovation behavior. By synthesizing these streams of literature, the study changes the focus from comparing theories to advancing theory development.

Expected findings and contribution

The findings provide both a theoretical and practical framework for understanding entrepreneurial cognition and innovative behavior, while emphasizing the significance of capabilities and routines within organizations.

Originality and value

The study's originality is grounded in explicating how capabilities are developed through routines to cultivate innovative behavior within organizations.

Research limitations

An empirical testing of the variables could provide valuable insights about innovative behavior within organizations.

HOW PROXIMITY SHAPES INNOVATION: THE CONTINGENT ROLE OF BUSINESS MODELS

Massacci, Alberto[1]; Pucci, Tommaso[1]; Benvenuti, Caterina[2]; Zanni, Lorenzo[1]

[1]Department of Business and Law, University of Siena, Siena, Italy

[2]Department of Economics and Management, University of Florence, Florence, Italy

Keywords: Proximity, Business Model, Product Innovation, Process Innovation.

Introduction

Innovation lies at the heart of organisational evolution and firms' competitive advantage. Within the innovation context, the concept of proximity, spanning geographical, social, and cognitive dimensions, has been studied over the years in various disciplines and continues to attract the attention of top management journals (Chu et al., 2019, Crescenzi et al., 2016). Nevertheless, while the literature has largely discussed the linkage between proximity and innovation (Boschma, 2005, Janssen et al., 2020), the relation between proximity and business model design (Amit and Zott, 2015; Delorme, 2023;) and the importance of business model in shaping firms' innovation capacity (Hu and Chen, 2016, Massa et al., 2017), the underlying mechanisms through which the three variables interact still deserve attention.

Purpose, Aim and Objectives

This study attempts to fill this literature gap by empirically analysing the linkage between proximity, innovation and business models. In particular, the research attempts to understand whether the business model configuration could act as a mediating variable between partners' proximity and their ability to innovate, either from a product or process perspective.

Methodology and Methods

The empirical analysis is conducted on a database of 457 Tuscan firms that were interviewed between June 2020 and January 2021.

To assess whether business model characteristics mediate the relationship between proximity dimensions and innovation outcomes, we conducted a mediation analysis using nonparametric bootstrap procedures. Indirect effects were estimated as the product of path coefficients and evaluated using percentile-based confidence intervals obtained from 200 bootstrap replications.

Findings and Contribution

Results show that the indirect effects of social proximity on both product and process innovation through business model characteristics are not statistically significant. In both cases, the percentile-based confidence intervals include zero, indicating the absence of a robust mediation effect.

In contrast, cognitive proximity exhibits a significant indirect effect on innovation outcomes through business model characteristics. The indirect effect on product innovation is positive and statistically significant. A similar pattern emerges for process innovation.

Geographic proximity, measured as the share of partners located in the same municipality, shows a negative indirect effect on product innovation through business model characteristics. The indirect effect on process innovation is negative but not statistically significant.

Overall, these findings indicate that business models act as a selective mediation mechanism: while cognitive proximity fosters innovation primarily through business model configurations, social proximity operates through direct channels, and geographic proximity may constrain innovation via business model lock-in.

Originality and Value

The results offer interesting theoretical and managerial insights. From a theoretical perspective, they highlight that proximity cannot be defined as a homogeneous driver; indeed, different proximity dimensions activate distinct mechanisms. In addition, they show that business models act as selective mechanisms that transform relational inputs into innovation output only under specific cognitive conditions.

Theoretical and Practical Applications and Implications

Finally, the negative relationship between geographic proximity and innovation, through the business models, highlights the risks of regional lock-in and path dependence. From a managerial standpoint, the findings emphasise that proximity per se does not guarantee innovation. While social proximity helps build relationships, it does not automatically translate into structured innovation; similarly, cognitive proximity must be actively governed rather than left to emerge naturally. Furthermore, managers should be warned against the risks of excessive localism. In conclusion, this study shows that proximity fosters innovation through different mechanisms, with business models acting as selective transmission devices rather than universal mediators.

BEYOND RESOURCES: UNIVERSITY INCUBATORS AND THE NEGLECTED DIMENSION OF ENTREPRENEURIAL TEAM MANAGEMENT IN EARLY-STAGE STARTUPS

Lingua, Francesco[1]; Demaria, Riccardo[1]

[1] Department of Management "Valter Cantino", University of Turin, Turin, Italy

Keywords: University incubators, Entrepreneurial teams, Team dynamics, Early-stage startups, Academic entrepreneurship, Team management, Qualitative research

Introduction

University incubators are central in academic entrepreneurial ecosystems, supporting early-stage startups through access to resources, mentoring, and networks. Prior research has focused on incubators' role in business model development and venture survival, often neglecting the internal functioning of entrepreneurial teams. Early-stage startups are characterised by fluid roles, emergent leadership, and high interpersonal interdependence. Evidence shows that team-related dysfunctions such as role ambiguity, leadership conflicts, and misaligned expectations are a primary cause of failure (Diakanastasi et al., 2018). Yet little is known about how university incubators engage with intra-team dynamics during the incubation process.

Purpose, Aim and Objectives

The study explores how university incubators support early-stage entrepreneurial teams beyond business and technical assistance. It aims to examine how incubators address team formation, leadership emergence, and internal coordination challenges. Objectives: (1) identifying forms of support provided for team management; (2) analysing main difficulties experienced by incubated teams; and (3) capturing teams' perceived needs regarding collaboration, leadership, and conflict resolution within academic incubation environments.

Literature Review and Theoretical Framework

Incubation literature predominantly adopts a resource-based view, emphasising access to financial capital, knowledge, and networks (Mian et al., 2016). This approach treats startups as

internally coherent units, overlooking team dynamics. Research on entrepreneurial teams highlights that early venture performance is shaped by role negotiation, shared leadership, and conflict management (Klotz et al., 2014). Team dynamics are particularly fragile in academic startups, where founders often lack managerial experience. This study integrates these perspectives, viewing university incubators as institutional contexts that may shape team norms and managerial practices.

Methodology and Methods

A qualitative interpretive approach is adopted. Data are collected via semi-structured interviews with early-stage startups operating within university-affiliated incubators in the Turin entrepreneurial ecosystem. Purposive sampling ensures variation in sector, team composition, and development stage. The sample is guided by theoretical saturation until no substantially new themes emerge. Interviews explore: (1) team origin and evolution; (2) perceived incubator support regarding team functioning; and (3) key interpersonal frictions and decision-making challenges. Interviews are transcribed and analysed using inductive thematic analysis, allowing recurring patterns and latent themes to emerge.

Expected Findings and Contribution

Findings are expected to show that incubators play a limited and informal role in addressing intra-team dynamics. While effective in business development support, interventions in team management are reactive and fragmented. Team-related issues are often addressed only when critical problems arise. Expected themes include leadership ambiguity, role misalignment, communication breakdowns, and informal conflict mediation. The study contributes empirically by documenting a structural blind spot in academic incubation practices and theoretically by integrating entrepreneurial team dynamics into the incubation literature.

Originality and Value

The study’s originality lies in shifting the focus from external resource provision to internal team processes within university incubators. By foregrounding team management as a neglected but critical dimension, it extends theories of academic entrepreneurship and incubation beyond the dominant resource-centric framing.

Research Limitations

The study is based on qualitative data from a limited number of incubators, which may constrain generalisability. Findings reflect team perceptions and are context-specific to academic incubation environments. The findings may also be relevant to similar university-based incubation contexts beyond Turin.

Theoretical and Practical Applications and Implications

Theoretically, the study suggests reconceptualising university incubators as organisational contexts shaping early team dynamics. Practically, it highlights the opportunity to integrate structured mechanisms such as role clarification, leadership coaching, conflict mediation into incubation programmes, enhancing startup resilience and long-term viability. Findings may lead incubation programmes toward more team-oriented support practices.

FAN EXPERIENCES, SPORT TOURISM AND CONSUMER BEHAVIOUR AT THE AFRICAN CUP OF NATIONS

Nicoliello, Mario [1]

[1] Department of Economics and Management, University of Brescia, Italy

Keywords: Sport tourism; Consumer behaviour; Fan experience; Mega sport events; African Cup of Nations

Introduction

Mega sport events increasingly function as hybrid platforms where sport consumption, tourism experiences and consumer behaviour intersect. While events such as the FIFA World Cup and the Olympic Games have received extensive scholarly attention, continental tournaments – particularly those hosted in emerging tourism destinations – remain underexplored. The African Cup of Nations (AFCON) represents a significant case, both as the flagship football competition of the Confederation of African Football and as a catalyst for tourism development and destination branding. The 2025 AFCON hosted in Morocco offers a timely opportunity to explore how fans experience the event beyond the stadium, combining sport fandom with travel motivations, cultural encounters and consumption practices.

Purpose, Aim and Objectives

The research aims at investigating how football fans attending AFCON 2025 in Morocco experience the event as both a sport spectacle and a tourism experience. The study analyses fans' motivations, behaviours and perceptions in order to understand how sport events shape tourist consumption patterns and destination experiences. The objectives are threefold: (1) to explore fans' motivations for travelling to AFCON 2025; (2) to examine how fans consume sport, tourism and cultural products during the event; and (3) to analyse how these experiences influence perceptions of Morocco as a host destination. The research question is the following: How do sport fans attending AFCON 2025 construct and negotiate their roles as consumers of both sport and tourism experiences?

Literature Review and Theoretical Framework

The research draws on three main strands of literature: sport tourism, consumer behaviour in sport and event experience research. Sport tourism scholars highlight the dual identity of spectators as fans and tourists, emphasising the role of motivation, authenticity and place attachment (Gibson, 1998; Weed and Bull, 2009). Consumer behaviour research in sport has increasingly focused on experiential consumption, symbolic meanings and identity construction (Funk, 2017). Event experience frameworks further suggest that mega events generate value through emotional, social and cultural dimensions that extend beyond the core sport product (Getz, 2008). Despite this, limited research has examined African sport mega-events from the consumer perspective, representing a significant gap this study seeks to address.

Methodology

The research adopts a qualitative methodology based on semi-structured interviews conducted with football fans during AFCON 2025 in Morocco. Interviews were carried out in host cities before and after matches, targeting both domestic and international fans. This in-situ approach allows for the capture of lived experiences and immediate reflections on sport consumption, travel behaviour and destination interaction. Data were analysed using thematic analysis, enabling the identification of recurring patterns related to motivation, consumption practices and destination perceptions.

Main Findings and Contribution

Preliminary findings indicate that fans' motivations extend beyond football attendance to include cultural discovery, social interaction and destination exploration. AFCON 2025 is experienced as a multi-layered consumption experience in which matches act as anchors for broader tourism activities, including gastronomy, heritage tourism and informal social encounters. Fans perceive Morocco not only as a sport host but as an accessible and culturally rich destination, with positive implications for destination image formation. The findings contribute to a deeper understanding of sport events as experiential ecosystems rather than isolated spectacles.

Originality and Value

The originality of this study lies in its focus on AFCON as a sport tourism event and its consumer-centric perspective. Examining an African mega-event through fan interviews, the study challenges the dominance of Eurocentric and Global North contexts in sport tourism

research. It offers empirical insights into how continental tournaments can generate tourism value and shape consumer experiences in emerging destinations.

Research Limitations

The study is limited by its qualitative design and the contextual specificity of AFCON 2025, which may restrict generalisability. Language barriers and time constraints during the event may also influence data depth. Future research could adopt mixed-methods approaches or comparative designs across different editions of AFCON.

Theoretical and Practical Implications

Theoretically, the study contributes to sport tourism and consumer behaviour literature, reinforcing the concept of hybrid fan-tourist identities. Practically, the findings offer valuable insights for event organisers, destination managers and policymakers seeking to leverage mega sport events for sustainable tourism development. Understanding fan consumption patterns can inform integrated sport-tourism strategies and enhance the long-term legacy of continental sport events.

FROM TRIP TO CONTINUUM: A SCOPING REVIEW OF AI-ENABLED IMMERSIVE TECHNOLOGIES IN DESTINATION EXPERIENCE DESIGN

Kouroupi, Nansy[1]

[1]Les Roches Global Hospitality Education, Crans-Montana, Switzerland

Keywords: immersive technologies; metaverse; extended reality; artificial intelligence; destination experience; temporal continuity; governance; scoping review.

Introduction

AI-enabled immersive technologies are being positioned as a bridge between physical travel and ongoing digital engagement, yet tourism research often describes these systems as stand-alone applications rather than as a temporal continuum. This matters because persistence changes what is measured (repeat engagement, memory effects, re-entry) and what must be governed (data, transparency, cultural integrity). This extended abstract reports early-stage outputs from an ongoing scoping review that maps how tourism and destination experience studies conceptualise and evaluate these converging realities (Dwivedi et al., 2022; Buhalis et al., 2024). Evidence on VR and presence suggests immersive media can shape attitudes and intentions, but effects depend on design, authenticity cues and context (Tussyadiah et al., 2018). Framed as a journey, AI-enabled touchpoints can extend value creation beyond the visit and into planning and remembering (Lemon and Verhoef, 2016).

Purpose, Aim and Objectives

The review maps how tourism and destination research frames and measures AI-enabled immersive experiences, with specific attention to (a) immersive modalities, (b) AI capabilities, (c) impact measures, and (d) whether "experience over time" is operationalised.

Literature Review and Theoretical Framework

Literature review and theoretical framework: Smart tourism scholarship frames destinations as data-rich ecosystems where value is co-created through technology-mediated interactions (Gretzel et al., 2015, Buhalis et al., 2024). Metaverse-focused tourism syntheses indicate rapid growth but fragmented constructs, with limited attention to longitudinal continuity and governance (Dwivedi et al., 2022). Within tourism, VR and AR reviews show growth yet limited theorisation of post-visit engagement and memory effects (Yung and Khoo-Lattimore,

2019). Technology studies stress socio-technical ecosystems and the rise of non-human service actors (Sigala, 2018). These strands motivate attention to how personalisation systems and agents reconfigure experience metrics across phases.

Methodology and Methods

A scoping review approach was selected to clarify conceptual boundaries and map evidence breadth (Arksey and O'Malley, 2005) and will be reported using PRISMA-ScR conventions (Tricco et al., 2018). Searches were executed in Scopus and Web of Science for January 2018-January 2026 (English; journal articles). Records were exported, merged and deduplicated; 72 duplicates and one retracted record were removed. The current dataset contains 139 unique records for title/abstract screening. Eligibility focuses on tourism and destination experience studies where an immersive modality (VR/AR/MR/XR/metaverse) is paired with an AI technique (e.g., chatbots, recommender systems) used for personalisation, guidance or interaction.

Main/Expected Findings and Contribution (Preliminary)

Preliminary text mining of titles and abstracts (n=139) suggests concentration on VR (70 records) and AR (45), with comparatively few explicit mentions of MR (4) and XR (3). AI is frequently signalled (110), most commonly via chatbots/conversational agents (21). By contrast, explicit mentions of recommender systems (7), generative AI (5) and large language models (3) remain limited. The most striking early signal is temporal silence: terms such as pre-trip, post-trip, "always on", "ongoing engagement" and "experience continuity" are absent from titles/abstracts. Only "journey" appears in two records and persistence terms in three, suggesting continuity is more often implied than explicitly measured. The planned synthesis will therefore prioritise how studies locate experiences in time and what they treat as evidence of continuity (e.g., repeat use, memory, loyalty, trust).

Originality and Value

The review foregrounds temporality and governance as first-order design and measurement questions, rather than treating them as secondary issues.

Research Limitations

Findings reported here are preliminary and derived from titles/abstracts and partial full-text retrieval. Full-text screening, data charting and synthesis are in progress and may refine interpretations.

Theoretical and Practical Applications/Implications

For destination organisations and technology partners, the emerging message is cautionary: persistence is frequently a design aspiration, but appears weakly specified in research language. Governance-by-design (data stewardship, transparency and cultural representation) may therefore need to be treated as an explicit variable to specify, measure and govern across phases, rather than assumed.

RETHINKING THE LINK BETWEEN WORK-FAMILY CONFLICT AND TURNOVER INTENTIONS IN TOURISM AND HOSPITALITY

Papavasileiou Emmanouil, Kourgiantakis Markos and Rovithis Michael

Department of Business Administration and Tourism, Hellenic Mediterranean University, Heraklion, Greece

Keywords: work–family conflict; turnover intentions; systematic literature review; source attribution; PRISMA; tourism and hospitality

Abstract

Purpose: There is an ongoing scholarly debate regarding how the two dimensions of work–family conflict—family interference with work (FIW) and work interference with family (WIF)—affect key work-related outcomes such as turnover intentions. From a cross-domain perspective, FIW is expected to exert a stronger influence on turnover intentions, whereas the matching-domain perspective suggests that WIF should be more impactful. This study reviews the extent to which tourism and hospitality research engages with and contributes to this theoretical discussion.

Design/methodology/approach: A systematic literature review was undertaken using a multi-source search approach. This included peer-reviewed studies identified through previous reviews, Scopus, and Google Scholar. The review process adheres to the PRISMA 2020 guidelines.

Findings: This review offers a comprehensive and up-to-date synthesis of empirical research, incorporating a significant number of studies published since earlier reviews. The final sample consists of 30 peer-reviewed articles published between 2006 and 2025, contributed by 60 authors.

Originality/value: The review identifies four key directions for future research: (1) expanding the empirical scope beyond frontline employees and beyond predominantly Middle Eastern and Asian contexts (contextual); (2) embracing a bidirectional understanding of work–family conflict by jointly examining WIF and FIW (conceptual); (3) using source attribution theory to explain why WIF tends to predict turnover intentions more consistently than FIW (theoretical); and (4) exploring mechanisms that can buffer or reduce the negative impact of work–family conflict on turnover intentions (practical).

Introduction

Work–family conflict arises when the demands associated with work and family roles are incompatible (Greenhaus and Beutell, 1985). Drawing on role theory (Goode, 1960; Pleck, 1977) and further informed by conservation of resources theory (Hobfoll, 1989), prior research suggests that individuals possess limited time, energy, and cognitive resources to meet expectations across both domains. Consequently, competing demands often lead to conflict (Kappe et al., 2025; Wu and Perrigino, 2025). This conflict is typically conceptualised as bidirectional: work may interfere with family (WIF), and family may interfere with work (FIW). Although these two forms are related, they remain conceptually distinct (Kobayashi et al., 2025).

A key debate in the literature concerns how these two dimensions relate to outcomes. The cross-domain perspective posits that conflict originating in one domain has its strongest effects in the other domain; for instance, FIW may lead to higher turnover intentions (Shockley and Singla, 2011; Nohe et al., 2015; Zhao et al., 2019). In contrast, the matching-domain perspective suggests that the greatest effects occur within the same domain, implying that WIF is more likely to influence work-related outcomes, while FIW primarily affects family-related outcomes. Despite its importance, this theoretical distinction has received limited attention within tourism and hospitality research.

Turnover intentions remain a significant issue in the tourism and hospitality industry. Although the sector generates considerable employment, it is characterised by high levels of workforce instability. For example, in the United Kingdom, 41% of employees changed jobs between 2022 and 2023, while 12% exited the labour market entirely, resulting in a turnover rate of 53% (CIPD, 2024). High employee turnover imposes substantial organisational costs, including recruitment and training expenses, as well as diminished morale and service quality (De Vos et al., 2025). Even in cases where employees do not actually leave, the mere intention to do so can negatively affect organisational performance, as such employees are more likely to become disengaged or exhibit counterproductive behaviours (Ruiz-Palomino et al., 2021). Accordingly, identifying and understanding the drivers of turnover intentions—particularly the role of work–family conflict—is crucial for long-term organisational sustainability.

To address this gap, the present study provides an updated systematic review with two main objectives: (1) to synthesise the most recent empirical findings, and (2) to identify contextual, conceptual, theoretical, and practical limitations that should guide future research and practice.

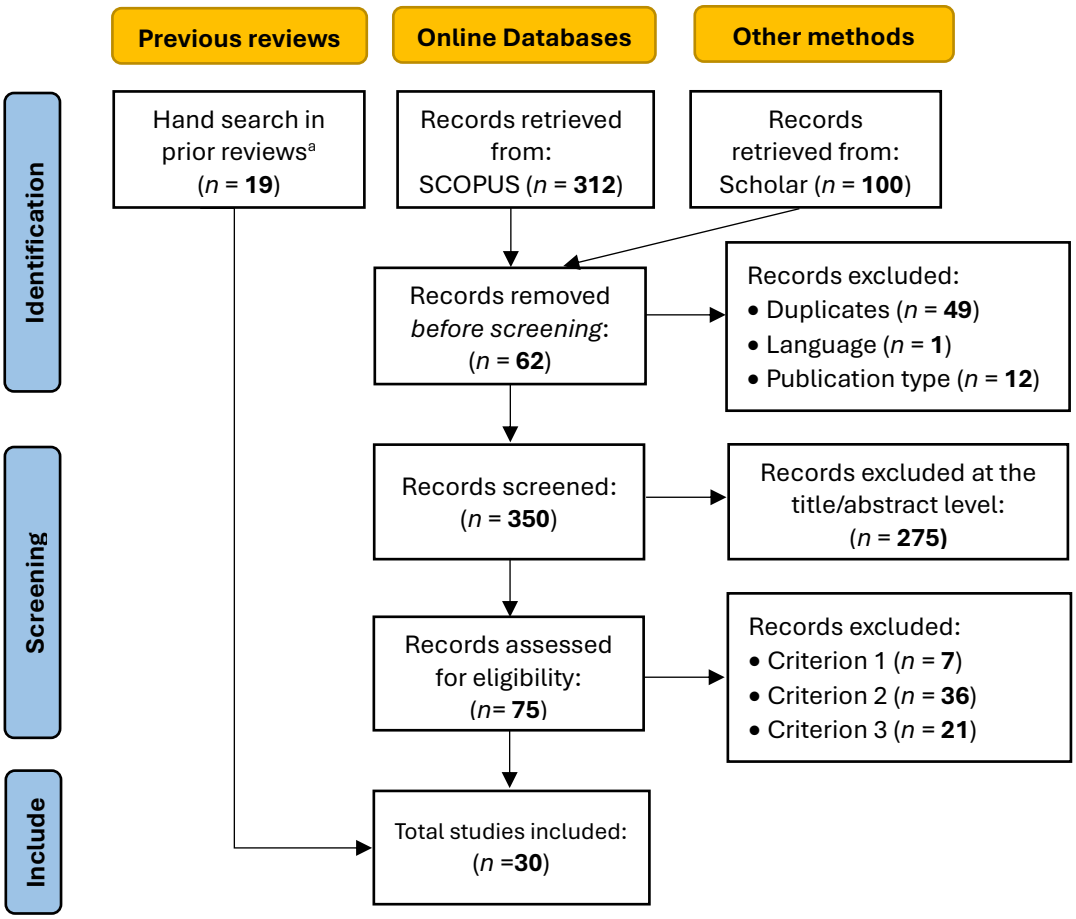
To achieve these objectives, the review is guided by the following research questions:

RQ1 (Contextual): In which organisational and cultural settings has the relationship between work–family conflict and turnover intentions been examined, and how do these contexts shape the relationship?

RQ2 (Conceptual): How has work–family conflict been conceptualised—particularly with respect to its bidirectional nature—and what are the implications for understanding its link to turnover intentions?

RQ3 (Theoretical): What theoretical frameworks have been used to explain this relationship, and how do they enhance or limit current understanding?

RQ4 (Practical): What mechanisms have been identified as effective in mitigating the impact of work–family conflict on turnover intentions?



By addressing these questions, this review not only updates the existing body of knowledge but also evaluates whether the observed dominance of WIF over FIW reflects a genuine theoretical pattern or is instead shaped by how work–family conflict has been operationalised in prior research.

Methodology

This review followed the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA 2020) framework (Page et al., 2021), which comprises a 27-item checklist (Appendix A) and a flow diagram illustrating the stages of identification, screening, and inclusion (Figure 1). Adopting PRISMA 2020 improves methodological transparency, enhances replicability, and ensures a systematic and consistent review process (e.g., Papavasileiou et al., 2025b; Sahoo and Sethi, 2025).

Search strategy

The review included only English-language studies published in peer-reviewed journals. Eligible studies were required to employ quantitative methods to examine the relationship between work–family conflict (WIF and/or FIW) and turnover-related outcomes, including intention to stay and withdrawal behaviours, within the tourism workforce. Based on these criteria, a three-stage search strategy was implemented (Papavasileiou and Stergiou, 2025).

Inclusion/exclusion criteria: A quantitative study focusing on the relationship between work-family conflict (*Criterion 1)* and turnover intention (including intention to stay and withdrawal behaviours) (*Criterion 2)* within the tourism and hospitality workplace (*Criterion 3)*.

Figure 1 – PRISMA 2020 flow diagram and search strategy for capturing studies about the relationship between work-family conflict and turnover intentions in tourism workforce.

First, as outlined in the introduction, the reference lists of prior review articles were manually examined, resulting in the identification of 19 relevant studies. Second, the Scopus database was searched, following the approach of Pakhalov et al. (2025), who highlight that Scopus-based searches help capture studies beyond tourism-specific journals, including those in management, business ethics, and marketing. Keyword combinations applied to the "title, abstract, and keywords" fields yielded 310 records (Figure 1). Third, an additional search using Google Scholar was conducted with the same search string, in line with Sposato et al. (2025), and the first 100 results were screened (Papavasileiou et al., 2025a).

Screening

A total of 412 records were initially retrieved. These were first screened to remove duplicates and to ensure compliance with language and publication type criteria (i.e., English-language, peer-reviewed journal articles), resulting in the exclusion of 62 records. Subsequently, the first and second authors independently reviewed the titles and abstracts of the remaining 350 studies, with any discrepancies resolved through consultation with the third author.

This stage resulted in the exclusion of 275 studies, with minimal potential for bias. The remaining 75 articles were then subjected to full-text review using the eligibility criteria specified in Appendix B. At this point, a further 64 studies were excluded following detailed assessment. For example, Rasheed et al. (2018) focused on female employees in the banking sector rather than tourism. Likewise, Mensah et al. (2023) investigated work–leisure conflict instead of work–family conflict among hotel employees. In addition, although Zhao et al. (2024) examined customer misbehaviour, work–family conflict, and withdrawal behaviours, they did not directly assess the relationship between work–family conflict and turnover intentions.

Data extraction

The final sample of 30 eligible studies was compiled into a Microsoft Excel file. Following Papavasileiou et al. (2025c), a standardised data extraction framework was applied, consisting of four separate spreadsheets aligned with the study's four research questions (Table 1). This approach facilitated a structured and consistent analysis of contextual, conceptual, theoretical, and practical insights across the included studies.

Table 1: Characteristics of the literature based on the review questions

Results – Two Decades of Tourism and Hospitality Literature (2006–2025)

Table 1 illustrates the evolution of research on work–family conflict and turnover intentions over the past two decades, organised around the four review questions. In the first period (2006–2015), a total of 13 studies were identified. With the exception of Blomme et al. (2010) and Yunita and Kismono (2014), the majority were authored by Osman Karatepe and his collaborators (n = 11). From a contextual perspective (RQ1), most studies focused on frontline hotel employees (93%), with only one examining travel agency workers (Karatepe and Kilic, 2015). Geographically, approximately 70% of the research was conducted in the Middle East, with a limited number of studies undertaken in Romania (Karatepe and Karadas, 2014), Indonesia (Yunita and Kismono, 2014), and Nigeria (Karatepe and Magaji, 2008).

From a conceptual and theoretical standpoint (RQ2 and RQ3), ten studies adopted a bidirectional view of work–family conflict, proposing that both WIF and FIW would positively influence turnover intentions, largely drawing on prior empirical evidence. However, only about half of these hypotheses were empirically supported (e.g., Yavas et al., 2008). Three additional studies focused exclusively on WIF, two of which found significant positive relationships with turnover intentions (e.g., Blomme et al., 2010). Notably, research during this period did not examine any mediating mechanisms (RQ4).

In the subsequent period (2016–2025), the volume of research increased substantially to 30 studies, involving a more diverse group of scholars (n = 50), with at least one publication appearing each year. Contextually (RQ1), the scope expanded beyond hotels to include other settings such as casinos (e.g., Vong and Tang, 2017), restaurants (e.g., Atmajaya et al., 2024), events (e.g., Mistry et al., 2024), and yachting (e.g., Yorulmaz and Sevinc, 2021). Geographically, there was a noticeable shift towards Asian contexts (59%), including Taiwan (Wang et al., 2017), Macau (Chan and Ao, 2019), Bangladesh (Arefin et al., 2020), China (Pan and Yeh, 2019), and Indonesia (Putra and Suwandana, 2020).

Conceptually (RQ2), most studies in this later period focused on a unidirectional approach, primarily examining WIF. Fourteen studies operationalised work–family conflict solely in this way and, from a theoretical perspective (RQ3), generally hypothesised a positive relationship with turnover intentions, with most findings supporting this expectation (e.g., Abdou et al., 2022). Only three studies examined both WIF and FIW, drawing on conservation of resources theory, although two reported non-significant effects (e.g., Bai et al., 2025; Yang and Peng,

2018). Research into mediating mechanisms (RQ4) also began to develop during this period, with a small number of studies identifying job satisfaction and organisational commitment as key mediators (e.g., Yang and Peng, 2018; Chan and Ao, 2019).

Discussion and Future Research Directions

The review indicates that research on work–family conflict and turnover intentions is heavily concentrated in specific geographical regions—primarily the Middle East and Asia—and tends to focus on similar organisational contexts, particularly hotel settings. This narrow concentration restricts the generalisability of existing findings. The analysis further reveals that much of the literature does not explicitly engage with the distinction between cross-domain and matching-domain perspectives. This oversight appears to stem from both conceptual limitations—especially the frequent reliance on unidirectional measures of conflict—and unresolved theoretical inconsistencies. Consequently, the observed patterns in the literature seem to be influenced more by how constructs are measured than by robust theoretical explanations.

Moreover, although there is widespread agreement that work–family conflict is a significant predictor of turnover intentions, relatively limited attention has been given to identifying mechanisms that might buffer or mitigate this relationship. In response, the following section outlines key directions for future research, drawing on relevant theoretical frameworks and recent calls for stronger theoretical development in the field.

Contextual directions – Broadening the empirical scope

The findings highlight a strong geographical concentration of studies, largely confined to the Middle East and Asia, which limits the wider applicability of results. Future research should therefore expand into more diverse cultural and occupational contexts to enhance generalisability. For instance, Mistry et al. (2024) provide valuable insights through their study of an international event association in the United States. Additionally, the review confirms that most studies focus on frontline roles, a trend also identified by Magrizos et al. (2023), who note that hospitality research often prioritises customer-facing employees while neglecting back-of-house roles, such as kitchen staff. Extending research to underexplored groups—such as chefs—would help address this gap and respond to recent calls (e.g., Giousmpasoglou et al., 2025) to examine employee experiences in less visible workplace settings.

Conceptual directions – Emphasising bidirectionality

The conceptual review suggests that recent studies often fail to clearly distinguish between cross-domain and matching-domain perspectives, largely because work–family conflict is frequently operationalised as a unidirectional construct, typically focusing only on WIF. This limitation has been highlighted by Nohe and Sonntag (2014), who argue that examining only one dimension overlooks the value of assessing both WIF and FIW simultaneously. Although earlier work, particularly by Karatepe and colleagues, considered both directions, these studies generally assumed uniform positive effects, making it difficult to disentangle their distinct contributions. Future research should therefore treat work–family conflict as a genuinely bidirectional construct and test both dimensions concurrently (see Kappe et al., 2025). This approach aligns with recent developments in social science and health research, which emphasise the importance of separately examining both directions due to their distinct effects (Kobayashi et al., 2025).

Theoretical directions – Reconciling competing perspectives

The review also demonstrates that many existing hypotheses are grounded more in prior empirical findings than in well-developed theoretical reasoning. Among studies that do adopt a theoretical lens, conservation of resources (COR) theory is most commonly used and aligns with the cross-domain perspective. According to this view, resource loss in one domain should primarily affect outcomes in the other, suggesting that FIW should be the stronger predictor of work-related outcomes such as turnover intentions. However, empirical evidence consistently shows that WIF has a greater impact, revealing a clear theoretical inconsistency.

To address this gap, future research should consider alternative frameworks, such as the source attribution perspective (Zhang et al., 2019). For example, Yang and Peng (2018) demonstrate that attribution-based explanations may better account for the relationship between work–family conflict and job outcomes than traditional resource-based models. Adopting such perspectives may provide a more coherent explanation of observed patterns and supports calls by Ladkin et al. (2023) to use tourism contexts as platforms for advancing new theoretical insights.

Practical directions – Identifying mitigating mechanisms

Despite strong evidence linking work–family conflict to turnover intentions, the literature has paid limited attention to identifying factors that could mitigate this relationship. Shifting the focus toward such mechanisms would enable researchers to move beyond documenting negative outcomes and toward identifying actionable solutions. Only two studies in the current review—Yang and Peng (2018) and Chan and Ao (2019)—identify mediators, suggesting that job satisfaction and organisational commitment can reduce the negative effects of WIF.

Future research should extend this line of inquiry by examining additional mediating variables, including constructs from positive psychology such as work engagement and perceived organisational support. This direction aligns with Liu et al. (2025), who advocate for more comprehensive models that capture the psychological processes underlying work–family dynamics.

Emerging evidence also points to the potential of intervention-based approaches. For instance, Amiri et al. (2026) found that an eight-session resilience training programme significantly reduced work–family conflict among nurses and their partners, with consistent effects across genders. Similarly, Tirrel et al. (2026) show that flexible working arrangements are associated with lower turnover intentions. Future research should explore whether similar interventions can be effectively applied within tourism and hospitality contexts to reduce both work–family conflict and employee turnover.

Conclusion

The aim of this study was to position business research within the wider debate on work–family conflict by exploring its patterns and implications in organisational contexts. To do so, a systematic literature review was conducted examining the relationship between work–family conflict and turnover intentions in the tourism and hospitality sector. The review offers a comprehensive and up-to-date synthesis of empirical evidence, incorporating a substantial number of studies published since previous reviews. In total, 30 peer-reviewed articles published between 2006 and 2025, contributed by 60 scholars, were analysed.

By integrating existing findings and highlighting key contextual, conceptual, theoretical, and practical limitations, this review provides a solid foundation for advancing research on work–

family conflict and employee retention in the sector. The proposed future research directions outline a clear and actionable agenda to address current gaps, responding to calls for more rigorous, diverse, and context-sensitive scholarship.

However, the study is subject to certain limitations. Most notably, the review includes only peer-reviewed articles published in English, which may have contributed to the underrepresentation of research from regions such as South America and France, where scholars often publish in Spanish, Portuguese, or French rather than English (Boncourt et al., 2022; Takahashi et al., 2025). Future reviews would benefit from adopting multilingual search strategies to achieve broader and more inclusive coverage. Encouragingly, a growing body of tourism research is beginning to incorporate non-English scholarship—for example, studies published in Spanish, Portuguese, and French (e.g., Romera et al., 2024)—thereby helping to bring previously overlooked knowledge "into the light" (Papavasileiou and Stergiou, 2025).

Despite these limitations, this review encourages scholars to build on the identified literature—particularly studies that acknowledge the bidirectional nature of work–family conflict—and to conduct meta-analytic comparisons across sectors, such as nursing or education. Such efforts would enhance understanding of work–family conflict across different occupational contexts and support the development of more effective workforce strategies in service-intensive industries.

SAFEGUARDING XENIA: BUILDING RISK-RESILIENT HOSPITALITY IN AN AGE OF UNCERTAINTY

Paraschi, Elen Paraskevi[1]; Lampropoulos, Ioannis[2]; Georgopoulos, Antonios[2]; Georgopoulos, Nikolaos[2]; Anastasopoulou, Aikaterini[1]; Chatzopoulou Evi[1]

[1]Department of Tourism Management, University of Patras, Patras, Greece.

[2]Department of Business Administration, University of Patras, Patras, Greece.

Keywords: Risk assessment, Risk management, Hotels, Resilience, Tourism, Greece, Xenia, Uncertainty

Introduction

Risk assessment and management are essential in the hotel sector due to its exposure to an expanding range of risks (Brown et al., 2017). While existing studies examine specific risk categories, research remains fragmented and weakly connected to organizational resilience. This study addresses this gap by offering an integrated, manager-informed assessment of natural, safety, and security risks, framed through the culturally grounded concept of *xenia* (ξενία) - the sacred duty of hospitality that demanded protection and care for guests.

Purpose, Aim and Objectives

This study identifies key risks, explores managers' perceptions of their likelihood and severity, and evaluates the effectiveness of current risk management practices, highlighting ways to uphold the spirit of *xenia* while strengthening resilience and sustainability.

Literature Review and Theoretical Framework

Risk assessment in hotels is multi-dimensional, encompassing natural, health and safety, and security hazards (Vivel-Búa et al., 2018). Natural hazards include earthquakes, floods, typhoons, wildfires, and landslides, depending on location. Health

and safety hazards involve risks such as injuries, burns, electric shocks, chemical and biological exposure, and ergonomic issues. Security hazards include crime, terrorism, political violence, and cybersecurity threats.

Risk assessment raises awareness of hazards, evaluates their likelihood and severity, and supports risk prioritization (van Duijne et al., 2008). Subsequently, risk management includes strategies to control, reduce, transfer, or accept risks (Cummins, 2017).

Methodology and Methods

Grounded in the literature (Paraschi, 2025), this study adopts a four-step approach: risk identification and classification; risk analysis; risk evaluation through a risk matrix; and risk management.

Data were collected from 41 hotels across Greece between January and March 2024, using random sampling. Greece was selected as a case study due to its mature tourism sector and recent exposure to multiple risks, including financial crises, pandemics, earthquakes, floods, and wildfires. Using a five-point Likert scale, respondents assessed the likelihood and impact of natural, safety, and security risks, as well as the adequacy of existing risk management measures. Descriptive and inferential statistics were used for data analysis.

Findings and Contribution

The findings show that safety hazards, particularly psychological risks such as mobbing, are perceived as both more likely and more severe. Natural and security hazards are rated at moderate levels, with cybersecurity threats (especially phishing and cyberattacks), along with fires and earthquakes, emerging as key concerns.

In terms of risk management, hotels report stronger preparedness for natural hazards, moderate protection against safety risks, and weaker readiness for cybersecurity threats. Fire safety measures are the most commonly implemented, while greater attention is needed for cyberattack response planning and workplace ergonomics.

Originality and Value

This study draws on insights from experienced hotel managers who have faced multiple risks. The findings offer practical value for researchers, practitioners, and policymakers aiming to strengthen organizational resilience in an increasingly VUCA environment.

Research Limitations

Among the study's limitations are the relatively small sample size, the geographically limited study area, and the exclusive use of a qualitative risk assessment method, which entails a risk of subjectivity.

Theoretical and Practical Applications and Implications

This study contributes to risk management literature through a framework inspired by *xenia* - the ancient Greek sacred duty to protect guests. By identifying, assessing, and prioritizing risks while highlighting mitigation measures, this research enables hotels to fulfil their modern duty of care. This builds trust, enhances satisfaction and brand equity (Du, Sun & Wang, 2025), strengthens competitive advantage (Cummins, 2017), and ensures compliance (van Duijne et al., 2008). In honoring *xenia* through risk management, hotels transform from service providers to guardians of safety - reviving an ancient covenant between host and guest.

CULTURAL BRANDING FOR UNDERRATED DESTINATIONS: QUALITATIVE FRAMEWORK FOR ENHANCING GLOBAL VISIBILITY

Razi Parjikolaei, Heidar[1]; Sanchez Bengoa, Dolores[2]

[1]Business Management Department, Hochschule der Wirtschaft für Management (HdWM), Mannheim, Germany

[2] Business Management Department, Hochschule der Wirtschaft für Management (HdWM), Mannheim, Germany

Abstract

This study explores how cultural branding enhances the visibility of underrated destinations in Iran. It integrates Cultural, Emotional, Viral, and Mind-Share Branding into a conceptual framework. A qualitative design used semi-structured interviews with ten stakeholders in Iran. Data was analysed using thematic and framework-based coding in MAXQDA. Findings show cultural meaning-making is central to branding heritage-rich but underrated destinations. Emotional branding strengthens visitor attachment, viral mechanisms increase digital visibility, and mind-share strategies support message consistency. Rituals and cultural narratives emerged as key assets.

Originality / Value:

This study proposes an integrative cultural-branding framework for underrated destinations, combining stakeholder insights with branding models.

Keywords

Cultural branding; destination branding; qualitative research; underrated destinations; Iran; emotional branding; viral branding; mind-share branding

Introduction

This gap reflects fragmented branding, inconsistent storytelling and limited digital engagement (Kavaratzis, 2005; Karoubi et al., 2022; Tran & Rudolf, 2022).

Research Gap

Existing destination branding frameworks remain fragmented (Holt, 2004; Aaker, 1996; Godin, 2000), limiting the global visibility of underrated destinations (Tran & Rudolf, 2022; Pradnyandari et al., 2025). This study proposes an integrated cultural branding framework.

Research Objectives

This study examines how cultural branding enhances the visibility of underrated destinations in Iran through an integrated branding framework.

Literature Background

Destination branding creates identity through differentiation, emotional engagement, and consistent communication (Aaker, 1996; Kavaratzis, 2005; Prayag et al., 2017). For underrated destinations, branding communicates cultural narratives globally (Holt, 2004; Roh et al., 2025). Recent research shows destination brand awareness, association and image strengthen brand equity and loyalty (Pradnyandari et al., 2025). Cultural branding (Holt, 2004) views brands as cultural artifacts shaped by myths, symbols, and rituals. Complementary perspectives include Emotional, Viral (Godin, 2000), and Mind-Share Branding (Aaker, 1996), integrated into a framework for underrated destinations (Figure 1).

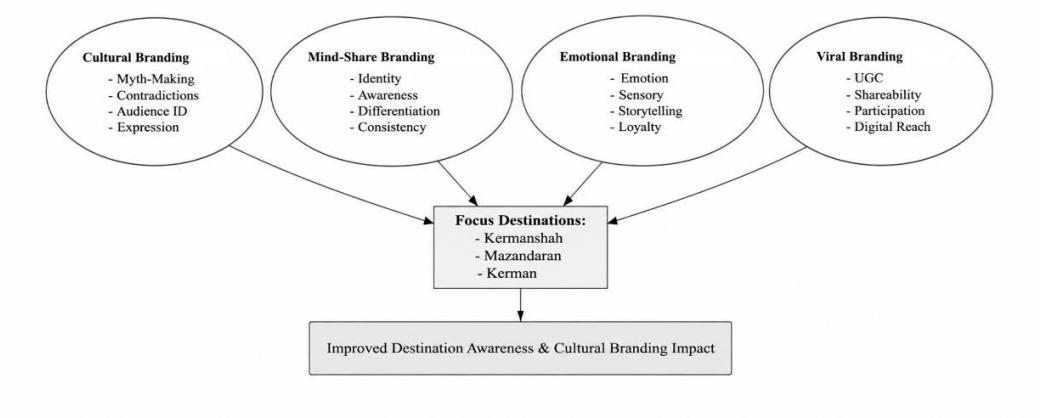

Figure 1. Conceptual framework for underrated destinations.

Source: Author's synthesis from Holt (2004), Aaker (1996), and Godin (2000).

Methodology

This study adopts a qualitative design to explore destination branding. Data were collected through semi-structured interviews with ten tourism and hospitality stakeholders in Iran. Interviews were conducted in Persian or English. Data were analysed through thematic and framework coding in MAXQDA. Participant data were anonymized.

Results and Discussion

Findings show that cultural meaning-making is central to branding heritage-rich but underrated destinations. Cultural elements create stronger emotional connections than monument-based tourism. Symbols and narratives function as identity anchors. Cultural branding emerged as the authentic approach, while emotional branding strengthened visitor attachment, viral branding increased digital visibility, and mind-share branding remained weakest due to fragmented national messaging. These findings highlight rituals and narrative continuity as branding mechanisms.

Conclusion

The proposed framework explains how underrated destinations strengthen identity and visibility. Cultural meaning-making forms the core of destination identity, emotional engagement strengthens visitor attachment, viral mechanisms expand digital visibility, and mind-share branding ensures message consistency. Rituals, symbols and cultural narratives are key branding assets.

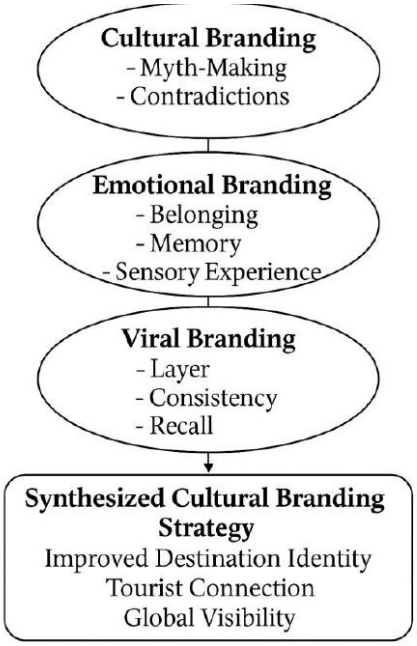

Figure 2. Final branding framework for underrated Iranian destinations.

ESG STRATEGY FOR ACHIEVING LONG-TERM SUSTAINABILITY

Paužuolienė, Jurgita; Šimanskienė, Ligita

Management and Economics Department, Klaipeda university, Klaipeda, Lithuania

Keywords: Sustainability, ESG strategy, stakeholders.

Introduction

Companies are increasingly embedding Environmental, Social, and Governance (ESG) principles into their long-term sustainability frameworks to address regulatory, investor, and societal demands for responsible and sustainable business practices.

In recent years, due to stricter environmental regulations and growing consumer and investor expectations regarding sustainability, companies have increasingly faced the need not only to declare their commitment to sustainability but also to effectively implement ESG principles in their day-to-day operations. ESG has become an integral part of many companies' strategic agendas, particularly following the introduction of mandatory sustainability reporting requirements, such as the European Union's Corporate Sustainability Reporting Directive (CSRD).

Purpose, Aim and Objectives

The purpose of this article is to analyze the impact of integrating ESG strategies into organizational operations on long-term sustainability. The study aims to examine how ESG strategies are integrated into organizational operations and how this integration contributes to long-term value creation, as well as to identify stakeholder expectations and the key challenges associated with ESG implementation. The objectives of the study are: to analyze the challenges and benefits of integrating ESG strategies into organizational operations; to explain how ESG contributes to long-term value creation and sustainability; to assess stakeholder expectations regarding ESG practices and performance.

Literature Review and Theoretical Framework

An ESG strategy is a framework that integrates sustainability considerations into an organization's decision-making, creating long-term value for stakeholders while ensuring environmental stewardship, social responsibility and ethical management. ESG principles are associated with

greater stakeholder trust, reputation, financial performance, and long-term organizational resilience (Kulova and Alexieva, 2023; Laokulrach, 2025).

A review of the literature highlights the key elements of ESG strategies: Governance Structures (Kulova and Alexieva, 2023; Ed-Dafali et al., 2025; Sinha, 2026; Alhamami, 2025); Stakeholder Engagement (Kulova and Alexieva, 2023; Ed-Dafali et al., 2025; Biswas and Dygas, 2025); Transparency & Standardized Disclosures (Kulova and Alexieva, 2023; Ed-Dafali et al., 2025; Biswas and Dygas, 2025) Knowledge Management (Alhamami, 2025; George et al., 2025); Alignment with Global Frameworks (Skvarciany and Jureviciene, 2024).

At the same time, several fundamental challenges are highlighted, including inconsistency in ESG ratings, lack of transparency, differing reporting standards, limited infrastructure, and resistance to integration within organizational culture. These factors make it difficult to accurately assess the real impact of ESG practices and to support effective decision-making. The conceptual ESG strategy framework is provided in the Figure 1.

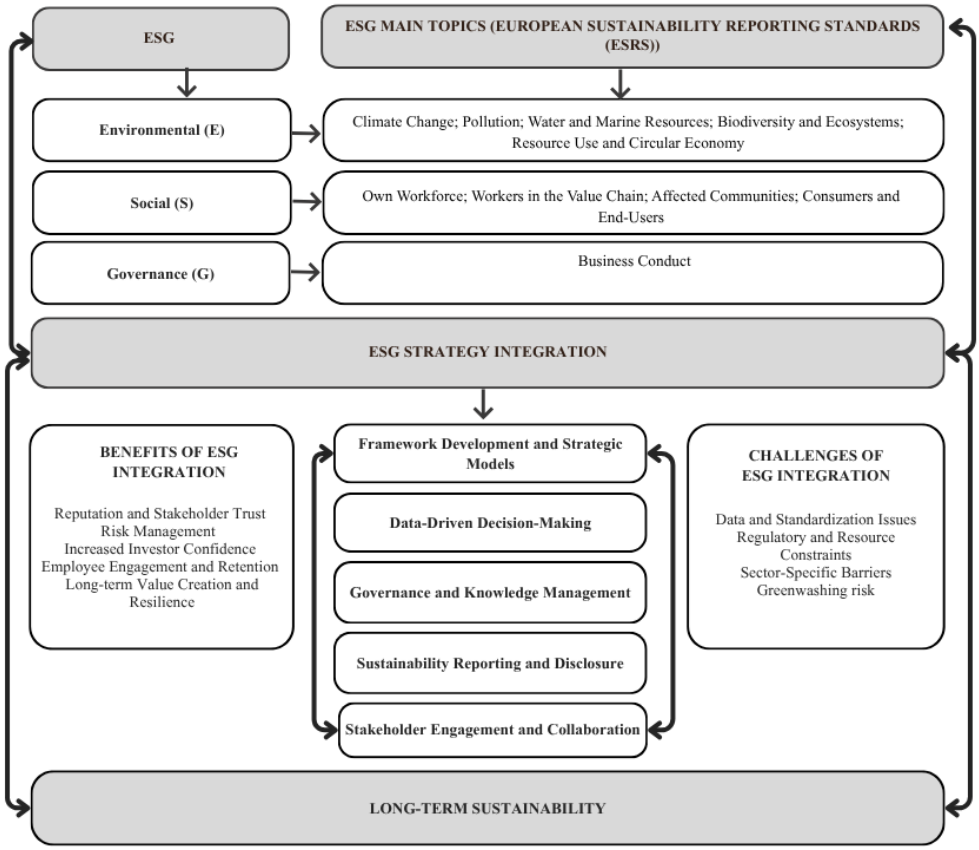

Figure 1: *ESG strategy conceptual framework.*

Methodology and Methods

The study applies a systematic analysis of 80 peer-reviewed scientific articles published between 2016 and 2026, conducted in accordance with PRISMA guidelines. The theoretical foundations, application contexts, and methodological approaches are analyzed to identify ESG strategy implementation practices, key challenges, and aspects related to long-term sustainability impacts.

To initiate the systematic review, a literature search was first conducted using the Scopus database. A carefully designed search string was employed to identify articles addressing ESG or sustainability strategies. The screening data process is presented in the PRISMA flow diagram shown in Figure 2.

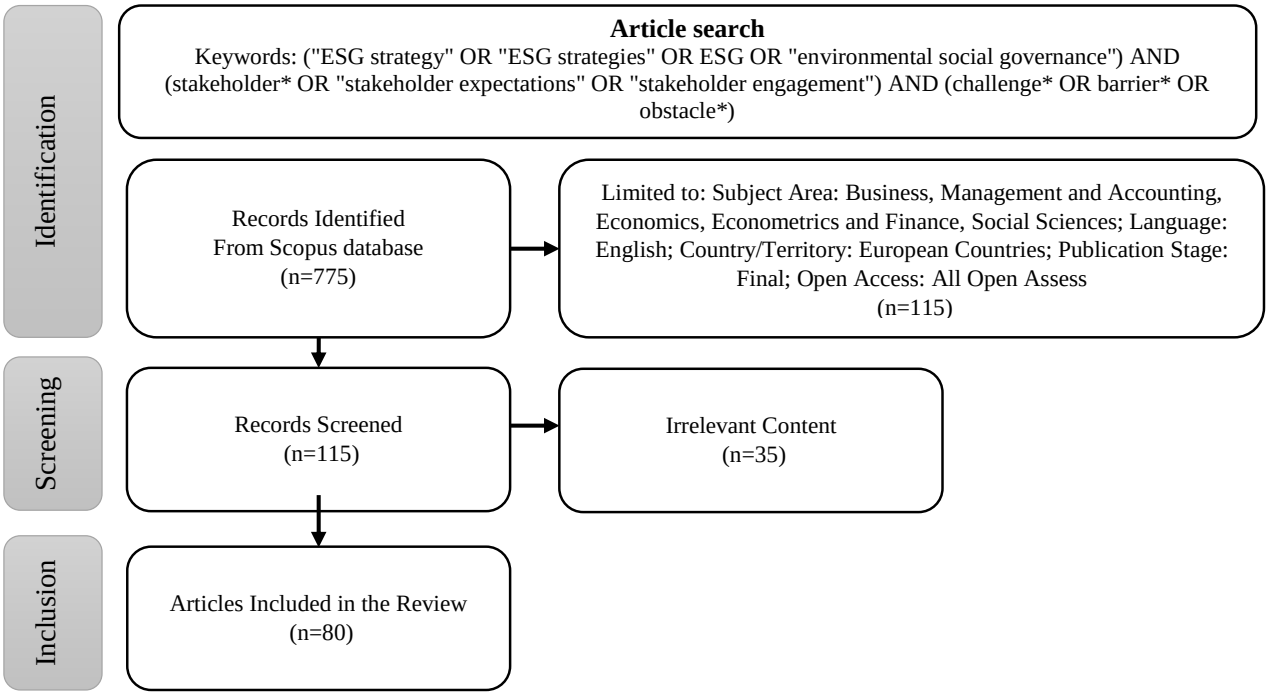

Figure 2: *Screening data process.*

Main Findings

To achieve long-term sustainability through an effective ESG strategy, organizations must integrate ESG principles into their core governance and decision-making processes, tailor their approaches to sector-specific challenges, and enhance transparency and credibility through standardized disclosures.

An effective ESG strategy for long-term sustainability requires a multi-faceted approach that incorporates strong governance, transparent reporting practices, and adaptation to sector-specific

needs. By addressing challenges such as standardization and the balance between financial performance and sustainability objectives, organizations can create value for stakeholders while contributing to a more sustainable future.

Originality and Value

This article contributes to the sustainability and strategic management literature by systematically analyzing ESG integration within organizations and developing a conceptual framework that explains how ESG strategies are embedded in organizational processes. The study identifies the key challenges and benefits associated with ESG integration with an emphasis on long-term sustainability.

Research Limitations

This study relies on secondary data, limiting direct assessment of causal links between ESG integration and organizational performance. It also does not account for sectoral or regional differences. Future research should incorporate quantitative and qualitative empirical studies to address these gaps.

Theoretical and Practical Applications and Implications

Theoretically, this study extends sustainability, stakeholder, and resource-based theories. Practically, it provides managers and policymakers with guidelines on how to integrate ESG into organizational strategy, avoiding challenges and addressing stakeholder needs.

ESG KPIS AND KRIS FOR WATER AND WASTEWATER UTILITIES: A SYSTEMATIC REVIEW AND TAXONOMY FOR RISK-ORIENTED INDICATOR DESIGN

Kostaki, Aggeliki[1]; Goneswaran, Shopithan[2]; Spanaki, Konstantina[3]; Voyiatzis, Ioannis[4]

[1] University of West Attica, Athens, Greece

[2] Heilbronn University, Heilbronn, Germany

[3] Audencia Business School, Nantes, France

[4] University of West Attica, Athens, Greece

Keywords: ESG indicators, KPIs, KRIs, water utilities, wastewater utilities, operational risk, resilience, strategic governance.

Water and wastewater utilities are increasingly exposed to ESG-related disruptions driven by climate volatility, regulatory transition and infrastructure ageing. However, the indicator systems currently used across the sector remain largely designed for disclosure and compliance, rather than for strategic risk governance, early warning and resilience-building. This misalignment creates a managerial and strategic gap for utilities operating under uncertainty.

This paper addresses that gap by proposing a sector-specific taxonomy of ESG Key Performance Indicators (KPIs) and Key Risk Indicators (KRIs) for water and wastewater utilities, shifting the focus from reporting-oriented measurement to risk-oriented indicator design. The study is guided by three questions: which ESG-related indicators are currently used in the sector; how these indicators are structured across ESG dimensions and risk categories; and where current indicator systems reveal blind spots that limit early warning, adaptive capacity and strategic prioritisation. In this context, the paper conceptualises ESG risk as a dimension of operational risk in critical infrastructure and distinguishes between lagging KPIs, leading KRIs and dual-role indicators that can support both performance management and risk escalation.

Methodologically, the study adopts a systematic literature review and design-oriented approach, drawing on Webster and Watson's (2002) guidance for backward and forward searching and concept matrix synthesis, and on Fettke's (2006) framework for structured classification and taxonomy development to systematically and transparently identify research published between 2020 and 2025 on ESG, sustainability and risk-relevant indicators

in water and wastewater utilities. The identified indicators are coded by ESG pillar, indicator role, risk category, strategic objective and early-warning relevance, enabling a structured KPI–KRI taxonomy and matrix tailored to sector-specific operational realities.

The findings show a dominance of environmental and performance-oriented KPIs, especially in relation to water quality compliance, leakage, non-revenue water, energy use and emissions, while explicit KRIs remain underdeveloped. Social and governance indicators are narrower in scope and used mainly for compliance, reliability or incident reporting. At the same time, several existing indicators appear to hold latent early-warning potential and could be redesigned as dual-role indicators through threshold-based monitoring and escalation logic. The analysis also reveals important blind spots, including limited attention to infrastructure vulnerability, transition-related stressors, service continuity exposure and governance mechanisms that could support earlier and more proactive intervention.

The paper contributes to theory by reframing ESG indicators as dynamic components of strategic risk governance rather than as static disclosure tools, and by showing how indicator architectures make ESG-related risk interdependencies visible and governable operationally. It contributes to practice by offering a structured basis for utilities, regulators and benchmarking organisations to redesign ESG indicator portfolios in ways that strengthen resilience, improve investment prioritisation and support long-term value creation. Overall, the paper adds originality by articulating a risk-oriented ESG indicator architecture tailored to utilities and by demonstrating how KPI–KRI design can expose and address ESG-related blind spots in existing indicator systems. The study also connects ESG indicator design with innovation trajectories such as dashboard-based monitoring, predictive analytics and AI-enabled decision-support systems for CSRD-ready utilities.

The study is limited by its reliance on published academic and sectoral sources and does not yet incorporate systematic primary data from utilities, limiting the empirical assessment of indicator usability in practice. As research in progress, the next phase will focus on empirical validation through utility-based case applications assessing whether the proposed taxonomy improves blind-spot identification, early-warning capability and the prioritisation of resilience-oriented managerial responses.

Abstract

This paper presents a conceptual model that identifies and relates the main approaches and thematic areas within the field of tourism and gender research. The model was developed through the analysis of data collected to support Gender Mainstreaming in Tourism in The Gambia, considering the intersection between women's status, the socio-cultural context, and the tourism sector.

The study adopts a qualitative and analytical approach to examine the challenges and opportunities faced by women in tourism. Based on the findings, a set of recommendations is proposed to strengthen women's employment, entrepreneurship, and leadership opportunities in the Gambian tourism industry. The recommendations are grounded in an assessment of gender inequalities, local social dynamics, and the structural characteristics of the sector.

The main contribution of this research lies in the development of a conceptual framework that integrates a gender perspective into tourism studies and facilitates the identification of priority areas for future research and policy action. The model provides a useful tool for researchers, practitioners, and policymakers seeking to promote gender equality and women's empowerment through tourism development.

The study is subject to limitations related to accessing comprehensive and reliable information on women's experiences and challenges, particularly within a socio-cultural context characterized by deeply rooted traditions and male-dominated social structures. Nevertheless, the findings offer valuable insights for advancing gender mainstreaming in tourism planning and management.

Introduction

Travel and tourism have been proven to provide women with more opportunities for empowerment compared to other industries, giving the sector's increased responsibility for the advancement of women (Inda, 2016, 47). According to the UN Global Report on Women and

Tourism by World Tourism Organization, tourism provides better opportunities for women's participation in the workforce, women's entrepreneurship, and women's leadership than other sectors of the economy. For example, the report found that women were nearly twice as likely to be employers (Ireland, 1993, p. 676) in the tourism sector than in any other industry (UNWTO, 2011).

However, women are also more likely to be involved in tourism due to the unique characteristics of the tourism sector (Kinnaird, 1996, p. 99; Figueroa-Domecq and Segovia-Pérez, 2020). The barriers to entry are low, particularly in terms of skill requirements and capital. There is less emphasis on formal education and training and greater emphasis on personal and hospitality skills (Mooney, 2020; Zhang, 2021). There are increased options for entrepreneurship that do not require heavy start-up financing. Moreover, the nature of the work can be quite flexible in terms of work hours and part-time or full-time employment (Bianchi et al., 2021). However, jobs in tourism are also likely to be low earning, businesses are smaller, less well-capitalized and informal.

The Gender Assessment of the Tourism Sector in The Gambia aims to document the existing gender disparities and key gendered challenges in tourism for inclusive economic growth in The Gambia. Tourism is the second biggest contributor to the Gambia's GDP and a key source of job creation. The assessment aims to understand women's participation in the tourism sector in The Gambia where gender gaps are among the largest in the region and the world. More specifically, it aims to demonstrate the gender disparities in participation and earnings; assess the underlying barriers and binding constraints to women's participation and better economic outcomes in tourism; and provide targeted recommendations to be incorporated into the implementation of the World Bank Tourism Diversification and Resilience in The Gambia project (P177179) as well as to create a knowledge base for future interventions.

The assessment explores key issues in women's employment, entrepreneurship and leadership within the tourism sector while examining cross-cutting factors which impact women's economic opportunities as well as their decision-making, such as policy and institutional environment, social norms, and education (Markussen and Røed (2017)). To guide policies and programmes within tourism that aim to enhance women's economic empowerment, the assessment analyzes wage employment, self-employment, and leadership in different buckets as their interventions and stakeholders could be different. And policies, social norms and education are analyzed as important contextual factors determining outcomes in three areas. In addition, the assessment unpacks the impact of diversification of tourism activities, such as eco-tourism and conference tourism, on women's economic outcomes.

Methodology

The design of the conceptual model is based on data analysis for improving Gender Mainstreaming in Tourism

Framework

The gender gap analysis examines women's participation in tourism through three lenses: Employment, Entrepreneurship and Leadership. Employment and entrepreneurship are seen as principal objectives for increasing women's participation and earnings in tourism (Kimbu and Ngoasong, 2016). They are treated separately as the stakeholders and interventions can be quite different. For example, how to encourage hotels to hire more women staff requires a different intervention than how to encourage hotels to procure from women-owned enterprises. The third pillar, leadership is seen both as an enabling factor that can support bringing about the proper policies needed to support women's employment and entrepreneurship but also a key outcome in their own right. While assessing the status of women in leadership roles within tourism and more broadly, women's presence in broader decision-making mechanisms is also taken into consideration.

The ecosystem and stakeholder assessment examines the enabling environment through three areas: policy and institutional environment, social norms, and tourism education that are cross-cutting. These are explored as the key external factors contributing to women's outcomes in employment, entrepreneurship, and leadership.

The framework identifies the key areas needed to examine barriers and binding constraints to increasing women's participation in the sector.

Data collection

The first step in the assessment was desk research. The World Bank Group's Gender Data Portal, UNDP's Gender Development Index, World Economic Forum Global Gender Gap Report, and Women Business and the Law provided useful initial background information on how The Gambia was performing on gender equality. The National Tourism Strategy, National Gender Strategy, and Country Partnership Framework provided an understanding of the broader policy landscape of the country. The assessment also took note of descriptive statistics on gender gaps shared in country surveys or in other surveys such as World Bank Enterprise Surveys.

Recent research conducted in the Gambia contributed invaluable insights to the gender assessment of the tourism sector. Some of these resources include The Gambia Poverty and Gender Assessment 2022, Policies for Sustainable and Inclusive Private Sector-led Growth:

Achieving Sustainable and Inclusive Growth The Gambia, and the Project Appraisal Document of the Tourism Diversification and Resilience in The Gambia (P177179) among others.

Following the desk research, the assessment undertook a mapping of the stakeholders with several important considerations. First, the authors identified a number of actors in the five economic activities that generate revenues and income in the tourism sector (transport, accommodations, excursions, food & beverage and shopping). Depending on the size of each sub-economic activity and the conditions in the field, the authors interviewed a representative number of stakeholders to reflect diversity of experience and opinion. In addition, relevant stakeholder suggestions by the Project Implementation Unit of the current Gambia Tourism and Resilience project were included in the list. Finally, the assessment tried to ensure a balance of female and male participants in the stakeholder meetings.

Key informant interviews and focus group discussions were conducted in The Gambia in May 2023. The 22 organizations interviewed included industry associations; training institutes; direct tourism service providers in accommodation, tour excursions, crafts sellers, hotel and restaurant personnel; enablers; development partners; and NGOs. In addition, the authors interviewed multiple hotel staff, fruit sellers, tour guides, and conducted a focus group with women entrepreneurs in different industries across the tourism value chain which was facilitated by the Gambia Women's Chamber of Commerce.

The in-person assessment also resulted in the collection of data from tourism organizations such as the Gambia Tourism Board and the Gambia Tourism and Hospitality Institute. Though available to a certain extent, finding sex-disaggregated data was a challenge throughout the assessment. The in-country assessment filled some gaps in data and provided a complementary analysis, but more data will need to be systematically collected to shed light on the issues women face in the tourism industry as well as any progress made going forward.

The assessment's focus was less on rural areas and more on urban tourism centers, though it investigated community-based tourism in rural areas which carries a potential for The Gambian tourism and women's economic opportunities. The in-person consultations mostly took place around more urbanized centers such as Serrakunda and Banjul except for a few eco lodges visited and interviewed. Even though the assessment has not conducted in-depth interviews in villages, there were interviews that took place around Kunta Kinteh Island and with the community-based tourism actors such as Institute of Travel and Tourism in The Gambia. The assessment recognizes the key linkages, especially agricultural, between the rural economy and the tourism ecosystem. Where necessary, the analysis tried to fill in the gap with the study,

Barriers to Economic Empowerment of Rural Women in The Gambia, which has a strong focus on rural women and findings from relevant key informant interviews.

Gambia Context

Tourism in The Gambia

Tourism is a major contributor to The Gambia's economy, accounting for an estimated 12–16% of GDP, supporting more than 42,000 direct jobs and 40,000 indirect jobs, and generating about US$85 million annually in foreign exchange earnings. However, the sector underperforms compared to competitors due to limited diversification of source markets, distribution channels, and tourism products. This results in strong seasonality, lower visitor spending, and greater vulnerability to economic and climate-related shocks.

Despite its rich natural and cultural assets, The Gambia remains heavily dependent on "sun and sea" tourism and has made limited progress in developing alternative segments such as ecotourism and cultural tourism. The country boasts significant biodiversity and several UNESCO-recognized heritage sites, but many tourist attractions suffer from poor maintenance and require substantial investment.

In addition, inadequate infrastructure and climate change pose major challenges. Coastal erosion threatens heritage sites such as Kunta Kinteh Island, while rising sea levels endanger both tourism assets and coastal communities, where a large share of the population lives.

Status of women in The Gambia

The Gambia continues to experience significant gender inequality, ranking low in global gender equality and human development indices. Women and girls face major barriers in education due to poverty, early marriage, and cultural norms, resulting in lower literacy rates than men. Child marriage and female genital mutilation (FGM) remain widespread despite legal efforts to address them.

Women also face economic disadvantages, including lower labor force participation, limited access to formal employment, and a high concentration in vulnerable or unpaid work. Their representation in leadership and decision-making positions remains low, reflecting persistent gender stereotypes and barriers to political participation.

Gender-based violence is a serious concern, with around one in four women experiencing physical or sexual violence from an intimate partner. Additionally, women entrepreneurs often struggle to access banking services and credit, limiting their ability to grow businesses and achieve financial independence. Overall, women in The Gambia continue to face

interconnected challenges that hinder equality, empowerment, and socio-economic development.

Tourism segments in The Gambia

By far the most predominant tourism sector, the beach—'sun and sea'—is still the main attraction for about 80 percent of tourists. The sector is heavily reliant on International Tour Operators (ITO), which bring 50–70 percent of all tourists, control 70 percent of all air access and international marketing and contribute 85 percent of all hotel revenues. (Gambia Country Partnership Framework). Tourists predominantly come from select markets in Europe particularly the UK and Netherlands. This assessment analyses women's participation in the hotels' workforce and the role of women-led businesses in the hotels' value chains.

The diversification of the tourism offering in the Gambia, especially conference tourism, eco-tourism, and community-based tourism could lead to promising economic outcomes for women, both in terms of improving women's employment and women-led MSMEs accessing new markets, contributing to inclusive economic growth opportunities (Anyanwu et al. (2013)). Due to limited diversification, distribution channels, and product offerings, Gambia currently lags behind its competitors. The diversification carries new possibilities for women's economic involvement in the sector while also broadening the sector and boosting the economy.

Eco-tourism combines well with community-based tourism, creating additional employment opportunities for women, such as birdwatching tours, cooking demos, etc. This is in line with various studies which show that women could be psychologically, socially, economically, and politically empowered by their participation in ecotourism ventures (Deori and Das, 2013; Irandu and Shah, 2014). Ninki Nakka trail, which offers community-based tourism in rural communities along the Gambia River, was designed to promote travel during the low season, between May and October. Its focus is on sustainable tourism to benefit host communities, businesses and the environment. Gambia Tourism Board has a code of conduct for Ninki Nakka Trail tour operators, both domestic and international including a condition to be an ethical business with decent employment practices, and to maintain a policy on gender equality and decent working conditions.

Research shows that developing nature-based and sustainable tourism could also help attract high-value tourism. Recent World Bank consumer research on three key European outbound markets (Germany, Sweden, United Kingdom), which are also important for the Gambian tourism, identified five market segments amongst travelers (World Bank 2022). Three of these segments, which account for 66 percent of respondents, focus on nature-based and sustainable

tourism and are the highest spending of all traveler types. These tourists actively seek distinctive experiences, aspire to connect with local communities and enterprises, view travel as a means of education, and are committed to sustainable practices. Attracting more of these tourist segments by changing the marketing strategy and increasing the supply of active, nature-based experiences, coupled with targeted strategies to employ women, could positively impact women both as producers of local goods and services but also actors in community-based and eco-tourism.

Data Analysis

Gender disparity in employment

There are five key economic activities that generate revenues and income in the tourism sector – transport, accommodations, excursions, food & beverage, and shopping and women's participation within each of these activities vary as do the explanations and the interventions needed. In all key economic activities of Gambian tourism, male workers are employed at higher numbers than women, with the gender gap smaller for part-time work in some activities. Women constitute 35 percent of all full-time employees in the tourism sector compared to 65 percent of men, with a resulting gender gap of 29 percentage points. The gender gap in employment drops for part-time work. Women comprise 42 percent and men make up 58 percent of part-time employees, resulting in a smaller gender gap of 16 percentage points.

Two-thirds of the tourism jobs are heavily concentrated on accommodation - accounting for 64 percent of men's and 58 percent of women's tourism employment. In part-time work, the gender gap in employment in accommodation drops to 3 percentage points, showing that women are more likely to be hired as part time employees in hotels and other accommodation establishments. The next largest employment area is food, beverage, and entertainment. Food, Beverage, and Entertainment account for nearly a quarter of the tourism jobs and close to one third of women's employment in the sector.

Hotels constitute more than one quarter of all accommodation jobs but only one third of hotel employees are female. They work as receptionists, waitresses, housekeeping staff or as managers in HR, finance, and marketing. They are more likely to be part-time or paid seasonal workers. Among the large hotels, data collected by one study shows that women represent on average 15 percent of the workforce, ranging from a minimum of 4 percent to a maximum of 35 percent.

Transport and Excursions are heavily male dominated. According to 2018 data, 85 percent of full time and 89 percent of part time workers in transport are male. Excursions are also male

dominated, almost all tour guides being male in the country. Being a tour guide is seen as not a possibility once a woman is married or has children, mainly for the long hours excursions may take, or if the clients are only male. However, there is female ownership of the tour operator outfits.

Gender disparity in entrepreneurship

Women show strong willingness to participate in the hospitality industry, given their enrollment rates in the tourism and hospitality institute are higher than men but this is not translating to employment in the hotel industry, due to a composition of key supply and demand-side barriers identified. Female labor force participation could remain low due to lack of skills, assets and networks, time-based constraints, limited mobility, gender discrimination in hiring and promotion, and restrictive gender norms (Halim et al., 2023). The key informant interviews suggest that women are switching to alternative jobs or self-employment due to an interplay of factors.

The restricted hours that women typically work within the tourism and hospitality sector might potentially result in a bias towards selecting male candidates over female ones. Most businesses have a policy of not hiring women for shifts after 4pm. Though this is not a legal requirement, it is a de facto practice due to a variety of cited reasons, including safety and norms. As a result, this might be leading to a preference in hiring men as there is greater flexibility in employing men for both day and night shifts.

Tourism businesses might be favoring women for part-time work over full-time work also partially due to maternity policy. Businesses in The Gambia are legally obligated to implement a 6-month paid maternity leave policy for female employees. Paid paternity leave is available up to 10 days for fathers. Some interviews suggest that this results in favoring women for part-time work or male candidates over female ones. In other countries, such as Sao Tome and Principe, this maternity leave bias is eliminated as it is social security that pays for the leave rather than the companies. The Women, Business and the Law 2023 report lists ‘laws affecting women's work after having children’ as one area for improvement to improve legal equality for women in The Gambia. Offering only leave for mothers, especially above a threshold of 30 weeks, can be correlated with fewer women in the workforce (Del Rey, Kyriacou, and Silva, 2021). Studies show that a smaller gap between mothers’ and fathers’ leave is associated with a higher female labor force participation rate.

Women’s participation in The Gambia’s tourism sector is constrained by several factors. Safety concerns during late-night travel, high transportation costs, inadequate street lighting, and limited employer-provided transport make it difficult for many women to work in the industry.

Women also often lack information, training, and prior exposure to better-paid tourism jobs, such as tour guiding, which remains a male-dominated occupation.

Seasonal employment further limits women's participation, as many are hired on part-time contracts and may not have income throughout the year. Consequently, many women turn to self-employment to secure year-round earnings and gain greater flexibility over their working hours.

Micro, Small, and Medium Enterprises (MSMEs) are a major source of employment in The Gambia, contributing around 20% of GDP and employing about 60% of the urban workforce. However, although self-employment is common among women, female-owned businesses tend to be smaller, employ fewer people, and generate lower profits than male-owned businesses. Most female-led enterprises are one-person businesses, and women earn significantly lower median monthly profits than men, highlighting persistent gender gaps in entrepreneurship and economic opportunities.

As the literature shows, gender gap in business performance is attributed to the gender-related limitations that women encounter when initiating, maintaining, and expanding their businesses. In Sub-Saharan Africa, women are more likely to be entrepreneurs than men, and yet their businesses earn only two-thirds the profits of their male-owned counterparts (World Bank 2019). The significant gender gap in earnings is not a result of inherent variations in the skills of male and female entrepreneurs. Instead, there are multiple underlying contextual constraints such as legal discrimination, social norms, and risk of gender-based violence; endowments such as education/skills, confidence/risk preferences, finance and assets, and networks and information; and, finally, household-level constraints such as care and allocation of factors of production (World Bank 2019).

Increased revenue of tourism-related MSMEs is a key country priority as also indicated in the Country Partnership Framework. The MSMEs within the sectors of accommodation, food and beverage, and travel and tours have exhibited a higher level of economic activity. Nevertheless, the presence of exclusive agreements between international tour operators (ITOs), accommodation providers, and ground tour operators has limited the potential for numerous MSMEs to partake in the existing tourism value chain. Furthermore, the impacts of COVID-19 have rendered many businesses in the tourism sector susceptible to concurrent shocks in both supply and demand.

Women are crafts sellers, beach fruit sellers, tour operators and restaurant owners and contribute indirectly to the tourism sector as vegetable and food suppliers, with their catering, beauty & skin care, and fashion businesses. Economic activities in the tourism industry are

often intertwined with other sectors. The transport sector is heavily male dominated. There is a large share of women participation in the crafts market, however mainly for beaded jewelry, cloth, and basket. In beauty, there is an increasing number of women entrepreneurs who use the local plants/trees of the country to make oils, such as baobab oil.

Leadership and decision-making

Women's participation in decision-making and leadership remains low in The Gambia. While the United Nations at the 1995 Beijing Conference on Women set a gender quota of 30 percent for women's representation in decision-making processes, the actual representation of women in leadership roles falls far below this standard (Segovia-Pérez et al. 2019). Women constitute only 8.6 percent of the parliament while 91 percent of the parliamentarians are men, ranking The Gambia 168th out of 186 countries worldwide. This falls behind the Sub-Saharan Africa average as well as the world average. In the executive, only 3 of the 22 Ministers in the current Cabinet are women, at the local level eight out of 120 councilors are female, and among traditional council leadership only 13 of the 1,887 Alikaalo are female. Women represent a full 57 percent of the registered electorate in The Gambia but they play mostly supporting roles, e.g., as voters and party organizers and mobilisers. Often, when a woman and a man want to run for the same political party, the woman is asked to step aside to make room for the man.

Leadership positions at the upper echelons of companies are lacking in terms of female representation (Moreno Alarcón, 2018). According to World Bank Enterprise Surveys in 2018, only 10 percent of firms have a female top manager and 17 percent of all firms have female participation in ownership. These are significantly lower than the SSA average which is 16 percent for top management and 31 percent for female ownership.

None of the leading tourism organizations in the ecosystem are headed by women, though women have presence at other levels. Even though tourism globally provides better opportunities for women's leadership than other sectors of the economy, none of the key public tourism players such as Gambia Tourism Board, Gambia Tourism and Hospitality Institute, and NCAC are headed by women. On the private sector side, female representation has been better. There is some female presence among General Managers of hotels, approximately 3-4 out approximately 40 hotels are women. Aside from GMs, women are often managers in back-office positions such as accounting and sales. Additionally, the Gambia Hotel Association and the Gambia Travel and Tourism Association have had women in leadership at various times in their history.

Gender norms, discrimination and stereotypes also combined with forms of gender-based violence, such as sexual harassment, are some of the factors which contribute to keeping women

from leadership positions. In the Gambia, about three-quarters (74%) of citizens say women should have the same chance as men to run for political office. Especially economically better-off citizens (86%) and those with post-secondary education (84%) are more likely to agree with this view. However, 60 percent of Gambians think that if a woman runs for a public office, she will be likely criticized or harassed by others in the community, and 40 percent think she will probably face problems with her family. Cultural phenomena have created the stereotype "impression that men are superior and women are inferior" and a "socialization process [that] has also led men and women to perceive men as leaders and women as supporters". These perceptions are alleged to "put women in the private sphere as wives, mothers and daughters and men in the public domain of decision-making", as well as the economic and political arena.

Conclusion

To strengthen gender mainstreaming in The Gambia's tourism sector, a comprehensive set of recommendations has been identified across employment, entrepreneurship, leadership, and public policy. Increasing women's participation and earnings in tourism requires addressing financial, social, and cultural barriers while creating safer and more inclusive workplaces.

Key actions include recognizing hotels that promote gender equality, implementing anti-harassment measures, improving women's access to training and job placements, and expanding management and technical skills development to support women's career advancement.

Women-owned businesses also face challenges related to limited market access and skills gaps. To address these constraints, efforts should focus on strengthening links with tourism value chains, facilitating partnerships with hotels and retailers, improving product quality and marketing, expanding opportunities in crafts and tourism-related services, promoting digital platforms and e-commerce, and providing both technical and entrepreneurial training. Advancing gender equality in tourism further requires stronger leadership, better data collection, and supportive policies. Priorities include increasing the representation of women in tourism-related institutions, collecting gender-disaggregated data, promoting best practices in gender-inclusive businesses, expanding community-based tourism opportunities, strengthening legal protections against workplace harassment, and improving mechanisms to address gender-based violence within the tourism sector.

Together, these measures aim to create a more inclusive, diverse, and equitable tourism industry in The Gambia, fostering women's economic empowerment and expanding access to sustainable opportunities.

EXPLORING THE SYNERGIES OF CIRCULAR ECONOMY AND ARTIFICIAL INTELLIGENCE: STATE OF DEVELOPMENT AND A COMPREHENSIVE RESEARCH AGENDA

Keywords: Circular economy, Artificial intelligence, Sustainability transitions, Circular supply chains, Responsible innovation, Bibliometric analysis

Introduction

The transition toward a Circular Economy (CE) increasingly relies on emerging technologies to close resource loops. Artificial Intelligence (AI) is positioned as a key enabler of this shift, yet the intellectual structure of the AI–CE nexus remains fragmented, as existing reviews tend to address individual Industry 4.0 technologies in isolation rather than AI–CE synergies specifically.

Purpose, Aim and Objectives

This study aims to comprehensively map the AI–CE nexus by combining bibliometric analysis, network mapping, and qualitative synthesis. It addresses two questions: What is the current knowledge structure of AI–CE integration in the business and environmental management literature? How can AI support and enhance CE practices? The study seeks to identify dominant themes, applications, and gaps, and to propose a research agenda.

Literature Review and Theoretical Framework

The study is grounded in Circular Economy theory and its evolving 'R' strategies (Kirchherr et al., 2017), sustainability transition theory (Geels, 2002), and responsible innovation (Stilgoe et al., 2013). While AI is widely adopted across organisational functions, its integration into CE strategies remains under-theorised, particularly regarding energy footprint, regulatory fragmentation, and rebound effects (Dwivedi et al., 2023).

Methodology and Methods

Data were retrieved from Scopus using a Boolean search combining "circular economy" and "artificial intelligence", restricted to English-language articles and reviews from 2021 onward (322 documents). A three-step filtering process – quality screening, manual review, and metadata export – produced a final sample of 21 documents. Co-citation network analysis (CiteSpace) identified 36 nodes and 375 links across four clusters, followed by an inductive qualitative synthesis (Patton, 1990).

Main Findings and Contribution

Three interconnected domains emerge: responsible and efficient production, responsible consumption and product life-cycle extension, and ethics, governance, and regulation of AI in circular systems. Key applications include generative design, predictive maintenance, computer vision-based recycling, reverse logistics optimisation, and digital traceability. Persistent challenges include the energy intensity of AI systems, high implementation costs, data limitations, and regulatory fragmentation.

Originality and Value

Unlike prior reviews examining single Industry 4.0 technologies in isolation, this study is among the first to apply a comprehensive multi-method approach – integrating bibliometric evidence, network structure, and qualitative interpretation – specifically to the AI–CE nexus, clarifying how AI technologies interconnect across circular value chains.

Research Limitations

The small final sample (21 documents) reflects the nascent state of the AI–CE field and reliance on a single database, which may limit generalisability. Future research could broaden database coverage and incorporate empirical validation through case studies.

Theoretical and Practical Implications

Theoretically, the findings refine socio-technical transition and responsible innovation frameworks. Practically, the study guides scholars, practitioners, and policymakers seeking to scale AI-enabled circular solutions through energy-efficient AI architectures and adaptive, anticipatory governance mechanisms.

Abstract

Entrepreneurial ecosystem research explains how institutional and resource conditions support productive entrepreneurship, but it has not systematically and explicitly incorporated sustainability. This gap is especially relevant in sustainable food tech, where entrepreneurial activity is shaped by ecological goals, regulation, legitimacy, and broad stakeholder involvement. Building on stakeholder theory, this paper investigates whether sustainability may act as a systemic modifier of entrepreneurial ecosystems through stakeholder relationships. Using a theory-elaborating qualitative single-case design, the study examines Ecorobotix, a Swiss firm operating in precision agriculture within the broader agrifood system. Based on secondary data, the analysis provides a first exploratory mapping of how sustainability appears to influence the relational logic of the ten ecosystem components identified by Stam and van de Ven (2021). More specifically, the case suggests that sustainability may broaden the relevant stakeholder base, diversify the forms of value exchanged, and reshape how ecosystem components interact. The paper contributes to entrepreneurial ecosystem research by proposing a sustainability-oriented extension of the ten-component model, to sustainable entrepreneurship research by offering a more systematic ecosystem-level interpretation of sustainability, and to stakeholder theory by applying it beyond the firm level to the ecosystem as a whole. Given the exploratory nature of the study, the findings should be understood as a first analytical step and a foundation for future interview-based inquiry.

Introduction

One of the relevant lenses for explaining why some ventures emerge, grow, and scale more

successfully than others is the entrepreneurial ecosystem. Its success relates to the emphasis this perspective gives to the broader configuration of institutions, resources, networks, culture, leadership, and support structures surrounding entrepreneurial actors (Isenberg, 2010; Stam, 2015; Stam and van de Ven, 2021; Khatami et al., 2022), rather than attributing entrepreneurial outcomes solely to individual talent or firm-level strategy. Among the available frameworks, Stam and van de Ven (2021) developed a model that offers a structured and empirically grounded account of how ten interdependent ecosystem components jointly support productive entrepreneurship.

At the same time, the growing relevance of sustainability-oriented entrepreneurship raises an important question for ecosystem research, as in sectors linked to the agrifood transition, sustainability is not simply an external concern or a reputational add-on. It can shape technological priorities, regulatory exposure, legitimacy processes, investor expectations, market demand, and the range of actors involved in venture development (Hall, Daneke, and Lenox, 2010; Schaltegger and Wagner, 2011). This suggests that sustainability may influence not only the goals of entrepreneurial activity, but also the way entrepreneurial ecosystems are organized and function, but existing research has addressed this issue only partially. Studies on sustainable entrepreneurship have shown that sustainability-oriented culture and stakeholder support matter for entrepreneurial activity (Bischoff, 2019; Simatupang et al., 2015). Khatami et al. (2022) examine how the European entrepreneurial ecosystem influence sustainable innovation. However, the literature has not yet systematically explained whether and how sustainability may reshape the internal logic of entrepreneurial ecosystems across their components. This gap is particularly important in sustainability-intensive contexts, where entrepreneurial action depends on the coordination of diverse actors around both economic and ecological objectives.

Stakeholder theory provides a useful interpretive lens for addressing this gap. By emphasizing value creation through relationships with multiple stakeholders, it helps explain how organizations operate in settings where legitimacy, knowledge, trust, regulation, and shared purpose are central to performance (Freeman, 1984, 1999; Mitchell et al., 1997; Jones and Wicks, 1999; Trevino and Weaver, 1999). In sustainability-oriented ventures, relevant stakeholders extend beyond customers and investors to include regulators, research institutions, certification bodies, intermediaries, communities, and environmental actors. This broader relational field proposes that sustainability may affect not only who matters in the ecosystem, but also the forms of value exchanged within it. This paper explores this possibility by examining the entrepreneurial ecosystem of Ecorobotix, a Swiss company operating in precision agriculture and oriented toward the reduction and replacement of chemical inputs. Through this investigation, the aim is discovering how stakeholder relationships shape the entrepreneurial ecosystem of a sustainable agrifood venture, and whether

sustainability may act as a systemic modifier of ecosystem components. Building on the entrepreneurial ecosystem model of Stam and van de Ven (2021) and using stakeholder theory (Freeman, 1984) as an interpretive extension, the paper argues that sustainability may alter the relational logic of existing ecosystem components instead of simply add a new one. Methodologically, the study adopts a qualitative single-case, theory-elaborating design based on secondary sources (Fisher and Aguinis, 2017; Yin, 2003). It offers an initial analytical mapping of how sustainability appears to influence stakeholder relationships across the ten ecosystem components. In doing so, the paper contributes to entrepreneurial ecosystem research, sustainable entrepreneurship research, and stakeholder theory, while also laying the groundwork for future interview-based investigation.

Literature review

Discovering entrepreneurial ecosystems

Entrepreneurship research has long been led by an individualistic perspective, underlining the entrepreneur's personal traits as the main factor influencing their success. This perspective emphasizes individual agency, including risk propensity, inventiveness, and entrepreneurial spirit (Schumpeter, 1934, cited in Stam and van de Ven, 2021), but it is unable to explain why entrepreneurs with similar capabilities achieve different results, depending on the context in which they operate or why some regions consistently produce more entrepreneurship than others. Entrepreneurship is a collective accomplishment that lies in the actions of individual entrepreneurs but also necessitates active roles from actors in both the public and private sectors to create an industrial infrastructure that supports innovation (Stam and van de Ven, 2021). This limitation encouraged further research, moving the focus from the individual to the wider system of institutions, resources, and relationships that characterize the entrepreneurial activity (Aldrich, 1990; Steyaert and Katz, 2004). Indeed, the entrepreneurial ecosystem perspective emerged to address this issue. Van de Ven (1993) made a fundamental contribution in this direction by proposing the idea of a "infrastructure for entrepreneurship" consisting of four main elements, such as market demand from knowledgeable consumers; institutional arrangements that legitimize and encourage entrepreneurial activity; public resource endowments that include scientific knowledge, financing mechanisms, and pools of skilled labour; and proprietary business activities carried out by private entrepreneurs. This formulation foresaw the systemic nature of entrepreneurship, highlighting that entrepreneurship is a collective endeavour since individual entrepreneurs cannot independently address all the institutions and resources needed to develop and commercialize their

ventures. The ecosystem paradigm was gradually embraced by academics and professionals in the following decades to characterize the geographical settings where entrepreneurship thrives (Moore, 1993; Acs, Stam, Audretsch, and O'Connor, 2017). Isenberg (2010) proposed a framework consisting of six domains, namely policy, finance, culture, support, human capital, and markets, with the aim of creating an environment that would facilitate entrepreneurship. Feld (2012) highlighted the relational aspect of ecosystems, stressing the significance of network density, connecting events, and cooperation between large firms and startups. Despite becoming extremely influential among policymakers and practitioners, these contributions were criticized by academic scholars and produced what Stam (2015) described as "laundry lists" of relevant factors, lacking a clear causal logic connecting ecosystem conditions to entrepreneurial outcomes. Stam and van de Ven (2021) proposed a systems framework composed of ten interdependent ecosystem components grouped into institutional arrangements and resource endowments. Their model highlights three core dynamics: co-evolution among ecosystem elements, the influence of overall ecosystem quality on productive entrepreneurship, and feedback effects from entrepreneurial success back into the ecosystem.

This model is particularly relevant for the present study because it provides the most structured and empirically grounded architecture currently available for analyzing entrepreneurial ecosystems. Although the model explains the structural conditions supporting productive entrepreneurship, it does not specify how sustainability may reshape the internal logic of ecosystem components.

Stakeholder Theory as an interpretive lens

According to stakeholder theory (Freeman, 1984; Freeman, Harrison, and Wicks, 2007; Jensen, 2001), an organization’s long-term success depends on its capacity to generate value for a variety of stakeholders, including workers, customers, investors, local communities, and the environment. It has inspired a variety of perspectives that all claims that stakeholders influence business performance by their moral legitimacy and vice versa businesses need to satisfy stakeholders’ interests (Jones and Wicks, 1999; Trevino and Weaver, 1999). Civera, Moggi, Chiaudano, and Freeman (2025) have recently expanded on this relational understanding by conceptualizing how stakeholder relationships evolve across various engagement approaches in sustainability-oriented contexts, ranging from informative to reciprocal, advocative, and ecosystemic. This concept supports the idea that stakeholder relationships involve several levels of value, purpose, and mutual interdependence and cannot be reduced to transactional trades in environments where ecological and social goals are paramount. In turn, it leverages the relevance of a stakeholder on others (Mitchell et al., 1997).

Value creation within an ecosystem is not a zero-sum process (Erina et al., 2017), nor can it be reduced to economic return alone. Different stakeholders may exchange and receive economic, intangible, intrinsic, and transcendent forms of value, many of which emerge through cooperative and relational processes, not just through market transactions (Argandoña, 2011; Erina et al., 2017). This perspective is especially relevant for sustainable entrepreneurship (Spence et al., 2011; Schaltegger and Wagner, 2011), because sustainability-oriented ventures interact with a broader and more heterogeneous stakeholder base than conventional firms, including environmental regulators, civil society actors, certification bodies, impact investors, and research partners. Sustainability may therefore alter not only who matters in the ecosystem, but also the kinds of value exchanged and the relational mechanisms through which ecosystem components operate (Bischoff, 2019). Using the triple helix model of university-industry- government interactions, Erina et al. (2017) further show that ecosystems generate greater value in contexts characterized by sophisticated institutional networks, whereas synergistic benefits are less likely to emerge where network architecture is weak. In this sense, stakeholder theory complements the structural strength of the entrepreneurial ecosystem approach with a more relational understanding of how sustainability-oriented ecosystems function in practice.

Sustainable entrepreneurship and the ecosystem research

A second relevant stream of literature concerns sustainable entrepreneurship. One of the first contributions to explicitly include sustainability within the ecosystem paradigm was Cohen (2006). The term “eco-preneurship” was first used by Schaltegger (2002), who highlighted the role of environmentally conscious entrepreneurs as catalysts for long-term economic change. According to Hall, Daneke, and Lenox (2010), sustainable entrepreneurship is essential to the transition toward a more sustainable economy. More recently, Bischoff (2019) conducted one of the first comparative studies of sustainable entrepreneurial ecosystems and found that entrepreneurial cultural awareness and stakeholder support and collaboration specifically focused on sustainability are key predictors of perceived ecosystem strength. This finding is important because it suggests that general support for entrepreneurship does not replace support explicitly oriented toward sustainability. In a similar vein, Simatupang, Schwab, and Lantu (2015), as discussed by Bischoff (2019), emphasized the significance of stakeholder support and involvement in the development of effective sustainable entrepreneurial ecosystems. More recently, Filippelli, Troise, Bigliardi, and Corvello (2025) demonstrate how stakeholders, such as governments, universities, and big businesses, actively push startups toward economic, social, and environmental goals at the same time, further demonstrating that sustainability and economic growth can coexist within

entrepreneurial ecosystems.

Taken together, these studies suggest that sustainability may affect multiple ecosystem dimensions, including culture, stakeholder support, legitimacy, and coordination. However, they do not yet provide a systematic account of whether and how this influence extends across the full ten-component architecture proposed by Stam and van de Ven (2021). Nor do they explain, through a single analytical framework, how stakeholder relationships may shape sustainability-oriented entrepreneurial ecosystems in the food tech sector. This is the gap addressed by the present study.

The Research Framework

The paper adopts the model developed by Stam and van de Ven (2021) as its structural baseline. The model identifies ten observable components that are mutually dependent and co- evolutionary (Proposition 1), and their combined quality determines productive entrepreneurial capacity (Proposition 2), with previous successes feeding back into the system (Proposition 3). Its core insight is that entrepreneurial performance cannot be explained by isolated factors, because ecosystem elements are interdependent and mutually reinforcing, providing a robust structural account of how entrepreneurial ecosystems operate over time. Nevertheless, it remains under-specified with regard to sustainability, particularly in relation to stakeholder composition, value exchange, and the internal logic of ecosystem components.

To address this limitation, the stakeholder theory is used as an interpretive extension of the ecosystem model. It explains how organizations generate value through relationships with multiple actors rather than through shareholder-oriented economic exchange alone. In sustainability-oriented settings, this relational perspective becomes especially important, since relevant stakeholders extend beyond conventional market actors and include regulators, environmental organizations, certification bodies, sustainability-focused investors, research institutions, and communities affected by ecological outcomes. Applied at the ecosystem level, stakeholder theory makes it possible to examine not only which actors populate each component, but also what kinds of value circulate through those relationships. This includes economic value, but also intangible value such as legitimacy, knowledge, and trust, intrinsic value linked to purpose and identity, and transcendent value connected to wider environmental and societal goals. In this way, stakeholder theory complements the structural logic of the ecosystem model with a relational and value-based logic.

Building on these two theoretical pillars, the paper proposes that sustainability may modify the

internal logic of all ten components by broadening the relevant stakeholder base, changing the forms of value exchanged, and intensifying interdependencies among components. Existing literature already suggests parts of this argument—for example, in relation to sustainability-oriented culture and stakeholder support—but has not systematically mapped it across the full ecosystem architecture.

Methodology

This paper uses a qualitative single case study design within the theory elaboration perspective (Yin, 2003). Research questions of the "how" and "why" types that aim to comprehend complicated phenomena in their real-world context are especially well-suited to the case study technique. According to Fisher and Aguinis (2017), qualitative case-based designs have been used in many of the most influential theory elaboration studies because they enable researchers to identify constructs and relations that would be invisible to purely quantitative approaches and to get close to empirical reality. More specifically, three requirements identified by Fisher and Aguinis (2017) are met in this study. The entrepreneurial ecosystem model of Stam and van de Ven (2021) offers a well-validated structural account of the conditions enabling productive entrepreneurship, but it does not systematically incorporate sustainability as a structural dimension. This is the first theory that partially explains the focal phenomenon. Second, the current explanation is insufficient because, as the literature review shows, sustainability has been recognized as pertinent to entrepreneurial ecosystems but has not been systematically incorporated into the ten-component model, creating a theoretical gap that this paper aims to fill. Third, there is the possibility of gathering data from an empirical setting to incorporate with current theory. For example, the case of Ecorobotix offers a well-documented example of a sustainable precision agriculture company functioning within a complex stakeholder ecosystem, allowing the development of current theory through the strategies of specific relation structuring and new construct specification (Fisher and Aguinis, 2017).

Through theoretical sampling, Ecorobotix was chosen as the empirical case (Eisenhardt, 1989), for its theoretical significance (Yin, 2003). Ecorobotix simultaneously meets four requirements for selection. First, it works in the industry domain of this article, which is the food technology sector, in particular the precision agriculture within the agrifood system. Second, its initial objective of lowering, replacing, and regenerating chemical inputs in agriculture and its B-Corp certification, which was gained in 2019 and reaffirmed in 2023, reflect its stated, verifiable, and continuous sustainability approach. Third, it has grown to such an extent that it has established meaningful, documented relationships with a wide range of ecosystem stakeholders. It operates in more than 20

countries, employs more than 200 people, and has raised more than $150 million over several funding rounds. Fourth, it is integrated within the well-established institutional and innovative backdrop of the Swiss entrepreneurial ecosystem. It is agreed that Ecorobotix is part of a supportive national environment and is a reasonably developed and well-funded case. However, according to Yin (2003), this makes it a revelatory case in the sense of theory elaboration: because its sustainability orientation is institutionally embedded and its stakeholder relationships are well-documented, it makes it possible to observe patterns and mechanisms that would be invisible in ecosystem contexts that are less developed or at an earlier stage. Analytical generalization, or the expansion and improvement of theoretical claims, is the goal here rather than empirical generalization (Yin, 2003; Fisher and Aguinis, 2017). A well-selected extreme or revelatory case might contribute more to theory building than a representative one, according to Flyvbjerg (2006), who contends that the purpose of case study research is not statistical representativeness but rather the depth of insight it enables.

The company's official website, together with complementary publicly available documents such as press releases, investor-related materials, certification-related information, and partnership documentation, were used as secondary sources for data collection. This strategy aligns with Yin's (2003) suggested archive method for case studies aimed at producing a theoretical extension. The available documentary evidence is used to identify salient stakeholder categories, relationships, and value exchanges that can support an initial analytical mapping of the ecosystem. The structural strategy of theory elaboration (Fisher and Aguinis, 2017) guided the deductive template analysis process used for data analysis (King, 2004). The main analytical template was the ten ecosystem components defined by Stam and van de Ven (2021), while the interpretative lens was Freeman's (1984) Stakeholder Theory. Three questions guided the analysis for each component: *who are the stakeholders in that component; what kind of value is exchanged in that relationship (economic, intangible, intrinsic, or transcendent); and how does Ecorobotix's sustainability orientation alter the relational logic of that component in comparison to what a traditional, non-sustainability-oriented ecosystem model would predict*. These questions were used to structure a first-stage analytical exploration of whether sustainability appears to broaden the stakeholder base, diversify the forms of value exchanged, and modify the logic of interaction across the ten components. This process therefore operationalizes the paper's proposition as an exploratory analytical guide and makes it possible to identify preliminary patterns, tensions, and relational mechanisms to be examined more deeply in subsequent interview-based research.

Findings and Discussion

In the analysis that follows, the integrated theoretical framework is applied to Ecorobotix, a Swiss precision-agriculture firm founded by Steve Tanner and Aurélien Demaurex in 2014 and guided by the "Reduce, Replace, Regenerate" goal. The following figure summarises the main findings presented in this section.

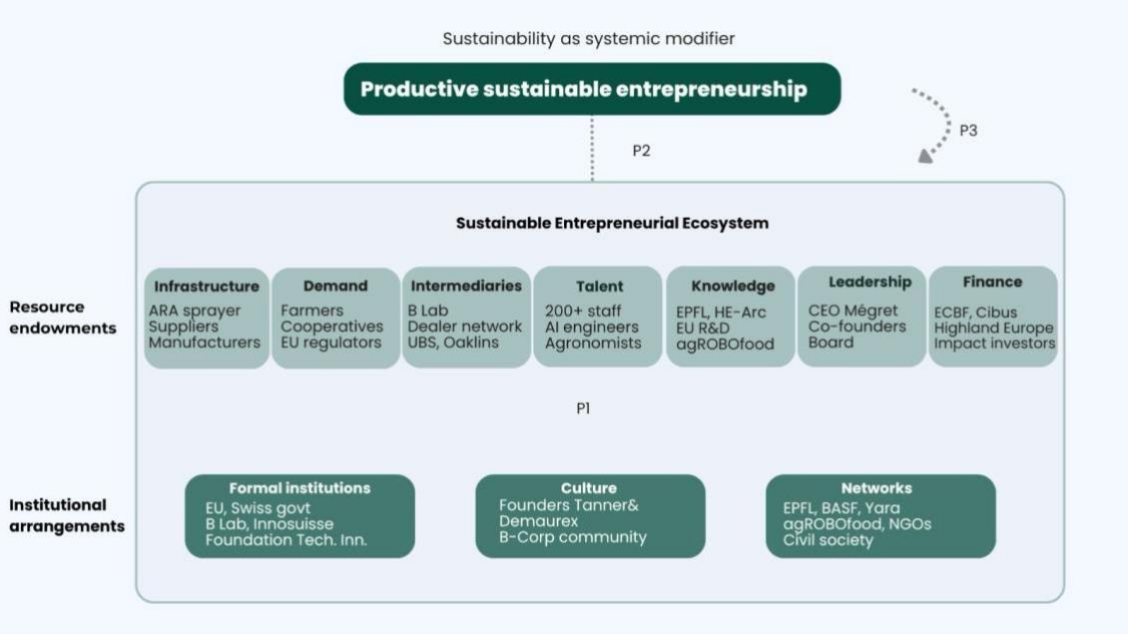

Figure 1. *The entrepreneurial ecosystem of Ecorobotix. Source: our elaboration*

Formal Institutions. Early governmental funding from the Swiss Foundation for Technological Innovation in 2014 gave the business legitimacy at the outset. The company's technology faces structural regulatory pressure due to the EU Farm to Fork Strategy, which calls for a 50% decrease in pesticide use by 2030. B Lab confirms and disseminates the company's environmental performance through B-Corp accreditation. Taken together, these publicly documented institutional relationships suggest that sustainability is not merely a voluntary orientation but is embedded in broader regulatory and legitimizing structures. This result is consistent with recent research demonstrating that institutional support and government initiatives are important factors in the development of sustainable entrepreneurship, especially when they integrate ecosystem-building initiatives, legitimizing structures, and regulatory frameworks (Ben Chikha, Salloum, El Hilali, and Jarboui, 2025). These institutional stakeholders appear to convert sustainability from a personal choice into a structural market condition by exchanging primarily intangible and transcendent value, such as legitimacy, normative direction, and regulatory frameworks (North, 1990; Bischoff, 2019).

Culture. The company's beginnings are clearly based on a common ecological concern, and the two

founders met at an event for environmental conservation. This founding culture is formally institutionalized through the "Reduce, Replace, Regenerate" objective and the yearly B Impact Assessment. According to Bischoff (2019), Ecorobotix suggests that sustainability awareness and entrepreneurial consciousness coexist as complementary dimensions from the beginning, founders and employees appear to exchange intrinsic and transcendent value, understood as the personal meaning associated with contributing to ecological change. However, the ways in which these actors themselves articulate and experience such motivations remain an open question for future interview-based research.

Networks. Early knowledge infrastructure was supplied by academic collaborations with EPFL and HE-Arc, and the company's involvement in the EU agROBOfood project expanded its reach to a pan-European innovation network. Most importantly, despite manufacturing goods that Ecorobotix's technology partially replaces, corporate investors BASF Venture Capital and Yara Growth Ventures-incumbent agrochemical actors-take part. In line with Freeman's (1984) forecast that stakeholder value creation transcends zero-sum competitive logic, this can be interpreted as evidence consistent with a sustainability-driven reconfiguration of competitive relationships into cooperative ones.

Finance. The European Circular Bioeconomy Fund (ECBF), Cibus Capital, McWin Capital Partners, Flexstone Partners, and Stellar Impact are among the investors. These investors are sector-specific or impact-oriented, and their decision-making criteria specifically take into account both financial performance and quantifiable environmental returns. In line with Meyskens and Carsrud's (2013) prediction, the Series C ($45M, 2024) and Series D ($105M, 2025) of funding investment rounds suggests, that sustainability changes the standards governing access to financing by reflecting a potentially different financial logic in which capital flows toward both ecological outcomes and financial return.

Knowledge. Developed in partnership with EPFL and EU-funded research programs, more than 25 crop-specific AI algorithms represent a knowledge agenda influenced by ecological values rather than just productive efficiency. Research on substituting natural acids for synthetic chemicals in organic farming markets further demonstrates how sustainability reroutes knowledge creation toward issues that are not visible in traditional agtech models, creating asymmetries that favor businesses with specialized sustainability expertise (Schaltegger and Wagner, 2011). This indicates that sustainability may shape not only what knowledge is produced, but also which knowledge trajectories become strategically valuable.

Leadership. With a background in venture capital at Swisscom Ventures, CEO Dominique Mégret, who was appointed in 2024, appears to illustrate an ecosystem connector role. He appears to act as

a mediator between the public, non-profit, and for-profit sectors and to translate a long-term sustainability vision into coordinated commercial action. Since good leadership fosters systemic cooperation that no one player could do on their own, the value traded appears to be transcendent for the ecosystem and intrinsic for the leadership team (Simatupang et al., 2015).

Talent. According to Spence et al. (2011), Ecorobotix's workforce has grown from 30 in 2020 to over 200 in 2024. This growth may indicate the ability to attract experts driven by both financial reward and a sense of purpose and ecological impact. The sustainability mission appears to broaden the standards by which people choose employers, changing the internal organizational culture as well as the makeup of the talent pool. The traded value seems to include an internal and transcendent motivational component, while its economic component is extrinsic. However, this interpretation remains preliminary and would require interview-based evidence to assess how employees themselves articulate these motivations.

Demand. Demand for Ecorobotix's technology appears to be shaped both by regulatory developments, such as the EU Farm to Fork Strategy, and by market-based considerations, including farmers' search for cost savings and operational efficiency. Agricultural cooperatives and institutional customers may therefore be influenced by both ecological and economic considerations. This dual demand structure suggests that, in sustainability-oriented settings, demand may be partially normatively shaped and not driven exclusively by conventional market mechanisms (Hall, Daneke, and Lenox, 2010).

Physical Infrastructure. Infrastructure decisions influenced by environmental standards are reflected in the ARA sprayer, a tractor-pulled device with a foldable six-meter frame made for compatibility with current farm equipment. In addition to operational efficiency, regulatory and environmental restrictions on autonomous machinery also played a role in the decision to switch from the autonomous AVO robot to a tractor-pulled system. This suggests that environmental and regulatory considerations are incorporated into infrastructure design choices from an early stage, rather than being addressed as ex post constraints.

Intermediaries. Investors, clients, and partners are informed about the company's sustainability credentials by B Lab. Through co-marketing, training, and on-farm demonstrations, the dealer network converts the sustainability value proposition into commercially viable connections with end users. Financial advisors Oaklins France and UBS Growth Advisory helped the business find investors who shared its commitment to sustainability. Unlike traditional ecosystem intermediaries, these specialized intermediaries appear to help make ecological value readable, believable, and scalable across various stakeholder populations (Howells, 2006).

The analysis shows a recurring trend across all 10 components. Ecorobotix's sustainability

orientation is associated with stakeholder interactions whose logic extends beyond purely commercial exchange and includes intangible, intrinsic, and transcendent forms of value (Erina et al., 2017). Across the case, sustainability appears to shape multiple dimensions of ecosystem functioning, including legitimacy, coordination, knowledge creation, financing logics, demand formation, and intermediation. Taken together, these patterns provide preliminary support for identifying a proposition consistent with the view that sustainability may operate as a systemic modifier of the entrepreneurial ecosystem. Therefore, the present study advances the following proposition:

In entrepreneurial ecosystems characterized by a strong sustainability orientation, greater diversity in the stakeholder base will be positively associated with greater diversity in the forms of value exchanged among ecosystem actors. Ecosystems involving a broader and more heterogeneous range of stakeholders are expected to display value-exchange configurations that extend beyond economic value, including social, ecological, intrinsic, and transcendent forms of value that are less prominent or less differentiated in conventionally oriented entrepreneurial ecosystems.

This proposition represents a first step, an analytical guide for examining whether and how sustainability appears to reconfigure ecosystem components in the selected case study; it will be refined through in-depth interview-based inquiry.

Conclusions

This paper explored the role of stakeholder relationships in the entrepreneurial ecosystem of a sustainable food tech venture by combining the entrepreneurial ecosystem model of Stam and van de Ven (2021) with Stakeholder Theory (Freeman, 1984). Using Ecorobotix as a case study, the study examined whether sustainability may act as a systemic modifier of entrepreneurial ecosystems, not as a marginal or isolated factor.

The analysis suggests that sustainability may influence entrepreneurial ecosystems by reshaping how existing components function and interrelate. Rather than adding a separate element to the ecosystem, sustainability appears to operate as a cross-cutting relational logic that broadens the relevant stakeholder base and diversifies the forms of value exchanged. In this sense, the paper offers preliminary analytical support for extending the ten-component model of Stam and van de Ven (2021) in a sustainability-oriented direction, providing a further proposition sustainability-oriented.

The study makes three main theoretical contributions. It contributes to entrepreneurial ecosystem

research by proposing that sustainability may reconfigure the internal logic of ecosystem components through stakeholder relationships (Stam and van de Ven, 2021). For sustainable entrepreneurship research, the research provides a more systematic ecosystem-level interpretation of how sustainability may shape entrepreneurial contexts beyond the established themes of culture and stakeholder support (Bischoff, 2019; Simatupang et al., 2015). Lastly, it contributes to stakeholder theory by applying it at the ecosystem level and showing that coordination in sustainability-oriented settings may involve not only economic value, but also intangible, intrinsic, and transcendent forms of value (Freeman, 1984; Erina et al., 2017).

The paper also has practical implications. For entrepreneurs, it suggests that sustainability should be treated not only as a mission statement but as a strategic organizing logic affecting access to legitimacy, partnerships, finance, and demand. For investors, it highlights the importance of evaluating ventures also in terms of their capacity to mobilize stakeholders around sustainability-oriented outcomes. For policymakers and ecosystem builders, it indicates that support for sustainable entrepreneurship may be more effective when regulation, innovation policy, certification systems, and market formation processes are aligned (Bischoff, 2019). Intermediaries also emerge as important actors in making sustainability value legible across heterogeneous stakeholder groups (Howells, 2006).

Despite the several contributions, the study has important limitations. It relies on secondary sources and therefore captures a document-based representation of stakeholder relationships instead of on the direct perspectives of ecosystem participants. It is also based on a single case, which supports theory elaboration but limits empirical generalization (Fisher and Aguinis, 2017; Yin, 2003). In addition, Ecorobotix is a relatively mature and well-funded venture embedded in a supportive national ecosystem, so the observed dynamics may not apply in the same way to earlier-stage firms or weaker ecosystems. Therefore, future research should extend this first step through in-depth interviews with founders, employees, investors, customers, intermediaries, and institutional actors, in order to validate, refine, or challenge the patterns identified here. Comparative and longitudinal studies would also help clarify under what conditions sustainability becomes a systemic modifier of entrepreneurial ecosystems (Fisher and Aguinis, 2017; Stam and van de Ven, 2021).

THE BENEFITS OF CHATBOTS IN CUSTOMER SERVICE: A SYSTEMATIC LITERATURE REVIEW

Srikanth, Neha; Schlegel, Dennis

Faculty of Informatics, Reutlingen University, Reutlingen, Germany

Keywords: Chatbot Implementation, Customer Service, Benefits, Systematic Literature Review

Introduction

Chatbots have become widely used tools for automating customer service interactions, offering organisations a scalable way to manage rising customer expectations for fast, accessible support. Despite their widespread deployment, many organisations still lack clarity regarding the full range of benefits chatbots can offer. Existing studies tend to examine isolated outcomes of chatbot use, leaving the literature fragmented and without a consolidated overview of chatbot benefits in customer service.

Purpose, Aim and Objectives

This study aims to synthesise and structure the benefits associated with chatbot implementation in customer service through a systematic literature review (SLR). The objective is to identify the range of reported benefits across existing academic and grey literature and to organise these into a coherent framework that can inform both future research and organisational decision-making.

Literature Review

Prior studies have examined individual chatbot outcomes, such as brand loyalty and conversion rates (Ramki et al., 2024) or user satisfaction and loyalty (Hsu and Lin, 2023), but few have attempted a structured synthesis across the full range of reported benefits. Nicolescu and Tudorache (2022) provide a systematic review of chatbot-related human-computer interaction, though with a narrower focus on user experience rather than organisational value more broadly. This gap motivates the present review's broader, benefit-focused synthesis.

Methodology and Methods

Following established SLR guidelines, academic and selected grey literature were identified using Web of Science and Google Scholar. After screening for relevance and removing duplicates, 17 articles were retained for full analysis. Data were analysed using qualitative content analysis (Mayring, 2015), following an inductive category development process to identify benefit-related themes, which were then consolidated into a concept matrix mapping benefits against the reviewed studies.

Findings and Contribution

The review identifies 17 distinct benefits, grouped into four aggregate dimensions: Customer Experience and Satisfaction, Operational Efficiency and Cost Savings, Data-driven Insights and Trust, and Business Growth. Findings show that chatbots create value not only through efficiency gains and cost reduction, but also by enabling personalised interactions, supporting data-driven decision-making, and contributing to business growth through improved lead qualification and multilingual reach. The four dimensions appear to be mutually reinforcing rather than independent, with benefits such as data collection functioning as an enabling capability across multiple dimensions.

Originality and Value

This study contributes a structured, evidence-based framework consolidating previously fragmented findings on chatbot benefits in customer service. Unlike prior work examining isolated outcomes, this review offers a broader conceptual lens applicable across industries, providing a foundation for future empirical research and a practical reference for organisations setting realistic expectations around chatbot adoption.

Research Limitations

This review offers limited quantitative evidence to support several reported benefits, as most reviewed studies present qualitative findings. The inclusion of grey literature helped capture practice-oriented insights but introduced variation in methodological rigour. The search was not restricted by industry, which limited depth within any single sector.

Theoretical and Practical Applications and Implications

Theoretically, this review consolidates fragmented findings into a four-dimensional framework that future studies can test or extend across sectors. Practically, the concept matrix

serves as a reference tool, helping organisations identify which benefits are most relevant to their context and prioritise chatbot investment accordingly.

FROM ALGORITHMS TO JUDGEMENT: ARTIFICIAL INTELLIGENCE AND STRATEGIC DECISION-MAKING IN MANAGEMENT

Melillos, George[1]**; Tsikkou, Emily**[1]**; Thanasoula, Panagiota**[1]

[1]College of Business Studies Cyprus (CBS), Nicosia, Cyprus

Keywords: Artificial Intelligence, Managerial Judgement, Strategic Decision-Making, Automation Bias, Sensemaking, Accountability, Human-AI Interaction, Conceptual Framework.

Introduction

Artificial intelligence (AI) is reshaping strategic decision-making, with forecasting models, recommendation engines, and dashboards now central to managerial practice (Vrontis et al., 2022; Csaszar et al., 2024). Existing research emphasises performance benefits but overlooks a deeper shift: AI changes not only what decisions are made, but how managers think and bear responsibility. Prior work examined structural change in AI-mediated decision-making (Shrestha et al., 2019); this study addresses the intra-cognitive mechanisms it leaves underspecified.

Purpose, Aim and Objectives

This study theorises how AI reconfigures managerial judgement in strategic decision-making. Three research questions are addressed. RQ1: How does AI reconfigure information sourcing in managerial judgement? RQ2: How does AI restructure accountability for strategic decisions? RQ3: Under what conditions does AI deployment intensify cognitive risk in high-stakes decisions? The aim is a conceptual framework yielding falsifiable propositions for empirical testing.

Literature Review and Theoretical Framework

Four frameworks are integrated, each with a distinct role. Dual-process theory supplies the cognitive architecture, separating fast System 1 from deliberate System 2 reasoning (Kahneman, 2011). Automation bias specifies its failure mode: under pressure, individuals over-rely on algorithmic outputs (Parasuraman and Manzey, 2010); the two are nested, the second locating where the first breaks down. Sensemaking adds the interpretive demand, as managers must evaluate an AI interpretation, not raw data (Weick, 1995). Accountability

theory supplies the governance constraint: decision-makers must justify choices to relevant audiences (Bovens, 2007), yet algorithmic opacity undermines this capacity. The integration moves beyond the automation-augmentation binary dominating current debate (Raisch and Krakowski, 2021). Individually, each framework explains one facet, cognition, error, interpretation, or accountability, but none captures their simultaneous reconfiguration by AI, the gap addressed.

Methodology and Methods

A conceptual, theory-building design is adopted using integrative literature synthesis (Jaakkola, 2020). Frameworks were selected for explanatory relevance to the cognitive, interpretive, or governance dimensions of AI-mediated decision-making, then integrated through scoping, selection, cross-framework integration, and proposition derivation. Macro-structural frameworks were excluded, as they do not address the intra-cognitive mechanisms central here.

Main Findings and Contribution

The study advances a reconfiguration thesis: AI neither replaces nor augments judgement but restructures the conditions under which it operates, across three causally linked dimensions (RQ1 to RQ3). Information sourcing shifts from interpreting organisational data toward evaluating algorithmic outputs (P1). Accountability becomes structurally diffused as decision rationale migrates into opaque model logic, creating a governance gap that individual diligence cannot resolve (P2). Automation bias is most severe under the time pressure, overload, and uncertainty of high-stakes decisions (P3), misaligning AI deployment with the conditions needing the greatest oversight. The first dimension conditions the second and third, and the third amplifies the second.

Originality and Value

The distinctive contribution lies in treating dual-process theory and automation bias as nested accounts, yielding the non-obvious prediction (P3) that automation bias peaks when oversight is most needed, a claim neither substitution nor augmentation framings generate.

Research Limitations

The framework is conceptual and not empirically tested, and does not address sector, firm-size, regional, or team-level variation.

Theoretical and Practical Implications

Because accountability diffuses structurally (P2), organisations need mandatory decision logs, explainability standards, and override protocols. Because automation bias intensifies under pressure (P3), institutionalised System 2 checkpoints are needed, since voluntary vigilance is insufficient. Management education must treat critical evaluation, contextualisation, and ethical oversight of algorithmic outputs as core competencies. Future research should test the propositions through cognitive task analysis, vignettes, and governance audits.

GENERATIVE ECONOMY AND EFFECTUATION PROCESSES: A CONCEPTUAL FRAMEWORK

Gianpaolo Basile[1], Mario Tani[2], Maria Palazzo[3], Marco Valerio Rossi[4]

[1] Department of Economics, Business and Statistics, Universitas Mercatorum, Rome, Italy

[2] Department of Economics, Management, Institutions, University of Naples Federico II, Italy

[4] Department of Economics, Business and Statistics, Universitas Mercatorum, Rome, Italy

Keywords: Generative AI, Effectuation theory, Innovation ecosystems, Value co-creation, Generative economy

Introduction

The increasing relevance of AI in shaping firm–user relationships is transforming business behaviour, shifting from a "causation" to an "effectuation" approach.

Purpose, Aim and Objectives

In the current era, based on the growing generative economy and a turbulent society, the decision-making process is based on an abductive approach in which the decision maker has to find the problem and, in the absence of antecedent experiences, start, in a creative state, a trial-and-error process to create a conceptual frame on which to base the behaviours.

This trend is shaping decision-making and management approaches, prompting businesses to adopt "effectuative" behaviours, capitalise on their own resources and capabilities, and create relationships with various stakeholders to adapt knowledge to competitive challenges.

The study addresses the following research questions:

- *Are the growing complex user-company interactions shifting decision-making processes from causation to effectuation?*
- *Can GAI help amplify the ecosystem model, leading to a new business configuration?*

Literature Review

The effectuation approach is a more flexible, resource-driven approach in which goals emerge over time in response to available means and evolving knowledge exchange relationships (Racat et al., 2024). It is therefore often associated with high-uncertainty contexts in which outcomes are indeterminate, and adaptability is critical (Sarasvathy, 2001; Garbuio and Lin, 2021; Galkina and Jack, 2024; Joussen et al., 2025).

Methodology and Methods

The work adopts an integrative conceptual approach based on the analysis of literature on causation and effectuation approaches and on generative economy. This work's scientific focus is aimed at presenting a conceptual framework.

Findings and Contribution

The research proposes a conceptual framework in which the Intelligence (AI) has a role in the abductive state (Ranieri et al., 2023; D'Angelo et al., 2024; Davenport and Ronanki, 2018; Cherbib, 2024; Kanbach et al., 2024; Dogru et al., 2025).

Originality and Value

The generative economy trend and the social and economic turbulences are shaping the management approach from a traditional causation-based approach, grounded in the Porterian STP process, to an effectuation approach grounded in relevant reactive behaviours in response to continuous change.

Research Limitations

The work is in progress, and the state of the art is at a conceptual level, lacking a practical application.

Theoretical and Practical Applications/Implications

The paper's contribution is to show how AI is changing decision-making processes, reshaping firm boundaries and business models, focusing on reactive and effectual approaches, and shaping the current economic model into a generative economy.

ETHICAL COLLABORATION OF GAI-HI FOR STRATEGIC MARKETING PLANNING

El-Wakil, Ahmed[1]; Kaufmann, Rüdiger [2]; Thrassou, Alkis [3]; Wagner, Ralf [4]

[1]Management Department, Business School, University of Nicosia, Nicosia, Cyprus
[2]Management Department, Business School, University of Nicosia, Nicosia, Cyprus
[3]Management Department, Business School, University of Nicosia, Nicosia, Cyprus
[4]School of Economics and Management, University of Kassel, Kassel, Germany

Keywords: GAI - HI Collaboration - Ethics - decision-making – problem-solving - Strategy - Marketing Planning

Abstract

In the manufacturing sector, effective strategic marketing planning is essential for sustaining strong relationships between manufacturers and their sales channels (Brooksbank et al., 2018). Within this context, strategic marketing problem-solving can be seen as playing a central role in managing these relationships (Svensson et al., 2023).

The literature review explores the evolving landscape of strategic marketing problem-solving and decision-making, emphasizing that problem-solving is the more relevant for addressing complex challenges. Therefore, professionals must make numerous timely decisions, often by breaking the problem into smaller decisions (Yurtseven et al., 2021). Accordingly, a Conceptual Strategic Problem-Solving Path (CSPSP) is proposed, which decomposes complex strategic marketing planning problems into groups of Decision Units (DUs). Each DU represents a decision-making process aimed at solving a specific sub-problem statement. By addressing all DUs, the main problem statement is resolved.

As GAI increasingly contributes to decision-making while HI remains in the loop, the literature review examines the dynamics of GAI–HI collaboration in strategic marketing (Huang, M. & Rust, 2021). However, the use of AI in decision-making presents ethical challenges (Çerçi, 2024; Islam et al., 2024; Su et al., 2023). Accordingly, this study aims to examine how collaboration between GAI and HI can improve strategic marketing planning decisions (Erlei et al., 2024; Huang, M. & Rust, 2022; Raisch & Fomina, 2023) while carefully addressing the ethical implications of this collaboration (Huang, Y. et al., 2025; Islam et al., 2024; Su et al., 2023).

Therefore, the research questions of this study are:

1- What is the effective collaboration pattern between GAI-HI for achieving successful decision-making in strategic marketing?

2- What are the ethical dimensions and considerations of both GAI and HI in strategic marketing decision-making, and how they interact in practical application?

As pioneers in this field, Huang & Rust (2022) proposed an AI–HI collaboration framework in marketing with three intelligence levels: Mechanical, Thinking, and Feeling. AI is stronger in routine and analytical tasks, while humans excel in contextual, intuitive, and emotional work. Rather than replacing humans, AI should augment and complement human performance.

While their work provides a good foundation, their framework is largely conceptual and offers limited practical and ethical guidance. It was also developed before the rise of GAI.

To address these gaps, this research extends the framework proposed by Huang & Rust into the *Conceptual Ethical Collaboration Framework* (CECF) by incorporating complementary ethical dimensions and themes from the literature.

While the CECF is still under development, it is designed to integrate five ethical dimensions across both GAI (rule-based, outcome-based) and HI (adaptive, moral, affective), while extending its scope to complex strategic decision-making.

As this research focuses on strategic problem-solving in marketing, ten ethical themes were derived from six key frameworks identified in the relevant literature. They explain how GAI–HI collaboration can be managed ethically which are: Accountability, Transparency, Fairness and Non-bias, Human Autonomy and Empowerment, Ethical Governance and Responsibility, Cultural and Societal Ethics, Collaboration and Co-creation, Creativity and Integration, Consumer Protection, Consent, Privacy and Trust, and Sustainability and Long-term Impact (Choudhary, 2025; Hari et al., 2025; Hermann & Puntoni, 2025; Heyder et al., 2023; Kirkby et al., 2025; Madanchian & Taherdoost, 2025). These ten ethical themes are subsequently integrated into the five ethical dimensions of the CECF.

The CECF seeks to bridge the gap between theory and practice (Zhou & Chen, 2023). It integrates ethical considerations into practical marketing decision-making processes, ensuring that collaboration remains ethically grounded. To support practical application, the CECF will be applied to the DUs of the CSPSP proposed earlier.

To empirically examine the CECF, a qualitative case study research method will be applied in a manufacturing context from an interpretivist epistemological stance, making it a domain

specific. This approach is particularly effective for exploring complex phenomena that cannot be fully understood through other research methods (Kuckartz, 2014).

The study employs purposive sampling and semi-structured interviews with 10 experts each in strategic marketing, AI development, and AI ethics, all with professional expertise. The interview guide will be pre-tested, and snowball sampling will be used to recruit additional participants. (Naderifar et al., 2017).

The interview transcripts will be coded and organized into themes. Subsequently, a thematic analysis, supported by MAXQDA software (Kuckartz & Rädiker, 2019), will be conducted to identify diverse perspectives on collaboration patterns, recurring ethical tensions, and the role of human oversight.

The study aims to identify GAI–HI collaboration patterns, key ethical issues, and the role of human oversight in marketing decisions. It will develop a framework linking collaboration with ethics, supporting better marketing strategies and future research.

DOES INFORMATION SHARING HELP OR HURT COLLECTIVE INNOVATION IN AI-BASED ECOSYSTEMS?

Labonia, Umberto[1]; Bargoni, Augusto[1,2]; Bresciani, Stefano[1,3]

[1]Department of Management "Valter Cantino", University of Turin, Turin, Italy
[2]Faculty of Informatics and Statistics, Prague University of Economics and Business, Prague, Czech Republic

Keywords: AI-based ecosystems, collective innovation, information sharing, procedural justice, knowledge withholding, learning investment

Introduction

AI-based innovation ecosystems depend on interdependent actors who combine data, technical expertise and domain knowledge across organisational boundaries. To coordinate these contributions, ecosystem orchestrators often formalise information sharing requirements. Yet mandatory sharing is ambivalent: it can improve comparability and learning, but it can also heighten concerns about knowledge leakage and appropriation (Laursen and Salter, 2014; Secundo et al., 2025).

Purpose, Aim and Objectives

This study examines when information sharing requirements help or hurt collective innovation. It asks whether stricter requirements reduce collective innovation directly and indirectly through two opposing behavioural mechanisms: defensive knowledge withholding and learning investment. It also tests whether procedurally fair governance changes this balance.

Literature Review and Theoretical Framework

Collective innovation is defined as the joint generation, integration and refinement of novel ideas, prototypes or solutions by interdependent ecosystem actors. It is therefore bounded to ecosystem-level outcomes requiring cross-actor knowledge integration, rather than single-firm innovation

performance or generic collaboration quality (Dhanaraj and Parkhe, 2006; Adner, 2017). Stricter information sharing requirements should increase defensive knowledge withholding because actors may restrict or sanitise valuable inputs when visibility and transferability rise. This should damage collective innovation by reducing the completeness and recombinability of contributions. However, the same requirements may also stimulate learning investment by clarifying what knowledge is needed, how it should be exchanged and how actors can jointly develop solutions. Procedural justice, understood as transparent, consistent and correctable governance, should weaken the protection pathway and strengthen the learning pathway (Adamovic, 2023).

Accordingly, we hypothesise that stricter information sharing requirements reduce collective innovation (H1), increase defensive knowledge withholding (H2), and increase learning investment (H4); defensive withholding decreases collective innovation (H3), whereas learning investment increases it (H5); procedural justice weakens the requirement-withholding relationship (H6a) and strengthens the requirement-learning relationship (H6b).

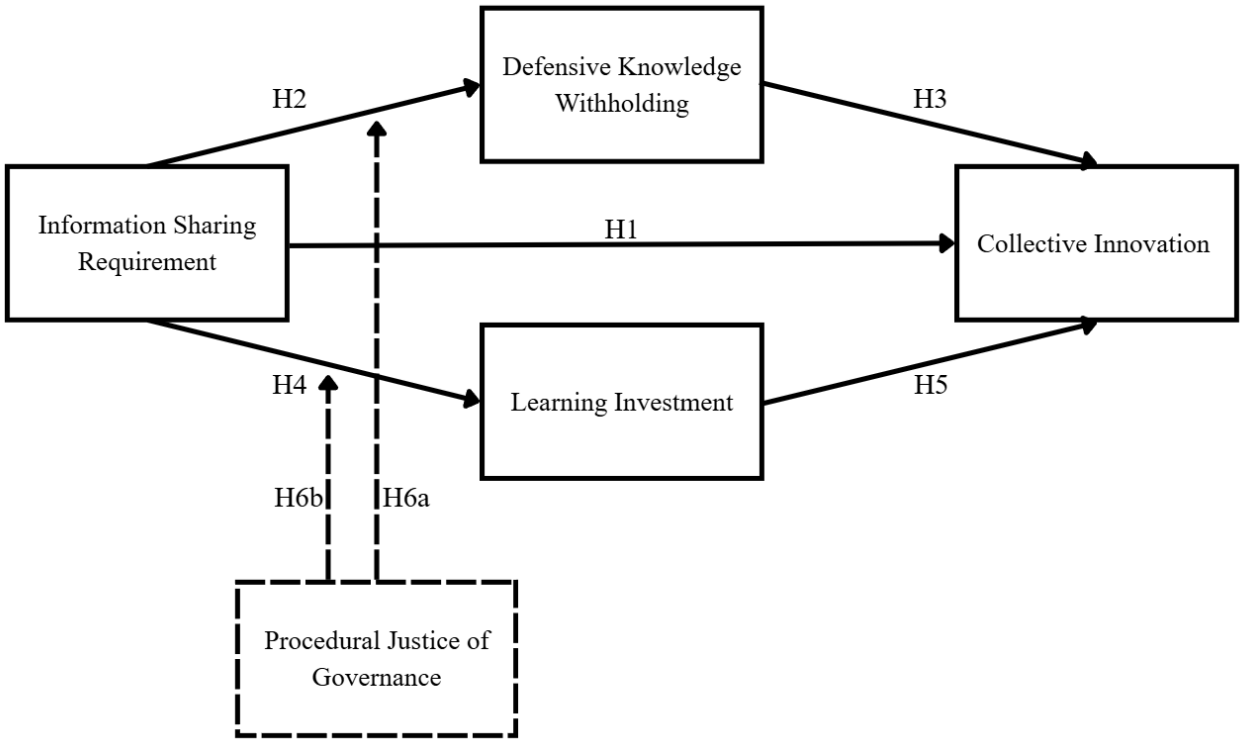

***Figure 1**: Conceptual framework*

Methodology

Data will be collected through an online 2×2 randomised vignette experiment. Information sharing requirements vary between low discretion and high scope and standardisation, while procedural

justice varies transparent criteria, consistent enforcement, and voice and correction opportunities. Collective innovation captures expected contribution to shared development through knowledge integration and co-creation. Hypotheses will be tested with factorial regression and bootstrapped conditional indirect effects.

Expected Findings and Contribution

We expect stricter requirements to reduce collective innovation when defensive withholding outweighs learning investment, especially under low procedural justice. Under high procedural justice, defensive withholding should decline and learning investment should dominate, producing a less negative or positive net effect. The study contributes by shifting attention from openness as a structural design choice to the behavioural consequences of mandatory sharing in AI-based ecosystems. It explains why the same governance requirement can generate opposite behavioural responses and identifies procedural justice as a boundary condition that rebalances protection and learning.

Originality and Value

The study specifies the micro-behavioural tension behind ecosystem openness: actors may comply with formal sharing while still protecting their most valuable knowledge. This distinction clarifies why information sharing mandates may fail even when they improve transparency.

Research Limitations

The study relies on scenario-based behavioural intentions rather than observed ecosystem behaviour. Its findings therefore require validation across real AI-based ecosystems and different appropriation regimes.

Theoretical and Practical Implications

For managers, the study indicates that more information sharing is not automatically beneficial. Orchestrators should pair demanding requirements with transparent rules, consistent enforcement, voice mechanisms and credible correction procedures, because these practices target defensive withholding while preserving the learning benefits of richer exchange.

FROM THE BRIGHT TO THE DARK SIDE OF STRATEGIC LEADERSHIP IN AI MANAGEMENT: A MULTI-ECHELON PERSPECTIVE FROM SMES

Bevilacqua, Simone[1,2]; Baima, Gabriele[1]; Ferraris, Alberto[1,3]

[1] Department of Management "Valter Cantino", University of Turin, Turin, Italy

[2] Department of Management and Marketing, University of Innsbruck, Innsbruck, Austria

Keywords: Strategic Leadership, Artificial Intelligence, Dark Side, Top Managers

Artificial intelligence (AI) has rapidly become a central driver of digital transformation in organizations, reshaping organizational processes and decision-making (Enholm et al., 2022). Unlike previous waves of digitalization, AI encompasses heterogeneous technologies such as generative AI, machine learning algorithms, robotics, and augmented reality that introduce autonomous, adaptive, and learning-based capabilities directly influencing how decisions are generated, evaluated, and executed, and overall performance (Bevilacqua et al., 2026; Mikalef & Gupta, 2021).

As AI increasingly permeates strategic decision processes, its implementation becomes not merely a technological issue but a leadership challenge (Enholm et al., 2022). Within the strategic leadership literature, scholars underscore the pivotal role of top managers in shaping AI adoption, portraying AI as a strategic enabler that enhances decision-making and creates new managerial roles and skills (Bevilacqua et al., 2025, 2026; Jorzik et al., 2023). However, this literature remains predominantly focused on the positive implications of AI for leadership, underexploring the potential dark side of strategic leadership in AI-enabled contexts.

A parallel stream of research has increasingly drawn attention to the unintended consequences of AI use, highlighting risks such as bias amplification, opacity, accountability gaps, and reduced human agency (Mikalef et al., 2022). More recently, leadership research has suggested that managing human–AI collaborations may induce moral relativism among leaders, increasing the likelihood of unethical behaviour (He et al., 2025). Taken together, these insights suggest a critical theoretical gap. While prior research has extensively examined how AI enhances strategic leadership, we still lack clarity on which negative leadership practices may

emerge from AI management and their consequences for employees across organizational levels.

Grounded in a multi-echelon strategic leadership perspective that considers both leaders' and followers' dynamics, this study investigates the potential dark side of strategic leadership in AI management. Accordingly, we address the following research question: What negative leadership practices emerge in the management of AI use, and what are their consequences for employees?

To address this question, we conducted a qualitative study of Italian SMEs that have adopted AI technologies. Our data include semi-structured interviews with top managers, middle managers, and/or employees, complemented by focus groups and internal documents, analyzed using the Gioia methodology.

Preliminary findings reveal three recurring negative leadership practices in AI management. First, we identify AI micromanagement, whereby leaders intensify algorithmic monitoring and control, generating social stress and reducing employee autonomy and creativity. Second, we observe AI washing, characterized by the symbolic adoption of AI without clear strategic alignment, process redesign, or upskilling investments, leading to employee disengagement, loss of direction, and resistance to technology. Third, we uncover AI productivity intensification, in which leaders implicitly raise output expectations enabled by AI tools without redefining workload boundaries or sustainability norms, resulting in expanded task scope, accelerated work rhythms, and increased cognitive strain, while heightening the risk of opportunistic and ethically questionable behavior.

This study contributes to strategic leadership research by showing, beyond the optimistic perspective, the dark side of leadership in the management of AI inside organizations. Adopting a multi-echelon perspective, it considers followers' experiences and the consequences of negative AI leadership practices. Finally, for managers, the findings highlight the need for governance mechanisms that preserve discretion, autonomy, and ethical responsibility.

LEARNING TO SCALE: WHAT MENTORING REALLY DOES FOR STARTUPS

Macca, Luca Simone[1]; Daou, Alain[1,2]

[1] Faculty of Business, American University of Beirut – Mediterraneo, Paphos, Cyprus

[2] Olayan School of Business, American University of Beirut, Lebanon

Keywords: *Entrepreneurship, Mentoring, Entrepreneurial ecosystem, Scalability, Startups, Business models, Innovation*

Abstract

In contemporary entrepreneurial ecosystems, early-stage ventures are increasingly exposed to strong pressures to demonstrate scalability, legitimacy, and investment readiness at very early stages of development (Stein et al., 2026; Spigel, 2017; Troise et al., 2022). Mentorship programs have emerged as a central mechanism through which startups are guided in navigating these pressures, particularly in accelerator- and university-affiliated settings (Eesley and Lee, 2021; Lall et al., 2023). Prior research positions mentoring as a key mechanism through which early-stage founders gain access to experiential knowledge, strategic feedback, and social capital, thereby helping them cope with uncertainty and resource constraints (Yusubova and Knoben, 2025; Wu and Tsao, 2025). Empirical studies consistently show that founders value mentoring highly and often cite it as a primary reason for participating in structured support programs (Kirsch et al., 2025; Yusubova and Knoben, 2025).

The dominant stream of mentoring research adopts an outcome-oriented perspective. Quantitative, experimental, and survey-based studies link mentoring to outcomes such as entrepreneurial self-efficacy, opportunity recognition, strategic goal attainment, and major strategic decisions including pivoting (Kirsch et al., 2025; Pereyra et al., 2021; St-Jean and Tremblay, 2020). Recent work further demonstrates that the framing of mentor feedback matters, showing that concrete feedback increases the likelihood that entrepreneurs act on advice compared to more abstract guidance (Welbourne and Miller, 2026). While these studies establish that mentoring can influence entrepreneurial behaviour, their findings are often context-dependent, and similar mentoring interventions frequently produce heterogeneous outcomes across ventures.

To address these limitations, a growing body of research conceptualises mentoring as a relational and cognitive process embedded in ongoing interaction. For example, drawing on socially situated cognition and sensemaking perspectives, Kaffka et al. (2021) highlight how feedback from mentors and other stakeholders can disrupt entrepreneurs' existing assumptions and trigger new sensemaking through reframing, questioning, and reinterpretation. Process-oriented studies of entrepreneurial learning similarly show that entrepreneurs dynamically shift between exploratory and exploitative learning strategies in response to uncertainty and feedback, with learning trajectories shaped by situational conditions and interactional contexts (El-Awad, 2023; McKevitt and Marshall, 2015). A similar stream of research on sustainability-driven enterprises further demonstrates that entrepreneurs engage in different patterns of sensemaking depending on the ambiguity and urgency of the issues they face (Zeng et al., 2026).

Despite these advances, mentoring interactions themselves remain underexplored. Most studies rely on retrospective accounts, experiments, or surveys, rather than examining mentoring interactions as they unfold over time. This aspect follows an evident need to investigate and learn more about how the mentor-mentee relationship transforms in scalability and business model transformation. While research on scaling, pivoting, and platform growth identifies key drivers of venture growth and strategic reorientation (Granot et al., 2026; Macca et al., 2025; Nagy et al., 2025), it largely focuses on outcomes rather than on how founders learn to think in scalable terms. This lack of knowledge is especially evident for early-stage ventures, where scalability requires cognitive, strategic, and identity transformations (Liu et al., 2026; Somaya and You, 2024). In this regard, the literature points to a need for longitudinal, interaction-level research that examines how mentoring shapes founders' sensemaking and scalability thinking over time.

Building on the above literature, this study examines mentoring as an evaluative and sensegiving process that structures how scalability is defined, assessed, and enacted in early-stage ventures. Building on qualitative evidence from a longitudinal mentorship program involving five startups operating across diverse sectors (e.g., digital platforms, marketplaces, creative industries, and knowledge-intensive services), this research investigates how mentoring interactions reshape founders' interpretations of venture progress and legitimacy. Each startup was supported through multiple semi-structured mentoring sessions over time, generating a rich dataset of recorded and transcribed interactions that captures both mentor interventions and founder responses as they unfolded. Data collection was also supported by documentary and observational evidence (e.g., mentoring policy statements, guidelines and

procedures, company websites and business plans), which were useful in validating the startup's development phase and identifying milestones.

Our preliminary findings show that: (1) mentoring consistently installed what we conceptualise as a scalability evaluative regime. Through repeated interactions, mentors introduced external evaluative criteria aligned with investor, partner, and market expectations, thereby shifting attention away from internally meaningful indicators such as effort, creativity, or early traction; (2) founders did not respond uniformly to this evaluative regime: instead, they engaged in active sensemaking and boundary work as they interpreted and translated mentoring input into action; (3) over successive interactions, these sensemaking responses stabilised into three distinct emergent scalability trajectories (i.e., relabeling trajectory, systematising trajectory, narrativising trajectory), which illustrate that scalability is not a singular outcome but an emergent process shaped by how evaluative criteria are enacted in practice.

The contribution of this study is threefold. First, it advances entrepreneurial mentoring research by conceptualising mentoring not only as relational support or knowledge transfer, but as an evaluative sensegiving process that actively structures how ventures are assessed and understood. Second, it contributes to the entrepreneurship and scalability literature by showing that scalability emerges through multiple trajectories rather than converging on a single dominant model. Third, it offers practical implications for the design of mentorship and accelerator programs by highlighting the unintended consequences of evaluative regimes and the importance of recognising founder sensemaking dynamics.

DOES PUBLIC FUNDING DRIVE SME INNOVATION? RETHINKING INNOVATION SUPPORT FOR SMES.

Peiro-Signes, Ángel[1]; Segarra-Oña, Marival[1]; García-Meseguer, Carlos[1]; Sempere-Ripoll, Francisca[1]

[1]Management Department, Universitat Politècnica de València, Valencia, Spain

Keywords: SME innovation, Public funding**,** Non-R&D innovation**,** Innovation pathways

Introduction

European innovation policy has long emphasized public funding and R&D expenditure as key instruments for fostering innovation, particularly among small and medium-sized enterprises (SMEs). However, increasing evidence shows that SME innovation rarely depends on R&D alone. Firms instead combine internal R&D, non-R&D innovation activities, technology adoption, cooperation, and strategic orientation in diverse ways. This raises a critical question: when these drivers are considered jointly, does public funding act as a decisive catalyst for SME innovation, or does it mainly reinforce innovation efforts already underway? Addressing this issue is essential for designing innovation policies aligned with the actual innovation behavior of SMEs.

Aim of the Study

The purpose of this study is to reassess the role of public funding in SME innovation within a broader configuration of innovation drivers. The main aim is to identify combinations of firm-level characteristics that distinguish innovators from non-innovators and to assess the relative contribution of public funding within these configurations.

Theoretical Framework

The study builds on literature highlighting the limitations of linear innovation models and the heterogeneity of SME innovation processes. The Science Technology Innovation (STI) and Doing Using Interacting (DUI) frameworks emphasize that firms may innovate through formal R&D or through practice-based learning, technology adoption, and interaction with external actors (Jensen et al., 2007; Asheim and Coenen, 2006). Empirical research on public funding reports mixed

effects, often contingent on firm characteristics and innovation type (Bronzini and Piselli, 2016). Recent studies therefore call for approaches that capture complementarities and non-linear interactions among innovation drivers (Hervás-Oliver et al., 2021). This study adopts a configurational perspective consistent with these insights.

Methodology

The empirical analysis uses firm-level data from the Spanish sample of the 2018 Community Innovation Survey, covering 26,270 SMEs. Firms are classified as innovators or non-innovators based on the introduction of product and/or process innovations. A supervised machine-learning classification approach is employed, using Extreme Gradient Boosting (XGBoost) to model non-linear relationships and interactions. Feature selection is conducted using the Boruta algorithm, while model interpretability is enhanced through SHapley Additive exPlanations (SHAP) and a surrogate decision tree identifying recurrent configurations associated with innovation or non-innovation.

Main Findings and Contribution

The results show that SME innovation is multi-path. Several distinct combinations of drivers are sufficient to generate innovation outcomes. Non-R&D innovation expenditure, sustained in-house R&D with a strategic focus on new products, adoption of new machinery and software, and cooperation emerge as the most influential drivers. Their joint absence almost always leads to non-innovation. Public funding for R&D shows a positive but comparatively modest influence: its effect strengthens when combined with other drivers but it does not function as a standalone determinant of innovation. These findings challenge policy approaches focused narrowly on expanding funding volumes or R&D inputs.

Originality and Value

The study shifts the analytical focus from average funding effects to the configurations that characterize innovative SMEs. By applying interpretable machine-learning techniques to large-scale microdata, it uncovers heterogeneous innovation pathways that remain hidden in conventional linear models and provides a more realistic understanding of the conditional role of public funding.

Research Limitations

The analysis relies on cross-sectional, self-reported survey data, which may involve recall bias and limits causal inference. The absence of detailed information on funding amounts, timing, and duration constrains the assessment of intensity and lagged effects. The focus on Spanish SMEs also limits generalizability to other institutional contexts.

Theoretical and Practical Implications

Theoretically, the findings support configurational and systemic views of innovation, reinforcing the relevance of the STI and DUI frameworks. Practically, they suggest that innovation policy should link funding more closely to concrete innovation activities—such as non-R&D projects, technology adoption, and cooperation—rather than treating funding as an end in itself.

THE AI CO-FOUNDER: A TYPOLOGY OF STUDENT-AI INTERACTIONS IN THE ENTREPRENEURIAL "FUZZY FRONT END"

Gil-Or, Oren[1]

[1]School of Management & Economics, The Academic College of Tel Aviv-Yaffo, Tel Aviv-Yaffo, Israel

Keywords: Entrepreneurship Education, Generative AI, Ideation, Human-AI Collaboration, Opportunity Recognition, Prompt Engineering, Co-creativity.

Introduction

The "fuzzy front end" of entrepreneurship—the chaotic initial stage of opportunity identification—is traditionally a cognitive bottleneck for novice entrepreneurs. The integration of Generative AI (GenAI) agents into this process promises to alleviate cognitive friction. However, while the technical capabilities of Large Language Models (LLMs) are well-documented, the nature of the *dialogue* between nascent entrepreneurs and AI remains underexplored. Does the AI act as a mentor, a tool, or a crutch? This study analyzes naturalistic conversation logs to categorize emerging patterns of student-AI interaction.

Purpose, Aim and Objectives

The primary aim is to empirically classify how MBA students utilize GenAI during venture ideation. The objectives are: (1) to identify distinct typologies of user interaction; (2) to assess the correlation between interaction style and business model viability; and (3) to determine if AI fosters critical thinking or cognitive offloading.

Literature Review and Theoretical Framework

The study is grounded in the theory of Human-Computer Co-Creativity, which posits that creative output is a function of the collaborative friction between human intent and machine generation (Dell'Acqua et al., 2023). Previous literature on entrepreneurship education emphasizes "divergent thinking" as a core skill (Girotra et al., 2023). However, recent studies

suggest a risk of "cognitive offloading," where users uncritically accept AI outputs (Mollick and Mollick, 2023). This research addresses the gap regarding conversational mechanics, specifically, how students negotiate validity and feasibility with an AI agent prone to "hallucinations", by questioning whether students treat the AI merely as a passive search engine or engage it as an active co-founder.

Methodology and Methods

The study employs a qualitative, inductive research design. The dataset consists of 40 complete conversation logs between MBA students and a custom "Ideation AI" bot, collected during a graduate-level entrepreneurship course. The data was subjected to thematic content analysis to map prompt strategies, iteration frequency, and decision-making patterns. The unit of analysis was the full conversation thread, tracing the evolution of the concept from initial prompt to finalized Business Model Canvas.

Main Findings and Contribution

The analysis reveals three distinct typologies of Student-AI interaction, forming a U-shaped utility curve:

- ***The outsourcer (Low agency - 15%):*** Students utilized AI to bypass cognitive effort (e.g., *"Find me a venture that earns 2 million"*). These interactions produced generic, "hallucinated" opportunities with low market viability. The students accepted high-level abstractions as actionable plans.
- ***The validator (Medium agency - 55%):*** The majority used AI to confirm pre-existing biases. The AI served as a "feasibility check", refining financial assumptions but rarely altering the core value proposition.
- ***The commander (High agency - 30%):*** This cohort engaged in "adversarial collaboration." These users, often with domain expertise, explicitly corrected the AI's technical assumptions. Some employed advanced prompt engineering (e.g., defining <ROLE> and <TASK> tags) to force specific outputs. These interactions produced the most distinct and viable business models.

Crucially, the U-shaped utility suggests that without human agency, AI democratization risks widening the competence gap between 'Commanders' and passive users.

Originality and Value

This research offers one of the first empirical taxonomies of *actual* student-AI dialogues, moving beyond self-reported surveys. It contributes to the field by demonstrating that "Prompt Engineering" is a proxy for entrepreneurial agency.

Research Limitations

The study is limited to a single cohort in the Israeli ecosystem. Future research should examine cross-cultural differences in AI adoption.

Theoretical and Practical Implications

Theoretically, this refines the *Opportunity Recognition* model by inserting "Algorithmic Iteration" as a critical stage. Practically, it highlights the need for curricula teaching "Conversational Competence", critically leading AI rather than passively following. Developing 'Conversational Competence' empowers students to strategically direct AI, preventing uncritical cognitive offloading. Curricula must therefore prioritize 'prompt leadership', teaching students to manage AI as a critical co-founder rather than an oracle.

PROMOTING SUSTAINABILITY IN PERIPHERAL REGIONS: A REGIONAL ECONOMIC DEVELOPMENT (RED) MODEL

Keywords: Sustainability, Peripherality, Regional Development, Spillovers, Income Leakages.

Abstract

The growing concentration of innovation-driven economic activity in core metropolitan areas threatens the sustainable development of peripheral regions. Conventional aid programs are giving way to place-based strategies that harness endogenous regional resources. Yet most computable general-equilibrium (CGE) models, the standard tools for policy appraisal, operate at the national scale and generally treat regions as passive recipients. This study adopts the regional system (RS) approach and contributes a step towards its practical implementation with the introduction of a Regional Economic Development (RED) model, a CGE framework that embeds the region as an explicit behavioral block inside a national system. The model comprises four interlinked modules and makes a key distinction, often overlooked in the RS literature, between a region's domestic product (output generated within the territory) and its regional product (income earned by resident labor and capital, irrespective of where those factors are employed). This distinction captures income leakages and interregional spill-overs, factors that are critical for peripheral economies. Scenario analysis couples exogenous policy levers, tax incentives, infrastructure upgrades, human-capital investment, with endogenous outcomes such asemployment, income, and structural change. By disentangling internal production capacity from external income opportunities, the RED model lets policymakers compare strategies that prioritize local output with those that maximize household welfare. Iterative simulations reveal feasible development targets, the policy mixes required to achieve them, and the structural implications of each trajectory.

CORPORATE VENTURE CAPITAL PERFORMANCES IN INNOVATION ECOSYSTEMS – EVIDENCE FROM STARTUPS

Abstract

Corporate Venture Capital (CVC) initiatives may foster entrepreneurial outcomes adopting a strategic perspective that focuses on relational-embedded ecosystems and not only on the outputs of discrete transactions. Grounded in the Knowledge-Based View and in the Innovation Ecosystems framework, this research aims to examine how CVC operational intensity and network embeddedness may shape startup (SU) funding and innovation. Analyzing a large-scale panel constructed from Crunchbase and USPTO PatentsView data, the investigation results show that startups assisted by CVC with high operational intensity and high network embeddedness exhibit enhanced entry to further funds and superior innovation performance. In addition, a moderating role of technological intensity seems to exist, meaning that CVC engagement may probably rely more on the ecosystem positioning than on the technological context. Envisioning CVC as an embedded, learning-oriented dynamics, this research aims to provide novel empirical evidence on the mechanisms of value creation management in

entrepreneurial finance, highlighting the relational impact of corporate investors within broader innovation networks.

Introduction

Corporate Venture Capital (CVC) is a form of entrepreneurial finance that has constantly intensified innovative responding to environmental demands, emerging technologies, and increasing situational uncertainties (Xiao et al., 2025). In this vein, innovation emerges as the outcome of multiple interconnected relationships among disruptive companies (and mainly startups), investors, large corporations, and institutions, each characterized by continuous change (Jha and Basu, 2025).

This study aims to understand some nuances of the transforming dynamics of CVC from the perspective of the innovation ecosystems, focusing on the emerging integration of open innovation, knowledge management, and intellectual capital into the ecosystem value creation (Bugl et al., 2022). More specifically, adopting the theoretical approach of the Knowledge-Based View (Pereira and Bamel, 2021) in combination with the Innovation Ecosystems framework (Toth and Hary, 2024), CVC is assumed as an entrepreneurial activity with multiple dimensions, with particular focus, within this setting, on operational intensity and networked embeddedness.

Background and Hypotheses

Iin terms of entrepreneurial finance management, CVC means and implies much more than the mere finding of innovation outside the organization (Rossi et al., 2022). In truth, CVC is also and perhaps most of all a way for big players to prepare for uncertainty regarding innovation, exploring and exploiting new business trajectories without the large and permanent cost of working on new applications internally or purchasing competing companies (Ryu et al., 2025). Several studies have further elaborated this perspective focusing on the distinction between strategic and financial CVC activities: strategic CVC is designed for gaining advantages in terms of knowledge spillover, identifying and creating new complementary technologies (Bugl and Kanbach, 2022), while financial CVC is designed for portfolio firm gains (Szalavetz and Sauvage, 2024). In truth, CVC has consistently shown some orientation toward creating hybrid value or value adjacency (Kronberger et al., 2025).

In this respect, Venture Capital (VC) environments are interconnected through factors that may influence investment decisions, like syndication patterns, reputational assets, and recurring interactions among diverse investors (Danneels and Miller, 2023). In this regard, the Knowledge-Based View and the Innovation Ecosystem framework appear as essential development perspectives when considering investments that are operated with the intention to go beyond the first round and approaching a broader entrepreneurial system vision with a broader performance system evaluation. More specifically, the following research hypotheses have been conceived with specific focus on startups, due to their peculiar nature of entrepreneurial ventures starving for financial funds, professional competences, and business relations (Errico et al., 2024).

First, when CVC operational intensity is intended more in terms of experience, learning, and competence (rather than just strict control of the backed startup), the advantages of better knowledge management are likely to succeed (Rossi et al., 2022). Thus, it is assumable that higher levels of operational intensity in CVC initiatives on startups could lead to better entrepreneurial results of the backed startups (Seitz et al., 2026).

Hypothesis 1 (H1): There is a positive association between the CVC operational intensity and the entrepreneurial performance of CVC-backed startups.

Second, a strong network embeddedness can bring some risks, because 'central' players often face more coordination tasks, which can lead to information overload: in addition, being central might heighten conflicts of interest or distract from the needs of individual portfolio companies (Anokhin et al., 2011). More in general, however, even with these potential downsides, the advantages of being embedded in an ecosystem likely outweigh the potential associated costs, especially when paired with relevant CVC involvement (Haslanger et al., 2023).

Hypothesis 2 (H2): There is a positive association between the CVC ecosystem embeddedness and the entrepreneurial performance of CVC-backed startups.

Third, and finally, technological intensity seems to play an ambiguous role, potentially moderating interactions in enhancing some value creation mechanisms while lowering others (Xie and Wang, 2025). Thus, it is assumable that the conditions of the technological environment might influence how the CVC engagement affects the entrepreneurial outcomes (Sharan et al., 2023).

Hypothesis 3 (H3): The positive association between the CVC engagement and the entrepreneurial outcomes of CVC-backed startups depends on the technological intensity of the environment.

Methods

As regards the variables, to measure the CVC outcomes in startup investments, data has been extracted from the Crunchbase open datasets, which provide relating information about startups, investors, funding rounds, and their institutional relationships (Crunchbase.com). To measure the innovation outcomes, data has been extracted from the United States Patent and Trademark Office (USPTO) PatentsView database (Patentsview.org), which provides details on patent applications, assignees, and tech classifications. Additionally, further data from the World Bank (Worldbank.org) and the OECD – Organization for Economic Cooperation and Development (Oecd.org) archives has been investigated to provide more contextual information regarding the economic and technological conditions at the country level.

As regards the sample, the perimeter under investigation has included, starting from the abovementioned databases, 5,420 startups and 845 CVC firms from around the globe. Table 1 provides an overview of all the variables that have been used in the analysis, together with their measurements (as per underlying theoretical foundations and/or similar studies in the field).

Variable	Level	Measurement
Innovation performance	Startup–year	Number of patent applications (IPC – Intellectual Property Committee scope)
Follow-on funding	Startup–year	Dummy = 1 if a new funding round occurs
Post-investment capital	Startup–year	Logarithm of the raised capital
Operational intensity	Investor	Cumulative number of prior CVC investments
Ecosystem embeddedness	Investor–year	Degree and betweenness centrality
Technological intensity	Industry	Patent intensity, R&D expenditure
Control variables	Multiple	Age, prior funding, industry, country, year

Table 1: Variables' overview (authors' elaboration).

As regards the investigation methods, a blended approach including descriptive statistics and inferential statistics (namely, logistic regressions and linear regressions) has been adopted.

Results

About H1 and H2. As shown in Table 2, the correlations indicate that both operational intensity and ecosystem embeddedness have a positive relationship with the innovation outcomes and the funding outcomes of CVC-backed startups, although with some weakness. These insights pave the way for further multivariate analysis that may explore the combined effects of CVC operational intensity and ecosystem embeddedness.

Variable	Mean	SD	1	2	3	4
1 SU Patents	2.140	4.870	1,000	-	-	-
2 SU Follow-on funding	0.410	0.490	0.320	1,000	-	-
3 CVC Operational intensity	18.600	27.400	0.280	0.210	1,000	-
4 CVC Ecosystem embeddedness	0.037	0.062	0.310	0.260	0.440	1,000

Table 2: Descriptive statistics and correlations (authors' calculation).

About H3. As shown in Table 3 and Table 4, the technological context is a background in which, in this scenario, the interaction terms are related with the CVC engagement. The trend of interaction effects is positive but ambiguous, as supposed, implying that although the technological context affects the impact of both CVC operational intensity and CVC ecosystem embeddedness on entrpreneurial outcomes, it does not explain it unequivocally.

Variables	Model 1	Model 2	Model 3	Model 4

Operational intensity (OI)	+***	+***	+***	+***
Ecosystem embeddedness (EE)	/	+***	/	+***
Technological intensity × CVC engagement (OI/EE)	/	+*	+*	/
Controls	Yes	Yes	Yes	Yes
Year & Country	Yes	Yes	Yes	Yes

*Table 3: CVC engagement and innovation outcomes (authors' calculation) (*p < 0.10; **p < 0.05; ***p < 0.01).*

Variables	Follow-on funding	Capital raised
Operational Intensity (OI)	+***	+**
Ecosystem Embeddedness (EE)	+***	+***
Technological intensity × CVC engagement (OI/EE)	?	
Controls	Yes	Yes

*Table 4: CVC engagement and funding outcomes (authors' calculation) (*p < 0.10; **p < 0.05; ***p < 0.01).*

Discussion

The results of the study offer empirical evidence showing that CVC influences entrepreneurial outcomes in several ways that go far beyond just providing financial support (Benkraiem et al., 2023). Focusing on both operational intensity and ecosystem embeddedness, the findings help better understand how corporate investors add value to entrepreneurial environments (Meng et al., 2023), naturally in particular when startups (which constitute the units of analysis in the investigated perimeter).

Both the levels of CVC engagement stand out as crucial factors driving innovation and funding success for startups. Moreover, the varying impact of the technological intensity highlights the significance of contextual factors, indicating that the success of CVC is not just about having corporate investors on board, but also about how and where these venture activities are situated and contextually managed.

These findings seem to strengthen the perspective of CVC as a phenomenon that is deeply embedded in innovation ecosystems and that is constantly driven by capabilities (Weiss and

Kanbach, 2022). More specifically, the success of corporate investments in startups hinges not only on whether corporations choose to invest, but also on the depth of their engagement over time and on their position within those entrepreneurial networks, helping startups or more in general backed firms secure both financial and non-financial resources (Bauer et al., 2024).

Implications

The study seems to reveal several key outcomes with significant scientific implications. One of the main findings highlights the crucial role of CVC in promoting entrepreneurship within innovative settings: this research enhances the existing scientific literature on CVC by framing corporate venture investing as a continuous, learning-oriented entrepreneurial practice instead of just a one-time investment decision (Tootoonchy and Sajadi, 2024). Additionally, it makes a valuable contribution to ecosystem and network studies by establishing a clear link between the network connections of CVC investors and the subsequent entrepreneurial success (Noyes et al., 2014; Baierl et al., 2016; Chen et al., 2023). Lastly, the study points out that the level of technological intensity can influence the analysis of how CVC initiatives might impact different technological profiles (Mayya and Huang, 2025).

The study also seems to reveal several relevant outcomes that have implications for management. One key takeaway is that professional management of CVC initiatives needs focusing on multiple levels (financial, organizational, and so on), going beyond the mere opportunistic investment: the positive impact of operational intensity on entrepreneurial outcomes indicates that successful CVC programs need long-term commitment and focus on organizational learning (Battisti et al., 2022). Secondly, the significance of being embedded in an ecosystem underscores the strategic advantage of actively engaging in venture capital networks (Noyes et al., 2014). Lastly, various technological contexts can affect the overall success of CVC initiatives, necessitating tailored actions that are specific to each industry (Xue et al., 2026).

Conclusion, Limitations, and Future Directions

As regards the potential limitations of this study, there are few important points to consider that could pave the way for future developments. The observational research design makes it tricky to draw causal conclusions, and using publicly available data might lead to some measurement

errors or at least some bias (institutional data normally responds to institutional more than entrepreneurial needs). Therefore, future studies could adopt quasi-experimental designs, delving into the micro-level interactions, maybe also investigating the differences across countries. Additionally, it would be worthwhile to explore some less favorable aspects of the ecosystem embeddedness, such as coordination costs and conflicts of interest.

Going beyond the mere financial perspective, this research shows how CVC influences entrepreneurial outcomes through various avenues of growth, expansion, and development (Röhm, 2018). In this specific investigation, the focus is on ecosystem embeddedness and ongoing engagement, with the related findings that highlight the relevance of contextual factors in the success of CVC initiatives, most of all in startups, from a knowledge-based angle, providing a nuanced understanding of the specific relational and industrial contexts involved (Frey and Kanbach, 2024).

THE IMPACT OF CHATGPT ON EDUCATION AND ITS INFLUENCE ON THE LABOUR MARKET

Andrea Bencsik[1], Timea Juhasz[2]

Wekerle International University, Budapest, Hungary

University of Sopron, Sopron, Hungary

Keywords: ChatGPT, higher education, knowledge, labour market, personal development, skills, students

Introduction

The digital transformation of higher education has accelerated over the past decade. ChatGPT, a large language model developed by OpenAI, is one of the most significant innovations, capable of natural-language interaction, text generation, summarisation, and explanation (OpenAI, 2023). ChatGPT can improve university students' learning outcomes. Employers point out that labour market expectations are constantly changing as artificial intelligence (AI) develops and its potential applications emerge (Wang, 2026). New professions are emerging, while others are fading into the background. Close collaboration between higher education and the labour market is needed, along with clear communication of expectations, building on the existing and expected skills of young people.

Purpose, Aim, and Objectives

The purpose of this study is to examine the role ChatGPT plays in the learning processes of university students in Mediterranean countries, the areas in which it is most frequently used, and its potential impact on learning, academic performance, and personal and professional development. A further objective is to examine how the use of ChatGPT affects the skills expected in the labour market, the evolving expectations in the workplace, and changes in the nature of work.

Literature Review and Theoretical Framework

According to a study by Cotton et al. (2023), more than 60% of university students use generative AI tools at least occasionally. Research indicates that ChatGPT effectively supports traditional in-class, online, and hybrid learning alike. Its use can contribute to the development of digital skills, the resolution of emerging problems, and improved employability (OECD, 2021). Research on labour demand and skill requirements across various occupations examines

whether generative AI displaces workers or, conversely, complements their work. The research model is shown in the figure below.

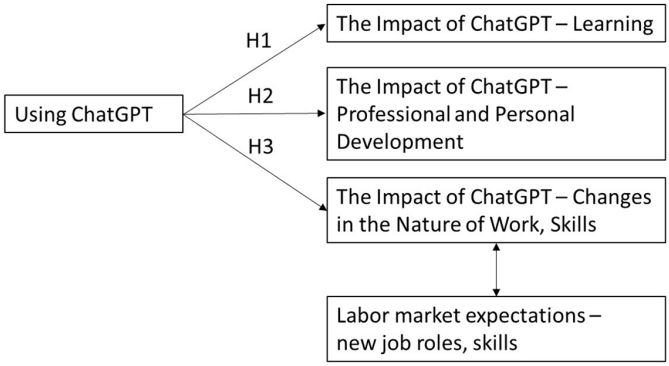

Figure 1: Conceptual framework

Methodology and Methods

This study employed quantitative methods. An online survey was conducted as part of a global research project involving Mediterranean countries. The analysis, performed using SPSS 26, tested three hypotheses using One-Way ANOVA, Welch's ANOVA, and SEM models.

Findings and Contribution

The hypotheses were accepted. The use of AI has a significant impact on individual development, as well as on expectations and changes in the workplace. Knowledge development and personal growth influence changes in the labour market. The use and support of AI explain progress in learning, as well as professional, personal, and knowledge development. The variables examined explain 31% of the changes in the nature of work. In the sample, ChatGPT has an impact, through individual development, on labour market expectations regarding employees, the nature of work, and changes in the skills required by the labour market.

Originality and Value

Most research on ChatGPT consists of theoretical studies and focuses on ethical issues. This research was conducted on a global scale, and its results provide a comprehensive picture of the opinions of young people in the Mediterranean region and their adaptation to labour market changes.

Research Limitations

The main limitation of this study is that its findings are based on a cross-sectional survey. Since AI is evolving so rapidly that it is difficult to keep pace with its progress, a repeat study today would likely provide a more nuanced picture than the current findings.

Theoretical and Practical Applications and Implications

The research findings highlight the importance of understanding the impact of generative AI on the labour market and developing targeted policies to enhance workplace skills (e.g., restructuring the educational framework of higher education institutions, reviewing courses, holding consultation meetings, and supporting students' preparedness). Labour market representatives, employers, and corporate leaders bear responsibility for these processes. A prerequisite for initiating change is understanding young people's preparedness, mindset, fears, and expectations.

THE DARK SIDE OF ENTERPRISE METAVERSE COLLABORATION: IDENTITY-BASED EFFECTS OF AVATAR CUES IN B2B-ORIENTED PROFESSIONAL INTERACTIONS

Lejealle, C. [1], Khelladi, I. [2], Rezaee Vessal, S. [3]

[1]Department of Marketing, ISC Paris, Paris, France

[2]Department of Marketing, Excelia Group, Cachan, France

[3] De Vinci Higher Education, De Vinci Research Center, Paris, France

Keywords: Enterprise metaverse; Proteus effect; Workplace incivility; Avatar embodiment.

Introduction and purpose

Enterprise-facing immersive platforms or professional metaverses are increasingly positioned as key infrastructures enabling distributed teamwork and client engagement through avatar-mediated interactions (Aliman et al., 2024). While prior literature predominantly focus on adoption and value creation (Kumar et al., 2025), less is known about behavioral risks like non-cooperation or workplace incivility. This gap is critical in B2B contexts, where interactions are repeated and reputation-sensitive. Addressing this limitation, this study pursues three objectives: (1) identify salient avatar-based identity cues and document forms of incivility; (2) develop a dual-path mechanism explaining when negative avatar cues elicit behavioral conformity versus compensation; and (3) examine how these cues relate to collaboration, contingent on avatar embodiment.

Theoretical framework

Grounded in Self-Perception theory, the Proteus effect posits that individuals infer traits from their avatar's appearance and adjust their behavior accordingly (Yee et al., 2009). However, these effects are context-dependent (Beyea et al., 2022). To explain negative outcomes in

professional exchanges, we propose two identity-regulation responses. When avatar cues signal undesirable traits, users may exhibit *behavioral conformity* (reduced cooperation or dismissive interaction). Conversely, when cues threaten professional identity, users may engage in *behavioral compensation* (strategic relational repair to salvage dyadic trust), aligning with dyadic avatar research (Van Der Heide et al., 2013). Furthermore, avatar embodiment — the sense of agency, self-location, and body ownership — acts as a conditional amplification mechanism. Higher embodiment intensifies avatar-based self-inference, strengthening the link between avatar cues and collaborative outcomes (Dupraz et al., 2024).

Methodology

The study adopts a mixed-methods design (Venkatesh et al., 2013). Phase 1 consists of an exploratory qualitative study within a real enterprise metaverse (Jamespot), combining observations and interviews to identify professional avatar cues and dysfunctional interaction patterns. Phase 2 builds on these insights through a controlled experiment manipulating avatar appearance during standardized B2B collaborative tasks (negotiation/decision-making). Incivility and non-cooperation will be quantified using validated behavioral scales to capture deviant behaviors within the immersive environment.

Findings and contribution

This study shifts attention from adoption metrics toward latent behavioral risks and relational harm in B2B exchanges (Dwivedi et al., 2022). It relocates avatar-effects theorizing from leisure to professional settings, distinguishing between Proteus-based behavioral conformity and identity-protective compensation. Finally, it refines embodiment research by showing that body ownership conditionally amplifies — rather than determines — the activation of identity-based processes.

Originality, limitations and implications

The originality lies in moving beyond linear models of behavioral conformity to uncover how professionals actively defend their credibility when confronted with counter-normative digital representations.

Limitations: The controlled experiment relies on standardized tasks that may not fully capture fluid, long-term corporate dynamics. Additionally, platform specificity (Jamespot) and the challenge of measuring fleeting, non-verbal immersive micro-behaviors may limit generalizability.

Implications: Theoretically, it nuances the Proteus effect and extends workplace deviance literature into immersive corporate spaces. Practically, it offers evidence-based guidelines for designing avatar customization parameters in B2B organizations, informs immersive HR onboarding practices, and helps platform architects protect team psychological safety.

EMBODIMENT, VOICE, AND GESTURES: ANTHROPOMORPHIC DIMENSIONS SHAPING THE ACCEPTANCE OF SOCIAL ROBOTS IN HIGHER EDUCATION

Papavasiliou, Dimitra[1]; Konstantoulaki, Kleopatra[1]; Rizomyliotis, Ioannis[2], Kostopoulos Ioannis[3]

[1] Department of Early Childhood Education and Care, University of West Attica, Athens, Greece

[2] Department of Business Administration, University of West Attica, Athens, Greece

[3]Liverpool Business School, Liverpool John Moores University, Liverpool, United Kingdom

Keywords: social robots, anthropomorphism, voice, gestures, acceptance, consumer psychology, higher education

The rapid advancement of artificial intelligence and robotics has facilitated the gradual integration of social robots into a wide range of social and professional environments. Social robots are artificial intelligence systems that can communicate with humans using socially salient modalities such as speech, gestures, facial expressions, and other nonverbal communications (Gao et al., 2025). This paper presents a conceptual framework examining how anthropomorphic dimensions shape student attitudes and behavioral intention toward social robot use in higher education. In contemporary universities in which students are informed consumers of educational services and increasingly advanced technologies and practices, social robots are being considered as possible agents of instruction in higher education, either for the role of professor or as an assistant professor (Wang and Xue, 2024). Although these roles are still in their infancy, yet they do herald a growing interest in embedding represented artificial agents in the teaching missions of universities and the roles that represented agents might play in higher education. This emerging trajectory makes it increasingly important to examine how learners and educators perceive social robots, particularly the social and communicative cues that influence their acceptance.

User acceptance is a major factor for successful implementation of social robots in service settings. Drawing on the Technology Acceptance Model (TAM) and social presence theory, it is generally known from human-robot interaction research that users are strongly influenced by anthropomorphism when interacting with social robots (Çalişkan and Sevim, 2025). Anthropomorphism refers to user's tendency to ascribe humanlike physical, cognitive and emotional characteristics to non-human agents (Baltaci et al., 2024). In the case of social robots, various anthropomorphic signals, including the physical appearance, voice and

gestural expressiveness of a robot, have been observed to influence users' expectations, affective responses and overall appraisal of robot social presence.

The robot's physical appearance is one of the most salient characteristics that influences the user's attitude towards robots. Robots with a human-like or social expressive features are generally considered as more approachable and socially competent than robots with a mechanical appearance, which may be considered as neutral, efficient and unemotional (Han et al., 2023; Gao et al., 2025b).

Another anthropomorphic signal is the robot's voice, including voice quality (prosody), clear speech, and naturalness, which influence the degree to which users perceive the robot as an intelligible, credible, and socially engaging instructional partner. A more human-like voice can eases warmth, authority, and presence. In contrast, a voice that is more clearly synthetic or monotonic can signal the robot's artificiality and may differentially affect the user’s attitudes towards robots (Hsu and Lee, 2023).

Gestures further enrich the communicative ability of social robots by providing nonverbal cues that complement verbal communication, convey emphasis, and contribute to a more dynamic and embodied instructional style (Çalişkan and Sevim, 2025). Such cues can facilitate comprehension, support cognitive processing, and enhance engagement (Chien et al., 2024).

Critically, however, these dimensions have rarely been examined in combination, limiting our understanding of their interactive effects on student acceptance.Despite growing academic attention to each of these aspects of anthropomorphism, the field lacks a comprehensive conceptual understanding of how appearance, voice, and gestures may influence students' attitudes and intention to use social robots in the role of teacher or teacher-education tool. As higher education institutions continue to adopt technology mediated learning and professional development, insights into human-robot social dynamics are increasingly relevant. This study advances the field by offering an integrated conceptual understanding of how appearance, voice, and gestures jointly shape students’ attitudes and intention to use social robots in educational roles—an area that has not been examined holistically before. A conceptual model is proposed in which appearance, voice, and gesture serve as independent anthropomorphic dimensions predicting student attitudes and behavioral intention, and a set of research propositions is developed to guide future empirical investigation. By clarifying these mechanisms, the work provides actionable insights for higher education institutions and technology developers seeking to design more effective, socially attuned robotic tools for teaching and professional development, including concrete design recommendations

concerning robot appearance, voice calibration, and gestural interaction in educational deployments.

DIGITAL FINANCIAL INTERVENTIONS: A SYSTEMATIC REVIEW OF EMERGING EVIDENCE

Perdiou, Demetra[1]; Themistocleous, Christos[2]; Karapanos, Evangelos[3]

[1]Department of Communication and Marketing, Cyprus University of Technology, Limassol, Cyprus

[2]Department of Communication and Marketing, Cyprus University of Technology, Limassol, Cyprus

[3]Department of Communication and Internet Studies, Cyprus University of Technology, Limassol, Cyprus

Keywords: Financial Technologies, Behaviour Interventions, HCI, Visual Communication

Background

Digital financial technologies are increasingly reshaping the ways individuals understand and manage their finances. This digital transformation offers unparalleled convenience and accessibility, enabling individuals to manage their financial activities with unprecedented ease (Brika, 2022).

The design of these applications or platforms does not merely facilitate use; it actively shapes user behaviour and decision-making, sometimes in ways that encourage rushed financial decisions. For instance, Kou et al. (2024) analysed Subreddit posts and found a YOLO (You Only Live Once) culture among millennials when it comes to investing, where real risks and prospective implications of bad investments are not accounted for.

Researchers in the Human-Computer Interaction (HCI) and Persuasive Technology communities have recently started exploring ways to improve financial behaviours and decisions in digital financial interventions. For instance, Hu et al. (2023) proposed the *Financial Decision Buddy*, an app aiming to bridge the education gaps of financial illiteracy by providing support for real-time purchasing decisions and short-term budgeting. Chaudhry et al. (2022) introduced *Robinhood's forest*, an idle app game, that uses different types of trees within a forest as an analogy of a diversified portfolio nudging consumers towards the latter desired behaviour. Despite these insights, the literature on digital finance remains fragmented, with limited integration of how cognitive biases shape behaviours and decision-making across these domains (Themistocleous & Karapanos, 2025).

In this paper, we report on a systematic literature review that seeks to investigate and address this gap by mapping the range of financial decisions targeted by digital interventions and evaluating how cognitive biases are incorporated into the design of these digital interfaces. The review aims to answer the following research questions.

RQ1: *What are the main financial behaviours tackled by digital financial interventions?*

RQ2: *Which populations do digital financial interventions target?*

RQ3: *What types of interventions are most commonly employed?*

Method

Financial Focus: Research articles needed to target a financial behaviour such as increasing savings, reducing spending, improving financial investments or providing access to credit.

Digital Intervention: Eligible articles needed to present the design, or evaluation or design and evaluation or a clear proposition for an intervention in a digital format. Interventions leveraging, for example, gamification, education, information, visualisation or reminders were deemed relevant.

Process: We included studies published in the top twenty Human-Computer Interaction journals and conferences according to Google Scholar rankings. Our search strategy aimed to capture articles situated at the intersection of Human-Computer Interaction, Finance and Behavioural Science using the following keywords:

Financial OR Invest OR Saving* OR Gambl* OR Trading OR Stock Market OR Financial Literacy OR Pension AND Digital Intervention**

Two independent reviewers screened titles, abstracts, and full texts following standard PRISMA procedures. Out of 618 a total of 21 articles remained for the final analysis stage.

Analyses: The analyses were designed to uncover the conceptual and empirical patterns underpinning digital interventions for financial decision-making. It focused on four dimensions: Targeted financial behaviour; Type of intervention; Groups being targeted (general or specialised group); The analysis of the intervention design. For the intervention type analysis, we coded papers based on whether they employed infographics, illustration and iconography, typography, nudges or procedural friction when designing their intervention.

Results: Preliminary findings show three main categories of targeted financial behaviours - savings, investments and access to credit. 12 of 21 articles (57.14%) did not use any visuals as an intervention method, while 9 of 21 articles (42.86 %) employed some form of diagrammatic representation. The prevalence of text-based or functional interfaces, particularly in investment-focused interventions, highlights a clear gap and opportunity for future research to leverage richer visual representations to support financial behaviour and enhance comprehension, especially within interventions.

Implications

The results indicate that the digital financial interventions should adopt a more inclusive and user-centred interface designs to address the diverse needs of users across demographic groups and with different medical conditions. Specifically, developed interventions focus on handling spending for older individuals yet research can be expanded to also improve investment decisions. Likewise, people with medical issues are nudged to save more money yet intervention relating to other financial aspects (like access to credit and loan management) have not been examined. As the range of financial decisions is vast, there is a strong tendency of HCI research to focus on entry level financial decisions like reducing spending and increasing savings. Investment decisions relating to NFTs, Index Funds, Crypto and how users can be nudged or educated to improve their choices are theoretically underdeveloped in the digital intervention domain. Future research should explore how demographic characteristics influence the effectiveness of digital financial interventions and whether tailored interface designs lead to more equitable financial outcomes. Consequently, behavioural outcomes may differ significantly across demographic groups, highlighting the need for more inclusive and accessible interface designs.

Contributions

This study offers original value by providing a systematic understanding of how digital financial interventions target behaviours and decisions while incorporating cognitive biases. It highlights a clear gap in the limited use of visual elements, offering insight into how design can better support user understanding as digital financial technologies increasingly reshape how individuals interact with and manage their finances, while also clarifying the current landscape of such interventions.

SOCIO-TECHNICAL TRANSFORMATION IN NGOS: TRANSFORMING RURAL EDUCATION AND DEVELOPMENT THROUGH DIGITAL PROJECTS

Endress, Tobias[1]; Manandhar, Ashna[1]

[1] School of Management, Asian Institute of Technology (AIT), Bangkok, Thailand

Keywords: Digital Transformation; Non-Governmental Organizations (NGOs); Digital Projects; Open-Source Innovation; Digital Governance; Accountability Infrastructure; Socio-Technical Systems; Thailand; Responsible Innovation

Abstract

Digital transformation research has predominantly examined corporate settings, platform competition, and enterprise system implementation. Far less attention has been paid to digital transformation projects in hybrid institutional environments in which NGOs, schools, and international donors interact through digital infrastructures. In such contexts, digital platforms do not merely improve efficiency but reshape governance, accountability, and stakeholder relationships. This study conceptualises and examines a digital reporting platform developed to connect rural schools in Thailand with international donors, positioning the initiative as a digital transformation project embedded in a socio-technical ecosystem.

Introduction

Digital transformation research has predominantly examined corporate settings. Far less attention has been paid to digital transformation projects in non-profit organizations. This study conceptualises and examines a digital reporting platform developed to connect rural schools in Thailand with donors, positioning the initiative as a digital transformation project embedded in a socio-technical ecosystem.

The project emerged through a multi-phase process. First, the idea was developed collaboratively with a Thailand-based NGO supporting rural education initiatives, identifying fragmented reporting and limited donor transparency as central challenges. Second, the concept was further refined during the *Unite for Action: Social Impact Hackathon 2025* (AIT School of Management, Rotary Bangkok DACH, & iCare Thailand, August 30–31, 2025), where

interdisciplinary student teams contributed to solution design, user flows, and governance logic. Third, an operational prototype was developed and released as open-source software (Endress, 2026), thereby enhancing transparency in the system architecture and encouraging community contributions. Finally, a pilot implementation and structured data migration from legacy records were completed in December 2025, marking the transition from conceptual innovation to operational deployment. The platform is designed to operate across constrained connectivity environments, enabling offline data capture within rural schools and subsequent synchronisation to cloud-based systems once network access becomes available. This staged development process reflects a digital project lifecycle perspective, linking ideation, co-creation, prototyping, deployment, and pilot evaluation. The initiative is therefore examined not merely as a technology artefact but as a digital transformation project that restructures reporting routines and accountability mechanisms.

Study Design and Methodology

The study draws on three complementary theoretical perspectives. First, digital transformation is conceptualised as a socio-technical change process involving organisational reconfiguration rather than simple digitisation (Vial, 2019). Second, the project is analysed through the Information Systems Success Model and technology acceptance frameworks to assess perceived usefulness, ease of use, and trust (Venkatesh *et al.*, 2003). Third, digital infrastructure theory informs the interpretation of the platform as an accountability infrastructure embedded within governance structures (Tilson *et al.*, 2010). Ethical-by-design considerations further frame the analysis of privacy and power asymmetries in data collection involving vulnerable populations (Floridi *et al.*, 2018).

The research addresses four questions: How do rural teachers perceive the usability and usefulness of the reporting platform? How does structured digital reporting influence consistency and administrative workload? What ethical tensions arise in digital data governance within rural educational contexts? And how does increased digital transparency reshape accountability relations between NGOs, teachers, and donors?

Methodologically, the study adopts a single-case mixed-methods design, combining quantitative and qualitative data in a single case to gain a comprehensive understanding of the phenomenon. A structured teacher questionnaire captures perceived ease of use, perceived usefulness, administrative burden, trust in data governance, and ethical comfort with data

sharing. These measures are complemented by qualitative, open-ended responses that explore perceived empowerment, concerns about monitoring, and challenges of contextual adaptation. Given the exploratory nature of the pilot phase, the analysis focuses on early-stage observations rather than statistically generalisable findings.

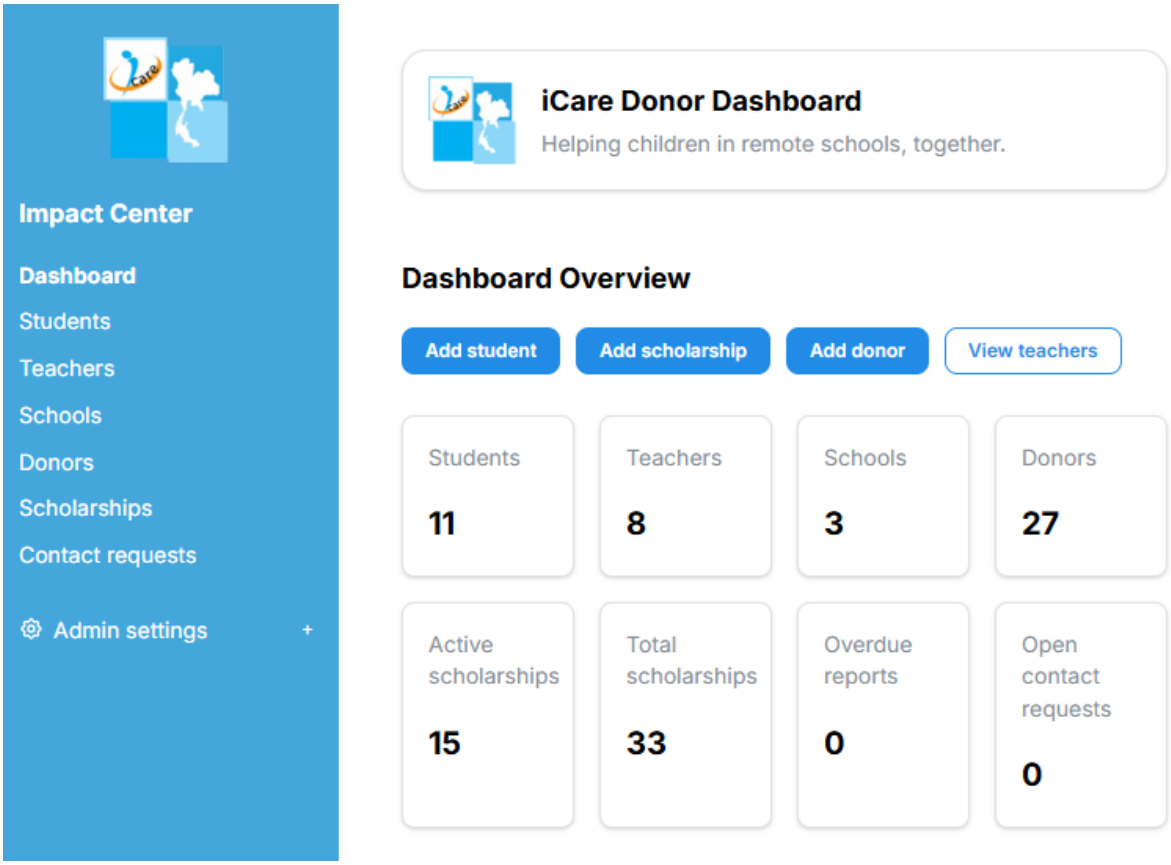

Figure 1: *Early-stage prototype of the reporting application populated with test data during development.*

The embedded researcher–practitioner role is explicitly acknowledged. As the author was involved in ideation and design phases, reflexive documentation is incorporated to mitigate bias and enhance transparency, aligning with calls for greater methodological openness in digital transformation research.

Findings

Preliminary findings from the December 2025 pilot indicate that the reporting platform has been integrated into routine documentation practices within participating rural schools. The introduction of standardised reporting templates increased consistency across submissions and reduced ambiguity in donor-facing communication. Initial observations suggest that while participants describe enhanced clarity in reporting expectations and improved organisational

structure, several express heightened awareness of external visibility resulting from structured data transparency. Concerns regarding student data sensitivity, consent clarity, and long-term control over information flows emerge as central to trust formation. These findings suggest that the platform's influence extends beyond administrative efficiency to shifts in perceived accountability and oversight within the educational ecosystem.

Discussion and Conclusion

The preliminary findings indicate that the platform operates as a digital governance mechanism rather than solely an administrative reporting tool. Standardised reporting templates enhance comparability and donor transparency while simultaneously formalising teacher accountability within the reporting process. Increased data visibility also introduces asymmetries in informational control, as donors gain enhanced oversight while teachers experience greater exposure to external evaluation (Zuboff, 2019). Although participants report improved clarity, structure, and consistency in documentation practices, increased external visibility reshapes perceptions of oversight and responsibility. This dual effect reflects a balancing of efficiency gains with process innovation in reporting practices, aligning with broader notions of organisational ambidexterity in digital transformation contexts (Verhoef *et al.*, 2021). These dynamics reinforce the interpretation of the platform as an accountability infrastructure embedded within an ecosystem, where digital transformation extends beyond efficiency gains to the reconfiguration of reporting routines and governance relations (Tilson *et al.*, 2010).

Conceptually, the study extends digital transformation research to rural education contexts, demonstrating how digital projects restructure institutional relationships beyond corporate environments. The staged lifecycle, from collaborative ideation and hackathon-based co-creation to open-source prototyping and pilot deployment, illustrates how governance outcomes are embedded in project design and implementation processes. Ethical considerations regarding student data sensitivity and consent transparency are central to long-term trust and adoption. Overall, digital teacher–donor platforms represent transformation initiatives whose effectiveness depends on institutional alignment, transparent governance architecture, and sustained stakeholder trust rather than technological functionality alone.

POSSESSION WITHOUT PURCHASE: THE MEDIATING ROLE OF PSYCHOLOGICAL OWNERSHIP ON EVALUATION OF ONLINE SHOPPING SESSION

Pikturnienė, Indrė[1]; Degutis, Mindaugas[1]

[1] Faculty of Economics and Business Administration, Vilnius University, Vilnius, Lithuania

Keywords: Online Purchase, Online Shopping Cart Abandonment, Cart Collection, Psychological Ownership, Evaluation of Online Session.

Introduction

Consumers collect online carts not only as a functional step to purchase, but also for hedonic reasons – self-entertainment, boredom relief, or curiosity – which often leads to cart abandonment (Close and Kukar-Kinney, 2010). Nevertheless, satisfaction with the session results might arise from psychological ownership of the online cart, that is, the feeling that items belong to the customer (Atasoy and Morewedge, 2018). This sense generates positive emotions among non-purchasers and reduces regret associated with non-intended purchase among purchasers.

The purpose of the research is to determine whether hedonic online cart collection leads to positive evaluation of online session results, mediated by psychological ownership, and how this pattern differs between cart abandoners and purchasers. We hypothesise that the relationship between hedonic cart collection and session evaluation is mediated by psychological ownership of the cart, and that abandoners vs. purchasers will demonstrate distinct paths due to goal-outcome (in)congruence.

Methodology

A panel survey in Lithuania was conducted in January 2026 (N=621; 232 male, 389 female; aged 18–65). Respondents were grouped using the criterion of whether they had abandoned the online purchase session (N=311) or purchased online (N=310) within the past 6 months, and instructed to respond about the filtering situation – cart abandonment or purchase.

7-point Likert scales were: Hedonic Cart Collection (HedCartCol) (N=3, Cronbach's Alpha= .803) (Close and Kukar-Kinney, 2010), Psychological Ownership of collected cart (PsyOwn) (N=3;

Cronbach's Alpha= .923) (Atasoy and Morewedge, 2018), and cognitive evaluation of the session result (SessionCogEval), operationalised as perceived completion of the browsing session as planned, perceived goal attainment, and subjective evaluation of the session outcome as successful (N=3; Cronbach's Alpha= .861). We tested the impact of HedCartCol on SessionCogEval, mediated by PsyOwn, in two separate groups, abandoners vs. purchasers (SPSS Process Macro, model no.4).

Findings

Mediation models for both groups were significant: Abandoners $R^2 = .0694$, $F(2,308) = 11.39$, $p < .001$; Purchasers $R^2 = .0690$, $F(2,307) = 11.995$, $p < .001$.

For abandoners, HedCartCol predicted SessionCogEval via PsyOwn: the total effect of HedCartCol to SessionCogEval from significant ($b = .152$, $p = .005$) became non-significant when PsyOwn was included in the model ($b = .031$, $p = .623$). HedCartCol predicted PsyOwn ($b = .511$, $p < .001$), which in turn predicted SessionCogEval ($b = .236$, $p = .002$). Bootstrap analysis (5,000 samples, 95% CI) confirmed an indirect effect ($ab = .121$, 95% CI [.051, .195]) of PsyOwn on SessionCogEval.

A different path was observed among purchasers. HedCartCol predicts SessionCogEval negatively directly ($b = -.169$, $p = .001$) and in the mediation model ($b = -.243$, $p < .001$). When PsyOwn was added to the model, both mediating relationships turned into positive: HedCartCol predicted PsyOwn ($b = .479$, $p < .001$), and PsyOwn predicted SessionCogEval $b = .155$, $p < .001$); a significant indirect effect through PsyOwn ($ab = .074$, BootSE = .025, 95% CI [.0295, .1283]) was confirmed.

Contribution, Implications, Limitations

Evidence that psychological ownership is a significant explanator linking hedonic online cart collection and the evaluation of session results for purchasers vs abandoners provides new insights. Hedonically collected cart, even if abandoned, evokes psychological ownership and leads to a positive evaluation of the session. Hedonic collectors who later purchased were less satisfied unless they had elaborated psychological ownership of the cart. If the cart is psychologically pre-owned, the evaluation of the session turns positive. This can be interpreted as an incompatibility between

cart-collection motives and the outcome, likely resulting in cognitive dissonance due to an unplanned purchase, outweighed by the perceived ownership effect.

Data suggests that for hedonic shoppers, the cart is a possession space. To maximise satisfaction (and CLV), managers must pivot from 'pushing for conversion' to 'facilitating ownership,' turning happy abandoners into loyal advocates and regretful buyers into confident owners.

Future research should manipulate online shopping conditions to determine what increases psychological ownership and the path to purchase, controlling for emotional and cognitive factors. The limitation is self-reported data regarding recent behaviour.

WHEN DOES CONSUMER ECO-LITERACY TRANSLATE INTO BEHAVIOURAL INTENTIONS TOWARDS SUSTAINABLE COSMETICS? THE ROLE OF GREENWASHING CONCERNS

Pumputyte, Milda[1]; Banyte, Jurate[2]; Dovaliene, Aiste[2]; Gadeikiene, Agne[2]

[1] Kaunas University of Technology and UAB Bio Sala, Kaunas, Lithuania

[2]School of Economics and Business, Kaunas University of Technology, Kaunas, Lithuania

Keywords: Consumer Eco-Literacy, Behavioural Intentions, Sustainable Cosmetics, Greenwashing Concerns.

Introduction

Consumer eco-literacy is increasingly recognised as an important factor shaping sustainable consumption decisions. By helping consumers understand environmental issues and assess sustainability-related information, eco-literacy may encourage more responsible purchasing choices. Prior research generally confirms a positive relationship between eco-literacy and intention to buy sustainable products; however, evidence on willingness to pay a price premium remains less consistent. This suggests that eco-literacy does not always translate directly into behavioural intentions. Consumer concern about greenwashing may help explain this relationship. The growing use of vague or misleading sustainability claims has increased scepticism towards sustainability-related communication. Sustainable cosmetics represent a particularly relevant context, as environmental and ethical claims are frequently emphasised but often difficult for consumers to verify. At the same time, cosmetics are closely associated with personal health and environmental impact, making them suitable for examining how eco-literacy relates to behavioural intentions under conditions of greenwashing concern.

The Aim and Theoretical Background

The study aims to assess the impact of consumer eco-literacy on two behavioural intentions: intention to buy and willingness to pay a price premium, while considering the moderating role of greenwashing concerns.

Consumer eco-literacy refers to consumers' ability to understand environmental issues and critically evaluate sustainability-related information. Although early research conceptualised eco-literacy mainly as environmental knowledge, recent studies emphasise behavioural

awareness and the practical application of knowledge (Wei et al., 2018). Accordingly, this study adopts a two-dimensional perspective on eco-literacy, distinguishing between environmental knowledge and understanding, and awareness reflected in practical actions. Prior findings generally confirm a positive relationship between eco-literacy and intention to buy sustainable products, whereas evidence on willingness to pay a premium remains inconclusive. This inconsistency may be explained by greenwashing concerns, understood as consumers' scepticism towards firms' sustainability claims and labels (Rejikumar, 2016; Riaz et al., 2023). Such concerns may weaken the extent to which environmentally literate consumers translate their knowledge and awareness into behavioural intentions.

Methodology and Methods

The empirical study is based on a quantitative survey of 482 Lithuanian consumers who had prior experience purchasing sustainable cosmetic products and possessed basic sustainability-related knowledge. Data were collected using an online questionnaire. Consumer eco-literacy was measured using scales adapted from prior studies, following a two-dimensional structure comprising knowledge and understanding, and awareness and practical actions. Behavioral intentions were operationalized as intention to buy sustainable cosmetics and willingness to pay a price premium. Greenwashing concerns captured respondents' scepticism towards sustainability-related claims. The proposed relationships were tested using regression and moderation analysis.

Findings

The results indicate that consumer eco-literacy is positively related to intention to buy sustainable cosmetics, whereas its direct relationship with willingness to pay a premium is weak. Awareness and practical actions are more strongly associated with intention to buy than knowledge and understanding. Furthermore, greenwashing concerns significantly weaken the relationship between consumer eco-literacy and intention to buy sustainable cosmetics. The effect is weaker for willingness to pay a premium, suggesting that price-related decisions may depend on factors beyond the scope of this study.

Research Limitations

The study is limited to a single product category and national context, which may restrict the generalizability of the results. In addition, behavioural intentions rather than actual purchasing

behaviour were analysed.

Contribution and Implications

This study contributes to sustainable consumption literature by supporting a two-dimensional conceptualisation of consumer eco-literacy and demonstrating that its dimensions differ across behavioural intentions. By integrating greenwashing concerns as a moderator, it explains why environmentally literate consumers may not always demonstrate stronger behavioural intentions. Practically, the results emphasise the need for transparent and credible sustainability communication, as increasing consumer eco-literacy alone may be insufficient to encourage sustainable purchasing if greenwashing concerns persist.

FUNDING THE WANT, NOT THE NEED: SELF-TRANSFORMATION AND MORAL EMOTIONS IN DESIRE-BASED CROWDFUNDING

Leonidou, Sophia[1]; Voutsa, Maria C.[1]; Tsapatsoulis, Nicolas[1]

[1]Department of Communication and Marketing, Cyprus University of Technology, Limassol, Cyprus

Keywords: Donation-Based Crowdfunding; Desire-Based Crowdfunding; Self-Transformation; Emotional Intelligence; Moral Emotions; Perceived Responsibility; Generation Z; Donation Intention

Introduction

Donation-based crowdfunding has emerged as a prominent form of digital philanthropy, enabling individuals to mobilize financial resources through online platforms and distribute contributions. While prior research has primarily focused on need-based campaigns driven by urgency, altruism, and moral obligation, an increasing number of campaigns now support personal desires and non-essential goals. This emerging form, referred to as desire-based crowdfunding, challenges traditional assumptions regarding donor motivations and highlights the need to better understand the psychological mechanisms underlying giving behavior (Mollick, 2014). To address this gap, this study introduces desire-based crowdfunding as a distinct research context, investigating whether giving for non-essential goals is driven by self-transformation or alternative moral mechanisms.

Purpose, Aim and Objectives

The purpose of this study is to examine how donation intention is formed within desire-based crowdfunding contexts. The main aim is to investigate whether giving is driven by self-transformation or by alternative psychological mechanisms. The study addresses the following objectives: (1) examine the effect of desire type (material vs.

experiential) on donation intention; (2) assess the mediating role of perceived self-transformation; and (3) evaluate the moderating role of altruism and emotional intelligence. The research further explores how these mechanisms operate among Generation Z, an underexplored but increasingly relevant donor group.

Literature Review and Theoretical Framework

Existing literature identifies donation behavior as a multidimensional process shaped by altruism, empathy, identity, and social influence (Bagheri et al., 2019; Wang et al., 2019). However, most studies focus on need-based contexts and emphasize prosocial motivations. Emerging perspectives suggest that giving may also generate internal benefits such as identity construction, emotional fulfillment, and psychological change.

This study is grounded in Social Exchange Theory (Homans, 1958), which conceptualizes donation as a value-driven exchange involving anticipated psychological rewards, and Schwartz's Theory of Basic Human Values (Schwartz, 1992). Drawing on these frameworks, self-transformation is theorized as a central mechanism because funding non-essential desires is expected to fulfill self-actualization needs; it allows donors to construct identity, experience vicarious joy, and achieve psychological change by fulfilling others' wants. Building on these frameworks, the study introduces self-transformation as a proposed motivational pathway and integrates emotional intelligence as an individual-level factor influencing emotional processing in donation contexts.

Methodology and Methods

Data were collected through a self-administered online questionnaire distributed via Prolific (N = 246, Generation Z participants, U.S.). A 2×2 experimental design was employed, manipulating desire type (material vs. experiential) and product involvement (low vs. high), after a pre-test. Participants were randomly assigned to conditions and exposed to standardized mock-ups of crowdfunding campaigns. All constructs demonstrated satisfactory reliability (Cronbach's $\alpha > .70$). Data were screened for quality and analysed using SPSS, including manipulation checks, MANCOVA, and moderated mediation analysis (PROCESS Model 63).

Findings and Contribution

Contrary to theoretical expectations, self-transformation did not significantly mediate donation intention. Instead, moral emotions ($\beta = .446$, $p < .001$) and perceived responsibility ($\beta = .472$, $p < .001$) emerged as the primary mechanisms explaining giving behavior. Notably, material desires generated significantly higher donation intentions and contribution levels than experiential desires, particularly under high involvement and high altruism conditions ($\beta = -.347$, $p = .041$, 95% CI [−.680, −.015]). This suggests that tangible, easily evaluable material goals reduce donor uncertainty and provide concrete evidence of impact, whereas subjective experiential desires are harder to assess. Furthermore, emotional intelligence acts as a key boundary condition: individuals with lower emotional intelligence exhibit weaker moral responses and reduced willingness to contribute, especially in experiential contexts ($\beta = -.208$, 95% CI [−.384, −.063]). These results suggest that donation behavior in desire-based crowdfunding is driven more by moral activation than by identity transformation.

Originality and Value

This study contributes by introducing desire-based crowdfunding as a distinct research context and by challenging the assumption that self-transformation is a central driver of giving. However, these contributions are constrained by the study's empirical design—specifically, its reliance on a single country (the U.S.). Generation Z sample, self-reported measures, and experimental scenarios rather than actual donation behavior—and thus represent a cautious, foundational step rather than definitive behavioral outcomes.

Research Limitations

The study is limited by its reliance on a single-country sample (U.S.) and self-reported data, which may affect generalisability. Additionally, experimental scenarios may not fully capture real-world donation behavior.

Theoretical and Practical Applications and Implications

Theoretically, the findings refine Social Exchange Theory by emphasizing emotional and individual-difference mechanisms in donation behavior. Practically, they suggest that campaign effectiveness depends on activating moral emotions and perceived responsibility, particularly for non-essential causes.

PHYGITAL GASTRONOMY: BLENDING EXPERIENCES BETWEEN PARADOXES AND AUTHENTICITY

Civera, Chiara[1]; Mosca, Fabrizio[1]; Chiaudano, Valentina[1]; Tamiazzo, Mattia[1]; Shakil, Hafsa[1]

[1]Department of Management, University of Turin, Turin, Italy

Keywords: Phygital, Gastronomy, Value Co-creation, Service-Dominant Logic, Authenticity, Experiential Value.

Extended Abstract

The gastronomic experience has evolved from a functional act of nourishment into a complex and multidimensional form of experiential consumption. Rather than being confined to the moment of eating, gastronomy is increasingly conceptualised as a dynamic process unfolding across cognitive, sensory, social, and symbolic dimensions. Food-related experiences encompass anticipating, selecting, co-creating, tasting, sharing, and remembering culinary encounters, extending beyond physical consumption and embedding themselves within broader emotional and cultural frameworks.

From a Service-Dominant Logic (SDL) perspective (Vargo & Lusch, 2008), value in gastronomy is not embedded in tangible outputs but emerges through resource integration. Gastronomy constitutes a paradigmatic domain for examining value co-creation, inherently involving sensory participation, emotional engagement, and symbolic meaning-making. The rapid integration of digital technologies, such as artificial intelligence, augmented reality, virtual reality, mixed reality, and 3D food printing, is reshaping how customers interact with food, space, and service providers. Luxury restaurants are evolving into hybrid environments, driving *phygitalization*: the seamless integration of physical and digital elements into a unified experiential continuum (Batat, 2024). This paradigm shift extends traditional quality dimensions by incorporating digital overlays using phygital connectors across the entire dining experience (Batat, 2021). For example, Sublimotion integrates molecular gastronomy with immersive projections and synchronised soundscapes, while Ultraviolet curates sensory stimuli through audiovisual and environmental control to intensify emotional responses. These formats reflect dining experiences situated within digitally mediated spatial-temporal

configurations, where physical and digital boundaries become imperceptible. However, technological enhancement does not inherently generate experiential value. Digital gastronomy must preserve sensory coherence to sustain experiential flow (Spence & Velasco, 2025). When technological mediation becomes excessive or intrusive, it may produce cognitive overload, weaken perceptions of authenticity, and disrupt engagement. Phygital gastronomy is therefore characterised by structural tensions between immersion and overload, authenticity and spectacle, and personalisation and perceived artificiality.

Although research on digital dining is expanding, significant gaps remain. Richards (2021) calls for more empirical investigation of gastronomic experiences within evolving technological contexts. Existing literature concentrates on isolated technologies or controlled settings, without systematically examining how phygital restaurant experiences are evaluated in real-world environments, where insights on adoption barriers, perceived risks, and best practices remain limited (Bartoli et al., 2025). We address these gaps by answering the following research question: *How does the phygitalization of the luxury gastronomy experience generate experiential paradoxes, and how do these paradoxes influence authenticity?*

Given the subjective and phenomenological nature of gastronomic experiences, we adopt a qualitative multiple-case study design (Yin, 2018). We analysed 3,500 reviews from Google My Business and TripAdvisor for ultra-luxury vanguard restaurants, including Alchemist and Sublimotion, encompassing the complete experiential journey. Using Leximancer for thematic analysis, we clustered narratives across tangible and intangible dimensions, coding for authenticity enablers and barriers triggering paradoxes. Furthermore, to ensure scientific rigor and minimise bias, two independent authors analysed and discussed the results with all authors. A third independent author reviewed the contentions, offering specialised insights to inform an unbiased, robust qualitative consensus.

Expected results indicate a shift from technological affordances to lived experiences and extend SDL by framing digital technologies as operant resources whose value depends on interpretative and sensory integration. We identify experiential facilitators and barriers, highlighting that technological enhancement generates value only when aligned with experiential coherence and customer expectations.

GLOBAL STRATEGY AND DIGITAL INNOVATION FOR NGO YOUTUBE ENGAGEMENT: ONLINE SENSORY MARKETING AND CINEMATOGRAPHIC EXECUTION

Avgeropoulou, Aikaterini[1]; Papasolomou, Ioanna[2]; Melanthiou, Yioula[3]

[1]School of Business, University of Nicosia, Nicosia, Cyprus

[2]School of Business, University of Nicosia, Nicosia, Cyprus

[3]Cyprus University of Technology, Limassol, Cyprus

Keywords: Online Sensory Marketing, Strategic Business Communication, Cinematography, NGOs, YouTube, CSR, Digital Storytelling

Introduction

In a landscape of digital saturation and socio-economic uncertainty, NGOs must go beyond mere visibility and actively enhance audience engagement with their mission to ensure long-term survival (Avgeropoulou & Melanthiou, 2021; Cordery et al., 2023). Hence, the present research integrates Online Sensory Marketing (OnSenM) with micro-level cinematographic execution to increase audience engagement in NGO YouTube campaigns. Its core theoretical contribution is the development of an S-O-R-based framework that maps how designed audiovisual stimuli activate internal psychological states and translate into measurable audience outcomes. While focusing on the nonprofit sector, the framework is commercially transferable, offering for-profit organizations a scalable mechanism to optimize user interactions through strategically engineered, multisensory digital environments.

Purpose, Aim and Objectives

Although sensory marketing has gained prominence in consumer behavior research (Krishna, 2012; Antunes & Verissimo, 2024; Wörfel et al., 2022), its application in audiovisual storytelling remains underdeveloped, especially in mission-driven, resource-limited contexts. This study addresses that gap by showing how sensory cues, visual, auditory, and linguistic, can be enhanced through cinematographic techniques such as framing, rhythm, color, and motion to foster deeper consumer engagement (Dessart & Pitardi, 2019). These techniques evoke psychological mechanisms like vividness, emotional arousal, and narrative transportation (Van Laer et al., 2014; Teixeira et al., 2012; Armstrong & Cutting, 2023).

Literature Review and Theoretical Framework

Using the Stimulus-Organism-Response (S-O-R) model (Mehrabian & Russell, 1974), this research explores how OnSenM influences digital engagement behaviors via internal psychological mediators in online environments (Eroglu, et al., 2001; Petit et al., 2019). The proposed framework positions cinematographic and storytelling cues as designed sensory

stimuli (S) that activate internal affective and cognitive states, including emotional arousal, vividness, and narrative transportation (O). These internal states, in turn, drive audience outcomes such as attention, recall, emotional intensity, and engagement intentions (R). The study further identifies e-literacy as a selective moderator of the stimulus-organism pathway, recognizing that digital proficiency shapes how audiences interpret and respond to complex sensory cues, particularly for recall and engagement (Ng, 2012).

Methodology and Methods

The study employs a mixed-methods design that integrates qualitative and quantitative approaches to provide a comprehensive understanding of user engagement. A netnographic analysis was conducted on YouTube campaigns by globally recognized NGOs, with content systematically coded using OnSenM attributes and cinematographic micro-elements (Kozinets, 2015). In parallel, a quantitative survey (N=294) measured how combinations of sensory and audiovisual elements shaped viewer responses. Key metrics included emotional intensity, perceived authenticity, message retention, and intent to support (Hamacher & Buchkremer, 2022). The mixed-methods approach enables a multidimensional exploration of NGO campaign strategies and audience responses.

Main Findings and Contribution

Quantitative findings reveal that both perceived cinematographic techniques and storytelling clarity are significantly and positively associated with all four audience outcomes, emotional intensity, attention, recall, and engagement intentions (rs range: .270-.456, all $p < .001$). E-literacy functions as a selective moderator, with its effect most pronounced for recall and, to a lesser extent, engagement intentions. Netnographic analysis further indicates that sensory techniques are more effective when paired with intentional cinematographic execution, such as close-up framing, ambient audio, slow-motion, and rhythmic editing. These methods enhance viewer attention, message recall, emotional connection, and credibility. The model provides a scalable, resource-efficient strategy for producing emotionally impactful content, especially vital for NGOs and small-scale initiatives.

The contribution is threefold: first, it reframes OnSenM as a strategic, designable cue system rather than a passive sensory experience; second, it demonstrates how digital storytelling can be operationalized through precise, measurable audiovisual micro-decisions; and third, it provides empirical evidence for the framework's transferability to business settings, particularly in CSR, sustainability branding, and purpose-driven marketing.

Originality and Value

For organizations dealing with audience fatigue and limited budgets, the proposed framework offers a psychologically grounded engagement strategy. It is especially relevant in multicultural

and digital-first contexts. Although centered on YouTube, these principles are adaptable to other platforms like TikTok and Instagram.

Research Limitations

Key limitations include its platform-specific focus and the cultural variability in decoding sensory stimuli. Further research could explore its application in commercial sectors and different digital ecosystems across global contexts.

Theoretical and Practical Implications

Theoretically, the study extends the S-O-R model into the domain of online audiovisual content by demonstrating that cinematographic and storytelling cues function as designable sensory stimuli with measurable effects on audience cognition and behavior. Practically, the finding that both types of cues significantly enhance recall and engagement, and that e-literacy moderates these effects, suggests that content creators can prioritize specific low-cost audiovisual decisions, such as close-up framing and rhythmic editing, to improve campaign effectiveness. While rooted in the NGO sector, the framework is relevant for businesses that aim to design innovative, sustainable, and emotionally resonant digital strategies.

HOW ENTERPRISE SOCIAL NETWORK-SUPPORTED KNOWLEDGE SHARING ENHANCES EMPLOYEE INNOVATIVE BEHAVIOR: A CREATIVE SELF-EFFICACY MODERATION MODEL

Paulienė Rasa, Tamaševičius Virginijus, Rudžiūnaitė Greta, Stankevičienė Jelena, Michael Christofi

Faculty of Economics and Business Administration, Vilnius University, VU, Vilnius, Lithuania

Keywords: Enterprise Social Network, Knowledge Sharing, Employee Innovative Behavior, Creative Self-efficacy.

Abstract

This study examines how the use of enterprise social networks (ESN) relates to employee innovative behaviour via knowledge sharing and under the boundary condition of creative self-efficacy. Knowledge is widely recognized as a strategic asset for organizations (Ollier-Malaterre & Redston, 2025), and knowledge sharing - active exchange among organizational members - drives innovation and performance (Wang et al., 2025). When employees are unwilling to share knowledge, organizational growth and advantage are jeopardized. ESN - organizational social media used for communities, problem solving, and task management - are increasingly leveraged for knowledge sharing and innovation (Olfat, 2025), yet prior work often focused narrowly on productivity or single ESN dimensions. Innovation - the basis of competitive advantage - emerges from employees' innovative behaviour (Hamid et al., 2025) and is strengthened by creative self-efficacy (Khan et al., 2023). We therefore test a model incorporating ESN use, knowledge sharing, employee innovative behaviour, and creative self-efficacy. Hypotheses:

H1a: The consumptive use of an enterprise social network positively influences knowledge sharing.

H1b: The contributive use of an enterprise social network positively influences knowledge sharing.

H1c: The hedonic use of an enterprise social network positively influences knowledge sharing.
H1d: The social use of an enterprise social network positively influences knowledge sharing.
H2: Knowledge sharing positively influences innovative behaviour.
H3: Creative self-efficacy positively moderates the relationship between knowledge sharing and innovative behaviour: the relationship is stronger when creative self-efficacy is high.
H4a: Knowledge sharing mediates the relationship between the consumptive use of an enterprise social network and innovative behaviour.
H4b: Knowledge sharing mediates the relationship between the contributive use of an enterprise social network and innovative behaviour.
H4c: Knowledge sharing mediates the relationship between the hedonic use of an enterprise social network and innovative behaviour.
H4d: Knowledge sharing mediates the relationship between the social use of an enterprise social network and innovative behaviour.
H5a: Creative self-efficacy moderates the indirect effect of consumptive use of an enterprise social network on innovative behaviour via knowledge sharing.
H5b: Creative self-efficacy moderates the indirect effect of contributive use of an enterprise social network on innovative behaviour via knowledge sharing.
H5c: Creative self-efficacy moderates the indirect effect of hedonic use of an enterprise social network on innovative behaviour via knowledge sharing.
H5d: Creative self-efficacy moderates the indirect effect of social use of an enterprise social network on innovative behaviour via knowledge sharing.

A cross sectional survey (n = 313) used validated scales (Kügler & Smolnik, 2014; Lu et al., 2006; Hu et al., 2009; Tierney & Farmer, 2002); sample adequacy followed Kline's (2015) rule; data were analysed with SPSS and PLS SEM in SmartPLS 4. Contributive and social ESN use significantly increased knowledge sharing; consumptive and hedonic did not. Knowledge sharing positively influenced innovative behaviour; creative self-efficacy strengthened this link. Mediation was supported for contributive and social use (VAF > 20%), and moderated mediation was stronger at higher creative self-efficacy. The study provides an integrated, mechanism focused account; limitations include cross sectional design and a single context, convenience sample. Practically, organizations should prioritize contributive and social ESN behaviours, design platforms for visible knowledge exchange, and develop creative self-efficacy to maximize innovation.

PROMOTING WOMEN IN BUSINESS

Binder, Bettina, C.K.,[1] Schipani, Cindy A.[2]

[1]Faculty of Engineering, Pforzheim University, Pforzheim, Germany

[2]Business Law, University of Michigan Stephen M. Ross School of Business, Ann Arbor, MI USA

Keywords: Gender Quota, Women on Boards, Management Reporting, Women Process Performance Measurement Index, Key Performance Indicators

Introduction

During the COVID-19 crisis, many women were either unemployed or not fully employed, which limited their participation in the labor market. Since then, the number of women in companies across Europe, the US market, and the Asia-Pacific region has risen again. Companies now need straightforward ways to track and support this progress. Tools like gender quotas and the Women Process Performance Measurement (WPPM) Index can help measure how women move up within organizations.

Purpose, Aim and Objectives

Against an international backdrop whereby some countries are resisting legal efforts to provide women with leadership opportunities, it is increasingly clear that companies must take initiative on their own terms. The importance of developing internal strategies that recognize both the business and moral imperatives of gender-balanced leadership has arguably never been more apparent.

This manuscript invokes an eight-step framework to give corporations a practical roadmap for embedding women's equality into leadership structures regardless of the prevailing legal environment. The first step—deciding upon the strategic relevance of women on boards—strikes a particularly strong cord in today's discourse. To continue advancing gender equality and building corporate boards that reflect the populations they serve, we must first confront and articulate why women's presence in leadership is not only valuable but essential.

Literature Review and Theoretical Framework

The answer need not be complicated. Research consistently shows that gender-diverse leadership teams are associated with stronger financial performance, greater innovation, and enhanced corporate responsibility (Faten Lakhal, Mahjoub, & Benkraiem, 2024). Women in leadership roles have been shown to drive sustainability initiatives, elevate customer engagement, and foster healthier workplace cultures (Chandra Srivastava, Saim Kashmiri, & Vijay Mahajan, 2023). More balanced leadership produces decision-making processes that better reflect the perspectives of an organization's entire workforce, not merely those of men.

Beyond business, the moral imperative is also undeniable. It is indefensible for half of humanity to remain systematically underrepresented in decision-making spaces that shape economies, societies, and lives. Achieving gender-balanced leadership is not only a matter of competitive advantage but also of justice and dignity.

Findings and Contribution

We advocate an eight-step process which companies might utilize to increase women's presence in top leadership positions. These are: (1) decide upon the strategic relevance of women on boards; (2) include women in the strategic model of the company; (3) build a process-based organization and through a process analysis take stock of the headcount of women; (4) identify strategically relevant key performance indicators (KPIs) with a correlation to a women's process performance (WPPM) index; (5) develop and implement a controlling system which includes the WPPM index; (6) build and foster harmonized teams; (7) design an incentive scheme which includes the WPPM index; and (8) implement any needed structural reorganization to achieve a better score on the WPPM index (Schipani, Binder & Dworkin, 2024).

Implications

Excluding women from leadership, whether intentional or not, is not only unjust but strategically unwise. Organizations thrive when diverse perspectives inform decision-making. By ignoring the insights and experiences of women, firms risk forfeiting valuable data and innovative solutions. The path forward is clear: companies must embrace gender diversity not as an obligation, but as an opportunity to achieve excellence and equity.

DIAPERS, DEADLINES, AND DEPARTMENT MEETINGS: ACADEMIC CAREER SUSTAINABILITY AND THE MOTHERHOOD PENALTY

Meng, Yuetong[1] Váradi, Kata[1]

[1]Institute of Finance, Corvinus University of Budapest, Budapest, Hungary

Keywords: motherhood penalty, academic motherhood, career sustainability, higher education, social role theory, Hungary

Introduction

Since women with children constitute a large share of the labor force, it is essential to examine how the motherhood penalty affects them and shapes their role in the workplace. Mothers often experience disadvantages in addition to those commonly associated with gender, while the number of children may further negatively affect mothers' careers (Correll et al., 2007; Neumark, 1992). In academia, mothers face competing expectations from both institutions, academic progress and family life. Existing research has shown that academic mothers face challenges in terms of output, promotion, work-family conflict, and rooted institutional stress. However, less attention has been paid to how academic mothers perceive the motherhood penalty and how these perceptions shape career sustainability.

Study Aims

To address this gap, the research question of this paper is: How do academic mothers perceive the motherhood penalty, and how does this perception shape their academic career sustainability? It further analyzes the impacts of these perceptions on their career planning, work engagement, willingness to stay, and future career development in academia in terms of research, teaching and service tasks. Furthermore, it offers insights into institutional support mechanisms within Hungarian higher education, with implications for university human resource management and gender equality initiatives.

Literature Review and Theoretical Framework

The study builds on social role theory as the core theoretical framework (Eagly and Diekman, 2005). It explains that motherhood penalty is not only an explicit institutional obstacle but may be constantly reproduced through daily expectations, implicit norms, and cultural evaluation mechanisms.

Successful scholars are often tacitly assumed to be continuously engaged, readily available, and work-centered (Ward and Wolf-Wendel, 2016). Lutter and Schröder (2019) found that fertility significantly reduces the publication output of female scholars, while male scholars do not show the same degree of negative impact, providing direct evidence for the academic motherhood penalty. Morgan et al. (2021) also indicates that parenthood can explain a considerable part of the gender productivity gap in academia, as the decline in short-term academic output of mothers after childbirth is usually greater than that of fathers. However, the current literature focuses predominantly on objective outcomes rather than on how mothers individually comprehend and react accordingly to these pressures.

Methodology

A qualitative single-institution case study design is adopted to examine motherhood penalty perceptions, involving 8-10 married female academic staff with children, working at a Hungarian university but representing diverse international backgrounds. Data are collected through semi-structured interviews, using purposive sampling and thematic coding.

Theoretical and practical contributions

First, it offers a novel perspective on gender practices by social role theories to highlight both the individual and institutional challenges women face. Second, instead of merely looking at objective results, it focuses on the perception of motherhood penalties by academic mothers and how this perception affects career sustainability. Third, it places the discussion in Hungarian higher education, contributing evidence from a non-Anglo-American context.

Originality and values

The study emphasizes the comprehension of motherhood penalty in a Central-Eastern European context. Meanwhile, the study highlights how these motherhood penalty perceptions shape their

understanding or decisions on career sustainability, thereby creating a conceptual model of "perceptions – decisions – sustainability".

Research limitations

This is a single-institution based study, the findings may be strongly shaped by a specific institutional culture. However, the study provides in-depth individual experiences within a specific context, providing insights of how motherhood penalty operates within Hungarian higher institutions.

TOWARDS CAREER SUCCESS: PERCEIVED EDUCATIONAL RETURNS AND CAREER SATISFACTION AMONG UNIVERSITY STUDENTS IN MALAYSIA

Soong C.J[1], Noe K. M. 2 [2], Tonelli R. [3], Fiore M.[4]

[4] Department of Economics, University of Foggia, ITALY

Keywords: Employability, Skill Relevance, Income Expectations, Career Satisfaction, Structural Equation Modelling, Higher Education, Malaysia

Introduction

Malaysia's higher education sector has expanded rapidly over the past two decades, with increasing enrolment, a growing number of public and private institutions, and greater emphasis on producing a highly skilled workforce to support national economic development. Despite these advances, a persistent gap remains between what students expect their education to deliver and what they actually experience as they prepare to enter the labour market. Understanding what drives students' sense of educational return therefore matters not only for curriculum design but also for improving graduate employability, strengthening the alignment between tertiary education and labour market needs, and informing higher education policy aimed at enhancing the overall value of university education.

Purpose, Aim and Objectives

The aim of this study is to examine how perceived educational returns shape career satisfaction among university students in Malaysia. The objectives are to examine the influence of employability confidence (H1), perceived skill relevance (H2) and income expectations (H3) on career satisfaction, with each hypothesised to exert a positive effect.

Literature Review and Theoretical Framework

Recent research highlights curriculum innovation as a key strategy for preparing graduates to address SDGs environmental and societal challenges (Symeonidou et al., 2025). The study is

grounded in human capital theory, which views education as an investment yielding labour market returns (Becker, 1962). Recent evidence indicates that human capital is essential, though not sufficient, for perceived employability (Ma and Bennett, 2024), and that employers in Malaysia report persistent skills gaps among graduates (Tee et al., 2024). However, few studies model these three constructs together as joint predictors of career satisfaction, a gap the present study addresses.

Methodology and Methods

A quantitative, cross-sectional survey design was adopted to test the hypothesised relationships. Data were collected through a structured questionnaire administered via Google Forms, yielding 384 valid responses across four year-of-study groups and six broad fields of study. Every questionnaire item was set as a required field, leaving no missing data. The sample size satisfies Cochran's (1977) formula at a 95% confidence level and 5% margin of error. Each of the four constructs was measured with five five-point Likert-scale items, and all scales showed strong reliability (Cronbach's alpha = 0.901 to 0.929). Multiple regression first quantified the predictors' joint and unique contributions to career satisfaction, and covariance-based structural equation modelling then cross-validated these results by modelling each construct as a latent variable and separating measurement error from the structural relationships. Collinearity diagnostics confirmed acceptable variance inflation factors.

Findings and Contribution

Income expectations, employability confidence, and perceived skill relevance collectively explained 61% of the variance in career satisfaction ($R^2 = 0.610$, $p < 0.001$). All three hypothesised relationships were supported: income expectations was the strongest predictor ($\beta = 0.386$), followed by employability confidence ($\beta = 0.324$) and perceived skill relevance ($\beta = 0.198$). The structural equation model exhibited an excellent fit (CFI = 0.998, RMSEA = 0.012), supporting the proposed framework. Students across all education levels reported similarly positive career satisfaction, and only 10.4% reported income expectations exceeding their current satisfaction, indicating realistic expectations and a generally positive outlook toward future careers.

Originality and Value

This study provides one of the few comprehensive examinations of employability confidence, perceived skill relevance, and income expectations as simultaneous predictors of career satisfaction within a developing-economy context. Integrating these key determinants into a single framework enhances understanding of the factors that shape students' career satisfaction during higher education.

Research Limitations

This study offers valuable insight by capturing students' perceptions at a well-defined stage of their academic journey, using validated self-report measures that directly assess how students themselves experience their educational returns. Building on this foundation, future research could adopt longitudinal designs to track how these perceptions evolve after graduation and incorporate objective indicators such as graduate salary records.

Theoretical and Practical Applications and Implications

Theoretically, this study advances the human capital perspective by demonstrating that students' subjective, forward-looking evaluations of expected returns significantly shape career satisfaction even before graduation. Practically, higher education institutions and career services can provide reliable graduate salary information to help students develop realistic income expectations, and strengthen the connection between coursework and workplace requirements through employer engagement, industry briefings, internships, and applied learning projects to enhance skill relevance, reinforce employability confidence, and foster greater career satisfaction.

IS THE ISRAELI HIGH-TECH SECTOR A BUBBLE IN THE ISRAELI ECONOMY?

Schein, Andrew
Netanya Academic College, Netanya, Israel

Keywords: Economics, Economic growth, Start-up companies, Exits, Productivity, Cybersecurity.

Introduction

Economic growth can be broad based or dependent on certain key sectors in an economy. When it is based on a few sectors, then there is a risk, that if there is a negative shock to the successful sector, then the entire economy can have a large decline. One example of a country whose economy is based almost exclusively on one sector is Saudi Arabia whose economy depends on the oil sector. Also, many of the economies of countries in the Caribbean Islands are very dependent on the tourism industry, and these economies declined significantly during COVID-19, when tourism all over the world collapsed.

Purpose and Objectives

The purpose of this study is to examine whether Israel has also become an economy which is heavily dependent on one sector, in this case its high-tech sector, and our objective is analyze the relationship between Israel's high-tech sector and the rest of Israel's economy.

Literature Review and Theoretical Framework

Schein (2003) examined the relationship between Israel's high-tech sector and the general growth in Israel's economy, and found that for the years 1994-2001, the high-tech sector did not have a significant impact on Israel's GDP. More recently, *The Economist* (2017) noted that "dazzling high-tech firms divert attention from a serious productivity problem" and quote Eugene Kandel, then director of Startup Nation Central in Israel, who "talks of the high-tech industry as a Zeppelin floating above the rest of the economy and only loosely

connected to it." Filut (2026) in his analysis of an OECD report on productivity noted that "Despite record investment in innovation, Israeli workers still produce less per hour than their counterparts in leading developed economies" which he labels a "high-tech paradox."

Methodology, Methods and Preliminary Findings

We begin with a brief survey of Israel's high-tech sector and then we will look at Israel's exports as a measure of Israel's high-tech sector within Israel's economy. Afterwards, we will examine the relationship between exits in Israel's high-tech sector and changes in Israel's GDP. While the number of exits and the value of the exits are much more volatile than changes in GDP, still one would think that if exits contribute to the greater economy, then changes in the value of high-tech exits would be closely correlated to changes in GDP, especially in a relatively small economy such as Israel's. At a minimum one should expect to see a positive correlation between exits and the growth in Israel's GDP, and in theory it is just a question of how strong is the positive correlation. However, if there is a negative correlation or an insignificant correlation, then this indicates that Israel's high-tech sector is independent of the general economy, and it is not able to generate growth overall. Preliminary results from the regressions indicate a lack of causality between Israel's high-tech industry and the remainder of the economy.

Implications and Practical Applications

One of the implications of the study is that there is a danger that the Israeli economy could stagnant if the high-tech sector declines. While Israel's high-tech sector is now booming (see Israel Innovation Authority 2026), there are possible scenarios where the sector could decline. One scenario is a brain drain of people working in the high-tech sector who might choose to live and work in other countries or a second scenario is where foreign investors could decide to shun investing in Israeli high-tech firms due to antagonism to the policies of the Israeli government. The implication is not only that the Israeli government should assist the high-tech sector, which it already does, and not antagonize foreign investors, but also that it should try to ensure that the growth in the economy is broad based and not only dependent on the high-tech sector.

INTERGENERATIONAL COOPERATION WITH GENERATION Z AS A STRATEGIC CAPABILITY: EVIDENCE FROM LEBANESE FAMILY BUSINESSES

Fahed-Sreih, Josiane

Department of Management Studies, Byblos, Lebanon

Keywords: Generation Z, family business, innovation, resilience, sustainability, cooperation, intergenerational collaboration, socioemotional wealth

Abstract

This paper examines how cooperation with Generation Z (Gen Z) within family-owned firms influences organizational innovation, resilience, and long-term sustainability. Drawing upon generational cohort theory, socioemotional wealth (SEW) perspectives, and dynamic capabilities, this study proposes that active inclusion and collaboration with Gen Z employees and successors can enhance creative problem-solving, adaptability in changing environments, and sustainable competitive advantage. While family firms often exhibit strong traditions, values, and governance structures, integrating Gen Z's digital fluency, entrepreneurial mindset, and sustainability orientation may catalyze positive organizational outcomes. This paper synthesizes existing literature, develops a conceptual framework, and outlines avenues for future empirical research.

1. Introduction

Family firms are a critical segment of the global economy, contributing significantly to employment, GDP, and entrepreneurial activity. At the same time, demographic shifts are bringing new generational cohorts — particularly Generation Z (born roughly 1997–2012) — into organizational roles as employees and potential successors. Compared to previous cohorts, Gen Z exhibits distinct values, including a strong orientation toward digital technology, sustainability, and collaborative work environments (Fahed-Sreih 2026).

While family businesses often depend on established routines and long-standing culture, these strengths can also lead to rigidity. Concurrently, market competition, technological disruptions, and societal expectations regarding sustainability demand organizational innovation and resilience. The central question of this study is: Can cooperation with Gen Z improve innovation, resilience, and sustainability outcomes in family firms?

This paper argues that the strategic integration of Gen Z perspectives can enrich family firms' resource base, build adaptive capacity, and foster sustainability-oriented innovation.

Purpose, Aim and Objectives

This paper examines how cooperation and active engagement with Generation Z (Gen Z) within family-owned firms may influence organizational innovation, resilience, and long-term sustainability. The study aims to explore how the inclusion of Gen Z employees and next-generation family members can contribute to the renewal and adaptation of family firms while maintaining the values and continuity associated with family ownership. Specifically, the paper seeks to: (1) examine the potential role of Gen Z in fostering innovation and creative problem-solving; (2) explore how collaboration between generations can strengthen organizational adaptability and resilience; and (3) assess how Gen Z's digital fluency, entrepreneurial orientation, and sustainability awareness may contribute to the long-term competitiveness and sustainability of family firms. The paper is guided by the question: How can cooperation with Gen Z contribute to innovation, resilience, and long-term sustainability in family-owned firms?

Literature Review and Theoretical Framework

The study draws upon three complementary theoretical perspectives: generational cohort theory, socioemotional wealth (SEW) theory, and the dynamic capabilities perspective. Generational cohort theory provides a basis for understanding differences in values, attitudes, technological competencies, and work orientations across generations. SEW theory helps explain how family firms balance economic objectives with the preservation of family identity, relationships, values, and control when integrating younger generations. The dynamic capabilities perspective, in turn, provides a framework for understanding how family firms can renew organizational resources and capabilities in response to technological, market, and societal changes. Existing literature suggests that family firms benefit from strong traditions, relational ties, and distinctive governance arrangements, but these characteristics may also create challenges for generational renewal and organizational change. The literature indicates a need for greater understanding of how Gen Z can be integrated into family firms in ways that reconcile continuity with innovation and strengthen the firm's capacity to respond to emerging challenges.

Methodology and Methods

This paper adopts a conceptual and literature-based research approach**.** It synthesizes relevant academic literature on family business, intergenerational collaboration, Generation Z, organizational innovation, resilience, sustainability, generational cohort theory, socioemotional wealth, and dynamic capabilities. The literature is critically examined to identify recurring themes, theoretical relationships, and gaps in existing research. Based on this synthesis, the paper develops a conceptual framework linking cooperation with Gen Z to three key organizational outcomes**:** innovation, resilience, and long-term sustainability. The conceptual approach is appropriate because research specifically examining the role of Gen Z within family-owned firms remains emerging, providing a basis for developing propositions and guiding subsequent empirical investigation.

Main Findings and Contribution

The literature synthesis suggests that meaningful cooperation with Gen Z has the potential to strengthen family firms' capacity for innovation, adaptability, and sustainable value creation. Gen Z’s digital fluency may facilitate technological adoption and new approaches to problem-

solving, while their entrepreneurial orientation may encourage experimentation, opportunity recognition, and business renewal. Their greater awareness of sustainability and social responsibility may also support the development of more sustainable business practices. However, these potential benefits depend on the ability of family firms to create mechanisms for genuine intergenerational collaboration rather than merely transferring authority from one generation to another. The study therefore proposes that the interaction between Gen Z capabilities and established family-firm resources can generate dynamic capabilities that support organizational resilience and long-term competitiveness. The paper contributes by bringing together generational cohort theory, SEW, and dynamic capabilities to explain how intergenerational cooperation may facilitate both continuity and renewal in family-owned firms.

Originality and Value

The originality of the paper lies in its specific focus on Gen Z as a source of renewal and strategic capability within family-owned firms**,** an area that remains comparatively underdeveloped in the family business literature. By integrating generational, socioemotional, and capability-based perspectives, the proposed framework offers a more comprehensive understanding of how family firms can manage the tension between preserving established traditions and embracing technological, entrepreneurial, and sustainability-oriented change. The framework has potential implications for family business owners, boards, and next-generation leaders seeking to design governance and succession practices that encourage meaningful intergenerational participation. Future empirical research should test the proposed relationships across different generations, family-firm contexts, industries, and institutional environments and examine the conditions under which cooperation with Gen Z produces positive organizational outcomes.

2-Literature Review

2-1. Family Businesses and Intergenerational Cooperation

Family businesses are characterized by the intersection of family, ownership, and management systems, which creates unique strengths and tensions (Tagiuri and Davis, 1996). One defining feature of family firms is their long-term orientation, often driven by the desire to preserve socioemotional wealth (SEW), such as family legacy, identity, and control (Gómez-Mejía et al., 2007). While these characteristics enhance stability and resilience, they may also inhibit openness to change and innovation (Kellermanns et al., 2012), flexibility and receptivity to novel ideas.

Intergenerational cooperation has been identified as a critical mechanism for sustaining competitive advantage in family firms (Vallensi and Guillon, 2020). Prior research shows that knowledge exchange between generations improves decision quality and strategic renewal (Cabrera-Suárez et al., 2001). However, differences in values, communication styles, and risk preferences often lead to intergenerational conflict, particularly when younger generations seek to modernize business practices (De Massis et al., 2016).

- **Socioemotional Wealth (SEW)**: The value derived from family control, legacy, and reputation can sometimes constrain risk-taking.
- **Leadership and Succession**: Succession planning is a prominent concern in the family business literature, often tied to generational transitions.

2-2. Generation Z in Organizations

Generation Z, typically defined as individuals born between 1997 and 2012, represents the newest cohort entering the workforce (Twenge, 2017). Gen Z differs from prior generations in several key dimensions relevant to organizational performance.

First, Gen Z is highly digitally fluent, having grown up with constant access to technology and social media (Priporas et al., 2017). This digital competence enables rapid adoption of new tools, platforms, and data-driven processes. Second, Gen Z employees tend to value collaboration, transparency, and continuous feedback (Schroth, 2019). Third, sustainability and social

responsibility play a central role in their employment preferences and organizational commitment (Francis and Hoefel, 2018).

Gen Z is the first cohort to grow up entirely in a digital era, shaping distinct competencies and expectations:

- **Digital Fluency**: High comfort with technology and digital communication tools.
- **Collaborative and Entrepreneurial Mindset**: Strong preference for teamwork and innovation-driven projects.
- **Sustainability Orientation**: Greater emphasis on environmental and social corporate responsibility.

These attributes have implications for organizational processes, especially if harnessed productively.

Despite these strengths, Gen Z is often perceived by senior generations as inexperienced or insufficiently loyal, which can limit their involvement in strategic decision-making, particularly in family businesses with hierarchical governance structures (Rauvola et al., 2019).

2-3. Cooperation with Gen Z and Innovation

Innovation in family firms has traditionally been constrained by risk aversion and a preference for preserving existing routines (Chrisman and Patel, 2012). However, recent studies suggest that younger generations can act as catalysts for innovation by introducing new perspectives, technologies, and business models (Kronke and Laulitz, 2019).

Innovation refers to the development and implementation of new ideas, products, or processes. Resilience is the capacity to absorb shocks and adapt to change. Sustainability encompasses long-term economic, environmental, and social viability.

The literature suggests that diverse perspectives and adaptive cultures promote innovation and responsiveness to environmental change (Crossan and Apaydin, 2010). Family firms can exhibit

resilience through long-term orientation and strong relational networks, but may under-leverage younger cohorts.

From a **Resource-Based View (RBV)** perspective, Gen Z's digital skills and sustainability-oriented mindset constitute valuable, rare, and difficult-to-imitate resources (Barney, 1991). When family firms establish cooperative mechanisms—such as cross-generational teams, participatory governance, and reverse mentoring—these resources can be effectively leveraged to enhance innovation outcomes (Vallensi and Guillon, 2020).

Empirical evidence suggests that firms with higher generational diversity demonstrate greater exploratory innovation and adaptability (Pelled et al., 1999).

2-4. Cooperation with Gen Z and Organizational Resilience

Organizational resilience refers to a firm's ability to absorb shocks, adapt, and continue functioning during periods of disruption (Lengnick-Hall et al., 2011). Family firms often exhibit resilience due to strong social capital and long-term orientation (Amann & Jaussaud, 2012). However, resilience increasingly depends on digital transformation and adaptive learning—areas where Gen Z excels.

Gen Z's familiarity with remote work, digital collaboration, and rapid information processing enhances a firm's capacity to respond to crises such as technological disruption or market volatility. Studies show that inclusive decision-making and generational collaboration improve crisis responsiveness and organizational learning (Duchek, 2020).

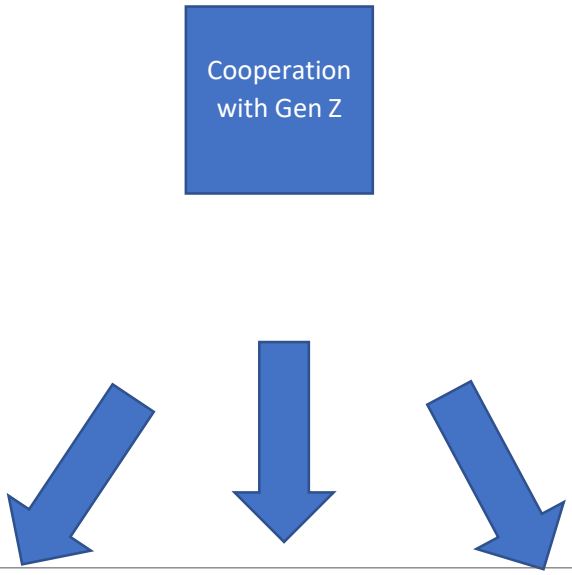
2-5. Cooperation with Gen Z and Business Sustainability

Business sustainability encompasses economic longevity, environmental responsibility, and social legitimacy (Elkington, 1997). Family firms are often naturally inclined toward sustainability due to their transgenerational focus, but may lack the technical knowledge or urgency to implement formal ESG strategies (Berrone et al., 2012).

Gen Z employees demonstrate a strong commitment to environmental and social causes, influencing firms to adopt sustainable practices and transparent reporting (Francis & Hoefel, 2018). Cooperation with Gen Z can therefore bridge traditional family values with modern sustainability frameworks, strengthening long-term competitiveness and legitimacy.

3- Theoretical Framework

This paper integrates:



- **Generational Cohort Theory**: Explains differences in values and behaviors across birth cohorts.
- **Resource-Based View (RBV)**: Positions Gen Z competencies as strategic resources.
- **Dynamic Capabilities**: Suggests that collaboration mechanisms with Gen Z can enable sensing, seizing, and transforming capabilities within family firms.

3-1 Proposed relationships:

This paper looks into the relationship of cooperation with Gen Z and its effect on Innovation, resilience and improved family business sustainability

1. Cooperation with Gen Z → Increased Innovation
2. Cooperation with Gen Z → Enhanced Resilience
3. Cooperation with Gen Z → Improved Business Sustainability

3-2 Conceptual Model

Stemming from this conceptual model, a number of hypotheses are derived

Hypothesis 1 (H1): Cooperative engagement with Gen Z will positively influence organizational innovation outcomes.

Hypothesis 2 (H2): Cooperative engagement with Gen Z will strengthen organizational resilience during environmental changes.

Hypothesis 3 (H3): Cooperative engagement with Gen Z will increase adoption of sustainability-oriented practices.

4- Sampling and Methodology

This study adopts an **exploratory, cross-sectional research design** to examine the strategic role of cooperation with Generation Z in Lebanese family businesses. Given the limited empirical research on Gen Z integration in family firms—particularly in emerging and crisis-prone

economies—an exploratory approach is appropriate to identify patterns, relationships, and theoretical extensions rather than to test a fully established theory.

Data were collected using a structured survey questionnaire administered to key informants in Lebanese family-owned firms.

4-1 Sample and Data Collection

The target population consisted of **Lebanese family-owned businesses** operating in the private sector. A firm qualified for inclusion if:

1. A single family owned at least **50% of equity**
2. At least **two family members** were involved in management
3. At least **one Gen Z individual (born 1997–2012)** was employed or actively involved

Data collection took place over a four-month period. Questionnaires were distributed electronically and in person through:

- Lebanese Chambers of Commerce
- The Institute of Family and Entrepreneurial Business at LAU
- Professional and personal networks

Of the **220 questionnaires distributed**, **163 responses** were received (74.1% response rate). After eliminating incomplete surveys and responses failing attention checks, **156 usable questionnaires** remained.

4-2 Measurements and hypotheses

All constructs were measured using **multi-item reflective scales** on a **five-point Likert scale** (1 = strongly disagree; 5 = strongly agree). Items were adapted from prior literature and contextualized to the Lebanese family business environment.

Cooperation with Gen Z (CGZ)

Four items measured the extent to which Gen Z employees or family members are included in collaboration and decision-making processes. To measure **Innovation (INN),** three items assessed product, process, and managerial innovation. These items capture **product, process, and managerial innovation**, which is standard in strategic family business research because it covers multiple dimensions of innovation and is adapted from established innovation scales (e.g., Crossan and Apaydin, 2010; Zahra 1996) and appropriate for both SMEs and large family firms. These items have a strong fit with resilience theory, they are contextually appropriate for crisis-prone environments and aligned with Duchek (2020) and Lengnick-Hall et al. (2011). For the adoption of the new technologies or processes to improve efficiency and competitiveness (Zahra, Neubaum, and Huse 2000) As for employees and family members that are encouraged to experiment with new ideas and solutions (Jansen, Van Den Bosch, and Volberda,2006). These items jointly capture **outcome-based** (products/services) and **process-based** (technology adoption, experimentation) dimensions of innovation, consistent with strategic innovation research in family firms. This leads us to the following hypotheses:

H1-a- INN1: Our firm regularly introduces new or significantly improved products or services.

H1-b-INN2: Our firm adopts new technologies or processes to improve efficiency and competitiveness.

H1-c-INN3: Employees and family members are encouraged to experiment with new ideas and solutions.

To measure sustainability, SUS1 one has to think about three sustainability considerations that influence strategic decisions in the firm, (Berrone, Cruz, and Gómez-Mejía,2012), reflects the triple-bottom-line approach, (Elkington 1997; Porter and Kramer,2006) fits family business values and socioemotional wealth logic and is suitable for emerging economy contexts and influences strategic decision making (Eccles, Ioannou, and Serafeim, 2014). These items capture **economic longevity**, **social/environmental engagement**, and **strategic integration**, aligning with the triple bottom line and socioemotional wealth perspectives. This leads to the following hypotheses:

H2-a- SUS1: Our firm emphasizes long-term survival and continuity over short-term profits.

H2-b-SUS2: Our firm actively engages in environmental or social responsibility initiatives.

H2-c-SUS3: Sustainability considerations influence strategic decisions in our firm.

As for Organizational resilience, **(RES**) the items measured are adaptive capacity, crisis response and organizational learning.

Together, these items reflect the **three core dimensions of resilience**: response, adaptation, and learning, which are especially relevant in unstable economic contexts such as Lebanon. (Lengnick-Hall, Beck and Lengnick-Hall ,2011; Duchek ,2020; Burnard and Bhamra ,2011). This leads us to the following hypotheses:

H3-a-RES1: Our firm responds quickly and effectively to unexpected disruptions or crises.

H3-b-RES2: Our firm adapts its strategies and operations in response to environmental changes. **Source:** Adapted from

H3-c-RES3: Our firm learns from past crises and uses those lessons to improve future performance.

4-3 Theoretical and methodological Justification

Consistent with prior strategic family business research, innovation, organizational resilience, and business sustainability were measured using three-item reflective scales. This parsimonious approach is appropriate for exploratory research and minimizes respondent burden while maintaining strong psychometric properties. All items were adapted from established scales and contextualized to the Lebanese family business environment.

Three-item reflective scales are widely accepted in **strategic management and family business research**, particularly when constructs are **well-defined and unidimensional** (Hair et al., 2019). Innovation, resilience, and sustainability in this study are conceptualized at a **strategic, firm-level**, rather than as granular operational processes, making parsimonious measurement

appropriate. The three-item scales reduce **respondent fatigue**, which is critical in surveys involving senior family executives, they enhance **response quality**, particularly in emerging economy contexts, and prior studies in family business and strategy journals have successfully used three-item measures with strong psychometric properties. All constructs achieved **composite reliability (CR > 0.80); a**ll constructs achieved **AVE > 0.50**, indicating convergent validity; CFA results demonstrated strong standardized loadings (> 0.70). Thus, the three-item scales meet **SEM reliability and validity requirements** while preserving survey efficiency.

4-4 Common Method Bias

Given the use of self-reported survey data, several procedural and statistical remedies were employed to address **common method bias (CMB)**. Anonymity and confidentiality were assured, Item wording was concise and non-evaluative and independent and dependent variables were separated across sections.

Hence the target sample would be family businesses with multiple generational involvement, and the analysis methods would be the structural equation modeling (SEM) for quantitative data and thematic coding for qualitative data.

Harman's Single-Factor Test

An unrotated exploratory factor analysis revealed that the largest factor accounted for **31.4% of the total variance**, well below the 50% threshold, suggesting that CMB is unlikely to be a serious concern.

Common Latent Factor Test (AMOS)

A common latent factor was added to the CFA model. The standardized loadings changed by less than **0.20**, indicating no substantial inflation due to common method variance.

Together, these results suggest that **common method bias does not significantly affect the study's findings**.

4-5 Data Analysis

Data analysis proceeded in three stages:

1. Descriptive statistics and reliability analysis using SPSS
2. Confirmatory factor analysis (CFA) using AMOS 24
3. Structural equation modeling (SEM) to test hypothesized relationships

Given the exploratory nature of the study, model evaluation emphasized both statistical fit and theoretical plausibility.

A mixed-methods design is recommended to capture both depth and generalizability.

- Quantitative Component**:** Cross-sectional survey targeting family firms across industries.
- Qualitative Component**:** Semi-structured interviews with family leaders, Gen Z employees, and HR managers.

Construct	Measurement Examples
Cooperation with Gen Z	Participation in decision-making, feedback mechanisms, mentorship programs
Innovation	New product launches, process improvements, R&D intensity
Resilience	Adaptive strategies during disruption, continuity planning
Sustainability	Environmental policies, CSR initiatives, long-term ESG performance

4-5-1 AMOS Results

Confirmatory Factor Analysis (Measurement Model)

Model Fit Indices

Fit Index	Value	Recommended
χ^2 / df	1.94	< 3.00
CFI	0.93	≥ 0.90
TLI	0.92	≥ 0.90
RMSEA	0.078	≤ 0.08
SRMR	0.051	≤ 0.08

Interpretation: The measurement model demonstrates acceptable to good fit, consistent with exploratory SEM standards.

Construct Reliability and Validity

Construct	CR	AVE
CGZ	0.88	0.65
INN	0.85	0.59
RES	0.83	0.57
SUS	0.87	0.63

- Composite reliability (CR) exceeds 0.70
- Average variance extracted (AVE) exceeds 0.50
- Discriminant validity confirmed using Fornell–Larcker criterion

4-5-2 Structural Model Results

Structural Model Fit

Fit Index	Value
χ^2 / df	2.01
CFI	0.92
TLI	0.91
RMSEA	0.081

Path Coefficients

Hypothesis	Path	Std. β	p-value	Result
H1	CGZ → Innovation	0.41	< 0.001	Supported

Hypothesis	Path	Std. β	p-value	Result
H2	CGZ → Resilience	0.34	< 0.01	Supported
H3	CGZ → Sustainability	0.47	< 0.001	Supported

Control variables were included but did not materially alter the significance or direction of the main effects.

Given the nascent state of research on Generation Z cooperation in family firms—particularly in emerging economies—this study is explicitly exploratory. The results are intended to identify meaningful patterns and theoretical extensions rather than to provide definitive causal claims.

4-5-3 Reliability and Regression

Reliability Analysis

Construct	Cronbach's α
Cooperation with Gen Z	0.89
Innovation	0.86
Resilience	0.84
Sustainability	0.88

Since all exceed the recommended threshold of 0.70, this means that the hypotheses stated are all accepted.

Regression Results

Dependent Variable	β (Cooperation with Gen Z)	p-value
Innovation	0.42	< 0.001
Resilience	0.36	< 0.01
Sustainability	0.48	< 0.001

Cooperation with Gen Z has a statistically significant positive effect on all three outcomes, with the strongest influence observed on sustainability.

5. Results and Discussion

Based on the literature, it is anticipated that family firms that establish structured cooperation mechanisms with Gen Z (e.g., inclusive governance practices, idea-sharing platforms) will report higher innovation metrics. Firms leveraging Gen Z's digital and adaptive capabilities will show greater resilience to market or technological disruptions. Incorporation of Gen Z values related to sustainability will align family firm strategies with ESG frameworks.

These findings would suggest that rather than treating generational differences as obstacles, family firms can leverage them as strategic assets.

5-1. Implications

5-1-.1 Theoretical

- Extends family business literature by linking intergenerational cooperation to dynamic capabilities.
- Bridges generational studies with organizational performance outcomes.

5-1-2 Practical

- Encourages family business leaders to institutionalize cooperation channels with Gen Z.
- Highlights the strategic value of Gen Z competencies for future-proofing firms.

6. Limitations and Future Research

This paper, in spite of its merit has some limitations. This conceptual paper points to several research gaps: the first research gap is that it doesn't capture long term impacts, it is advisable to conduct longitudinal studies to be able to explore this research gap. The paper fails as well to explore cross cultural comparisons, given varying family firm norms globally. One can further explore the moderating factors such as firm size, industry, and /or governance structures.

Conclusion

In conclusion, cooperation with Gen Z represents not just a demographic necessity but an opportunity for family firms to enhance innovation, resilience, and sustainability. By embracing intergenerational collaboration, family businesses can build adaptive engines that balance tradition with future readiness.

GLOBAL TRADE MODELS AND NATIONAL ECONOMIC AND TRADE EQUILIBRIUM

Keywords: National macroeconomic and trade equilibrium, trade deficit, fair and free trade
Track No.13 Economics

Introduction

Governments always strive to achieve economic and trade equilibrium within their countries if there are no recessions. If aggregate supply equals aggregate demand, macroeconomic equilibrium is achieved, even if it may not be the case in some countries. Developed countries lost their real economies due to the offshoring of manufacturing. They achieve macroeconomic equilibrium with negative trade balances, which are undesirable. They have a comparative disadvantage. Adam Smith said that if a country has a negative trade balance, that country creates wealth for others. The optimum is that no country should have a negative balance. The present study analyzes trade models in macroeconomic equilibrium.

Literature Review

The Ricardian model (Ricardo, 1817) of comparative advantage demonstrates that free trade maximizes global output, whereas protectionism reduces efficiency. Empirical studies (Eaton & Kortum) confirm that comparative advantage explains trade flows.

The Heckscher-Ohlin (H-O) model (Heckscher & Ohlin, 1933) predicts that countries export goods that use abundant factors and import goods that require scarce factors. Empirical tests (Leamer, 1984) show mixed support for this theory.

New trade theory: Economies of scale and monopolistic competition (Krugman, 1979; 1980) show that economies of scale lead to lower prices and higher consumer welfare. Empirical studies (Helpman & Krugman, 1985) show that intra-industry trade is significant in developed economies.

Strategic Trade Theory and Game-Theoretic Models: Governments can use subsidies to boost domestic industries (Barnder & Spencer, 1985). Empirical evidence (Anderson & Neary, 1994) suggests limited success in strategic trade policies, as retaliation often negates benefits.

Dynamic Stochastic General Equilibrium Models (Shoven & Whalley, 1984) simulate the long-term effects of protectionist and globalist policies under uncertainties and business cycles (Smets & Wouters, 2007). Empirical studies (Hertel, 1997) confirm that tariffs reduce real income, particularly in small economies.

The National Economic and Trade Equilibrium

The research question is whether the U.S. government's new trade policies, as instrumental variables, modify the country's macroeconomic equilibrium.

The Model

Y = GDP ($) = C + I + G + (EX – IM) (Fair, 2021)

C – consumption

I – investment

G – government spending/expenditures

EX – exports

IM - imports

Trade equilibrium – international exchange of goods, services, and capital flows balance out:

EX = IM(Y) or NetEX=EX-IM=0 – Zero trade balance is desirable at least.

X - endogenous variable is run against Z – instrumental variable

$$X_i = y_0 + y_1 Z_i + u_i$$

The predicted value of X under the influence of the instrumental variable:

$$\check{X}_i = \check{y}_0 + \check{y}_1 Z_i$$

The predicted values are included into the second stage OLS regression (2SLS).

$$\mathbf{Y_i = \beta_0 + \beta_1 \check{X}_i + \beta_2 \check{X}_i + \ldots + \beta_n \check{X}_i + e_i}$$

Methods

2SLS – Instrumental Variable Estimation – helps determine the effects of Trump policies on the economic equilibrium, including foreign trade.

The original country trade equilibrium model

X - endogenous variable is run against Z – instrumental variable

$$X_i = y_0 + y_1 Z_i + u_i$$

The predicted value of X under the influence of the instrumental variable:

$$\check{X}_i = \check{y}_0 + \check{y}_1 Z_i$$

The predicted values are included into the second stage OLS regression (2SLS).

$$\mathbf{Y_i = \beta_0 + \beta_1 \check{X}_i + \beta_2 \check{X}_i + \ldots + \beta_n \check{X}_i + e_i}$$

Conclusion

Trade models ignore national macroeconomic equilibrium, treating the trade balance and the impacts of policy changes as instrumental variables. I propose to test Fair's (2018) model using Trump policies as instrumental variables. The results should demonstrate the importance of Trump's policies in achieving a better national economic equilibrium with a smaller negative trade balance and reduced dependence on global markets for critical commodities.

WHAT ABOUT COST AND VALUE DETERMINANTS OF MYANMAR STUDENTS' MOBILITY TO MALAYSIA? A PUSH–PULL PERSPECTIVE ON ACCESS TO QUALITY HIGHER EDUCATION

Soong C.J[1], Swe Z. W. [2], Maschio M.R. [3], Fiore M.[3]

Keywords: Push-Pull Theory, Myanmar Students' Mobility to Malaysia, Cost factors, Perceived value, Quality Education

Introduction

The globalization of higher education has fundamentally reshaped the landscape of international student mobility, influencing how prospective students evaluate and select overseas study destinations. Existing literature highlights that higher education generates both individual and societal returns by enhancing students' competencies, employability, sustainability awareness, and socio-economic outcomes. However, limited attention has been paid to how students themselves perceive the return on their educational investment, particularly in the Malaysian context (Spada et al., 2024; Maschio et al., 2024. Symeonidou et al., 2025). While traditional destinations such as USA, UK, Australia, and Canada remain highly attractive, emerging education hubs including Malaysia have become increasingly competitive. Existing research suggests that students' destination choices are shaped by a combination of push factors originating from their home countries and pull factors associated with host countries. At the same time, recent evidence points to a gradual diversification of international student flows beyond the traditional English-speaking destinations, reflecting the emergence of new regional education centers and evolving student preferences (Janik et al., 2023). Zaman et al. (2023) applying Push–Pull Theory highlight that destination choice results from a combination of educational, economic, and socio-political considerations.

Purpose, Aim and Objectives

The aim of this study is to study Myanmar's push conditions together with its emphasis on both affordability and value makes Malaysia an interesting and inclusive study destination in the ASEAN region. The objectives are to discuss how push factors in Myanmar highlighting structural challenges in achieving equal access to higher education; to investigate how cost

factors shape Myanmar students' intention to pursue higher education in Malaysia; and to determine the influence of perceived value reinforcing educational equity and inclusion.

Literature Review and Theoretical Framework

While prior studies have examined Chinese and other international students in Malaysia, limited research exists on Myanmar students (Sam et al. ,2025). Furthermore, the existing study on Myanmar students have primarily investigated their study destination decisions in Finland (Phyo ,2025). This study addresses that gaps by applying the Push Pull Theory to Myanmar students' mobility decisions to pursue higher education in Malaysia.

Methodology and Methods

A quantitative cross-sectional survey design was employed in this study. The target population comprised Myanmar nationals enrolled in private higher education institutions in Malaysia (MOHE, 2025). The sample size was calculated using Krejcie and Morgan's (1970) table, which yielded a sample size of 341. A stratified random sampling technique was employed to ensure adequate representation of the respondents. A structured questionnaire was developed 29 close-ended questions based on an extensive literature review. Data were analyzed to examine the predictive relationships between push-pull factors and quality education.

Findings and Contribution

The regression results partially support the hypothesis H1 since the push factors had a statistically significant, but small, coefficient ($B = 0.056$, Beta = 0.082, $t = 2.001$, $p = 0.046$). The hypothesis H2 is strongly supported by the results as cost factors showed a significant positive effect ($B = 0.396$, Beta = 0.508, $t = 12.483$, $p < 0.001$). The hypothesis H3 is well supported by the results as Perceived Value showed a significant positive effect ($B = 0.389$, Beta = 0.458, $t = 11.238$, $p < 0.001$).

Originality and Value

This study addresses the limited research on Myanmar students' educational mobility to Malaysia by applying the Push–Pull Theory. It identifies cost factors and perceived value as the key determinants of quality education outcomes and provides practical implications for higher education institutions and policymakers.

Research Limitations

The study may be limited by the use of cross sectional data, which could not examine changes in students' perceptions over time. The sample consisted only of Myanmar students enrolled in

Malaysian private universities, not consider students from other countries or those studying in public universities.

Theoretical and Practical Applications and Implications

The results of multiple regression analysis, based on 310 valid answers, indicate that the push–pull framework is theoretically relevant in this context, as 49.6% of the variance of quality education was explained.

Practically, the study can provide useful guidance and assistance for Malaysian universities in enhancing their strategies to attract international students, and promoting quality education and equal access.

Keywords: Effectuation; Generative artificial intelligence; Organizational decision-making; Decision boundaries; Theory adaptation; Organizational design

Abstract

Generative artificial intelligence (GenAI) is increasingly integrated into organizational decision processes, assisting in problem framing, option generation, and alternative evaluation prior to commitment. This development prompts critical questions for effectuation—a decision logic focused on action, commitment, and control under uncertainty—because effectuation traditionally assumes human-centered judgment, authority, and accountability. This study re-specifies effectuation for organizational contexts where GenAI contributes to decision construction. Employing a conceptual theory-adaptation approach, the analysis is situated at the organizational decision system level and investigates how GenAI alters the enactment of means, affordable loss, partnership, and control. The analysis also highlights two cross-cutting assumptions that become particularly salient with GenAI participation: cognitive effort allocation and accountability attribution. Decision boundaries are introduced as an organizational design construct that regulates admissibility, escalation, override, and accountability in joint human-GenAI decision contexts. A Decision-Boundary Process Framework is developed to distinguish augmented, hybrid, and delegated configurations, and to derive propositions linking these configurations to observable differences in means, affordable loss, partnership, control, evaluative effort, and accountability. The findings demonstrate that effectuation can be maintained under uncertainty when decision boundaries are intentionally designed.

Introduction

Organizational decisions are increasingly shaped by systems that help frame problems, generate options, and compare alternatives before final choices are made (Faraj, Pachidi and Sayegh, 2018; von Krogh, 2018; Raisch and Krakowski, 2021). With recent advances in generative artificial intelligence (GenAI), organizations can now create strategic scenarios and evaluate options by adding AI-generated content into decision processes before committing to a choice. This brings up questions about what is allowed, who has authority, and who is accountable, especially when outcomes are hard to predict and the limits of decision-making roles are unclear (Simon, 1979; Baird and Maruping, 2021; Dell'Acqua *et al.*, 2023; Brown *et al.*, 2024). In such settings, effectuation provides a useful lens, explaining how actors seek control through action, commitment, and stakeholder engagement (Sarasvathy, 2001; Wiltbank and Sarasvathy, 2006).

Effectuation, a decision logic centered on action and control under uncertainty, and related theories of uncertainty and managerial judgment rest on assumptions of human-centered interpretation, responsibility, and control (Knight, 1921; Sarasvathy, 2008; Penrose, 2009). GenAI changes these conditions by enabling large-scale option generation and evaluation through processes that are neither fully visible nor fully understood and that exceed what any individual can cognitively manage. The central human challenge therefore shifts from creating options to evaluating, filtering, and choosing among those that GenAI produces (Faraj, Pachidi and Sayegh, 2018; Baird and Maruping, 2021; Raisch and Krakowski, 2021). This creates a gap between traditional decision-making theories and how decisions are made with GenAI. The main challenge is to update decision theory for these new conditions.

Conceptual Approach, Theory Adaptation

This paper adopts a conceptual theory-adaptation approach to clarify and re-specify effectuation when changes in the focal phenomenon place pressure on its foundational assumptions while preserving its continuing relevance (Cornelissen, 2017; Jaakkola, 2020). The analysis is anchored at the level of the organizational decision system, where decision authority, information flow, and accountability are deliberately structured (Simon, 1979; Burton, Obel, B, and Hakonsson, D.D., 2020). It examines how organizations allocate authority and oversight when GenAI participates in framing, option generation, and evaluation. By changing how alternatives are produced and assessed, GenAI challenges the assumption that means, judgment, and control belong exclusively to human actors.

The focus is on decision contexts marked by high uncertainty and low predictive reliability, where effectuation has been theorized as a relevant non-predictive logic (Sarasvathy, 2001; Wiltbank and Sarasvathy, 2006). Although effectuation was developed mainly in entrepreneurial settings and later applied in established organizations (Brettel *et al.*, 2012), it is treated here as an organizational decision logic embedded in collective structures of authority, evaluation, and commitment (Felin *et al.*, 2012; Read *et al.*, 2016). GenAI changes the boundary conditions of effectuation by reshaping how means, control, and accountability are exercised in organizational decision systems (Faraj, Pachidi and Sayegh, 2018; Baird and Maruping, 2021; Raisch and Krakowski, 2021). The resulting tension reflects a mismatch between the theory's original foundations and new decision conditions. The response developed here is re-specification (Jaakkola, 2020).

The analysis proceeds in four steps. First, it makes effectuation's foundational assumptions explicit. Second, it identifies where those assumptions no longer hold when GenAI participates in decision processes. Third, it introduces decision boundaries as organizational adaptation mechanisms governing authority, admissibility, and accountability in joint human-GenAI decision contexts. Fourth, it revises effectuation principles considering boundary configuration and consolidates them in a framework with related propositions. To preserve empirical tractability, the claims are linked to observable features such as admissibility rules, escalation thresholds, and accountability assignments (Jaakkola, 2020; Lupp, 2023)

Theory Development

Effectuation as the focal domain theory

Sarasvathy (2001) developed effectuation theory to explain decision-making under uncertainty where prediction is unreliable, and Read et al. (2016) extended this logic by framing non-predictive control as shaping outcomes through action rather than forecasting. Effectuation is therefore suited to contexts in which uncertainty cannot be resolved in advance and must instead be navigated through action.

Effectuation is organized around five interrelated principles: means-driven action, affordable loss, strategic partnerships, leveraging contingencies, and control over prediction (Sarasvathy, 2001, 2008). Means-driven action begins from who the actor is, what they know, and whom they know. Affordable loss emphasizes limiting downside exposure rather than optimizing expected returns. Strategic partnerships reduce uncertainty through stakeholder commitments. Leveraging contingencies treats unexpected events as inputs to action, while control over

prediction replaces forecast-based planning with iterative enactment (Sarasvathy, 2001; Wiltbank and Sarasvathy, 2006). Across these principles, judgment, commitment, and control are exercised by human actors who author decisions and bear their consequences.

Effectuation also assumes human-centered judgment, interpretation, authority, and accountability. Uncertainty is engaged through experience, sensemaking, and social interaction, while consequential decisions remain attributable to identifiable human decision-makers, whether individuals or authorized collectives (Dew and Wiltbank, 2009; Arend, J. and Burkemper, 2015; Read *et al.*, 2016).

GenAI in organizational decision-making contexts

GenAI differs from earlier decision-support systems. Earlier systems assisted decision-makers by retrieving information, applying predefined rules, or optimizing within specified models, and relied on relatively stable decision premises, transparent logic, and human-defined evaluative criteria (Sprague Jr, 1980; Buchanan and Shortliffe, 1984). GenAI participates directly in problem framing, option generation, and evaluative comparison prior to choice, thereby shaping decision-making rather than merely supporting execution (Faraj, Pachidi and Sayegh, 2018; Raisch and Krakowski, 2021).

In this paper, GenAI is treated as a functional contributor to organizational decision processes, not as an agentic or accountable decision-maker. Its relevance lies in how it alters decision inputs and evaluative dynamics through large-scale option generation, probabilistic recombination of information, and AI-supported comparison across alternatives (Faraj, Pachidi and Sayegh, 2018; Raisch and Krakowski, 2021). Instead of replacing human choice, these capabilities shape which alternatives are generated, compared, and made salient before final judgment (von Krogh, 2018; Baird and Maruping, 2021).

A defining feature of GenAI involvement in decision-making is that it reallocates human cognitive effort. As GenAI can produce options and scenarios at scale, the human burden shifts from generating them to evaluating, filtering, integrating, and selecting among them (Faraj, Pachidi and Sayegh, 2018; Baird and Maruping, 2021). Under current technological conditions, this evaluation work cannot be fully automated or handed over to GenAI. GenAI capabilities vary sharply across domains and tasks, creating a jagged technological frontier in which performance is strong in some areas and unpredictable in others. Human judgment therefore

remains essential but increasingly centers on designing and governing the evaluative boundaries within which GenAI outputs are assessed, escalated, or overridden.

Decision boundaries as an organizational design construct

Decision boundaries are the rules an organization establishes to govern when and how GenAI outputs inform decisions. They document authority, admissibility, escalation, and accountability (Simon, 1979; Burton, Obel, B, and Hakonsson, D.D., 2020). Two mechanisms are especially salient: admissibility criteria, which determine which GenAI-created outputs may inform decisions, and escalation thresholds, which specify when GenAI-supported judgments require additional review, higher-level authorization, or human-only determination.

Organizations create, manage, and enforce decision boundaries at the organizational level. These boundaries act as design tools that influence behavior through roles, policies, and decision rules (Gulati, Puranam, P. and Tushman, 2012; Puranam, Alexy, O. and Reitzig, 2014; Burton, Obel, B, and Hakonsson, D.D., 2020). While their effects appear in individual and team decisions, the rules themselves are organizational. Boundary reliability refers to how consistently these rules are applied across decisions over time (Burton, Obel, B, and Hakonsson, D.D., 2020).

This construct draws on Simon's treatment of decision premises, authority structures, and accountability within organizational decision systems (Simon, 1979), and on Burton et al.'s (2020) view of decision rights and accountability as explicit design choices. Together, these foundations make it possible to analyze how GenAI strains effectuation's implicit assumption of human-exclusive control over decision inputs, evaluation, and commitment, and why boundary reconfiguration becomes an organizational design problem (Faraj, Pachidi and Sayegh, 2018; Raisch and Krakowski, 2021).

Decision-boundary process representation

To adapt the theory, the paper introduces a decision-boundary process model. The model links effectuation principles, GenAI's features, and organizational decision design. It shows how effectuation operates when GenAI is involved in framing problems, generating options, and evaluating choices, and how boundary rules govern admissibility, escalation, and accountability (Jaakkola, 2020).

General concepts such as governance and control are too broad to identify which design features matter when decision conditions change (Puranam, Alexy, O. and Reitzig, 2014; Burton, Obel,

B, and Hakonsson, D.D., 2020). Decision boundaries are more useful because they define who has authority, what inputs are allowed, how evaluations are managed, when decisions are escalated, and who is accountable (Simon, 1979; Burton, Obel, B, and Hakonsson, D.D., 2020). Framing the process in these terms makes it possible to adapt effectuation without attributing agency or responsibility to technology. Non-predictive control is therefore treated less as a matter of individual agency and more as an organizational question of how boundaries are set (Simon, 1979), especially when technology participates in decisions (Faraj, Pachidi and Sayegh, 2018; Raisch and Krakowski, 2021).

The framework is organized around three elements: decision inputs, human-GenAI interaction processes, and outcomes, including responsibility and accountability. GenAI expands available inputs beyond what an organization already knows and has experienced, weakening the classic effectuation assumption that means are inherently tied to human identity. Decision boundaries specify how such inputs enter decision processes, how they are evaluated, and how commitment and escalation are governed. The framework therefore makes hidden theoretical assumptions visible while remaining usable for empirical research (Langley, 1999; Cornelissen, 2017; Jaakkola, 2020). The next section uses this representation to compare classic effectuation with effectuation in the presence of GenAI.

Adapting Effectuation Theory to incorporate GenAI

When GenAI participates in framing, option generation, and evaluation, the conditions under which effectuation logic operates change. Options may be generated at scale, evaluative processes redistributed, and elements of decision construction become no longer exclusively human. These shifts raise questions about the fit between effectuation's foundational assumptions and emerging decision contexts, suggesting that some degree of theory adaptation may be required. This adaptation proceeds through comparative analysis at the level of theoretical claims (Jaakkola, 2020). This paper examines where classic effectuation remains applicable, where its assumptions are challenged, and how the theory might be updated to maintain coherence.

The analysis focuses on principles most closely linked to human authorship, judgment, and control, since these are most affected when GenAI expands options, changes how evaluation is done, and takes part in building decisions before commitment (Faraj, Pachidi and Sayegh, 2018; Raisch and Krakowski, 2021). In these situations, evaluative judgment becomes a more prominent constraint, and control often centers on evaluation, deployment, and escalation.

Table 1 presents a contrastive analysis of classic effectuation and effectuation in the context of GenAI participation, focusing on the principles most affected by AI-generated options, less transparent evaluation, and shifting control to boundary design.

Table 1 shows that GenAI does not affect all effectuation principles equally. The greatest strain falls on principles anchored in human authorship, judgment, and control, while observable boundary mechanisms such as admissibility rules, escalation thresholds, override rights, and accountability assignments indicate how effectual control is preserved under AI participation.

Principle (P) / Assumption (A)	Classic effectuation	With GenAI	Observable indicator	Implication
Means (P)	Human-anchored means: identity, knowledge, relationships.	AI-generated options expand means beyond existing knowledge and ties.	Admissibility rules; human/AI input distinction.	Means expand; admissibility must be specified.
Affordable loss (P)	Risk assessed through human resource commitment.	GenAI expands option/ scenario generation at low marginal cost; risk shifts to evaluation, deployment, escalation.	Approval gates; sign-off thresholds; accountability assignments.	Affordable loss shifts from generation to commitment and implementation.
Partnership (P)	Stakeholder commitments reduce uncertainty through shared obligation.	AI contributes input, not commitment; commitment remains human and organizational.	AI-use protocols; no AI commitment authority.	Uncertainty stabilization shifts from stakeholder commitment alone to boundary governance.
Control over prediction (P)	Human actors retain authorship and responsibility.	Control exercised through admissibility, oversight, escalation, override.	Override rights; escalation paths; final decision authority.	Control relocates from authorship to boundary design.
Cognitive effort allocation (A)	Effort focused on generating alternatives and acting under uncertainty.	Effort shifts to evaluating, integrating, and arbitrating AI-generated options.	Review committees; monitoring roles; expert oversight.	Boundary configurations vary by where judgment is concentrated.
Accountability attribution (A)	Accountability tied to human decision-makers.	Accountability remains human, mediated by boundary design.	Role descriptions; accountability matrices; review procedures.	Human accountability is preserved through boundary specification.

Table 1. Contrastive analysis of classic effectuation and effectuation under GenAI
Notes: Classic effectuation draws primarily on Sarasvathy (2001, 2008), Dew & Wiltbanik, (2009), Read et al. (2016), GenAI adaptation draws on Faraj et al. (2018), Raisch and Krakowski (2021), Baird and Maruping (2021), von Krogh (2018) and Doshi et al. (2025).

Refining Effectuation Theory

Theory adaptation becomes necessary when changing conditions alter fundamental parts of a theory while leaving its core logic relevant (Jaakkola, 2020). Under GenAI participation, means, affordable loss, partnership, and control are most directly affected because they depend

on human authorship, judgment, and authority. Leveraging contingencies remains relevant but is less directly altered because GenAI increases variation while people still determine which changes become consequential. The analysis also brings two cross-cutting assumptions to the foreground: where cognitive effort is concentrated and how accountability is assigned. Both are implicit in classic effectuation but become more salient when GenAI participation shifts evaluative work and makes responsibility attribution less clear.

Three adaptations follow. First, decision-making begins from what humans know and can do, but now also incorporates AI-generated options and scenarios, with boundaries determining which AI inputs are acceptable and how they inform decisions. Second, affordable loss changes because option-generation costs decline while organizational risk concentrates at evaluation, deployment, commitment, and escalation. Third, control shifts as GenAI participates in generation and evaluation, so non-predictive control is exercised increasingly through admissibility, interpretation, override, and escalation mechanisms. These shifts relocate human control and accountability to the design of organizational decision boundaries. Partnership remains a human commitment mechanism, and leveraging contingencies still depends on human judgment over which AI-generated variations become consequential. On this basis, three decision boundary configurations are identified: augmented, hybrid, and delegated.

GenAI-Adapted Effectuation Framework and Propositions

Framework development

This section introduces a Decision-Boundary Process Framework that links the re-specified effectuation principles to organizational boundary configurations. The framework explains how decision-making changes when GenAI is involved in framing problems, generating options, and evaluating choices. In classic effectuation, means-driven action, affordable loss, partnership, leveraging contingencies, and control rely on human judgment and responsibility. With GenAI, these principles still apply, but they operate differently because authority, admissibility, oversight, and escalation are managed at the organizational level. The framework therefore preserves effectuation’s core logic while specifying the changed conditions under which it operates.

The adaptation focuses on four classic principles: means, affordable loss, partnership, and control. It also highlights two important assumptions: the distribution of cognitive effort and the assignment of accountability. Leveraging contingencies remains included but is less affected by GenAI than the other principles. To illustrate these differences, the framework

distinguishes three boundary configurations: augmented, hybrid, and delegated. These configurations show how authority, evaluation, and accountability are divided between humans and GenAI. The next section explains these configurations in more detail using the process framework shown in Figure 1.

Decision-boundary configurations and proposition development

The Decision-Boundary Process Framework identifies three ideal-type configurations: augmented, hybrid, and delegated. These show how authority, evaluation, and accountability are allocated when GenAI is involved. In augmented configurations, where GenAI supports analysis but humans retain decision authority, GenAI contributes to option generation and evaluation while humans make the final choice. In hybrid configurations, where evaluative authority is shared, judgment is distributed across human and computational elements and across stages of the decision process (Raisch and Fomina, 2024). In delegated configurations, where GenAI operates within bounded organizational parameters, human involvement shifts toward designing, monitoring, and revising decision boundaries.

Across all configurations, humans remain accountable. Situated at the level of organizational decision systems, the framework links observable features of boundary design, including delegation scope, admissibility criteria, and escalation rules, to variation in means, affordable loss, partnership, control, evaluative effort, and accountability. It also captures how the human role shifts across configurations, moving from direct participation in evaluation and decision-making toward co-evaluation and boundary design. The research propositions below draw on Figure 1 and link boundary configurations to observable organizational features, including admissibility criteria, escalation thresholds, override rights, role allocations, and accountability assignments.

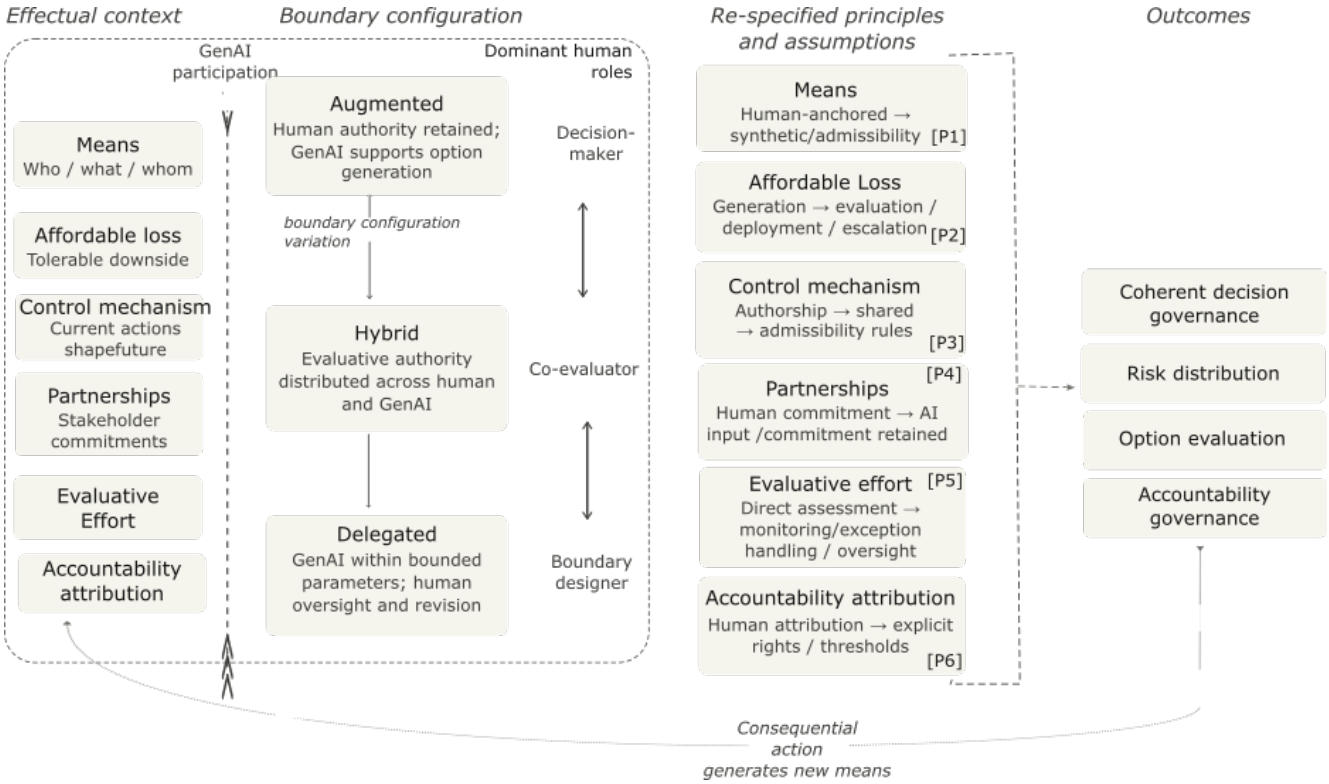

Figure 1: Effectuation adaptation Decision-Boundary Process Framework

Means-driven action. In classic effectuation, action begins from human-anchored means: who actors are, what they know, and whom they know. Under GenAI participation, available means expand through AI-generated options and scenarios, making admissibility and interpretation more important.

> RP1. Delegated configurations are more likely than augmented configurations to use explicit admissibility criteria for AI-generated options and scenarios entering organizational decision processes.

Affordable loss. In classic effectuation, affordable loss is assessed through resource commitments made during experimentation. Under GenAI participation, option and scenario generation become cheaper, while organizational risk appears later, during evaluation, deployment, commitment, and escalation.

> RP2. Affordable loss is assessed earlier in augmented configurations and later, in delegated configurations, at evaluation, deployment, commitment, and escalation.

Partnership. Partnership remains a human commitment mechanism even where GenAI shapes decision inputs and evaluation. Commitment, risk-bearing, and consequential obligation remain human and organizational.

> RP3. Partnership remains human across all configurations, but delegated configurations rely more heavily on formal protocols that separate AI-supported input from human and organizational commitments.

Control over prediction. Effectuation treats control as action based. Under GenAI participation, control depends increasingly on rules governing admissibility, evaluation, override, and escalation.

> RP4. Control is exercised more through admissibility, evaluation, escalation, and override rules in delegated configurations than in augmented configurations.

Cognitive effort allocation. As GenAI expands the number of options and scenarios, the main bottleneck shifts from generating alternatives to evaluating and selecting among them. Human effort shifts accordingly across configurations.

RP5. Augmented configurations keep human evaluative effort closer to direct option assessment, hybrid configurations distribute that effort across human and computational elements, and delegated configurations concentrate more of it on admissibility monitoring, exception handling, and override governance.

Accountability attribution. GenAI can shape framing, generation, and evaluation, while responsibility for outcomes remains human and organizational. As delegation increases, preserving clear accountability requires more explicit decision rights, escalation thresholds, and review arrangements.

RP6. Delegated configurations require more explicit accountability assignments and escalation thresholds than augmented configurations to preserve human responsibility for AI-supported decisions.

These research propositions translate the framework into testable relationships. They do not predict performance outcomes but connect the analysis to observable organizational features such as role assignments, admissibility rules, escalation points, override rights, and accountability.

Discussion, Implications, and Future Research

In this paper, we respecify effectuation for organizational decision-making in the context of GenAI. It shifts attention from GenAI as a tool for automation or improvement to the organizational boundaries that structure authority, evaluation, and accountability when non-human systems shape the content of decisions. In doing so, it shows that effectuation remains useful when GenAI participates, provided its assumptions are re-specified. Its core logic of non-predictive control, human judgment, and responsibility under uncertainty still holds, but under altered operating conditions. Means-driven action, affordable loss, partnership, and control are most directly re-specified, while leveraging contingencies remains relevant under changed conditions. This re-specification extends effectuation theory beyond its entrepreneurial origins by demonstrating that its core principles are not fixed but adaptive and capable of accommodating fundamentally new decision-making conditions introduced by generative AI, thereby deepening our understanding of how effectual logic operates in technologically transformed organizational contexts. For managers, the central implication is that effectuation in GenAI-supported environments relies increasingly on how decision boundaries are designed.

Organizations that clearly define rules for admissibility, escalation, override, and accountability are better able to maintain control under uncertainty and avoid unclear responsibility.

This paper re-specifies effectuation theory at a general level and does not address differences across specific GenAI models or architectures. It focuses on organizational decision structure and boundary design, leaving detailed governance, regulatory, and ethical frameworks outside its scope. Future research could examine how augmented, hybrid, and delegated configurations appear across organizations and decision contexts, how they shape evaluative effort, control, partnership, and accountability in practice, and how boundary designs drift or are recalibrated as organizational capabilities and GenAI technologies evolve.

Conclusion

This paper examines how effectual decision logic operates when GenAI contributes to decision inputs, options, and evaluations. GenAI is treated not as a substitute for human judgment, but as a condition that reshapes the boundaries within which organizational decisions are made. By shifting attention from decision-makers alone to decision architecture, the paper clarifies how authority, evaluation, and accountability are organized when decision inputs are no longer exclusively human. The paper advances effectuation theory by showing that it remains viable under GenAI participation when its assumptions are selectively re-specified. It also contributes to organizational decision-making by showing that decision boundaries are the organizational mechanisms that preserve non-predictive control, accountability, and judgment under uncertainty. The central challenge posed by GenAI is therefore not simply whether organizations adopt it, but how they design decision systems that govern its participation while keeping responsibility human.

WHY PEOPLE SHARE DEEPFAKES: THE ROLE OF PERCEIVED CREDIBILITY, COGNITIVE ABILITY AND ETHICS

Bhattacharya, Saurabh[1]; Agnihotri, Arpita[2]

[1] Newcastle University Business School, Newcastle University, Newcastle upon Tyne, United Kingdom

[2] School of Business Administration, Penn State Harrisburg, Middletown, Pennsylvania, United States of America

Keywords: Deepfakes, Perceived Credibility, Sharing Intention, Cognitive Ability, Digital Literacy, Ethical Position, Age Differences, Social Media

Introduction

The rapid advancement of artificial intelligence has enabled the creation of deepfakes, highly realistic synthetic media capable of manipulating visual and auditory content. These developments are transforming the misinformation landscape, raising concerns around trust, privacy, and societal stability (Hancock and Bailenson, 2021). Recent evidence suggests that deepfakes can influence attitudes and behaviour even when individuals are aware of potential manipulation (Ching et al., 2025). As communication becomes increasingly multimodal, visual misinformation is more engaging and harder to detect than text-based content.

While prior research has focused on younger populations, older adults remain underexplored despite evidence suggesting higher susceptibility to misinformation (Brashier and Schacter, 2020). At the same time, stronger ethical orientations among older individuals may shape sharing behaviour, suggesting a more nuanced response. Despite the growing literature, limited research explains how perceived credibility translates into sharing behaviour (Wang, 2026).

Purpose, Aim and Objectives

This study examines how deepfake videos (vs. real videos) influence sharing intentions across age groups. It investigates perceived credibility as a mediating mechanism and explores the moderating roles of cognitive ability, digital literacy, and ethical position.

Literature Review and Theoretical Framework

Deepfakes extend misinformation by combining realism and emotional salience, increasing persuasive impact (Hancock and Bailenson, 2021). Unlike textual misinformation, video content is processed heuristically, allowing perceptual realism to override analytical scrutiny. Perceived credibility therefore plays a central role in shaping sharing behaviour (Jin et al.,

2023). Importantly, deepfake videos can continue to influence beliefs even when individuals are warned about manipulation (Clark and Lewandowsky, 2026). Accordingly:
H1: Exposure to deepfake videos (vs. real videos) positively influences sharing intention.
H2: Perceived credibility mediates the relationship between video type and sharing intention.
Age-related differences shape credibility judgements due to cognitive decline and ethical considerations.
H3: Age moderates the relationship between video type and perceived credibility, such that older individuals perceive deepfake videos as more credible.
Cognitive ability and digital literacy influence information evaluation. Lower cognitive ability increases reliance on heuristics, while higher digital literacy enhances critical evaluation (Bejaković and Mrnjavac, 2020).
H4: Cognitive ability and digital literacy moderate the relationship between video type and perceived credibility, such that lower cognitive ability and lower digital literacy increase perceived credibility of deepfake videos.
Ethical considerations constrain sharing behaviour.
H5: Ethical position moderates the relationship between perceived credibility and sharing intention, such that stronger ethical positions reduce sharing intention.
Together, these relationships form a moderated mediation framework explaining how deepfake exposure influences sharing behaviour.

Methodology and Methods

The study adopts an exploratory sequential mixed-methods design. A qualitative phase (n = 10, UK) refines the model, followed by a pretest (n = 75) and two experiments (n = 400). Participants are randomly assigned to view real or deepfake videos. Data will be analysed using mediation and moderated mediation techniques.

Expected Findings and Contribution

The study expects perceived credibility to mediate the relationship between deepfake exposure and sharing intention. Older individuals are likely to exhibit higher perceived credibility but lower sharing when ethical considerations are salient. Cognitive ability and digital literacy are expected to reduce susceptibility to deepfakes.
The study contributes by extending misinformation research to deepfake videos and offering a unified framework explaining how cognitive, technological, and ethical factors jointly shape sharing behaviour.

Originality and Value

This study advances research by shifting focus from textual to video-based misinformation and integrating multiple individual-level factors into a single framework. It challenges assumptions of uniform vulnerability among older adults and highlights conditional susceptibility. Future research may explore cross-cultural contexts and behavioural data.

Theoretical and Practical Implications

Theoretically, the study refines credibility models by demonstrating how judgements are shaped by cognitive constraints, technological environments, and ethical considerations.

Practically, the findings inform digital literacy interventions, particularly for older populations (Bejaković and Mrnjavac, 2020), and highlight the role of ethical awareness in reducing misinformation sharing. Platforms can implement credibility cues and warning systems (Jin et al., 2023), while corrective strategies such as self-debunking interventions may further reduce misinformation influence (Lu, 2025).

Research Limitations

The study has several limitations. Experimental stimuli may not fully reflect real-world exposure to deepfakes, and self-reported measures may introduce bias. Additionally, the UK-based field study limits generalisability. Future research should incorporate behavioural and cross-cultural data.

PIONEERING ORIENTATION AND ORGANISATIONAL PERFORMANCE: THE MEDIATION ROLE OF AI CAPABILITY

Levi-Bliech, Michal[1]; **Dahan, Gavriel**[2]

[1] School of Management, Logistics Department, Western Galilee College, Acre, Israel
[2] School of Management, Western Galilee College, Acre, Israel

Keywords: AI capability, Pioneering orientation, Organisational performance, Mediation

Abstract

This study examines how pioneering orientation influences organisational performance through AI capability. Drawing on the Resource-Based View (RBV) and Dynamic Capabilities (DC) theory, we propose that AI capability translates pioneering orientation into organisational performance. Data from 195 managers in Israeli international firms were analysed using SmartPLS 4. The findings indicate that pioneering orientation positively affects AI capability and organisational performance, and that AI capability partially mediates this relationship.

Introduction

In digital markets, firms increasingly compete by adopting new technologies, business models, and market opportunities ahead of competitors. Pioneering orientation reflects a firm's proactive approach to introducing novel practices, technologies, and value propositions ahead of competitors. Prior research suggests that pioneering firms shape market structures and consumer expectations (Lieberman and Montgomery, 1988, Narver et al., 2004). However, evidence on its direct performance impact remains mixed.

One explanation is that pioneering orientation requires complementary capabilities to improve performance. AI capability refers to a firm's ability to deploy AI technologies, data infrastructure, and analytics-driven decision-making. AI technologies are transforming marketing decision-making and execution. AI-driven tools support data analysis, customer prediction, resource allocation, and marketing automation (Huang and Rust, 2021). This study examines how pioneering orientation influences organisational performance (ORGP) and what role AI capability plays in this relationship. It tests AI capability as a mediator between pioneering orientation and organisational performance. This study contributes to the literature by linking pioneering orientation to organisational performance and by conceptualizing AI capability as a strategic marketing capability.

Background and Hypotheses

Pioneering orientation (PO) reflects a firm's tendency to lead market and technological change, yet its performance implications depend on complementary capabilities such as AI capability (Covin et al., 2000). Organisational performance is examined as the outcome of pioneering orientation and AI capability. AI capability reflects the firm's ability to use AI for learning, decision-making, and value creation (Mikalef and Gupta, 2021; Wamba-Taguimdje et al., 2020).

Accordingly, the following hypotheses are proposed:

H_1: PO positively affects ORGP.

H_2: PO positively affects AI capability.

H_3: AI capability positively affects ORGP.

Results

The results of the hypothesis tests show that, in the direct effects, all hypothesised relationships were significant ($p < .001$). Thus, *H1-H3* were supported. Regarding the specific indirect effect, the findings show that the path PO → AI → ORGP was significant ($p < .05$).

Discussion and Conclusions

The findings show that PO and AI capability positively affect ORGP, with PO showing the stronger effect. Managers should strengthen PO in order to improve decision-making, efficiency, and performance. Additionally, regarding the mediating role of AI capability in the relationship between PO and ORGP, the findings show that AI capability has a partial mediating role in this relationship. Being a market pioneer alone is insufficient, firms must invest in developing AI capabilities**.** Therefore, managers who want to improve their ORGP need to integrate both AI capabilities and PO to achieve better ORGP and ultimately gain a competitive advantage. AI capability transforms pioneering risk into a competitive advantage by enabling more intelligent execution. AI capability development should be prioritized alongside market exploration to ensure performance benefits.

EMPLOYING AI TO EVALUATE HOW LINGUISTIC CONCRETENESS INFLUENCES CROWDFUNDING CAMPAIGN SUCCESS

Andreas Gregoriades, Michael Georgiades, Yioula Melanthiou

Keywords: Crowdfunding; Linguistic Concreteness; Large Language Models; Text Classification; Ensemble Learning; Kickstarter.

Introduction.

Crowdfunding has become an important alternative financing mechanism for entrepreneurs, with campaign descriptions and linguistic style playing an important role in funding decisions. Linguistic concreteness, which refers to the extent to which project descriptions provide specific rather than abstract information, can influence crowdfunding outcomes. However, limited attention has been devoted to examining whether the effect of linguistic concreteness varies across project categories characterized by different audience motivations and expectations. This study addresses this gap by employing an AI-based approach.

Purpose, Aim and Objectives

This research examines the influence of linguistic concreteness on crowdfunding success across Technology and Film & Video campaigns and investigates whether its effect varies between the two categories. An AI-based ensemble classification approach is employed to assess linguistic concreteness in campaign descriptions, followed by statistical analysis of its relationship with campaign success.

Literature Review and Theoretical Framework

Prior crowdfunding research demonstrates that campaign language influences backers' perceptions, trust, and funding decisions (Nielsen et al, 2021). However, existing studies provide limited evidence on whether the effectiveness of linguistic strategies varies across project categories. To address this gap, the study integrates Language Expectancy Theory and Self-Determination Theory. The former suggests that persuasive effectiveness depends on the alignment between linguistic style and audience expectations, while the latter distinguishes between intrinsic and extrinsic motivations.

Technology projects tend to attract backers concerned with functional outcomes, product performance, specifications, and tangible rewards, whereas Film & Video projects are more closely associated with intrinsic motivations such as personal interest, emotional engagement, identity, and symbolic meaning (Dousios et al, 2025). Concrete language may therefore be particularly persuasive for Technology campaigns, as specific and observable information can facilitate project evaluation and reduce uncertainty. In contrast, its influence may be more limited for Film & Video campaigns, where backers may place greater emphasis on emotional and symbolic value (Tafesse, 2021). Accordingly, the proposed theoretical framework predicts a positive effect of linguistic concreteness on Technology campaign success, a limited effect on Film & Video campaign success, and a significant difference in its effect across the two categories.

Methodology

The study combines LLM-based text classification with statistical inference. Kickstarter campaigns' descriptions from the Technology and Film & Video categories are analysed. The proposed LLM-based approach analyses text holistically in contrast to dictionary-based techniques. Two LLM models are fine-tuned using secondary labelled concreteness data and evaluated on held-out test data. The models are subsequently applied independently to Kickstarter campaign descriptions to assess their linguistic concreteness, and their predictions are combined to increase confidence in the resulting concreteness measure.

A binary logistic regression model is estimated with campaign success as the dependent variable and the AI-derived linguistic concreteness classification as the focal independent variable. Project category is included as a moderator, to determine whether the effect of concreteness on campaign success differs between Technology and Film & Video campaigns.

Findings and Contribution

The results provide strong evidence that the effectiveness of linguistic concreteness is category dependent. For Film & Video campaigns, linguistic concreteness does not significantly influence campaign success, white it has a strong positive effect on the success of Technology campaigns. The interaction between linguistic concreteness and project category confirms that the effect of concreteness differs significantly between the two categories.

Theoretical and Practical Applications and Implications

The study makes both theoretical and methodological contributions. Theoretically, it demonstrates that the effectiveness of linguistic concreteness depends on project category and the corresponding motivations and expectations of backers, suggesting that persuasive crowdfunding communication should be adapted to its target audience. Practically, Technology campaign creators may benefit from emphasizing specific functionality, and measurable outcomes. Methodologically, the study introduces an ensemble LLM-based approach for assessing linguistic concreteness, providing a context-sensitive alternative to conventional dictionary-based techniques and demonstrating how AI-derived linguistic measures can be integrated with statistical models to investigate crowdfunding success.

BROADCASTING ON DIFFERENT WAVELENGTHS: CONSUMER INNOVATIVENESS, PRODUCT PREFERENCES, AND WORD-OF-MOUTH

Moldovan, Sarit[1]

[1]Department of Management and Economics, The Open University of Israel, Ra'anana, Israel

Keywords: Consumer Innovativeness, Word-of-Mouth, Diffusion of Innovations, Product Originality, Product Usefulness

Diffusion theory assumes that innovators facilitate adoption by influencing less innovative consumers through word-of-mouth (WOM) (Rogers, 2003). While prior research documents innovators' central role in social networks, it largely assumes that their WOM is relevant for mainstream consumers' adoption decisions. This research challenges this assumption by examining whether the content of innovators' WOM aligns with the informational needs of less innovative consumers. Specifically, it proposes that systematic differences in preferences for product originality versus usefulness create a misalignment between WOM supply and demand, potentially slowing diffusion.

Prior research shows that innovators are attracted to novel innovations, whereas less innovative consumers favor functional value (Easingwood and Harrington, 2002; Li et al., 2015). Innovators are also more communicative and act as opinion leaders, while less innovative consumers rely heavily on WOM from prior adopters (Bartels and Reinders, 2011; Rogers, 2003). This research argues that this asymmetric but complementary relationship may become less effective when innovators disproportionately emphasize originality in their WOM. Building on this logic, this research examines systematic differences in product preferences and communication between innovators and less innovative consumers, focusing on how originality and usefulness shape product evaluations and the content of word-of-mouth across adopter segments.

Study 1 examined whether innovators and less innovative consumers differ in their evaluations of original versus useful products. A between-subjects experiment (N = 251) manipulated product features (originality vs. usefulness) and measured consumer innovativeness. Regression analyses revealed a significant effect of innovativeness on product evaluation (B =

.363, $p < .001$) and an interaction between innovativeness and product condition ($B = -.368$, $p = .003$). Less innovative consumers evaluated the useful product ($M = 3.914$) more favorably than the original product ($M = 3.256$, $B = .658$, $p = .007$), whereas innovators showed a marginal preference for the original ($M = 4.818$) over the useful product ($M = 4.426$, $B = -.392$, $p = .105$). These findings indicate systematic differences in the type of innovation valued by each segment.

Study 2a (N = 104) showed that increasing perceived product originality via a font-style manipulation (Cho and Schwarz, 2006) enhanced evaluations among innovators ($M_{regular_fonts} = 3.644$, $M_{italics} = 4.435$, $B = .79$, $p = .02$), but not among less innovative consumers ($t < 1$). Study 2b ($N = 98$) showed that providing additional usefulness information improved evaluations among less innovative consumers ($M_{no_information} = 2.376$, $M_{usefulness_information} = 3.292$, $B = .917$, $p = .007$), but not among innovators ($t < 1$). Together, these studies demonstrate asymmetric evaluation processes across adopter segments.

Study 3 ($N = 178$) showed that innovativeness predicted WOM intentions ($B = .359$, $p = .001$), and this effect was moderated by WOM focus ($B = -.448$, $p = .02$). Innovators reported stronger intentions to spread originality-focused ($M = 4.255$) than usefulness-focused WOM ($M = 3.492$, $B = -.763$, $p = .034$), whereas less innovative consumers reported low WOM intentions regardless of content ($p = .228$). These findings demonstrate a systematic asymmetry in WOM content.

Study 4 provided field-based validation using data from adopters ($N = 289$). Perceived product originality predicted intentions to spread originality-focused WOM ($B = .394$, $p < .001$), particularly among innovators (interaction $B = .102$, $p = .057$). Both innovators and less innovative consumers reported exposure to originality-focused WOM ($B = .367$, $p < .001$), indicating that such communication is prevalent in the marketplace.

This research reveals a systematic misalignment in WOM content across adopter segments. It contributes to diffusion theory by identifying communication content as a critical mechanism shaping diffusion outcomes. From a managerial perspective, the findings highlight the importance of actively communicating usefulness as innovations move beyond early adopters.

THE ROLE OF FOOD WASTE REDUCTION IN PROMOTING SUB-OPTIMAL FOOD THROUGH DIGITAL MARKETING IN SOUTH-EASTERN EUROPE

Ivanova, Lora[1]; Kapoulas, Alexandros[2]

[1]Business Administration and Economics Department, CITY College, University of York Europe Campus, Thessaloniki, Greece

[2]University of York Europe Campus, School of Business ,Thessaloniki , Greece

Keywords: Food Waste Reduction Platforms (FWRPs); Digital Marketing Sustainable Marketing; Imperfect Food; Food Waste Reduction; Sharing Economies; Sustainable Consumption; South-Eastern Europe;

Introduction

Food waste (FW) is a widely discussed sustainable issue (Lins et al., 2021). In 2022, the global FW accounted for 1.05 billion tonnes, including inedible components, translating to an average of 132 kg per person (Carvalho et al., 2025). One of the greatest reasons for waste at the level of consumption in Europe is the appearance of products (Porter et al., 2018). They are still edible, yet their outlook differs from the traditional appearance, referring to such products as “ugly” products, including sub-optimal and perishable food (de Hooge et al., 2022). These goods may be classified as such due to visual, temporal or peripheral defects (Loebnitz and Grunert, 2015; Aschemann-Witzel, 2021; White et al., 2016). The consumption of such food remains limited, specifically in South-Eastern Europe (SEE) for various reasons. To overcome this challenge, Food Waste Reduction Platforms (FWRPs) have emerged, connecting dining establishments with consumers, reducing the generation of waste and optimizing their budgets.

Purpose, Aim and Objective

This study explores the role of FWRPs in the region, investigating the developed digital marketing strategies and their impact on promoting “ugly” food products as well as contribution to sustainable consumption. Many academics illustrate Food Waste Reduction Platforms as sustainable innovation, driving environmental improvement and smart resource utilisation (Amaral and Orsato, 2023). Presently, such platforms are popular in Western Europe, while in SEE there is limited evidence.

Literature Review

Literature reveals that businesses are open to implement such innovative solutions to reduce costs and establish new revenue streams, selling at a lower price (Amaral and Orsato, 2023). FWRPs reduce FW by connecting retail stores and customers, enhancing the effectiveness of last-minute discounts while combatting the global issue (Yang and Yu, 2026). Considering that the business model is still developing, academics like Hong et al. (2023) define them in various ways - Food Waste Mobile Applications (FWMAs) or Food Waste Reduction Platforms (FWRPs). One successful example of such a business is Too Good To Go (TGTG). The research of Santos‑Corrada et al. (2023) concludes that health and functionality along with social and economic factors shape the motivations of consumers.

Methodology and Methods

The exploratory study used a qualitative method, conducting interviews with FWRPs founders, located in SEE (Bulgaria, Greece and Serbia). Many scholars state that this method as the most appropriate one for uncovering new phenomena (Creswell and Creswell, 2018; Lim, 2024). Interviews included open-ended questions, allowing founders to share valuable insights related to the industry and consumer behavior in the region. The data obtained was analysed via thematic analysis, uncovering patterns and differences in the business models, digital marketing activities and experience with targeting young audiences.

Findings and Contributions

The three FWRPs have overlapping business models, offering discounts from 40% to 90% as social media serves as the primary channel for communication. The analysis indicates that the Bulgarian platform has vast experience with digital marketing strategies. The Greek and Serbian entities, on the other hand, shared that social media allows them to promote themselves, considering that it is a less expensive tool as both startups have budget constraints.

At the beginning the Bulgarian platform designed its messaging techniques and values around sustainability. However, at a later stage the founder uncovered that pricing has the greatest impact on younger consumers. Interestingly, Serbians were not familiar with FWRPs and the primary goal of the business was to build messaging techniques that not only promote green initiatives, but also educates consumers. According to the entrepreneur the biggest challenges in the region are limited partner locations which minimises the variety of products along with lack of delivery. Furthermore, founders stressed that the hospitality and restaurant industry still do not acknowledge the benefit of joining sustainable initiatives, despite the positive brand image (Rotondo and Chow, 2025).

The FWRPs utilise various techniques when building trust with customers, including monitoring and referral programs as well as pricing strategies. Managers suggest that startups in SEE strive for professionalism, transparency and authenticity. Lastly, all three interviewees believe that genuine and educational content which stresses on better pricing contribute to the overall success of their digital marketing efforts.

Research Limitations

The nature of the study is exploratory and as such, several limitations have been identified. The limited number of platforms investigated does not outline different strategies that are developed in the market. Secondly, the research focuses on a specific region, preventing us from making generalisations. Lastly, the market is still maturing and the business model may change over time.

Originality and Value

The findings contribute to the existing literature on digital marketing for sustainable initiatives, stressing on the importance of FWRPs as mediator between businesses and consumers. Moreover, it elaborates on the knowledge on sustainable consumption and practices in South-Eastern Europe.

Theoretical and Practical Implications

The study provides practical insights for marketers and managers, outlining the significance of good pricing strategies, the value of building relations and creating online engagement to raise awareness of "ugly" food products in SEE markets.

SPEED AND SIMPLIFICATION IN CONSUMER BEHAVIOR: THE NEXUS OF TECHNOLOGICAL TEMPORAL DELEGATION, TIME PERCEPTION, AND CHOICE STRATEGY

Moutran, Serena[1]; Thrassou, Alkis[2]

[1]University of Nicosia, Nicosia, Cyprus

[2]University of Nicosia, Nicosia, Cyprus

Keywords: Technological Temporal Delegation, Choice Strategy, Decision-making, Decision Delegation, Consumer Behaviour, Time Pressure, Time-perception, Choice Quality.

Introduction and Problem Statement

Modern consumption is increasingly defined by a "nexus of speed," wherein structurally accelerated digital environments impose high decision pressure, driving a shift from systematic, compensatory reasoning toward non-compensatory heuristic processing (Godinho et al., 2016; Hochman, 2024). Consumers increasingly rely on AI-mediated decision aids to evaluate alternatives, with perceived usefulness and trust in AI shaping pre-purchase judgement (Lei & Liu, 2025; Waddell, 2025). This reliance is driven by time-pressure inherent in modern lifestyles, which reduces information processing capacity and heightens the adoption of simplified choice heuristics (Ordóñez et al., 2015; Godinho et al., 2016). When consumers highly value their time, they prefer convenience-oriented strategies (Benoit et al., 2017; Heinonen, 2004), motivating a transition toward "hybrid" and "GenAI consumers" who delegate cognitive labour to automated systems. (Huang & Rust, 2025).

Research Aim and Objectives

While it is established that time-pressure forces a shift from systematic to heuristic processing (Hermanns & Teubner, 2025), existing literature has not fully accounted for the role of 'surrogate cognition' in this transition (Jose et al., 2025). The primary aim of this research is to investigate how Technological Temporal Delegation (TTD), the outsourcing of time-intensive cognitive tasks to surrogate systems such as voice assistants or algorithmic curation, moderates the relationship between the combination of time-pressure and time-value perception and consumer choice strategies. Specifically, the study examines how this delegation alters consumption outcomes, focused on choice diversity and decision satisfaction. The objectives are to: theoretically examine the impact of time-pressure on cognitive simplification; theoretically analyse the mediating role

of time-perception; empirically evaluate TTD as a moderator; empirically assess the impact on consumption outcomes; and develop and test a "Temporal-Cognitive Nexus" framework.

Literature Review and Theoretical Framework

Grounded in Information Processing Theory, theory posits that situational time-pressure reduces cognitive capacity, forcing a transition from systematic reasoning to non-compensatory heuristics **(H1)** (Bobadilla-Suarez & Love, 2018; Godinho et al., 2016). Furthermore, the perception of time-value based on Economic Theories of Time and Service Convenience frameworks (Benoit et al., 2017; Heinonen, 2004) coupled with the psychological "mindset of scarcity," which taxes mental bandwidth (Smith et al., 2020), supports **H2**: the perception of time-value positively drives choice simplification.

The core theoretical contribution utilizes the Extended Mind Thesis and Cognitive Offloading Theory (Jose et al., 2025; Litvinova et al., 2024; Smith et al., 2020) to position TTD as a multi-dimensional moderator. Under high internal cognitive costs, consumers leverage "exogenous cognition," offloading decision tasks to surrogate systems (**H3a/b**).

However, grounded in Bounded Rationality and the Paradox of Choice, the framework suggests that while simplification conserves energy, it promotes "satisficing" and narrow framing (Ren & Huang, 2017). Consistent with choice overload, extensive options reduce commitment and satisfaction (Iyengar & Lepper, 2000), negatively impacting choice diversity **(H4)**. Drawing on Hyperbolic Discounting, the study proposes that such strategies favor immediate "present-bias" relief (**H5**) (Laibson, 1997; Ren & Huang, 2017). Finally, applying Psychological Reactance (Brehm, 1966) and Locus of Control (Rotter, 1966), the research explores how simplified strategies may boost short-term satisfaction while eroding long-term choice quality (**H6**), with **H7** testing the comprehensive moderating-mediating role of technology delegation in this process.

Methodology:

This Critical Realist study adopts a Sequential Explanatory design. Phase 1 (quantitative) tests TTD as a moderator between time-pressure and choice strategies through a survey instrument. Phase 2 (qualitative) semi-structured interviews explore the cognitive and psychological processes underlying delegated decision-making, providing deeper insights into exogenous cognition.

Originality and Value:

The study redefines AI as "exogenous cognition," exploring how technological delegation reshapes how consumers internally process and navigate intense temporal constraints. It fills a critical gap by demonstrating how TTD can potentially decouple the traditional link between situational time-pressure and suboptimal choice quality. By integrating Hyperbolic Discounting (Laibson, 1997; Ren & Huang, 2017) with Cognitive Offloading Theory (Jose et al., 2025), and drawing on recent work on human–XAI symbiosis (Litvinova et al., 2024) and dual-process frameworks (Hochman, 2024), this research offers a novel "Temporal-Cognitive" model that accounts for the emergence of the "hybrid consumer" in high-speed digital environments.

Theoretical & Practical Applications

The research refines Information Processing Theory by introducing "surrogate systems" as a multi-dimensional moderator, extending the Extended Mind Thesis into the domain of behavioral economics and consumer choice strategies. Practically, it provides detailed guidance for AI developers to shift from "speed-centric" automation to "agency-preserving" design.

SMES INVESTING IN CAUSE-RELATED MARKETING: AN SME-SPECIFIC FRAMEWORK FOR COMMERCIAL VALUE AND SOCIAL IMPACT

Dr Marlen Demetriou
School of Business, University of Nicosia, Nicosia, Cyprus

Keywords: Cause-Related Marketing, SMEs, brand differentiation, stakeholder engagement, social impact, nonprofit partnerships, consumer response, CSR

Introduction

Cause-related marketing (CRM) links a firm's market offer to a social or environmental cause through a visible purchase-related commitment. Although CRM is a well-established topic, recent reviews show that the literature still focuses mainly on consumer response and campaign effects, with less attention to the distinctive constraints and opportunities faced by small and medium-sized enterprises (Bhatti, Galan-Ladero and Galera-Casquet, 2023; Koushik and Sarkar, 2025; Stötzer and Kaltenbrunner, 2024).

Purpose

This paper develops an SME-specific framework for CRM design and evaluation. It addresses the following question: how can SMEs use cause-related marketing to create commercial value while maintaining credibility, operational feasibility, and measurable social impact?

Theoretical Background

The paper draws on stakeholder and signalling perspectives. From a stakeholder perspective, CRM can strengthen relationships with customers, employees, communities, and nonprofit partners when the cause is legitimate and aligned with firm values. From a signalling perspective, CRM works only when the commitment is clear, specific, and believable. Recent evidence also shows that CRM has positive effects on consumer responses, but these effects depend on campaign fit, transparency, and perceived sincerity (Schamp et al., 2023; Bhatti, Galan-Ladero and Galera-Casquet, 2023).

Methodology and Methods

The study adopts a conceptual, practice-oriented approach supported by six EU SME cases. Brewgooder links beer purchases to clean-water provision; Elvis & Kresse donates profits from its fire-hose collection to The Fire Fighters Charity; MUD Jeans combines its lease model with environmental restoration logic; Hydrophil links hygiene products with water-related giving through Viva con Agua; Too Good To Go uses food-rescue promotions with social benefit triggers; and Original Beans connects chocolate purchases to tree planting in origin regions (Brewgooder, 2023; Elvis & Kresse, n.d.; MUD Jeans, n.d.; BIO COMPANY SE, 2024; Too Good To Go, 2023; Original Beans, n.d.).

Main Findings and Contribution

Across the six cases, CRM appears most effective for SMEs when five conditions are present: strong cause-brand fit, a simple transaction rule, a credible social partner, transparent communication, and low executional strain. The cases also show that SMEs can adopt different CRM architectures, including percentage-of-sales donations, profit-share models, product-linked environmental commitments, and promotion-based trigger campaigns.

The paper contributes an SME-focused framework that shifts the discussion from whether CRM works in general to how it can be designed credibly under resource constraints.

Originality and Value

The paper adds value by translating CRM theory into an SME context. It argues that, for smaller firms, CRM should be treated as a structured marketing investment with measurable business and social outcomes rather than as an informal act of giving.

Research Limitations

The study is conceptual and illustrative. It does not test causal relationships with primary data.

Theoretical and Practical Applications/Implications

For managers, the paper offers a basis for low-cost CRM pilots that are visible, measurable, and operationally manageable. For researchers, it positions SMEs as a distinct CRM context in which local legitimacy, partner credibility, and resource constraints shape campaign outcomes.

THE CONSEQUENCES OF US-IMPOSED ECONOMIC SANCTIONS: A SYSTEMATIC REVIEW, 2015-2025

Mergaliyeva, Liliya[1]

[1]The University of Law Business School, London, United Kingdom

Keywords: Sanctions, Systematic Review, Firm Adaptation, Governance, Non-market Strategy, Thematic Synthesis

Introduction

Economic sanctions have become the foreign policy instrument of choice for the United States in the twenty-first century. As of 2025, the United States Treasury's Office of Foreign Assets Control (OFAC) administers more than 30 active sanctions programs targeting countries, entities, and individuals across six continents, making the US the world's most prolific and consequential sanctions sender. Yet the scholarly literature on US sanctions remains characterised by fragmentation, methodological inconsistency, and unresolved contradictions.

Purpose, Aim and Objectives

The purpose of this study is to examine how sanctions work, on whom they work, and what working means in a complex interdependent global economy. Specifically, the study aims to explore the sender-country perspective with the organisational consequences of sanctions. The objectives of the study are to identify what does the existing high-quality literature reveal about the economic, financial, governance, and societal consequences of US-imposed economic sanctions.

Literature Review and Theoretical Framework

Scholarship on sanctions operate primarily at institutional and aggregate-outcome levels (Felbermayr et al., 2021). Institution-based view research has addressed the firm-institutional interface (Peng et al., 2009) but typically treats the institutional environment as a background condition rather than a dynamic system that firms and stakeholders actively reshape. Global value chain and supply chain disruption research has developed rich accounts of the network layer (Witt et al., 2023), and the weaponised interdependence literature has theorised how state coercion travels through global economic networks (Farrell and Newman, 2019). Figure 1

presents the framework, which integrates the reviewed evidence (Frynas et al., 2017; Lawton et al., 2013).

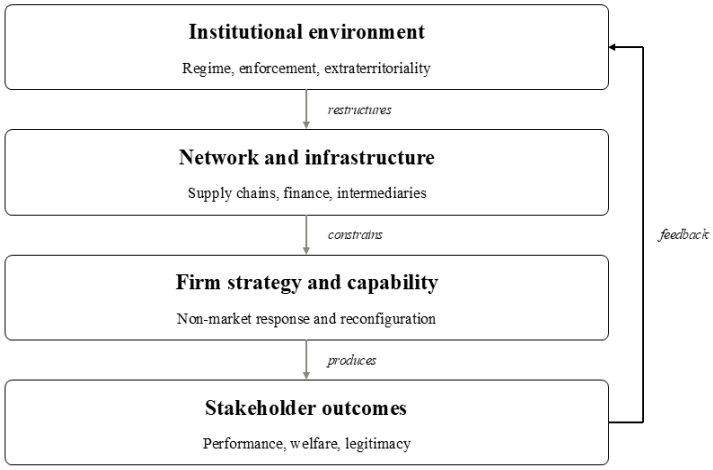

Figure 1: A multi-level non-market framework of economic sanctions

Methodology and Methods

This study employs a systematic review methodology. A search of the Web of Science returned 200 records, screened for inclusion in journals rated 3 or above in the AJG, ensuring the synthesised evidence base has itself passed rigorous peer review, yielding 77 studies for thematic synthesis.

Findings and Contribution

The thematic synthesis identified the following empirical themes: sanctions design, trade and macroeconomic consequences, financial systems, energy and resource markets, firm adaptation, and governance and stakeholder consequences. The study contributes to the growing literature by synthesising a fragmented body of research on how organisations respond to the coercive institutional environments created by US sanctions. It identifies the principal mechanisms through which sanctions influence firm behaviour, including regulatory exposure, reputational risk, financial restrictions, political uncertainty, and the extraterritorial reach of US enforcement.

Originality and Value

The originality of this study lies in integrating the sender-country perspective with the organisational consequences of sanctions within a contemporary international business context. This review centres on firms and other organisational actors, showing how sanctions reshape

strategic choices, cross-border operations, legitimacy pressures, compliance practices, market entry and exit, supply-chain configurations, and relationships with governments and stakeholders.

Research Limitations

Studies published in AJG 1- and 2-rated journals, specialist sanctions or regional outlets, interdisciplinary journals, books, policy reports, and other forms of grey literature were excluded.

Theoretical and Practical Applications and Implications

The review moves beyond treating firms as passive transmitters of state pressure. Instead, it conceptualises them as strategic actors that interpret, absorb, resist, and sometimes redirect the effects of sanctions. The resulting framework clarifies how organisational responses vary according to firm characteristics, industry exposure, institutional embeddedness, and relationships with sender, target, and third-country markets. In doing so, the study provides a foundation for future research on sanctions as coercive institutional environments and offers practical value for managers and policymakers seeking to anticipate the intended and unintended organisational consequences of economic statecraft.

RELYING ON AI AGENTS: FREE CONSUMERS OR ALGORITHMIC PUPPETS?

Yaniv Gvili

School of Business Administration, Ono Academic College (OAC), Kiryat Ono, Israel.

Keywords: Marketing, Consumer Behavior, AI Agents, Artificial Intelligence, Consumer Autonomy.

AI agents increasingly mediate consumer shopping decisions in agentic commerce, where autonomous systems recommend, filter, or execute product choices on consumers' behalf. Yet, it remains unclear when consumers are willing to rely on AI agents, particularly when their design affects consumer autonomy. Drawing on Self-Determination Theory, we examine how the autonomy afforded by AI agents influences consumer reliance and how this effect depends on perceived consumer-AI goal alignment. Across three experiments (N = 694), autonomy affordance is manipulated by varying the number of options recommended by an AI agent. Results show that consumers rely more on AI recommendations when agents preserve decision autonomy. This effect is moderated by perceived goal alignment: when alignment is low (e.g., under sponsorship disclosure), autonomy-supportive design increases reliance, whereas the effect attenuates when alignment is high. These findings advance advertising research by identifying autonomy-supportive AI design and goal alignment as key drivers of persuasion in AI-agent recommendation contexts.

VC-BACKED INNOVATIVE COMPANIES: HOW TO FACE CHALLENGING TIMES

Smirne, Paolo-Maria[1]

[1]Department of Law, Economics and Humanities, École Supérieure de Commerce de Paris, Turin, Italy

Keywords: Venture capital, Corporate governance, Shareholder rights, Articles of association, Transaction costs.

Abstract

Multiple factors must be brought together in order to achieve innovation: although scientific and organisational aspects often come to mind first, the company's legal architecture also plays a relevant role. The aim of my research therefore is to analyse some of the clauses most commonly used in VC-backed companies, in order to conclude that careful structuring of the company's articles of association can work as an effective tool to manage agency conflicts between outsiders (i.e. potential investors) and insiders (i.e. already existing shareholders, mainly founders), thus fostering the company's growth (Chaim and Eckstein, 2024). Two groups of clauses will thus be analysed: those directly shaping investors' rights and those shaping them indirectly, by limiting the rights of the founders.

A first group of clauses, which can foster efficiency in innovative companies, directly shapes investors' rights. This concerns the creation of special classes of shares, i.e. shares whose attached rights are tailored to meet some of the specific needs of venture capitalists. Three areas are especially significant in this respect: governance rights, economic rights and share transfer restrictions.

As for the first area (governance rights), venture capitalists often face a dilemma. On the one hand, their shareholding does not allow them to control the company they invest in; on the other hand, they contribute resources that require monitoring of how those resources are used. One possible response lies in strengthening their voice rights within the company, by granting enhanced voting rights to VC shares. Three types of clauses may be considered.

First, voting rights may be structured so as to reconcile a minority stake in the share capital with a significant weight in the company's decision-making process, thereby enabling investors to monitor the use of the financial resources they have provided. In other words, transaction

costs may be reduced by granting an investor, holding 20% of the share capital, 40% of the voting rights (Bini, 2024; Lamandini, 2024). Secondly, the number of votes in the general meeting (GM) may again be decoupled from the percentage of share capital owned by the investor by granting a veto right over decisions that are key for the protection of the investment. In this way, a minority investor becomes necessary for the adoption of certain resolutions that could adversely affect its position (typically: M&A, the sale of strategic assets or the admission of new investors). Thirdly, certain decisions may be removed from the vote of the GM and placed directly in the hands of the investor. This includes shares granting the right to sit on the Board of Directors, or to appoint one of its members: thus, ensuring that a minority investor has an adequate voice in the management of the resources it has contributed.

As for the second area of interest (economic rights), the number of share configurations typically adopted is, once more, three. First, venture capitalists often seek to protect their investment by decoupling the percentage of their economic rights from that of the share capital they hold: an investor holding 20% of the share capital may f.i. wish to participate in profit distributions on a 30% basis. Secondly, investors may want dividend distributions to be configured as an entitlement for the holders of a special class of shares: ordinarily instead, profits are not distributed unless the general meeting (GM) so decides. Thirdly, in the event of winding-up (or other liquidity events, such as the listing of the company or the sale of its assets), venture capitalists—consistent with their mission of pursuing the highest possible return in exchange for their willingness to undertake risky investments—often seek "liquidation preference" clauses (Maugeri, 2024). These provide investors with a preferential return, realigning the interests between investors and founders and thereby helping to mitigate asymmetric access to corporate information between the two groups (Gilson, 2003; Giudici et al., 2022). In European continental legal systems, however, such provisions must be reconciled with a higher level of mandatory rules than is typical in common-law systems (D'Alessandro, 2003; Giudici and Agstner, 2019; Tosch Hoggatt et al., 2026): this mainly concerns the prohibition of so-called "leonine" clauses (i.e. no shareholder may be entirely excluded from profits or losses).

As for the third area of interest (share transfer restrictions), two types of clauses are widely used in VC-backed startups (Dentamaro, 2022). The "tag-along" clause once again realigns the investors' interests with those of the founders by allowing venture capitalists to benefit from the same disinvestment conditions negotiated by the majority shareholders. That said, the "drag-along" clause can also be perceived as a way to strengthen the position of investors: the

fact that minority shareholders (such as the venture capitalists) may be forced to disinvest by the majority ensures that no minority shareholder will be able to veto a favourable deal.

A second group of clauses, which can also foster efficiency in innovative companies, indirectly shapes investors' rights by limiting the typical rights of the founders. This occurs in two main ways.

First, founders often agree to demonstrate their commitment to the business venture by subjecting their shares to lock-up clauses. The rationale is twofold: on the one hand, startups without the founders' input could easily turn into empty shells; on the other hand, the founders' continued involvement in the company for at least a certain period provides reassurance to investors as to the reliability of the business (i.e. if insiders believe in it, outsiders may be more willing to do so themselves).

Secondly, should the founders leave the company, exit provisions may help facilitate the process. It is reasonable to distinguish between an agreed exit and an unplanned exit. In the first case ("good leaver"), the valuation of the departing founder's shares will be calculated according to criteria favourable to the leaver; in the second case ("bad leaver"), the founder will have to pay for the value they are extracting from the company. Once again, these clauses promote efficiency by discouraging opportunistic behaviour.

Economic theory suggests that the more effectively the investors' and founders' expectations are aligned, the more resources can be devoted to fostering the company's development rather than to managing tensions among shareholders. This abstract therefore concludes that provisions tailored to the needs of venture capital investors can reduce transaction costs for prospective outside investors, thereby ultimately supporting the company's success and growth, even in the current turbulent economic environment.

COMMERCIAL RESILIENCE IN THE POLYCRISIS ERA: HOW FORWARDERS RETAIN CLIENTS THROUGH COMMUNICATION, TRUST, AND STRATEGIC PARTNERSHIPS

Meneses, Raquel[1,2] Brito, Pedro Quelhas[1,2] Nogueira, Alexandra[1]

[1]School of Economics and Management, University of Porto, Porto, Portugal

[2]INESC TEC - LIAAD - Institute for Systems and Computer Engineering, Technology and Science, University of Porto, Porto, Portugal

Keywords: Crisis Management, Freight Forwarding Industry, Communication Strategies, Trust, Relational Governance, Supply Chain Resilience, Strategic Partnerships, Uncertainty Absorption

Abstract

Freight forwarding companies play a crucial role in the global economy, moving large volumes of products, supporting exports and imports, providing shipping advice, packaging, and other logistics services. In recent years, this sector has faced many barriers due to natural disasters, pandemics, and geopolitical decisions. The research aimed to investigate the commercial strategies freight forwarders use to retain clients during market crises. This study employs a qualitative research design and uses semi-structured interviews. Data were collected from two complementary perspectives: commercial professionals from the freight forwarding industry and client representatives from multinational firms reliant on global logistics services. The analysis of the qualitative data has yielded several key findings that, taken together, illustrate a fundamental transformation in the industry's commercial approach, driven by a new reality of systemic and perpetual instability. Communication has emerged as the single most critical factor for client retention, extending beyond mere logistical updates to a transparent, consistent, and truth-based approach. Crises act as catalysts, accelerating the evolution of the client-forwarder relationship into a strategic partnership. Technology complements human relations, not substitutes for them. Moreover, finally, the recent disruptions have spurred a strategic imperative to build greater resilience. This is manifested in a client-driven shift from "just-in-time" to "just-in-case" inventory strategies, the implementation of active backup forwarder scenarios, and an increased demand for forwarders to enforce greater accountability from ocean and air carriers. becomes the primary source of differentiated value and client retention.

Introduction

In recent years, the global business environment has become increasingly unpredictable. Events such as the COVID-19 pandemic, geopolitical instability[1], the blockage of the Suez Canal, and labor strikes at major ports have created widespread disruptions with cascading effects across international trade. These developments highlight the fragile nature of global supply chains and the growing importance of managing client relationships under conditions of persistent uncertainty.

Freight forwarding companies play a crucial role in the global economy, supporting international trade through a wide range of services, including export and import coordination, shipping advisory, packaging, and other logistics services. Despite their central position in supply chains, the sector is particularly exposed to volatility, as it depends heavily on external actors, such as carriers, regulators, and geopolitical conditions. In times of crisis, this exposure is amplified, challenging the ability of firms not only to deliver operational performance but also sustain client relationships.

In such contexts, traditional commercial models, often based on stable demand, long-term contract, and price competitiveness, become increasingly fragile. Market disruptions frequently lead to contractual breakdowns, capacity shortage, and extreme price fluctuation, creating uncertainty for both service providers and clients. As a result, the commercial interface emerges as a critical site where uncertainty is managed, expectations are negotiated, and relationships are either reinforced or weakened.

Recent literature suggests that in environment characterised by “polycrisis”, firms rely on relational mechanisms, such as trust, communication and cooperative governance, to maintain business continuity and absorb uncertainty. However, while prior studies emphasise the importance of these concepts, there is limited empirical understanding of how they are operationalised at the commercial level, particularly in highly volatile, business-to-business service contexts such as freight forwarding.

To address this gap, this study focuses on the role commercial professionals in managing client relationships during crisis situations. In particular, it builds on the notion of uncertainty absorption, understood as the process through which actors interpret and translate ambiguous

[1] It is important to note that this research was conducted prior to the recent escalation involving the United States, Israel, and Iran, as well as the temporary disruption in the Strait of Hormuz. These developments have only reinforced the relevance and urgency of the issues examined in this study, further highlighting the persistent fragility of global logistics and commercial relationships.

information into actionable knowledge for others, and examines how this mechanism is enacted in client-facing interactions.

Accordingly, the study addresses the following research question: How do commercial professionals in freight forwarding act as uncertainty absorbers to sustain client relationships during market crises, and which relational mechanisms underpin effective client retention.? To answer this question, the study adopts a qualitative research design based on semi-structured interviews with two complementary groups: freight forwarding professionals and clients representatives from multinational firms. This dual-perspective approach enables a nuanced understanding of both the strategies employed by forwarders and the expectations and evaluations of clients during periods of market instability.

By focusing on the commercial interface and integrating insights from both sides of the relationship, this research contributes to the emerging discussion on client retention under conditions of systemic volatility. It also, provides practical implications for firms seeking to enhance resilience, build trust, and redefine value in an increasingly unstable global logistic environment.

Literature Review

The literature on client retention under crisis conditions spans several interconnected domains, including uncertainty management, relational governance, crisis communication, and supply chain resilience. While these streams have evolved largely in parallel, they collectively suggest that maintaining interorganizational relationships in volatile contexts dpends less on transactional mechanisms and more on relational and interpretive capabilities. This section reviews these perspectives to build an integrated framework for understanding client retention in freight forwarding under conditions of systemic instability.

Crises, uncertainty, and relational dynamics in interorganizational contexts

Nowadays, the competitive environment is not a sequence of isolated events but an interlinked set of crises that combine fast-moving triggers with slow-moving stresses, generating cascading effects across systems. Consequently, governance, trust, and communication shift from routine capabilities to everyday mechanisms of uncertainty absorption in B2B relationships (Lawrence et al., 2024; Liu and Renn, 2025). In such volatile contexts, client retention and business continuity depend on relational mechanisms, including trust (affective and competence-based commitment, perceived justice, and interdependence), which complement contractual safeguards. Environmental uncertainty and perceived risk increase the need for relational governance (cooperative norms, joint problem solving), while asset specificity and power

asymmetry warrant contractual safeguards; in practice, contractual and relational governance are complementary, and trust moderates the link between contextual factors and governance choice (Bonatto et al., 2022).

These relational governance mechanisms are particularly critical in crisis contexts, where formal contracts become less reliable and informal coordination mechanisms gain prominence. Crisis-management literature underscores that, in overlapping and unscheduled events, proactive, transparent, and timely communication is pivotal to uncertainty reduction, expectation anchoring, and accountability towards partners and clients; in public–private networks, collaborative governance and reconfiguration capacity emerge as resilience practices in the polycrisis era (Durugbo and Al-Balushi, 2022; Keinänen et al., 2026). This highlights the role of communication not only as an information-sharing tool but as a core mechanism through which commercial actors manage expectations and sustain trust during disruptions.

In complex services, analyses of interorganizational trust reveal that service innovation and digital platforms yield performance only when anchored in trust, agency, and coordination norms, reinforcing the centrality of relational mechanisms in high-risk contexts (He et al., 2022). In supply chains, key operant resources (information sharing, governance form, relation-specific resources, trust, relational commitment) outline distinct value-generation pathways. This helps reinterpret market shifts amid volatility: value is progressively reweighted from 'price' to 'resilience', i.e., the partner's capacity to absorb uncertainty and ensure continuity (Jaakkola et al., 2024; Rodríguez-López and Coronado Mondragon, 2024).

In polycrisis, client retention in B2B services is less a function of rates and more a function of relational capacity (trust, communication, coordination) and governance architectures that absorb uncertainty. While these dynamics are observable across several industries, they become especially pronounced in logistics contexts that are highly exposed to global shocks. This study maps, from two complementary perspectives (freight forwarders and clients), which commercial and relational practices sustain trust and continuity during crisis periods, advancing the conceptualization of the commercial professional as an 'uncertainty absorber.'

In this context, communication and relational mechanism can be understood as forms of uncertainty absorption, as they enable the translation of ambiguous and rapidly changing conditions into actionable knowledge for clients.

Market crises in the freight forwarding industry

Economic recessions often trigger widespread market crises in the freight forwarding industry. Freight forwarders face diminished revenue streams as shipping lanes see reduced activity and container utilization declines. Economic and geopolitical crises, conflicts, trade wars, and

regulatory shifts further complicate operations, as tariffs and sanctions force costly rerouting and renegotiation.

Beyond operational impacts, these disruptions strain relationships among forwarders, carriers, and clients, turning crises into critical tests of trust and partnership stability.

Recent literature on supply chain resilience emphasizes that firms now operate in an environment shaped by high levels of uncertainty, complexity, and risk. Shi et al. (2024) highlight that global supply chains face structural challenges resulting from increased geographic dispersion, recurrent disruptions, and unpredictable shocks that affect coordination and material flows. Their analysis shows that, under these conditions, volatility and risk exposure become central features of supply chain functioning, demanding strengthened resilience mechanisms and enhanced capacities for adaptation, alignment, and responsiveness. More specifically, Bai et al. (2022) identify volatility as a core characteristic of the freight forward industry. Large corporations are aware of these factors but are often poorly equipped to monitor, manage, and understand volatility, especially the unique volatility in the freight sector, which impacts their balance sheets through the movement of goods to market. Analysts are not equipped with detailed, in-depth freight industry experience, nor are they given the luxury of time to comprehend how the complexity of elements that impact a forwarder's performance, balance sheet health, and insurance needs have interacted, are interacting, or are forecast to impact a given timetable of projected events.

The commercial perspective highlights a trend toward integrated solutions and the critical importance of trust; the commercial relationship is the nexus where crisis impacts are felt most acutely and where retention is ultimately won or lost. However, while the literature acknowledges the importance of trust (Prakash et al., 2022), it offers limited empirical guidance on how to build and sustain trust amid operational chaos and contractual breakdowns.

In any business, establishing and maintaining customer trust and loyalty is crucial. However, since trust is not easily quantifiable and its evaluation is subjective, many professional organizations overlook the development and reinforcement of uniform guidelines for all employees. The higher the volume of services, the greater the likelihood of problems, errors, and disputes arising. A key takeaway is that trust levels can and should be enhanced to improve overall business efficiency. The foundation of a trustworthy corporate system lies in a well-coordinated, well-trained team that possesses a deep understanding of the boundaries within which employees operate in a supportive environment at all levels (Prakash et al., 2022).

Thus, a clear gap exists in the literature: a lack of in-depth research from both the forwarder and client perspectives on the specific commercial strategies that are effective in a perpetual

uncertainty environment. We aim to address this gap by exploring real-world techniques, successes, and failures in client retention, moving beyond theoretical models to provide a practical understanding of the commercial approach in today's volatile freight-forwarding industry.

Taken together, the reviewed literature suggests that client retention in crisis contexts is shaped by a combination of relational governance mechanisms (e.g., trust, cooperation), communication practices (e.g., transparency, timeliness), and the ability to manage uncertainty through interpretation and coordination. However, these dimensions are typically examined in isolation, with limited attention to how they interact at the commercial interface. In particular, there is a lack of empirical understanding of how commercial professionals enact these mechanisms in practice and how clients perceive their effectiveness. This gap motivates the present study, which adopts a dual-perspective approach to examine how these elements converge in shaping client retention during market crises.

Methodology

The methodology for this study is qualitative with primary data collection through semi-structured interviews. The primary objective is to explore the nuances of commercial strategies, client relationships, and decision-making processes during volatile periods, where context and perception are paramount. Data collection took place in early 2025, during a period characterised by ongoing instability in global logistics markets. The data were collected through 15 semi-structured interviews with SMEs (Subject Matter Experts): 10 from the freight forwarding industry and 5 clients. This dual approach was chosen to ensure a comprehensive understanding of both the industry's internal strategies and external customer experiences during market disruptions. The SMEs selected possess significant depth of experience, ranging from 5 to over 30 years in the sector, with the majority having at least 10 years. The client participants all represent large, multinational corporations, providing a strategic perspective from major global shippers who are critically dependent on their logistics partners. This dual-method approach enriches the study by revealing both the efficacy of commercial strategies and their real-world impact, offering actionable recommendations for the industry. The responses were transcribed, and key concepts, terms, and strategies were coded and organized into themes. Thematic analysis helps categorize the data and make sense of complex responses. It allows the identification of patterns related to market disruptions, crisis management, and client expectations.

Findings

The anatomy of Crisis Redefining the operational landscape

The breakdown of these established commercial norms is a critical finding. An SME explained that pre-COVID, the industry operated on "long-term contracts," but during and after the pandemic, these agreements "were thrown to the trash" as a force majeure environment took hold. A client-side manager described the tangible impact of this shift, stating that during a crisis, "All our agreements are more or less no longer respected from one day to the other... we are basically fully lost control". This contractual unreliability forces a move towards more dynamic, spot-market-driven interactions, which, while necessary, creates immense instability for clients' budgeting and planning. Consequently, the actual commercial challenge is not merely managing a single crisis but redesigning the entire commercial framework to function effectively amidst perpetual instability. This implies a strategic move away from price-centric agreements towards partnerships built on different value metrics, such as flexibility and resilience.

Crises function as a "litmus test" for client-forwarder relationships. They are powerful catalysts that either solidify a partnership by demonstrating value beyond price or expose its transactional weaknesses, often leading to its dissolution. One SME articulated this duality with clarity, stating that a crisis is an "opportunity" to "find great solutions, and there will definitely support the relationship, and it will be at the end much stronger than before. Or in the worst case, you can fail". Another SME reinforced this, noting that during a crisis, one could "build an... even stronger relationship with the customer because at the end it is a situation in which you have to deal with... Or you could completely destroy it". This aligns with Al-Dabbagh (2020), who observes that crises require structured decision-making processes, with rapid assessment, scenario evaluation, and strategic response. Although this work focuses on governmental crisis decision-making, the underlying principle that crises impose heightened cognitive and strategic demands on decision-makers applies to commercial settings as well. The outcome is not just operational but deeply interpersonal, impacting long-term business viability in a way that general frameworks often overlook.

The commercial response: a framework for client retention

The analysis of the interview data reveals a clear and consistent framework for success, moving from traditional, price-focused sales tactics to a relationship-centric, solution oriented approach in which communication, partnership, and flexibility are paramount.

Communication as the cornerstone of crisis management

Across all interviews, with near-unanimous consensus from both firms and clients, proactive, transparent, and reliable communication was identified as the single most critical factor for client retention during a crisis. It is the foundation upon which trust is maintained, and partnerships are preserved when operational stability falters. This finding strongly confirms the theoretical importance of communication in crisis management frameworks (Al-Dabbagh, 2020). Our data extends this theory by demonstrating that the quality and timeliness of communication (proactivity, honesty) are valued more highly than its positive or negative nature. This positions the commercial role not just as a communicator, but as a manager of uncertainty, a practical application that enriches the theoretical models.

From service provider to strategic partner

The intense pressures of market crises accelerate the evolution of the client-forwarder dynamic. The interviews show a clear trend away from transactional, price-based relationships towards strategic partnerships built on mutual trust, reliability, and a shared problem-solving ethos. Forwarders who successfully navigate this transition are far more likely to retain and even grow their business with key clients.

Clients explicitly prefer this partnership model. One procurement manager advises other businesses to "stick to our partner, and I'm using the word partner. Yeah, the service provider". Another client explains the benefits of this approach: "This is a cooperation, and if you have a good relationship and a good cooperation, it is also easier to get that hands-on feeling and that you are being prioritized". Successful firms have internalized this and view partnership-building as a long-term strategy that pays dividends during volatile periods. One account manager described his approach as looking at relationships "in a longer term. So mid to longer term, so even 5 to 10 years," moving beyond the short-term focus of the RFQ cycle. At the core of this partnership is a fundamental shift towards a solution-oriented mindset. Clients are less interested in a forwarder's standard service portfolio and more interested in their ability to solve complex, unforeseen problems. As one client bluntly stated, "What I want is a solution. A Person with solutions, not someone who wants to make more sales".

This shift has fundamentally redefined the concept of "value" in the commercial relationship. Before the constant state of crisis, value was heavily weighted towards price and cost savings. The interviews reveal that while cost remains a factor, its primacy has been usurped by metrics of resilience and reliability. Clients who previously might have switched providers for minor price differences now recognize the immense cost of a line-down situation or a failed delivery.

As the client-side procurement manager noted, businesses that are purely opportunistic and "jump" between forwarders for small savings are at a significant disadvantage during crises. They prioritize forwarders who demonstrate accountability and a willingness to "fight for us in these challenging times". This means a forwarder who can secure scarce capacity (even at a premium price) or propose a viable alternative routing provides far more value than one who offers the lowest theoretical rate on a contract that ultimately cannot be honored. The implication for commercial strategy is profound: sales and account management teams must shift their value proposition from "we can save you X% on your freight spend" to "we can help guarantee your production line keeps running." This requires a much deeper engagement with the client's business. The commercial role thus evolves from a service vendor to a strategic supply chain consultant.

This empirical evidence confirms the strategic importance of "Collaboration and Partnerships" and builds upon the concept of trust (Prakash et al., 2022). Our data extends these ideas by showing how this partnership materializes in a crisis: through a tangible shift in the value proposition from cost-saving to ensuring business continuity.

Strategic flexibility: adapting pricing, services, and operations

In a volatile market, rigidity is a liability. Successful freight forwarders demonstrate a high degree of strategic flexibility, adapting their pricing models, service offerings, and operational approaches to meet the unique and rapidly changing challenges of a crisis. This adaptability is a key component of the solution-oriented mindset that clients value.

Pricing becomes a dynamic and often transparently negotiated element. SMEs acknowledge that crises inevitably lead to higher interest rates. However, they frame this not as opportunistic price gouging, but as a necessary measure to secure scarce capacity in a highdemand market. One SME recalled that during the Icelandic volcano crisis, they "could increase the rates to a very interesting level," which was essential to chartering aircraft for a key automotive client and keeping their production lines moving. Another described a strategy of maintaining a base contract rate but adding a clearly communicated "emergency freight add-on," which provides a degree of transparency and predictability for the client even amidst volatility.

Another SME described a strategy of providing additional warehouse space or leveraging Free Trade Zones to help clients manage inventory and mitigate the impact of tariffs, allowing them to "decide on a shorter notice then and where the cargo goes... you have to pay that is similar to what I mentioned earlier regarding a bonded warehouse. This helps the customer to steer it a little bit". These actions demonstrate a willingness to move beyond a standard service menu and

co-create solutions with the client, cementing the partnership. These findings provide concrete examples of "adaptability" crucial for handling crises (Shi et al., 2024). The diversification of services and operational approaches aligns directly with the mitigation strategies proposed by Margherita and Heikkilä (2021), demonstrating how these theoretical strategies are implemented in practice to maintain supply chain integrity.

The human-technology nexus in crisis management

The data provide a nuanced perspective on the roles of human expertise and technology in the freight forwarding industry. While technology is recognized as an increasingly important enabler of efficiency and visibility, the data overwhelmingly indicates that the human factor (relationships, expertise, creative problem-solving, and communication) remains the decisive element in successfully navigating crises and retaining clients.

Technology's primary value lies in providing data, visibility, and efficiency. Clients appreciate digital tools that give them direct access to information, such as "predictive ETA" platforms that offer a "live view of where cargo is at", and online portals that provide daily updates without clogging email inboxes. Firms, in turn, see the value in "more automated messages" that provide faster alerts to clients about deviations, delays, or rollovers.

However, participants are keenly aware of the limitations of technology. A significant concern is the data's reliability. As one client pointed out, digital platforms are only as good as the information fed into them: "You are depending on human beings to input the data into these systems, and if they input it wrong, it's wrong". Another critical limitation is the lack of business context. A different client noted that while technology can provide data, it cannot understand its significance: "They don't know what is important for me or for us." This leads to a clear delineation of complementary, rather than competitive, roles for humans and technology in crisis management. Technology is best suited for information dissemination: tracking shipments, providing status updates, and reporting raw data. It answers the fundamental questions of "what" and "where." In contrast, humans are essential for interpreting information, providing context, and offering reassurance. They answer the more critical questions: "so what?" and "now what?" For example, a system can report that a container has been delayed by five days. A human account manager, knowing the client's production schedule, can interpret that this delay will shut down a critical assembly line and can proactively begin developing alternative solutions.

As one firm noted, a client "just wants the reassurance to speak to somebody else". This reassurance, born of trust and expertise, cannot be automated. The most effective commercial

approach, therefore, is one that integrates both elements. It leverages technology to deliver fast, accurate data, freeing up human account managers to focus on high-value activities, such as interpreting that data within the client's specific context, developing creative solutions, managing the relationship, and providing the essential human touch that builds lasting partnerships. This finding offers a nuanced counterpoint to the literature's strong emphasis on "Technology Adoption". While our data confirms that technology is a key tool, it suggests its role is primarily supportive rather than transformative in client retention during a crisis. This extends the discussion by delineating complementary roles: technology for information dissemination and humans for interpretation, strategic action, and reassurance—a critical distinction not explicitly detailed in the reviewed literature.

Building future resilience: strategic imperatives for the industry

The experience of recent, frequent, and overlapping crises has catalyzed a strategic shift within the supply chain community towards building greater resilience. The interviews suggest that the sector is shifting from a pure cost-optimization model to strategies that build buffers, options, and flexibility to withstand future shocks better.

A key theme is the move from "Just-in-Time" to "Just-in-Case" logistics. The hyper-efficient, low-inventory models that dominated for decades have been exposed as fragile. A firm advocated for a fundamental change in mindset, industry needs to build "buffer, the setup of the company... for people for operational stuff, but also for goods for spare parts". Clients themselves are driving this shift. A global logistics director noted that "many companies started to increase their inventories for both raw materials components and also for the finished goods... making their own warehousing" to generate agility and avoid being out of stock. For clients, a primary resilience strategy is diversifying their forwarder portfolio by implementing active backup scenarios. This marks a significant change from past practices. The new strategy is to "prepare more backup scenarios" and "keep backups running so that they really can take over if needed," even if this approach is "more expensive in rates" and more complex to manage. Having a secondary or tertiary partner already familiar with the business's volumes and requirements enables a much faster, more effective pivot when a crisis compromises the primary provider, whether a port strike or a cyberattack.

This finding is a direct, practical manifestation of the risk management principles discussed in the literature. The move from "Just-in-Time" to "Just-in-Case" is a clear response to the heightened volatility (Bai et al., 2022; Shi et al., 2024). The client-driven strategy of

diversifying the forwarder portfolio with active backups is a tangible application of the resilience strategies (Peters et al., 2023), reinforcing scenario planning and stress testing.

Finally, there is a clear imperative from the client side for forwarders to exert more influence upstream and drive greater accountability from carriers. Given that contracts are frequently dishonored during crises, clients expect their forwarder partners to leverage their consolidated volume and relationships to protect their interests. As one client stated, forwarders have "better negotiation power with the shipping lines, and they should somehow force shipping clients to stick to the agreements". The breakdown of this "trust circle" is seen as a significant threat to supply chain stability, and clients view their forwarders as the key agents in restoring a degree of reliability and predictability to the carrier market. This places a new strategic demand on forwarders: their value is not just in executing shipments, but in actively managing and stabilizing their corner of the supply chain ecosystem. This introduces a new dimension to the "Collaboration and Partnerships" theme, extending the concept beyond the client-forwarder relationship to include the forwarder's responsibility in managing the broader supply chain ecosystem, a point not explicitly covered in the reviewed literature.

Conclusion

The research aimed to investigate the commercial strategies freight forwarders use to retain clients during market crises. The analysis of the qualitative data has yielded several key findings that, taken together, illustrate a fundamental transformation in the industry's commercial approach, driven by a new reality of systemic and perpetual instability. First, the operational context for freight forwarding has undergone a fundamental shift. The empirical data confirms that the industry has moved beyond managing occasional, discrete crises to navigating a state of perpetual and overlapping "multi-crisis". This environment of pervasive uncertainty, characterized by the volatility described in the literature, has rendered traditional commercial models based on long-term, fixed-rate contracts increasingly ineffective.

Second, in this volatile environment, proactive, transparent, and reliable communication has emerged as the single most critical factor for client retention. The role of communication extends beyond mere logistical updates; it serves as a vital tool for reducing uncertainty, managing expectations, and demonstrating accountability. This finding provides a robust, real-world validation of theoretical crisis management frameworks that emphasize the importance of clear communication policies for organizational response. The consistent client demand for unvarnished truth underscores that the quality and timeliness of communication are more valuable than the positive (or not) nature of the information itself. Third, crises act as catalysts,

accelerating the evolution of the client-forwarder relationship into a strategic partnership. The definition of value has shifted from a primary focus on price to a new emphasis on reliability, flexibility, and solution orientation. This extends the existing literature on the importance of trust and collaboration in logistics, illustrating how these abstract concepts manifest during a crisis. Clients are increasingly prioritizing forwarders who demonstrate a deep understanding of their business and act as problem solvers, a trend that reflects the industry's shift toward more integrated, 4PL-style service offerings.

Third, while technology plays a crucial enabling role in providing visibility and efficiency, the human factor remains the decisive element in crisis management and client retention. Data clearly delineates complementary roles: technology is best suited for information dissemination (e.g., tracking data), while humans are essential for information interpretation, contextualization, and the reassurance that builds and sustains trust. The most effective commercial approach is one that leverages technology to free up human capital for high-value relationship management and creative problem-solving.

Finally, the recent disruptions have spurred a strategic imperative to build greater resilience. This is manifested in a client-driven shift from "just-in-time" to "just-in-case" inventory strategies, the implementation of active backup forwarder scenarios, and an increased demand for forwarders to enforce greater accountability from ocean and air carriers. This trend is a direct, practical application of the risk management principles and scenario planning, signalling a broader strategic realignment in global supply chain management. Beyond extending existing theories, this study makes several original contributions to the field. It articulates a critical shift in the definition of value in the client-forwarder relationship, moving away from price-centric metrics toward a new paradigm where reliability and solution orientation are paramount. The research also conceptualizes a new role for the commercial professional as an "uncertainty absorber", highlighting their function in processing chaotic information to provide clients with the clarity needed for strategic decision-making. During a crisis, the primary function of the account manager is not merely to communicate information but to process, interpret, and contextualize chaotic data streams, thereby absorbing market volatility on behalf of the client and enabling them to make strategic decisions. Finally, this study contributes a nuanced understanding of the human-technology nexus in crisis management, delineating the complementary roles where technology is commoditized for data dissemination. At the same time, human expertise in interpretation, creative problem-solving, and reassurance becomes the primary source of differentiated value and client retention.

The findings of this study have significant, actionable implications for commercial leaders and managers in the freight forwarding industry. To succeed in the current market, a strategic reevaluation of the commercial function is necessary, moving it beyond a traditional sales role to become a central pillar in the organization's resilience strategy.

Beyond the firm level, these findings signal a systemic transformation in freight forwarding's business model, with broader implications for the global economy. The industry appears to be moving from a transactional, cost-plus service model to one more akin to a strategic consultancy, where value is derived from knowledge, flexibility, and risk management. This shift positions the commercial professional not as a salesperson but as a risk-management consultant for the client's supply chain. The shift from "just-in-time" to "just-in-case" logistics, with the prioritization of resilience over pure cost efficiency, suggests a fundamental change in global supply chain strategy. Industries are beginning to internalize the high costs of disruption, leading to more robust, albeit potentially more expensive, supply networks. This trend could influence macroeconomic models by placing a higher premium on stability and predictability, potentially creating inflationary pressures as redundancy is built back into lean systems, but also yielding economic benefits through increased stability and reduced losses from disruptions. For the freight forwarding industry, this represents a historic opportunity to evolve from a commoditized service provider into a strategic enabler of global trade resilience, fundamentally elevating its role in the world economy.

While this study provides valuable qualitative insights into its chosen topic, it is important to acknowledge its limitations. The primary limitation is the limited sample size. While the interviews with 15 participants provided unparalleled depth and nuance, the findings are based on a small, purposively selected sample. They may not be generalizable to the entire freight forwarding industry. Furthermore, the sample was composed primarily of experienced professionals and large multinational corporations, with a focus on Europe and North America. The perspectives of small and medium-sized enterprises (SMEs) or those operating predominantly in other economic regions may differ significantly.

Future research should seek to test the hypotheses generated by this study. A large-scale survey could be distributed to a broader, more diverse sample of freight forwarders and shippers worldwide to assess the statistical correlation between specific commercial strategies (e.g., communication frequency and transparency) and client retention rates during a documented crisis period. As an extension of the first research avenue, a dedicated study should explore the development and viability of new contractual models grounded in shared risk and resilience

metrics. This could involve a comparative analysis of emerging contractual frameworks (e.g., gain-sharing agreements, resilience-based Service Level Agreements) and their impact on client-forwarder collaboration and performance during disruptions. This study found that technology is currently used more for visibility than for proactive solutions. Future research could focus specifically on the impact of advanced Artificial Intelligence and predictive analytics on crisis response. A comparative case study of firms that have heavily invested in these technologies versus those that have not could yield valuable insights into their effectiveness in anticipating disruptions, optimizing responses, and potentially automating some of the "uncertainty absorption" functions currently performed by humans. Flowing directly from this study's strong emphasis on the "human element," future research could explore the specific leadership qualities and human capital development strategies that foster organizational resilience. This could involve case studies on training programs, leadership styles, and corporate cultures that empower commercial teams to act as effective "uncertainty absorbers" and strategic consultants, as clients now demand.

In conclusion, this research confirms that the freight forwarding industry has entered a new paradigm defined by constant crisis. The findings demonstrate a clear and fundamental shift in the commercial landscape, where success is no longer solely dictated by price, but by a sophisticated blend of resilience, strategic partnerships, and transparent communication. While technology serves as a vital enabler, the human element, embodied by the commercial professional acting as a trusted advisor and "uncertainty absorber", has proven to be the decisive factor in navigating this new reality. The strategies identified herein are not merely tactics for surviving the next disruption; they represent the new standard for commercial excellence and the foundation for building lasting, resilient client relationships in a permanently volatile global market.

INTRADAY IMPLIED VOLATILITY SURFACE FORECASTING IN CRYPTOCURRENCY OPTIONS MARKETS

Elnur Namazov[1], Balázs Králik[2], Vilayat Valiyev[1], Kata Váradi[2]

[1] Azerbaijan Technical University, Baku, Azerbaijan
[2] Corvinus University of Budapest, Budapest, Hungary

Keywords: Implied volatility, Volatility smile, Bitcoin options, High-frequency forecasting, HAR model, Deribit, Tail risk.

Introduction and Research Question

Cryptocurrency options markets have grown rapidly, with Deribit the dominant venue for Bitcoin options. Trading is continuous (24/7), generating dense intraday quote streams without overnight gaps. Volatility forecasting is central to option pricing, hedging and risk management, yet the literature has focused overwhelmingly on realised volatility [1]. The dynamics of *implied* volatility (IV), and especially the *shape* of the IV smile, remain largely unaddressed in crypto markets at tick-level frequency. This study asks: *are intraday Bitcoin IV smile descriptors (Level, Skew and Curvature) forecastable beyond a random-walk benchmark, and how does forecastability vary across horizons?*

Conceptual Framework

The IV surface admits a parsimonious factor description [2], 2002): Level captures broad ATM uncertainty, Skew the relative pricing of downside versus upside risk, and Curvature the relative richness of the wings. These components should differ in predictability *ex ante*. ATM Level aggregates broad volatility expectations and is expected to behave near-efficiently [3]. Skew reflects segmented demand for downside protection that may adjust more slowly. Curvature reflects demand for convexity and tail protection together with dealer inventory and quote-depth constraints, and is therefore expected to be the most slowly adjusting component, particularly at longer horizons.

Data and Methods

We use tick-level Bitcoin option-chain data from Deribit (via Tardis.dev) spanning 20 December 2025 - 16 March 2026 (87 days, 25,038 5-minute bars). We restrict to a 14-30 day maturity band to isolate smile-shape variation from term-structure effects, and to log-moneyness $|x| \leq 0.02$ (ATM) versus $|x| > 0.02$ (OTM puts and calls). At each bar, Level is the cross-sectional median of mark IV across ATM contracts, Skew is median put-wing minus call-wing IV, and Curvature is the average wing IV minus Level.

Each descriptor is forecast at horizons of 5, 15, 30 and 60 minutes using a Heterogeneous Autoregressive specification [4] on the 5-minute grid, augmented with a lag-1 term, two intraday Fourier harmonics and lagged liquidity features, benchmarked against a naive random walk. Estimation is rolling-origin OLS with an expanding window. Inference uses signed HAC-adjusted Diebold–Mariano tests with a Newey-West bandwidth $\lceil 1.5h \rceil$. We report two R^2-OOS measures: the conventional benchmark against the unconditional mean, and the loss-differential against Naive ($1 - \text{MSE(HAR)}/\text{MSE(Naive)}$), the economically meaningful comparison for highly persistent series.

Findings

The results support the descriptor-specific hypothesis. *Level* is best forecast by a no-change rule: HAR loses to Naive at every horizon, with R^2-OOS (vs. Naive) ranging from -0.876 at 5 minutes to -0.090 at 60 minutes (DM significant at 1%). The conventional R^2-OOS of ~ 0.99 for both models reflects near-unit-root persistence, not skill. *Skew* is forecastable at 60 minutes, with a HAR gain over Naive of +5.3 pp ($p < 0.01$). *Curvature* is the most forecastable component: HAR gains over Naive are +8.9, +13.9 and +18.0 pp at 15, 30 and 60 minutes (all $p < 0.001$), rising monotonically with horizon (the opposite of Level) consistent with slow dissipation of tail-protection demand through the order book. The ranking is unchanged when the maturity band is widened to 7-60 days or when the bid-ask midpoint replaces mark IV.

Contribution and Implications

To our knowledge, this is the first systematic intraday smile-shape forecasting study for Bitcoin options on Deribit. The contribution is a clean descriptor-specific predictability ranking: ATM Level is informationally efficient at intraday horizons, while smile-shape components carry forecastable information that increases with horizon. The Curvature finding has direct implications for short-term hedging of straddles, strangles and convexity-bearing positions. Limitations include the short three-month sample, the single-venue and BTC-only scope, and the absence of a hedging-PnL evaluation. Economic-value evaluation, machine-learning extensions and longer multi-regime samples are left to future work.

GREENHUSHING PRACTICES IN FAMILY FIRMS

Battisti, Enrico[1] Bongiovanni, Noemi[1] Salvi, Antonio[1]

[1] Department of Management "Valter Cantino", University of Turin, Turin, Italy

Keywords: Greenhushing, Family firms, Socioemotional wealth, environmental performance, environmental disclosure

Introduction and theoretical background

In the 21st century, the pressure on companies to adopt sustainable practices has grown exponentially, forcing them to justify their environmental and social actions (Block et al., 2024). In this context, greenwashing has emerged as a common strategy for gaining undeserved environmental legitimacy, pushing regulators to intensify disclosure requirements and tighten environmental reporting standards (Lee & Raschke, 2023; Forliano et al.,2025). The increasingly demanding regulatory environment has led firms toward a defensive strategy known as greenhushing, whereby companies deliberately underreport their environmental performance and outcomes to avoid litigation arising from discrepancies with green regulations (Font et al., 2017; Wang et al., 2026). Despite its growing relevance, the literature on greenhushing remains fragmented and underexplored, particularly in the context of family firms, where communication dynamics and environmental performance measurement are particularly complex (Battisti et al., 2023). Their unique governance structure, shaped by the preservation of socio-emotional wealth (SEW), suggests a greater propensity to adopt strategic silence (Huang et al., 2025).

Aim

This study investigates whether family firms (FFs) exhibit a greater propensity for greenhushing than non-family firms. Drawing on SEW theory, we argue that the particular governance structure of FFs, characterized by long-term reputational orientation and strong commitment to the community, incentivizes under-communication of environmental achievements. This research aims to expand the empirical evidence on greenhushing, highlighting its growing relevance and rapid evolution as a strategic response to an increasingly

demanding regulatory environment. Furthermore, it represents an early attempt to examine how ownership structure may influence this emerging phenomenon, providing a basis for extending the greenhushing literature toward ownership-related factors.

Methodology

The analysis is conducted on a panel dataset of European listed companies covering the period 2012-2023. The final sample includes 383 firms, whose financial and ESG data were sourced from LESG Workspace and subsequently integrated with ownership data from Bureau van Dijk Orbis. Family firms are identified through a binary variable based on the definition of Global Ultimate Owner. The greenhushing is measured as the residual of an Ordinary Least Squares regression of environmental disclosure (dependent variable) on environmental performance (independent variable), controlling for firm size, leverage, and profitability, including year and industry fixed effects. To address sample heterogeneity, results are validated through Propensity Score Matching (PSM) with caliper and matching with replacement.

Preliminary results

Preliminary results show a consistent and clear direction. Descriptive analysis reveals that, despite comparable levels of environmental performance, FFs exhibit significantly lower environmental disclosure than non-family firms ($p = 0.048$). Regression analysis confirms a negative association between FF status and greenhushing scores ($\beta = -0{,}024$), suggesting that FFs tend to underreport their environmental performance. Although the results do not reach the conventional level of significance, likely due to the limited number of family firms in the sample, the direction of the effect remains stable and consistent. The PSM analysis supports this pattern, highlighting a stronger effect magnitude ($\beta = -0.029$) on a balanced sample, and reinforcing the robustness of the observed tendency.

Conclusion

This study contributes to an under-explored area of literature, offering preliminary empirical evidence on greenhushing as a governance driver phenomenon. Although the regression results do not reach conventional significance levels, the consistently negative trend observed cross descriptive and robustness analyses suggests that FFs tend to underreport their environmental performance, supporting the theoretical expectation that they may prioritize reputational protection over transparency. This behavior could translate into practical consequences,

including a higher cost of capital for FF due to the reduced environmental transparency toward investors. Future research should extend the analysis to mid-cap European firms, where family ownership is more prevalent, and incorporate continuous ownership variables to capture the intensity of family control and its effect on environmental communication strategies.

Abstract

This study investigates the adoption and impact of modern budgeting approaches in corporate planning. Through expert interviews with consultants and controllers, the research finds that while many organisations still rely on traditional Excel-based planning, there is increasing awareness of and interest in integrated software solutions, simulations, and predictive analytics. These techniques may deliver greater transparency, enhanced planning accuracy, and improved responsiveness. Nonetheless, significant barriers persist, including costs, complexity, and cultural resistance. The results indicate that benefits such as efficiency gains and organisational flexibility are existing but often gradual and difficult to measure, contributing to scepticism and slow adoption. Effective change management, comprehensive training, and clear communication are crucial for successful implementation. Despite the challenges, the research reveals substantial potential for modern approaches to improve corporate planning, advocating for ongoing development and further research to support informed decision-making in dynamic business environments.

Introduction

It can be observed that the transformation of the global economic system has accelerated dramatically in the last months and the world order in which business activities have been organised for decades does hardly exist any more (Dunoff and Pollack, 2025; Shahini and Shahini, 2025). As a result economic uncertainties for businesses have increased tremendously (Johnsen, 2023) and Europe is trying to find new trade partners in South and Latin America and Asia to stabilise a rule-based approach of doing business. With an export focused economic system, Germany is especially suffering under these developments and traditional busi-

ness models are not successful any more (Grömling, 2025). There is the urgent need to modernise and transform the German and European economic system to ensure future growth and prosperity. Budgeting and corporate planning are important corporate activities within the finance function and form the base of decision-making processes (Eichholz *et al.*, 2024; Klovienė and Uosytė, 2019). Especially, in times of constant change and crisis, which we can currently observe in the context of the German economy, firms need to carefully allocate their resources (Becker *et al.*, 2016; Eichholz *et al.*, 2024). Additionally, digital transformation puts pressure on traditional budgeting and planning approaches (Bergmann *et al.*, 2020; Fähndrich, 2023). Despite the challenges and downsides associated with traditional budgeting and planning approaches (Benzenhöfer *et al.*, 2025; Bergmann *et al.*, 2020; Klovienė and Uosytė, 2019), there is evidence that traditional approaches are still widely used in corporate practice (Benzenhöfer *et al.*, 2025; Henttu-Aho and Järvinen, 2013).

The aim of this paper is to better understand the current application and development of modern methods and tools in budgeting and corporate planning. It explores the factors that prevent organisations from adopting new concepts to optimise their planning processes. The study provides important contributions by offering a current practitioner perspective on the application of modern concepts based on subject matter expert perspectives in the sense of experienced consultants. With their expertise developed in various consulting projects, they can provide a comprehensive view on the phenomena under research.

The subsequent section provides a brief overview of the literature on budgeting and corporate planning. We then discuss the method used in this research, which tends to be a qualitative, exploratory approach. The following results and a discussion section provides a better understanding of modern budgeting techniques. The paper ends with a conclusion.

Literature Overview

The literature highlights that there are a number of advantages of budgeting and corporate planning. For instance, Rice et al. (2024) examined the relationship between strategic planning, budgetary planning, and future sales in their study on a sample of Australian SMEs. They found that formal budgetary and strategic planning is an important part of a well-run business, highlighting that then decisions are better aligned to the desired outcomes. Vividly

they argue that '[a]ppropriate planning and control systems are a counterpoint to organisational disarray and managerial capriciousness' (Rice *et al.*, 2024). However, it has to be noted that the dataset, they used is from 1995 to 1998 and may not account for recent developments. It seems that during a crisis, firms see a higher importance of the budgeting and planning function (Becker *et al.*, 2016; Eichholz *et al.*, 2024), although in situations of crisis, conflicts and disputes about the allocation of scarce resources tends to increase in contexts of organisational routines such as budgeting (Broman and Rocha-Pinto, 2023). Eichholz et al. (2024) show that budgeting has a positive influence on organisational resilience (Roffia and Dabić, 2024) but no significant association to competitive advantage, which they, however, partly explain with the research design during the COVID-19 pandemic.

Others highlight the downsides of traditional budgeting such as the time-consuming generation of budgets, associated costs, and the static, inflexible nature of budgets (Bergmann *et al.*, 2020; Hansen *et al.*, 2003; Neely *et al.*, 2003) as well as that annual budgets are outdated soon, causes well-known budget games, and lacks a real value adding function for operational business units (Henttu-Aho and Järvinen, 2013). Klovienė and Uosytė (2019) explain that traditional budgeting typically uses historical data as a reference for future planning. Such systems naturally reach limits in times of transformation and fundamental changes that can hardly be foreseen, which currently rather tends to be norm than the exception. At least with the efforts related to budgeting, Bergmann et al. (2020) found that the integration of business analytics in the budgeting process may lead to an increased satisfaction with the budgeting process. Others report on the usefulness of rolling forecast approaches to reach a more forward-looking management approach (Henttu-Aho, 2016). Bukh *et al.* (2025) vividly exemplify the journey of a company from abandoning budgets to reintroducing them again, complementing them with forecast-based approaches, as they say '… statistically projecting, rather than negotiating, the corporate budget was considered an improvement to its role fulfilling budgeting purposes' (Bukh *et al.*, 2025).

Corporate planning and budgeting has been discussed in scholarly research for several decades (Hansen *et al.*, 2003; Neely *et al.*, 2003; Stonehouse and Pemberton, 2002). However, we still see the need for further studies in this area. Traditional budgeting methods are still widely used in corporate practice despite existing challenges (Benzenhöfer *et al.*, 2025). However, some scholars observed incremental steps towards beyond budgeting logics but not replacing budgeting in its totality (Henttu-Aho and Järvinen, 2013). While studies note positive

effects of implementing modern planning methods, there is a lack of current evidence demonstrating how effectively these approaches resolve existing budgeting challenges. Although technologies generally improve budgeting compared to previous practices, critical issues such as uncertainty, budgeting efficiency, and forecasting accuracy remain insufficiently explored. Furthermore, studies indicate that companies are increasingly interested in modern planning processes and tools. However, development and improvements in practice were often still in early stages, with significant hurdles remaining. This context informs two central research questions for the present study:

- RQ1: How do companies organise and use modern planning approaches and tools in practice?
- RQ2: What factors influence and hinder the development and implementation of modern planning procedures?

Research Design and Method

Data was collected via qualitative expert interviews (Kvale and Brinkmann, 2009). This approach focuses on understanding and interpreting subjective perspectives. Qualitative research aims to generate theoretical insights by exploring the experiences and knowledge of individuals with exclusive expertise in the subject matter (Froschauer and Lueger, 2009).

Expert interviews in this study were semi-structured, guided by a flexible and open interview guide. This allowed us to adapt questions to each situation and develop an in-depth understanding through probing questions. Such flexibility ensured that interviews could be tailored to the background and expertise of each participant, maximising the information gathered (King and Horrocks, 2010). The process and analysis were documented to maintain transparency and allow scrutiny, with the researcher incorporating existing theoretical knowledge and remaining open to new insights.

A qualitative approach was chosen for its suitability in exploring how modern planning methods address corporate planning challenges. Interviews provided in-depth insights and captured a range of perspectives, including scepticism towards modernisation.

Given the nature of qualitative research, a smaller but meaningful sample is appropriate. Potential experts were identified based on their publicly available profiles. Nine interviews were conducted with experts contacted via email, and meetings held online using Microsoft Teams. The primary focus was on consultants from the Big Four consulting firms, who typically advise large companies and possess broad experience in optimising corporate budgeting and

planning processes. Their expertise enabled the collection of extensive information about current practices and innovations. Additionally, consultants from other firms specialising in medium-sized clients were included, alongside two experts from operational controlling. The latter interviews enabled a comparison between consultant perspectives and the practical realities within company controlling departments, highlighting any differences between ideal models and actual practices. For anonymity, interviewees and their companies were labelled with numbers (expert 1–9).

Expert	Industry	Function	Interview duration
1	Big Four Consulting	Consultant	59min
2	Consulting	Consultant	31min
3	Energy supply	Group controller	34min
4	Big Four Consulting	Consultant	37min
5	Big Four Consulting	Consultant	25min
6	Big Four Consulting	Consultant	38min
7	Automotive supplier	Head of Controlling	30min
8	Consulting	Consultant	40min
9	Big Four Consulting	Consultant	40min

Table 1:Interview Sample (created by the authors)

The interviews were analysed using template analysis with thematic coding (Braun and Clarke, 2006; King, 2004). This method involves creating a list of hierarchical codes that capture key themes from the text. Codes are assigned to sections of text for structured interpretation. Template analysis is well-suited for qualitative research and enables systematic organisation of interview content. Interviews were transcribed with Trint and analysed in MAXQDA. The coding scheme is shown in Table 2.

Themes	Codes
Application of modern planning approaches and tools	Distribution, tools, planning systems, analytics, top-down, integrated planning, event-driven planning, rolling planning, value drivers, simulation, beyond budgeting
Impact of modern procedures	Transparency, quality improvement, added value, simplification, accuracy, cost reduction, basis for comparison, basis for decision-mak-

	ing, responsiveness, sustainability, Crisis security, uncertainty
New planning challenges	Expertise, complexity, coordination, conflict potential, change management, clarification, controlling as a challenger
Implementation barriers	Costs, scepticism, effort, speed, priorities, shortage of skilled workers, solutions, promotion of young talent

Table 2: Themes and Codes identified in Template Analysis (created by the authors)

Results and Discussion

Modern planning approaches and their application in practice

Application of modern approaches

Expert 1 observes that many companies possess essential knowledge and have already adopted some 'modern' planning techniques, typically using Excel. Although these firms are not starting anew, their processes often lack efficiency and speed, as Excel's functions are limited. This highlights the importance of dedicated *planning software platforms*. Expert 8 agrees, noting that trends in available tools are recognised. However, this may create tension between the CFO's targets and the realities within individual departments. Identifying and addressing these conflicts is crucial to achieving better planning outcomes. Expert 4 adds that organisations increasingly acknowledge the need for varied approaches to successful planning. A significant challenge in digitalising planning processes is the neglect of conflicting targets and the iterative nature of planning itself. Processes must be revised before digital tools are implemented.

Expert 2 points out that SMEs still have considerable potential to adopt modern planning methods. Although effective tools exist, using them requires time, expertise, and resources which SMEs often allocate elsewhere or lack. Many SMEs do not recognise the necessity of business planning, leading to debates about its value and delaying modernisation. Changing organisational mindsets to appreciate how planning and related tools can support management is a critical first step. Expert 3 notes that lengthy planning cycles have initiated discussions about improving efficiency, but often established routines remain unchanged. Attempts to streamline planning, such as the 'three-week plus X' model, have proven more effective in theory than in practice. Nevertheless, ongoing feedback from decentralised planning units suggests that restructuring and increased tool support are important in the near future.

Modern software and analytics

Technological and procedural advancements are vital for modernising budgeting and corporate planning. From a technological standpoint, dedicated planning software and tools are required to efficiently implement planning processes. Many organisations utilise solutions such as PowerBI, which, according to Expert 1, is accessible as a local installation and is relatively user-friendly. As a result, it is commonly employed as a starting point for developing planning dashboards. Expert 2 highlights additional tools, noting that smaller solutions like LucaNet are cost-effective alternatives to larger ERP systems such as SAP, and specialised tools exist for functions like liquidity management. Most tools offer Excel integration, and combining different tools is a standard approach to supporting planning.

Expert 9 emphasises the necessity of a *clearly defined planning process* before choosing an appropriate tool. In the absence of such clarity, many organisations continue relying on Excel. Expert 4 argues that tools should serve as enablers; digital transformations driven solely by tool selection often fail due to insufficient focus on the transformation's objectives. The desired outcomes should guide the process, which often involves complex software selection and considerable effort to establish and integrate new procedures.

Expert 6 advocates for a flexible planning platform that can be expanded and supports decentralised planning. Expert 5 stresses the importance of system support, particularly for bottom-up processes, noting that *automated aggregation and workflow features* reduce manual effort. In expert 3's team, no dedicated planning platform is used; while SAP Analytics Cloud is available, it is not yet applied to planning.

Business analytics and predictive analytics are increasingly relevant technologies, which is confirmed by the literature (Bergmann *et al.*, 2020). Expert 5 describes predictive planning as a means to enhance planning quality and efficiency, particularly for organisations with stable business models. However, here analytics currently plays a minor role in planning, mainly due to the assumed high data granularity required in controlling. Expert 1 adds that meaningful use of analytics depends on the availability of a robust, high-quality database, something many companies lack. Expert 9 notes that predictive analytics also requires historical data and suitable source systems. However, according to expert 4, predictive analytics increasingly positions controllers as consultants within the organisation and the literature found that business analytics may increase the satisfaction with budgeting processes (Bergmann *et al.*, 2020). However, expert 8 estimates that it will take several years before analytics becomes more prominent, primarily due to *inadequate data quality* and acceptance issues. Analytics-generated figures that differ from manually planned values must be justified to management, and

trust in these figures depends on data quality. The need to improve data quality is therefore significant. Expert 2 reports that analytics is largely absent in SMEs, mainly due to their general attitude towards corporate planning. For SMEs to consider analytics, planning practices must first be modernised. If an SME with an annual turnover of 160 million euros relies solely on Excel, foundational improvements in planning are necessary before analytics can be considered. Operational controlling reveals limited use of analytics in group planning, as stated by expert 3. However, analytics is utilised for other analyses. Expert 7 indicates that business and predictive analytics have been explored, with potential applications identified, and the company is increasingly engaging with artificial intelligence. Overall, experts recognise substantial potential in in planning software and especially business analytics, but its current adoption is limited, mainly due to insufficient data volume and quality.

Modern processes and concepts

Beyond the adoption of technology and software, it is essential to modernise fundamental planning processes. The experts identified several key topics and process innovations. Expert 5 advocates shifting from a traditional decentralised, bottom-up approach to a *top-down method*, noting that top-down planning streamlines the process and may achieve comparable results with less effort. For expert 6, the widely applied top-down-bottom-up method represents modern planning, though the importance of clear guidelines is highlighted for operational units to shorten planning intervals. This method is also applied in expert 7's company, where centralised sales planning is distributed to individual production sites, which then plan quantities bottom-up, following set guidelines. Deviations from management expectations then trigger renewed top-down target setting.

Expert 2 emphasises that effective corporate planning should not be the sole responsibility of controlling; decision-makers should early involve other relevant departments, such as sales, in the planning process. Software support is seen vital for this integration. Expert 8 agrees, stressing that planning today must not occur in isolation, for instance, increases in volume require coordination between HR and production departments to ensure capacity. ERP systems enable integration across departments. Expert 4 highlights the importance of linking planning to strategy, execution, and planning.

Expert 4 also describes *event-driven planning*, where new plans are created only as necessary in response to specific events, reducing planning effort. Annual, rolling planning approaches are resource-intensive and less valuable in volatile environments, while rolling approaches,

covering shorter periods of time, allow for a more efficient forward-looking resource allocation. Fixed planning cycles can be restrictive.

Value driver-based planning also holds significant potential, as noted by experts 5, 6, and 9. This approach is widely used in their consulting projects and enables automation via driver models. Expert 6 identifies determining the relevant level of detail for value drivers as a common challenge. In expert 3's organisation, value drivers are used to simulate results, which are then compared to those from decentralised units to assess robustness. *Simulation models* are increasingly important for modern planning approaches. Simulations provide increased-certainty and flexibility, allowing various scenarios to be recalculated efficiently. They help ensure plans remain relevant over time. Expert 9 highlights factors such as exchange rates and commodity prices as key variables for simulation, with driver models essential for meaningful scenarios. While some companies have implemented simulation models, many lack the prerequisites.

Expert 4 mentions the *Beyond Budgeting* framework, which offers guidance for management and finance functions. Although useful for consulting, expert 3 found it unsuitable for group planning due to structural differences across divisions. The literature partly seems to confirm this, as some companies reintroduce budgets after having abandoned them, while maintaining a higher degree of flexibility of budgets (Bukh *et al.*, 2025).

In summary, the experts outlined several approaches and technologies shaping modern corporate planning. While several organisations are aware of these methods and have begun to implement them, considerable potential remains unused. Traditional processes still dominate, though ongoing modernisation seems to be evident (Henttu-Aho, 2016).

Impacts of modern planning procedures

Improvements to corporate planning

Expert 4 highlights that the pursuit of planning accuracy is unrealistic in increasingly volatile environments, requiring a shift to relative targets rather than fixed budgets (Neely *et al.*, 2003). Experts 1, 2, and 8 highlight increased transparency as key benefits. Planning software creates a single source of truth, eliminating the need for manual consolidation and increasing efficiency. While planning quality is generally considered to improve, this is difficult to measure. Improved data quality leads to better planning content, although external factors such as price fluctuations and energy costs still present challenges. Modern methods also add value by reducing repetitive tasks, allowing controlling more time for analytical and value-adding activities. The limited time during planning can be used for meaningful discussions

with the operational units involved in planning. Expert 4 emphasises that finance departments should focus on generating value with existing resources, rather than simply cutting costs. Expert 9 observes that integrated planning accelerates processes, enabling more time for value-creating efforts, and breaking down departmental silos.

Experts 1, 6, and 8 also mention simplification as a result of modern planning approaches. Tools and approaches make it easier to create plans, while integration and data transparency streamline coordination between departments. This also leads to shortened planning cycles. Planning accuracy is another important effect, though difficult to measure directly. Expert 6 sees this as significant, particularly in inventory and procurement management, where accuracy can have monetary impacts. Expert 8 adds that forecasting accuracy depends on the quality of underlying data; combining forecasting and simulation may enhance accuracy. The value of forecasting is also highlighted by the literature (Bukh *et al.*, 2025; Henttu-Aho, 2016).

Modernised planning may also contribute to cost reduction. Expert 9 reflects on a case where improved supply chain planning saved a car manufacturer millions by reducing reliance on expensive air freight. Optimised working capital planning and modern sales planning can also reduce costs, although cost reductions due to improved financial planning is difficult to measure. Modern approaches may improve the basis for comparisons and improve decision-making. Experts 1 and 2 stress that this enables managers to understand and address the reasons behind failed targets. Transparent data origins and inputs facilitate better discussions and hence support. Moreover, modern planning approaches may also improve organisational responsiveness, as rapid scenario calculations and sensitivity analyses, allowing quick reactions to changing circumstances. However, some challenges remain, as experts 1 and 2 refer to cultural barriers, such as resistance to transparency and ongoing communication issues between departments. Integrated planning supports collaboration but cannot eliminate siloed behaviour.

Regarding crises, expert 5 explains that modern planning methods, particularly the use of simulation, offer flexibility and can support effective crisis management. Simulations enable organisations to model uncertain scenarios and develop implementable measures. Expert 3 concurs, noting that crises are inherently unpredictable and often catch organisations unprepared. Regardless of the process or technology in place, crises invariably result in increased workload and increased uncertainty. The challenge of solving a crisis remains, whether modern planning procedures are used or not.

Emerging challenges

The adoption of modern planning methods also introduces new challenges. One key issue is the expertise required. Expert 1 notes that the successful application of planning software depends on employees capable of operating them, often requiring initial and on-going support from consultants. The goal is to build internal expertise, but hiring staff already familiar with tools is difficult, meaning specialists must be trained. Expert 5 also stresses the need for strong IT skills among relevant employees for successful IT projects. Expert 1 observes that integrated planning models are more complex and time-consuming to set up. Modern methods account for multiple dimensions, requiring careful education and management to avoid overwhelming users. Pilot projects and a 'think big, start small' approach, as expert 9 recommends, are helpful, as is careful planning of the implementation of technologies and planning techniques. Expert 5 considers the design of the software as critical for project success. Expert 6 confirms this and refers to the need for seamless internal integration to avoid system breaks requiring manual data treatment or corrections. Experts 1 and 9 agree that these projects require thorough preparation. Moreover, experts 2 and 8 point out that established reference values can lead to scepticism when new procedures deliver different outcomes. Discussions shift from how to achieve targets to why system-generated values cannot be met. New approaches may reveal hidden problems, such as inefficiencies, which can lead to internal conflicts. Effective change management is essential in such projects. Decision-makers may feel uncertain about a fundamental change of planning methods. Expert 4 highlights the importance of coaching to reduce these uncertainties, while expert 6 adds that transparency and a collaborative style are key. The parallel use of old planning logics and tools (e.g. Excel) often impedes progress. Expert 8 notes that cultural change and clear communication are crucial, as poor communication can cause project failure.

Implementation barriers of modernised approaches

It has to be noted that a major barrier to modernising planning processes could be associated costs. Significant consultancy fees and software expenses are frequently required, but the benefits of modernised planning approaches are difficult to measure quantitively leading companies to resist starting these kind of projects (experts 1, 2, and 4). Experts 2, 4, 5, and 9 report that organisations often fear that process changes will produce unfavourable outcomes. There is reluctance to change established routines, coupled with doubts that new methods deliver meaningful advantages. As a result, companies may lack openness to replacing current processes. Expert 3 notes that if existing methods work, there is little motivation to change,

even without planning software. Expert 6 reminds us that during such projects processes may be disrupted before improvements materialise, making benefits difficult to perceive and discouraging further adoption. Expert 4 highlights that workforce constraints limit capacity for transformation projects, as many employees are at their workload limits, and expert 6 points out that companies may favour other priorities, such as SAP S/4HANA migration. Expert 2 agrees that limited knowledge and skills impede the implementation of modernised planning approaches.

Experts offer solutions to overcome some of the identified barriers. Expert 1 recommends early involvement of senior management and recognising requirements throughout the projects to reduce uncertainty and highlight the benefits. Extensive user training is of eminent importance. Expert 8 stresses that familiarising users with the software and techniques early on is similarly important. Expert 2 suggests demonstrating applications on demo systems to build trust and secure approval, allowing benefits to be shown with minimal initial cost. For Expert 6, communicating the advantages of modern planning approaches is crucial for acceptance and successful implementation.

Conclusion

Synthesis of findings

This research examined how companies currently apply modern planning approaches, their concrete impacts on planning outcomes, and the factors that hinder implementation of new processes or tools. While traditional planning remains widely applied in practice it can be noted that the interest in modern planning is increasing, particularly regarding new systems and methods such as value driver-based planning and simulation models.

The findings show considerable potential for modern approaches. Some methods, including business analytics, simulations and integrated planning systems, are already used in practice and offer potential for further transformation. Companies using modern techniques benefit from increased planning accuracy, improved transparency, and the ability to respond more effectively to uncertainty and crisis. Scenario analysis, simulation, and value driver-based planning help organisations better anticipate change and adapt more quickly. These approaches contribute to more resilient planning, but also introduce new challenges, such as increased complexity, the need for specialist expertise, and demanding coordination of transformation projects. Effective change management is required to ensure acceptance and successful integration of new concepts.

Several barriers hamper the adoption of modern planning. There might be high costs and companies lack the budget or are unconvinced of the benefits, especially as improvements can take time to materialise. Decision-makers often hesitate to disrupt established processes, and a shortage of skilled staff further complicates transformation efforts. Time and resource demands are substantial, and priorities such as other IT projects (e.g., SAP S/4HANA migrations) often take precedence.

Limitations and avenues for further research

While expert interviews provided valuable insights into organisational practices, the findings are limited by a smaller sample size, which is line to the objectives of the study. The sample further includes several consultants, that have a cross-company perspective but may have limited insights to internal organisation individual context factors. Measuring concrete improvements and long-term impact of modern planning remains challenging, as many benefits cannot easily be quantified. This study provided an overview of key approaches, but further research is needed to validate, deepen, and operationalise these results.

Future studies should capture the evolving views of decision-makers as more techniques and solutions become available and should seek to conceptualise in greater detail improvements through case-based studies. Continued investigation will help organisations understand the benefits and best practices for implementing modern planning, supporting stronger, more flexible corporate management and controlling in dynamic economic environments.

Keywords: Financial literacy, Personality traits, Banking relationships, Financial product selection, Personal budget management, PLS-SEM, Trust, Portugal.

Abstract

This study examines the role of financial literacy, personality traits, and relational factors in shaping financial product selection. Drawing on the Big Five framework, it proposes a multidimensional model that also considers the mediating role of personal budget management. Using survey data from 215 participants and Structural Equation Modelling (PLS-SEM), the results show that financial literacy positively influences the adoption of more complex financial products. Conscientiousness and Openness to Experience are associated with disciplined financial behaviour and long-term planning, while personal budget management acts as a key mediating mechanism.

Relational factors present mixed effects: trust in bank sales representatives significantly influences financial decisions, sometimes discouraging the adoption of complex products, whereas institutional reliability is not significant.

These findings contribute to the literature by integrating cognitive, psychological, and relational dimensions, offering practical implications for financial institutions in terms of customer segmentation, advisory practices, and financial literacy initiatives.

Introduction

In the current context, we are witnessing an increase in the complexity and sophistication of financial products available to different consumer profiles. This evolution has heightened the need for research that deepens our understanding of the factors influencing financial decision-making, especially in markets such as Portugal, where financial literacy remains a significant challenge (OECD, 2023; Demertzis et al., 2024). This study aims to advance literature by integrating psychological factors such as personality traits and relational dimension (including trust in banking institutions and relationships with sales representatives) into the analysis of financial product choice. By combining the Big Five personality model with established frameworks of financial literacy and trust, the research offers a comprehensive perspective on how individual characteristics and perceived relationships with banks shape consumer decisions.

The main contribution of this work lies in its multidimensional approach rather than examining financial literacy or personality in isolation, it explores their interplay and the mediating role of personal budget management. This enables a more nuanced understanding of consumer behaviour, with practical implications for financial institutions seeking to personalize their offerings and improve customer engagement.

The study employs a quantitative methodology, using a structured questionnaire administered to a diverse sample of 215 participants. The results reveal that financial literacy and certain personality traits (notably Conscientiousness and Openness to Experience) are associated with prudent financial behaviour and long-term planning. Trust in bank sales representative also emerges as a critical factor, with a negative association observed between perceived reliability and the subscription to structured products.

By clarifying the psychological and relational determinants of financial product selection, this research contributes new insights to both academic theory and banking practice, highlighting the importance of behavioural profiling and targeted strategies in the Portuguese context.

Literature Review

Financial products selection

The banking sector is characterised by a broad range of products and services designed to address the financial needs of different customer segments, including both individuals and businesses. Generally, this offering includes deposit and savings instruments, credit, payment methods, investment services, and financial protection products such as insurance [1] and retirement plans. In recent years, banking institutions have responded to the context of digitalisation, increased competition, and more demanding regulations by promoting innovation and personalisation of their services. Simultaneously, there is a growing integration between traditional services and digital solutions, aiming to maximise customer convenience, agility, and trust. In this way, the banking sector reflects a process of continuous evolution, oriented not only towards the profitability of institutions but also towards objectives of sustainability, financial inclusion, and improving the consumer experience. Several factors (financial literacy, personality, relational factors) play a significant role in understanding the financial behaviour of individuals, particularly in the selection of financial products.

Financial literacy

From a minimalist perspective, financial literacy can be understood as an individual's ability to manage their money (OECD, 2023; Remund, 2010; Shi et al., 2025), which includes five competencies: knowledge of concepts; ability to communicate about financial concepts; ability

[1] "Savings insurance" is used here as a generic term for insurance products with a savings component, including life insurance, retirement savings plans, and other hybrid solutions.

to manage personal finances; ability to make the most appropriate decisions for their financial well-being; and to effectively plan for their future financial needs. Financial literacy is, therefore, a combination of awareness, knowledge, skills, attitude, and behaviour necessary to make sound financial decisions and achieve financial well-being (OECD, 2011). Studies such as those by Lusardi and Mitchell (2014) and Huston (2010) highlight the importance of financial literacy in promoting healthy financial behaviours, even placing it as one of the fundamental pillars for making conscious and effective economic decisions, since those with greater financial knowledge tend to better understand the products available on the market, assess risks, and plan their future with greater security and consistency.

***Psychological* factors**

The Big Five personality traits model (Agreeableness, Conscientiousness, Openness to Experience, Extraversion, and Neuroticism) has been widely used to explain differences in economic and financial behaviour. These traits represent relatively stable patterns of thought, emotion, and behaviour, influencing how each person perceives risk, manages their resources, and interacts with financial institutions to ultimately make financial or investment decisions.

The dimension of Agreeableness, one of the central traits of the Big Five Personality Model, is associated with characteristics such as empathy, cooperation, trust, and concern for others. People who demonstrate this characteristic value harmonious relationships and avoid conflict. This personality trait can be reflected in their financial attitudes and behaviours (Dalkilic & Kirkbesoglu, 2015). Considering the context of subscribing to financial products such as current accounts, investment funds, future-oriented savings, perception of financial security, and disciplined resource management, it is presumed that agreeableness plays a relevant role in the decision-making process at the time of subscription. Agreeableness has been associated with greater risk aversion and a preference for conservative financial strategies (Gurun & Booth, 2024), such as regular savings and the choice of financial products considered safe, motivated by a desire for stability and family well-being.

Conscientiousness is characterised by attributes such as organisation, responsibility, persistence, and goal orientation. Individuals with this personality trait tend to plan ahead, be disciplined in their actions, and demonstrate a strong sense of duty. In the realm of personal finance, this characteristic can translate into a greater propensity to subscribe to financial products that promote stability and long-term planning, such as term deposits, investment funds, savings for the future, perception of financial security, and the adoption of disciplined management practices. The literature has shown that conscientiousness is indeed associated with prudent financial behaviours, such as regular saving, budget control, and a preference for low-risk investments (Moore & Healy, 2008).

Openness to Experience is a personality trait that reflects intellectual curiosity, creativity, imagination, and a predisposition to explore new ideas and experiences. Individuals with high levels of this trait tend to be more receptive to innovation, change, and complexity, which can significantly influence how they make choices.

Extroversion is a personality trait characterised by sociability, assertiveness, enthusiasm, and a tendency to seek external stimuli. Extroverted individuals tend to be more communicative, confident, and action-oriented, which can significantly influence their financial decisions (Brown & Taylor, 2014). In the context of personal financial management, extroversion is believed to be associated with a greater predisposition to subscribe to financial products such as term deposits, investment funds, financial insurance, and discretionary management solutions. Furthermore, this trait may influence how individuals approach saving for the future, budgeting, and the adoption of structured products, including those involving emerging technologies such as artificial intelligence. The literature suggests that extroverted individuals tend to take more risks and seek opportunities for financial growth, although they may also demonstrate less self-control in certain situations (Brown & Taylor, 2014; Oehler & Wedlich, 2018).

Relational **factors**

Reliability of banking institutions

The perceived reliability of banking institutions is a determining factor in how individuals interact with financial products and services (Gurun & Booth, 2024). When customers trust their bank, they are more likely to subscribe to diversified financial products, follow investment recommendations, and maintain a long-term relationship with the institution. In this context, it is assumed that the perceived reliability of the bank positively influences the subscription of term deposits, investment funds, future-oriented savings products, financial insurance, and discretionary management solutions. Furthermore, this trust may be reflected in a greater openness to the use of structured products and in budget management aligned with the advice and tools provided by the financial institution. Trust in financial institutions is associated with higher levels of financial engagement, greater loyalty, and even a greater propensity to adopt prudent financial behaviours (Ennew & Sekhon, 2007; Johnson & Grayson, 2005). Institutional reliability is therefore a key element in building sustained relationships between customers and banks, with a direct impact on individual financial decisions.

Bank sales representative

Literature has highlighted the importance of the relationship between client and bank sales representative as a determining factor in institutional trust and the adoption of financial products (Ennew & Sekhon, 2007). The quality of service provided, combined with the perception of

competence and integrity of the sales representative, contributes to more informed financial decisions and greater loyalty to the institution.

Customers' perception of bank sales representatives plays a fundamental role in building trust and influencing financial decisions. This dimension encompasses their competence, empathy, clarity of communication, and advisory skills. A well-prepared representative with a customer-focused approach can positively influence the decision-making process when choosing various financial products. In this context, it is assumed that a positive perception of the banking sales representative is associated with the subscription of term deposits, investment funds, future-oriented savings products, financial insurance, and discretionary management solutions. It can also extend to other, more innovative areas, such as the adoption of structured products and the use of artificial intelligence-based tools, especially if the sales representative plays an active role in explaining and recommending these products.

Personal budget

The way individuals manage their personal budget acts as a link between personality traits and the choice of banking products. Effective budget management allows each person to better assess their needs, identify investment opportunities, and make more informed decisions. Individuals with greater budgetary discipline tend to opt for financial products that promote stability and security, such as term deposits, savings insurance, and conservative investment funds. On the other hand, people with profiles more open to experimentation or with greater financial literacy may explore more sophisticated products, such as structured solutions or discretionary management.

Thus, budgetary behaviour not only reflects personality traits but also influences the predisposition to subscribe to certain banking products. This mediation proves essential for understanding the financial decision-making process and for developing personalised banking advisory strategies.

Studies such as those by Xiao and O'Neill (2016) and Kim and Hanna (2017) demonstrate that budgeting is positively associated with prudent financial behaviours, including systematic saving and the strategic use of financial products. This evidence motivates the formulation of hypotheses that relate the budgetary dimension to the adherence to financial instruments that promote stability and security.

Hypotheses

Financial decision-making has been widely associated with individuals' level of financial literacy, which enables them to understand financial concepts, assess risks and benefits, and make more informed choices (Huston, 2010; Lusardi & Mitchell, 2014). In this context, individuals with higher financial literacy are expected to be more capable of selecting financial

products that align with their needs and financial goals.
H1: Financial literacy positively influences the selection of financial products.

Beyond cognitive abilities, financial behaviour is also shaped by psychological factors. Personality traits, particularly those captured by the Big Five model, have been shown to influence individuals' attitudes toward risk, financial planning, and decision-making processes. Traits such as conscientiousness and openness to experience are often associated with more structured and forward-looking financial behaviours, while others may lead to more conservative or impulsive choices (Moore & Healy, 2008). Therefore, personality is expected to play a significant role in shaping financial product selection.
H2: Personality traits significantly influence the selection of financial products.

In addition to their direct effect on financial decisions, personality traits are also linked to financial management practices, particularly in terms of budget control and planning. Individuals with certain personality profiles tend to exhibit greater discipline in managing their financial resources, which is reflected in their ability to plan and monitor their spending (Xiao & O'Neill, 2016; Kim & Hanna, 2017).
H3: Personality traits significantly influence personal budget management.

Personal budget management represents a key behavioural dimension of financial decision-making, reflecting individuals' ability to organise and control their financial resources. Effective budget management is associated with more informed and structured financial choices, including the selection of appropriate financial products.
H4: Personal budget management positively influences the selection of financial products.

Relational factors also play a crucial role in financial decision-making, particularly trust in financial institutions. Trust reduces uncertainty and facilitates engagement with financial products, especially in contexts where products are complex or difficult to evaluate. As such, individuals who perceive banking institutions as reliable are more likely to engage with and select financial products offered by those institutions (Ennew & Sekhon, 2007; Johnson & Grayson, 2005).
H5: The perceived reliability of the banking institution positively influences the selection of financial products.

Similarly, trust in bank sales representatives constitutes a key interpersonal dimension of financial relationships. The interaction between clients and sales representatives can shape perceptions of transparency, credibility, and product suitability. When clients perceive these representatives as reliable, they are more likely to engage in financial decisions and subscribe to financial products (Gurun & Booth, 2024).

H6: The perceived reliability of the bank sales representative positively influences the selection of financial products.

Methodology

This study is characterised by a quantitative approach, which aims to understand the factors that influence the subscription of financial products. Data collection was carried out through the application of a structured questionnaire, designed based on scales validated in the scientific literature. The questionnaire was distributed during June 2025, to a random sample of 215 participants, which allowed for sociodemographic and economic diversity. Participants were recruited from various regions across Portugal and were not affiliated with a single banking institution, ensuring national representativeness and diversity of experiences within the financial sector.

The questionnaire structure consists of items from scales validated in previous studies related to financial literacy (Lusardi & Mitchell, 2011, 2023), personality traits (Big Five Traits Model, Palaiou & Furnham, 2014), perception of bank reliability (Morgan & Hunt, 1994), relationship with the sales manager and budgetary behaviour (Xiao & O'Neill, 2016). The first part collected sociodemographic data, such as age, gender, education, occupation, and monthly income, allowing for the characterisation of the sample.

In selecting the financial products included in this study, consideration was given to the diversity of the national banking offerings, the representation of different risk profiles, and their suitability to clients' financial objectives. The inclusion of these products was designed to ensure a comprehensive behavioural analysis, considering both conservative solutions and more sophisticated options. Table 1 presents the products considered and the respective selection logic.

Financial Product	Selection Logic
Demand Deposits (DD)	A product offering immediate liquidity and low risk, suitable for current transactions.
Time Deposits (TD)	A conservative solution with guaranteed profitability, ideal for risk-averse profiles.
Retirement Savings Plans (RSP)	A long-term product, associated with financial planning and future security.
Pension Plans and Savings Insurances (PP&SI)	Hybrid instruments that combine protection and profitability, with tax benefits.
Multi-asset funds (Funds)	A diversified product, suitable for investors with a moderate risk profile and an interest in professional management.

Structured Products (SP)	Complex solutions with conditional risk, aimed at informed investors with higher financial literacy.
Discretionary Portfolio management (DPM)	Personalised investment service, ideal for clients who delegate decisions to specialists.

Table 1: Financial products

Note: Prepared based on the description of financial products available on the market (2025). The minimum investment amounts for each financial product vary according to the institution and product type. For example, retirement savings plans have minimum subscription amounts specified by each provider, which can be checked on the ASF platform. Structured products typically require higher minimum investments, often starting at €25,000–€50,000, while savings insurance products may start at €5,000–€10,000. These thresholds are indicative and may differ depending on the bank or insurance company, reflecting the accessibility and target profile of each product in the Portuguese market.

Before analysis, the data were prepared according to the methodological recommendations of Hair et al. (2016), including validation, cleaning and coding of responses. For statistical analysis, the Structural Equation Modelling (SEM) technique was used, implemented through the SmartPLS software. This approach allows testing complex relationships between observable and latent variables, being particularly suitable for investigations in the social sciences. The model structure was defined based on previously established theories and included measurement and structural submodels (Marôco, 2014).

Results

This investigation involved 215 respondents (62.3% were male and 37.7% were female), whose sociodemographic and economic characteristics reflect significant variations among the participants. The average age of the participants was 53.8 years, with a median of 51.0 years and a standard deviation of 15.8 years, indicating a diverse sample in terms of age. Regarding net monthly income, it showed an average of €1,975.54, a median of €1,700.00 and a standard deviation of €1,367.35, reflecting a high variability in income levels.

The reliability of the constructs was assessed using three main indicators: Cronbach's Alpha, Composite Reliability, and Average Variance Extracted (AVE). These indicators allow us to verify whether the items that make up each construct are consistently and coherently measuring the theoretical concept inherent in the model.

The results obtained (Table 2) demonstrate that all constructs present Cronbach's Alpha values greater than 0.78, indicating good internal consistency. Composite Reliability varies between 0.81 and 0.90, reinforcing the robustness of the measurement instruments. The AVE, in turn, presents values between 0.55 and 0.65, which confirms the convergent validity of the constructs – i.e., the ability of the items to adequately reflect the concept they intend to measure. Discriminant validity is essential in the evaluation of models in quantitative research, especially

in models based on structural equations. It ensures that the theoretical constructs measured are distinct from each other, meaning that each construct represents a unique concept and does not overlap with others.

	Ext	Agr	Consc	Exp	Neuro	Bud	Inst	Sales	Cronbach's α	CR	AVE
Extraversion (Ext)	0.787								0.85	0.88	0.62
Agreeableness (Agr)	0.42	0.768							0.82	0.86	0.59
Conscientiousness (Consc)	0.38	0.50	0.781						0.84	0.87	0.61
Openness to Experience (Exp)	0.45	0.41	0.47	0.755					0.80	0.83	0.57
Neuroticism (Neuro)	0.30	0.33	0.36	0.40	0.742				0.78	0.81	0.55
Personal Budget Management (Bud)	0.35	0.38	0.42	0.39	0.34	0.806			0.88	0.90	0.65
Reliability of banking institutions (Inst)	0.40	0.44	0.48	0.41	0.38	0.46	0.794		0.86	0.89	0.63
Reliability of sales bank representative (Sales)	0.36	0.39	0.43	0.37	0.35	0.40	0.43	0.775	0.83	0.85	0.60

Table 2: Construct reliability, convergent validity, and discriminant validity (Fornell–Larcker criterion)

The Fornell–Larcker criterion establishes that the square root of the AVE of each construct must be greater than the correlations between that construct and the others. This indicates that each construct shares more variance with its own indicators than with other constructs. In the analysed results, it was observed that all constructs meet this criterion, demonstrating adequate discriminant validity. Based on the Fornell–Larcker criterion, no issues of discriminant validity were detected.

Structural model

Table 3 presents the statistically validated hypotheses.

Relationship	β	t-statistic (|O/STDEV|)	p-value
Agr -> Bud	-0.221	2.784	0.005
Sales -> SP	-0.174	1.965	0.049
Cons -> Bud	0.290	4.054	0.000

Bud -> PP&SI	0.191	2.444	0.015

Table 3: Statistically validated hypotheses

Note: LF = Financial literacy. Statistically confirmed relationships are reported for $p < 0.05$.

Discussion

Statistical analysis revealed relevant associations that largely confirm patterns observed in banking practice. Conscientiousness stood out as a personality trait strongly related to budgetary behaviour, suggesting that organised and disciplined individuals tend to manage their resources better. Openness to Experience proved relevant in subscribing to savings products for the future, showing that curious and receptive people are more predisposed to invest with a long-term vision. Extraversion presented an interesting duality: while positively associated with budgetary behaviour, it shows a negative relationship with discretionary portfolio management, which may indicate a preference for personal control in financial decisions. Financial literacy demonstrated a direct impact on the adoption of more complex products, such as multi-asset funds and discretionary portfolio management, reinforcing the importance of technical knowledge in decision-making.

The results of this study reveal a negative association between the perception of the sales representative and the subscription to structured products, which raises relevant questions about the clarity of communication, the complexity of the products, and the alignment of the banking institution's interests with those of its clients.

Structured products are, by definition, complex financial instruments, often composed of derivatives and risk strategies that require a high degree of financial literacy or, at least, a strong confidence in one’s own financial abilities. When a client feels that the explanation provided by the bank's sales representative does not meet their expectations, or if it is excessively technical or oriented towards the institution's interests, they may withdraw due to feelings of distrust and, ultimately, not subscribe to the product.

Budgetary behaviour was positively associated with the subscription to financial insurance products, such as retirement savings plans and savings insurance. This result reinforces the idea that regular financial planning and control practices lead to more prudent decisions oriented towards future financial security.

This study highlights the relevance of certain personality traits and individual skills in financial management and the decision to subscribe to financial products. Data obtained through statistical models demonstrate that Conscientiousness influences financial behaviour indirectly through budget management, whereas Openness to Experience shows both direct and indirect effects on financial product adoption. Conscientious individuals tend to exhibit more organised and responsible behaviours, which is reflected in effective budget management and a greater propensity to invest in financial products. In turn, those with high Openness to Experience show greater interest and predisposition to explore financial alternatives, which favours the subscription to products such as savings plans and insurance.

Financial literacy emerges as a determining factor in the choice of more sophisticated products, such as investment funds and discretionary management. This finding reinforces the importance of educational programmes that promote financial knowledge, empowering individuals to make more informed and secure decisions.

Another relevant aspect is the reliability of the banking sales representative, which can negatively influence the subscription of certain products, such as structured products. A less effective sales approach, or one that generates distrust, can compromise the client's decision, demonstrating the need for adequate training for professionals in the financial sector.

Finally, the role of budget management as a mediating variable between personality traits and financial behaviour is highlighted. The way individuals organise and control their financial resources directly influences their predisposition to invest and subscribe to financial products, acting as a link between personal characteristics and economic decisions.

This allows banking institutions, through a deeper understanding of their clients and their characteristics, to tailor their offerings to them, thereby increasing the level of customer satisfaction with the bank and with its representatives.

In summary, these results contribute to a deeper understanding of the psychological, cognitive, and relational factors that shape financial behaviour, offering relevant insights for educational interventions, business strategies, and public policies aimed at enhancing financial literacy and inclusion.

Conclusion

This study aimed to understand the factors influencing the subscription to financial products by banking customers, based on variables such as personality traits, financial literacy, perception of the banking sales representative, and institutional reliability. Hypotheses were formulated and statistically tested in order to validate a robust explanatory model applicable to the Portuguese banking context.

The results show that, among the set of personality traits known as the "Big Five", some are positively associated with the adoption of structured and complex financial products, such as Conscientiousness and Openness to Experience. Extroversion and Agreeableness, on the other hand, show negative relationships with certain financial practices, suggesting the need for differentiated approaches in customer segmentation.

The customer's perception of the bank sales representative tends to negatively influence the adoption of structured products, thus reinforcing the importance of continuous training and effective communication on the part of these professionals. Budget management should be taken into account by the bank sales representative if it is a practice adopted by the customer; in such cases, it can be directed towards the subscription of insurance and other products such as term deposits and structured products.

The statistically supported hypotheses reveal consistent patterns between psychological variables and financial behaviours. However, some hypotheses were not statistically validated. The perceived reliability of the banking institution, for example, did not show statistical significance in any of the relationships, which may indicate that customers value the relationship with the sales representative more than the institutional brand. These unvalidated hypotheses should not be discarded but rather reviewed and explored in greater depth in future studies.

Building on these findings, the study offers several theoretical and practical implications. It contributes to the literature on financial decision-making by integrating cognitive, psychological, and relational dimensions into a unified framework. The results confirm the importance of financial literacy as a key determinant of financial product selection, while also demonstrating that personality traits—particularly those associated with more structured and forward-looking behaviours—play a significant role in shaping both decision-making and personal budget management. Interestingly, while relational factors are relevant, the findings reveal that the perceived reliability of banking institutions does not significantly influence financial product selection, whereas trust in bank sales representatives plays a more nuanced and decisive role, influencing financial decisions in ways that may either encourage or discourage the adoption of certain products, particularly more complex instruments. This suggests that financial decision-making is more strongly influenced by interpersonal trust than by institutional perceptions.

From a practical perspective, these findings provide important insights for financial institutions and policymakers. The role of trust in sales representatives highlights the importance of client–advisor relationships, not only in promoting product adoption but also in shaping clients' caution toward more complex financial instruments. At the same time, the lack of significance of institutional trust indicates that broader brand perceptions may be less influential than

expected in shaping financial decisions at the individual level. Additionally, the role of financial literacy and personal budget management reinforces the importance of promoting not only financial knowledge but also disciplined financial behaviours, particularly in contexts where individuals may face difficulties when engaging with more complex financial products.

Despite the robustness of the results, the study has limitations that deserve attention. The representativeness of the sample is a noteworthy concern, since the diversity of the Portuguese population may not be adequately reflected. It should be noted that the model prioritises direct relationships, without sufficiently exploring moderating effects or other mediating factors that could enhance our understanding of the phenomena. The inclusion of variables such as trust in the financial system, prior experience with banking products, or attitudes towards risk could offer a more complete and realistic view.

To address these gaps, it is recommended to conduct further studies with larger and more diverse samples, as well as to adopt mixed methodologies that combine quantitative analysis with qualitative approaches.

The practical applicability of the results is evident. Financial institutions can use this information to develop more accurate behavioural profiles, adjusting their product offerings to the psychological and behavioural characteristics of their clients. Several strategies can benefit from this knowledge, such as financial literacy campaigns, training for bank sales representatives, and the development of customised digital tools.

Furthermore, this study provides a solid foundation for understanding the factors that influence the financial decisions of bank customers. The alignment of the results with practical situations and their applicability generate strategic opportunities for banks to improve their commercial approaches, making them more effective and customer-centric. Certainly, methodological and analytical advancements, as well as future research, can further deepen this knowledge, promoting smarter, more inclusive, and value-oriented banking practices.

In summary, this research broadens the understanding of financial behaviour by highlighting the relevance of psychological and relational aspects. The findings offer useful information for financial institutions to better adapt their products to customer profiles. Future research has the potential to investigate these connections in greater depth, fostering a more tailored, efficient, and customer-focused financial system.

ENGAGEMENT IN THE FEED: HOW BRAND-RELATED USER-GENERATED CONTENT SHAPES CONSUMER-BRAND ENGAGEMENT

Uzunboylu, Naziyet[1], Vrontis, Demetris[1], Melanthiou, Yioula[2], Papasolomou, Ioanna[1]

[1] Department of Management, School of Business, University of Nicosia, Cyprus

[2] Department of Communication and Marketing, Cyprus University of Technology, Cyprus

Keywords: Consumer-Brand Engagement, Brand-Related User Generated Content, Br-UGC, Consumers' Online Brand-Related Activities, COBRAs, Instagram, Netnography, Cyprus

Abstract

The rapid growth of social media has transformed consumer–brand interactions from firm-controlled communication to participatory ecosystems, where brand-related user-generated content (BR-UGC) enables consumers to express opinions, construct meaning, and co-create brand value (Hollebeek et al., 2022; Dretsch et al., 2023). Despite increasing scholarly interest in consumer-brand engagement (CBE), existing research remains fragmented in its treatment of engagement behaviours, content forms, and platform-specific affordances (Dinh and Lee, 2024; Zhang and Phillips, 2025), with limited empirical insight into smaller or culturally distinct markets. Addressing these gaps, this study examines how BR-UGC on Instagram stimulates and shapes CBE through consumers' online brand-related activities (COBRAs) in the context of Cyprus.

The study aims to investigate the nature, drivers, and outcomes of CBE as manifested through BR-UGC, with particular emphasis on differences between Instagram posts and stories. Specifically, it seeks to (i) identify dominant visual, textual, and interactional characteristics of BR-UGC, (ii) analyse how these characteristics influence engagement behaviours across COBRAs (i.e., consumption, contribution, and creation), and (iii) develop an integrative framework linking content features, contextual factors, and engagement outcomes. The study is, therefore, guided by questions addressing how BR-UGC functions as a catalyst for engagement and how platform affordances mediate these processes.

Drawing on Br-UGC, CBE, COBRAs literature, the study responds to ongoing debates concerning the operationalisation of engagement behaviours (Schivinski, 2021; Azad

Moghddam et al., 2025; Dinh and Lee, 2024) and the comparative role of ephemeral (temporary content lasting 24 hours) versus permanent content (remain permanently visible and discoverable on the platform) (Zhang et al., 2024). Methodologically, the research adopts a qualitative netnographic design, enabling an in-depth examination of naturally occurring brand-related interactions on Instagram. The dataset consists of 125 BR-UGC units, including 74 Instagram stories and 51 posts, selected through purposive sampling based on predefined criteria such as brand relevance, public accessibility, and engagement potential. Data are systematically coded using NVivo, supported by structured coding matrices capturing engagement metrics, content attributes, and behavioural responses aligned with the COBRAs framework.

The findings demonstrate that BR-UGC plays a significant role in activating different levels of consumer engagement, with notable distinctions between posts and stories. Visual framing, human presence, brand visibility, and call-to-action cues emerge as key drivers of engagement intensity and type. Stories are found to more strongly stimulate creation-level behaviours due to their interactive and ephemeral nature, whereas posts more frequently support consumption and contribution behaviours through their permanence, visibility, and ability to facilitate prolonged interaction. The study contributes empirically by offering context-specific insights into Instagram engagement practices in Cyprus and theoretically by proposing an integrative Br-UGC Engagement Model that bridges content, behaviour, and platform affordances. Unlike previous models that view engagement as an outcome or classify behaviours hierarchically, the proposed model explains how BR-UGC features and platform affordances shape different COBRAs, offering a more dynamic and platform-sensitive understanding of consumer engagement.

The originality of this research lies in its holistic treatment of BR-UGC as both content and behaviour, its comparative analysis of Instagram formats, and its focus on an under-researched geographical context. While the qualitative design limits generalisability, the study provides rich contextual insights and opens avenues for future cross-platform and longitudinal research. Practically, the findings offer actionable implications for brand managers and digital strategists seeking to design engagement-oriented social media strategies, while theoretically refining existing engagement models through platform-sensitive and behaviourally grounded evidence.

HOW DO SOCIAL ROBOTS FACILITATE VALUE CREATION IN FINANCIAL SERVICES? CUSTOMER VALUE PROPOSITION, ARTIFICIAL INTELLIGENCE AND SOCIAL ROBOTS IN BANKING

Karageyim Meral[1] ; Durmusoglu, Serdar[2]; Coskun, Ali[3]

[1] CARF Research Center-Bogazici University Istanbul/Türkiye

Keywords: Value creation, Value proposition, Artificial intelligence, Social robots, Services, Financial services

Introduction

The customer value proposition (CVP) is defined as an important strategic tool that integrates communication, resource integration and superior packages and offerings (Payne, Frow and Eggert, 2017). The CVP is a central concept in business research and management, bridging strategy and customer communication. In addition, the banking industry is experiencing profound transformation driven by artificial intelligence (AI), social robots, and conversational agents.

Purpose

The aim of this study is to understand how artificial intelligence impacts and transforms the bank-customer relationship and the design of CVP for social robots.

RQ1 How do banks design customer value proposition for social robots in financial context?

RQ 2 What are the challenges and problems?

Literature Review

Social robots, virtual service assistants, and humanoid robots are defined as robots that work in a service context designed to communicate and connect with individuals in social environments.

According to Vargo and Lusch value propositions should be understood not merely as promises but as perspectives for facilitating value creation through resource integration among actors (Vargo and Lusch, 2008, 2016; Gummerus, 2013; Vargo, Akaka and Vaughan, 2017; Tadajewski and Jones, 2021). Payne et al. (Payne, Frow and Eggert, 2017; Manser Payne, Peltier and Barger, 2021) describe the CVP as the strategic articulation of value offered to customers, encompassing both functional and experiential benefits. Another definition of CVP is provided as a strategic tool facilitating communication of an organisation's ability to share resources and offer a superior value package to targeted customers (Payne, Frow and Eggert, 2017).

Methodology

The present research adopts a qualitative approach and relies on multiple case study design in order to address the research questions. Data is collected from managers of four European financial institutions and banks.

Findings

The findings reveal four important value propositions and underline important technical and market-related problems.

- Continuous technological development and customer role
- The need for providing financial information to the customer (need for enhancing financial literacy)
- Different communication styles and approaches of social robots for different customer segments.

Gamification, **professional-rigorous**, **informative and technical, supportive approach-helpful**

- The importance of digital platforms, social media and transparency

In addition, the findings revealed important problems and challenges for social robots' adoption in financial context (lack of financial information, trust issues and technical difficulties).

The Originality

This paper offers a framework that explains the elements and strategic dimensions of value proposition dynamics in financial services (strategically organising and communicating value for competitive advantage).

Research Limitations

This study may be subject to qualitative research limitations.

Theoretical and Practical Applications and Implications

The research describes the characteristics and priorities of CVP for social robots in the financial services industry, a specific industry with its own dynamics and peculiarities (Dibb, Simões and Wensley, 2014) by providing a comprehensive framework of value proposition dynamics (the CVP's critical role and strategies in financial services). The findings may be beneficial to managers, bankers and practitioners in developing strategies and in understanding value proposition dynamics related to social robots in financial services.

Rituals and cultural branding: young consumers' perceptions of coffee brands in Vietnam and Italy

Vu, Minh[1]; Ceruti, Francesca[2]; Bonera, Michelle[2]

[1]Faculty of Management & Hospitality, Hanoi University, Hanoi, Vietnam

[2] Economics and Management Department (DEM), University of Brescia, Brescia, Italy

Keywords: cultural branding, coffee consumption rituals, young consumers, coffee brands, Italy and Vietnam.

Introduction

Coffee ranks among the world's most pervasive beverages, intricately bound up with daily routines and cultural identities across nations (International Coffee Organization, 2023). Italy and Vietnam present striking contrasts in this domain: Italian coffee habits centre on brisk, rule-bound espresso shots taken standing at the bar, often anchored by venerable brands that cultivate an aura of historical authenticity; Vietnamese traditions, meanwhile, favour unhurried brewing via the Phin filter, laced with creative twists like condensed milk or coconut, and enjoyed in stylish cafés that serve as vibrant "third places" for the consumers (Gorgoglione *et al.,* 2018; Oldenburg, 1989). As coffee houses increasingly emerge as social hubs for young consumers - particularly in a producer market like Vietnam versus a consumer stronghold like Italy - the question arises of how such rituals might underpin effective cultural branding strategies.

Purpose

This research is motivated by the need to better understand the potential of utilising cultural rituals of coffee consumption in building branding strategies for coffee brands, with specific attention to young consumers. The aim of this study is to examine how coffee consumption rituals impact young consumers' perception and preference toward coffee brands in Vietnam and Italy through the lens of cultural branding theory (Holt, 2004).

This research addresses the following research questions:

1. How do young consumers perceive brand myth and product attributes of iconic coffee brands in Vietnam and Italy?

2. How do young consumers perceive and evaluate coffee brand alternatives based on their consumption rituals?

Theoretical framework

The study adopts Holt's (2004) cultural branding model, according to which brands become iconic when they channel identity myths capable of shaping and giving meaning to society. From this perspective, coffee rituals function as performative practices in which national narratives, youth aspirations, and forms of everyday sociality intertwine. This study situates Holt's theoretical framework within Consumer Culture Theory (CCT), which conceptualizes consumption as a socially and culturally embedded practice, shaped by market ideologies, identity projects, and community rituals (Arnould & Thompson, 2005; Thompson, 2022). CCT provides a general perspective through which rituals are understood not simply as behavioral routines, but as meaning-making practices that mediate between individual consumers and broader cultural discourses. In this sense, CCT extends Holt's model by foregrounding the role of lived consumption experiences and community practices in the construction of brand myths, suggesting that, in contexts such as Vietnam, rituals may precede and actively generate brand myths, rather than merely reproducing them. The theoretical framework is further complemented by studies on corporate heritage, which show how "historic" companies leverage their past and values to enhance their credibility (Balmer, 2011; Urde et al., 2007), and by research on ritualized tastes and third places, which highlights the role of coffee brands in building habits and community bonds (Oldenburg, 1989; Quintão et al., 2016). These perspectives present coffee houses as dynamic spaces in which narratives are constantly performed and, at times, cultural. In line with Kapferer (2012), culture thus emerges as one of the six fundamental dimensions of brand identity, which nourishes the roots of long-term equity.

Methodology

Italy and Vietnam were selected through a theoretical replication logic (Yin, 2018), as they occupy structurally different positions in the global coffee system. While Italy represents a mature Western consumption market, Vietnam is a leading Eastern producing country with a rapidly growing in the domestic consumption (International Coffee Organization, 2023). Moreover, Vietnam is the second-largest coffee supplier to Italy (CBI, 2024). This West–East and producer–consumer contrast enables a clearer observation of how culturally embedded

rituals shape branding meanings, compared to more homogeneous country pairings. The choice of these two countries over other possible pairings (e.g., Spain and Thailand, or France and Indonesia) is based on this direct structural relationship: no other pair combines a mature Western consumer market with its main Eastern production supplier, while simultaneously presenting such a divergent ritual landscape. This unique configuration makes Italy and Vietnam the most theoretically productive comparison for examining how culturally rooted rituals shape brand meaning.

To capture how consumption rituals are enacted and negotiated in everyday contexts, this ongoing research adopts an ethnomethodological and qualitative consumer-based approach, consistent with an interpretive constructivist epistemology. Primary data are collected through focus groups with young coffee consumers. Focus groups enable the exploration of collective sense-making among young consumers, particularly appropriate for socially embedded practices (Nyumba et al., 2018), while thematic analysis is applied to identify recurring patterns in ritual performance and meaning construction (Braun & Clarke, 2021). At least four focus groups are planned (two for each country), with an estimated average duration of 75 minutes. Each focus group involves at least 10 participants, and sampling logic is based on geographical location and accessibility. This approach is consistent with recent developments in Consumer Culture Theory, highlighting the interaction between marketplace practices and cultural meanings (Arnould et al., 2019).

Preliminary findings

Anticipated insights reveal rituals' sway over myth interpretation, attribute weighting, and brands' social valence, directly addressing how young consumers perceive brand myth and product attributes. Italian focus group signals portray coffee rituals as short, frequent “daily pulse” routines for habit and socialization, translating into a preference for heritage brands (e.g. Illy, Lavazza), where myth is linked to homely normalcy and professional bar culture, and product attributes are perceived as largely homogeneous, with choices driven by proximity and social interaction. In contrast, Vietnamese rituals are captured as long-duration stays in cafes (2–4 hours) used as multifunctional spaces for social exploration or work, shaping brand myths around experience, aesthetics, and national identity, and differentiating product attributes across usage situations. In terms of CCT (Arnould & Thompson, 2005), these divergent patterns reveal how market practices operate as cultural resources: in Italy, the brevity of the ritual consolidates pre-existing brand myths centered on tradition and authenticity; in Vietnam, the prolonged enactment of the ritual actively generates new brand meanings, making the ritual the primary

site of myth production. These findings suggest that Holt's (2004) model, in which brand myth precedes consumer adoption, may require contextual calibration: in emerging or producer markets, the causal arrow may point in the opposite direction.

These practices also explain how consumers evaluate coffee brand alternatives based on their consumption rituals. Italian participants show low differentiation among brands and favour convenience-oriented choices, while Vietnamese participants distinguish between instant coffee (e.g., G7, Trung Nguyen, Vinacafe) for functional utility, unique local cafes for atmosphere (e.g. Tiny Coffee) and signature drinks (such as Bac Xiu (coffee with condensed milk) and Egg Coffee (Giang Café)), and nearby cafes for social and productive use. The Phin filter, - the signature of Vietnamese coffee (Quintão et al., 2016), remains symbolic rather than functional, and higher willingness to travel reflects experiential evaluation. These findings hint at ritual inertia curbing disruption yet inviting re-mythologizing (Holt, 2004), extending the framework by demonstrating that iconic brand status, in contexts like Vietnam, is actively co-constructed through ritual participation rather than unilaterally authored by brand managers.

Originality and value

The originality of this research lies in its focus on coffee consumption rituals, interpreted within a cultural branding framework and with respect to young consumers. By comparing two distinctive coffee cultures, the study offers a contribution by connecting youth consumption practices, cultural meanings, and branding strategies.

Research limitations

This study presents some limitations. First, the qualitative and exploratory design limits generalisability beyond the sampled contexts. Second, the focus on young coffee consumers may not capture broader national consumption patterns. Future research could extend the analysis to additional cultural contexts, different ages and adopt mixed-method approaches.

Theoretical and practical implications

Theoretically, the research will enrich Holt’s (2004) cultural branding approach by exploring how coffee consumption rituals shape young consumers’ perceptions of consumption myths and product attributes. Practically, it will provide guidance to coffee brand managers for integrating local cultural rituals into branding strategies in contrasting contexts such as Vietnam and Italy.

EXPLORING AUGMENTED REALITY INITIATIVES WITHIN THE LUXURY FASHION SECTOR: SOUTH EAST EUROPEAN CUSTOMER INSIGHTS

Shilegova, Simona[1]; Kapoulas, Alexandros[2]

BAED, City College University of York Europe Campus, Thessaloniki, Greece[1]

School of Business, University of York Europe Campus, Thessaloniki, Greece[2]

Keywords: Augmented reality, Generation Z, Identity exploration, Digital trust, Digital self-concept, Innovation adoption, Luxury fashion, South East Europe

Abstract

Purpose, aim and objectives: This study explores augmented reality (AR) driven identity exploration and trust as key concepts in the context of Generation Z luxury fashion consumers in South East Europe (SEE). It aims to explore how AR influences self-discovery and new product adoption, while also exploring the role of source credibility and perceived realism in shaping consumer engagement.

Literature review and theoretical framework: The study draws on digital self-concept theory and innovation adoption perspectives to explore how AR-mediated experiences influence identity formation, personalization expectations, and trust in luxury consumption contexts.

Methodology and methods: Qualitative research was conducted, including 20 semi-structured interviews and 100 open-ended online qualitative questionnaires in SEE. Participants were Gen Z consumers from Greece, Bulgaria, North Macedonia and Serbia with prior experience or interest in AR-based fashion/beauty try-on tools and luxury fashion. Data were analysed thematically through coding, theme refinement and cross-country comparison.

Main findings and contribution: AR features encourage style experimentation helping Gen Z consumers discover new looks. Furthermore, AR reduces purchase uncertainty and introduces consumers to products they had not considered, making new product adoption easier. However, limitations in AR realism mean many users still rely on in-person validation before purchasing. Trust and source credibility are crucial factors; participants prefer AR provided by brands themselves and expect better realism before fully relying on it. These

findings contribute to the existing literature by showing that AR's influence on identity exploration and product adoption is conditional upon perceived realism and credible delivery, particularly within the underexplored South East European luxury context.

Originality/value - This study contributes to consumer behavior theory by combining the digital self-concept and innovation adoption perspectives, and it offers invaluable customer insights for marketing management purposes in respect to how luxury brands could potentially integrate AR authentically and improve its credibility to better engage Gen Z luxury fashion consumers in SEE.

Introduction

Augmented Reality (AR) adjusts how people see the physical environment around them by implementing digital data into the real-world perception (Arena et al., 2022). When it comes to the fashion industry, especially in the luxury segment, the application of AR allows consumers to virtually try on clothes, accessories, and make-up – basically visualize products in 3D – which enables companies to deliver a captivating experience for their customers (Nasya et al., 2024). In practical terms, luxury and fashion brands can create these experiences through marker-based filters, marker-less virtual try-ons, 3D product visualization, smart mirrors, mobile AR filters and AI-supported body or face scanning. Recent fashion-retail research identifies examples such as AR footwear try-ons, virtual dressing rooms, smart mirrors and social-media AR filters as mechanisms that make online fashion shopping more interactive and visually informative (Kovács and Keresztes, 2024; Batool and Mou, 2024).

AR has gained significant relevance among Generation Z (Gen Z) consumers – born 1995–2010 – who are digital natives that grew up with smartphones and interactive media (Ngo et al., 2025). Gen Z consumers are tech-savvy and also look for personalization, entertainment and authenticity in their shopping experience, and AR can deliver all of this (Schapsis et al., 2024). Their relevance to luxury fashion is also supported by academic research showing that Gen Z luxury consumption is influenced by social media, peers, opinion leaders and influencer credibility (Sun et al., 2022; Dobre et al., 2021). This does not mean that all Gen Z consumers can afford luxury products, but it shows that they engage strongly with luxury meanings, digital brand communities and aspirational fashion identities.

More specifically, within luxury marketing and consumer behavior research, AR technology influences two key aspects: consumer self-discovery and new product adoption. Consumer

self-discovery is a process in which consumers form and explore their identity, preferences and self-concept through consumption experiences (Bartoli, 2022). Ambika et al. (2023) highlights that AR tools enable the consumer to discover previously unknown sides of their self-concept, making AR experiences especially important for Gen Z, who often use social media filters to explore the question “who am I?”.

Even though the use of AR has increased in recent years, a significant knowledge gap exists regarding how AR marketing experiences contribute to Gen Z consumers’ self-discovery process and willingness to adopt new products, particularly in South East Europe. Much of the existing literature has focused on AR in fashion on Western markets and on quantitative studies of AR technology acceptance and purchase intention which is why very little is known from a qualitative perspective about AR’s impact on Gen Z consumers’ identity formation, brand relationships and decision making in countries like Greece and Bulgaria (EU countries) versus North Macedonia and Serbia (non-EU) (Sarkis et al., 2025). The four countries were selected because they represent a small but meaningful SEE comparison between EU and non-EU markets with shared regional cultural proximity but different market integration, digital-commerce maturity and luxury retail access.

Therefore, this research aims to explore how AR experiences in digital marketing shape Gen Z consumers’ self-discovery and adoption of new luxury fashion products in South East Europe, and what roles digital trust, source credibility, realism and personalization play in these processes. The research questions were reframed to align more directly with the empirical scope of the study:

RQ1: How do Gen Z consumers in South East Europe describe the role of AR luxury fashion experiences in identity exploration, self-expression and personalization?

RQ2: How do perceived realism, digital trust and source credibility shape Gen Z consumers’ willingness to engage with AR and consider adopting new luxury fashion products?

RQ3: What similarities and differences emerge between EU and non-EU SEE participants in their exposure to and evaluation of AR luxury fashion experiences?

Literature Review

Gen Z, digital identity & self-discovery in luxury fashion

AR plays a significant role in the identity of Gen Z consumers, as younger generations can see themselves in different looks and personas. Ambika et al. (2023) concluded that digital tools enable the discovery of previously unknown facets of the consumers' self-concept. In other words, by using AR tools, consumers are given the opportunity to explore "who I might be" by trying out different hair colours, cosmetics and fashion items that they had not considered before. Kim and Im (2023) further explain that when consumers use AR technology to try on products, they perceive their self-concept as more malleable, meaning they can see how they transform their look and style more easily than before. The researchers also highlight that AR leads to better self-brand connection, as users visualize a new version of themselves associated with the brand's products. The AR virtual try-ons support the self-identity of consumers by enabling autonomy, self-expression and self-referencing in their shopping experience (Lavoye et al., 2023). For Gen Z consumers, wearing a virtual luxury product and sharing such images on social media provides identity value, where they express their style and affiliation with luxury brands even though they do not physically own the product (Dobre et al., 2021). Further studies have identified that Gen Z consumers treat their digital appearance as an important part of themselves (Sitompul, Noviani and Sembiring, 2023). Moreover, Milanesi et al. (2024) revealed that Gen Z consumers feel "more like themselves" when using digital fashion products, which supports the idea that Gen Z finds comfort and authenticity in virtual self-discovery. The literature suggests that AR is among the important factors in Gen Z's self-discovery process, allowing individuals to explore who they might be through virtual luxury brand experiences.

At the same time, Gen Z's interest in luxury should be understood as both economic and symbolic: academic work on luxury fashion consumption shows that social media influencers, peers, celebrities and opinion leaders can shape Gen Z luxury attitudes and purchase-related behaviour (Sun et al., 2022). Thus, luxury fashion is relevant not only as a purchase category but also as a digitally mediated space of aspiration, social signalling and identity construction.

Digital trust, source credibility, realism and accuracy in augmented reality

Even though AR deepens the connection between consumers and brands, there are still many issues regarding the trustworthiness of AR content and the credibility of its sources. Gen Z

consumers are known to value authenticity, and their willingness to engage with AR for new product discovery and adoption may weaken depending on how much they trust the content and its provider. For this study, digital trust refers to the consumer's confidence that the AR tool represents the product accurately, uses data responsibly and comes from a reliable provider. Source credibility refers to the perceived trustworthiness, expertise and authenticity of the platform, brand or influencer delivering the AR experience.

AR in marketing can raise multiple trust questions, such as: "Is the AR filter accurate and realistic?"; "Who is providing this AR content, and does the consumer trust it?"; "What data is the consumer giving up to use AR?". Recent studies suggest that digital trust is crucial for AR marketing success. Taub et al. (2024) found that users trusted statements accompanied by AR visuals more than those with a static image. However, this applies only if the AR feature is not misleading; if an AR feature does not match reality, consumers may feel deceived. This is why accuracy in a brand's AR features is so important. In the luxury fashion context, where purchase decisions carry higher risk, it is crucial for a brand to have trustworthy AR technology that accurately represents fit, colour and style in order to gain Gen Z's trust in the digital environment.Another important factor is source credibility. Gen Z consumers may perceive content differently depending on whether AR is delivered by an official brand application, an e-commerce platform, an influencer or a social-media filter. Sun et al. (2022) show that social media actors can influence Gen Z luxury fashion consumption, while Singer et al. (2023) note that perceived influencer authenticity shapes persuasiveness. Building trust and credibility in the use of AR tools, therefore, is a must when conducting a digital marketing campaign. The AR experience should not only be entertaining, but also reliable and transparent in how businesses portray their products. The intersection of digital trust, source credibility, realism and AR marketing highlights that without trust, even the best AR tools cannot be fully effective for engaging Gen Z consumers (Taub et al., 2024). This suggests that companies need to design AR experiences based on trust and deploy them through channels that Gen Z finds credible. Accordingly, this study further explores how Gen Z's trust in AR tools influences their willingness to use such technologies for product discovery and purchase.

Methodology

This study implemented multiple qualitative methods. The first method was semi-structured interviews (an exploratory interview technique commonly used in social sciences).

Semi-structured interviews are guided by a set of key topics but allow the researcher to probe deeper as new insights emerge (Ruslin et al., 2022). Such interviews can be used in early stages of research design to formulate and clarify research questions (Adeoye‐Olatunde & Olenik, 2021). The second method was open-ended online questionnaires, in which participants can provide in-depth answers in their own words (Bielska et al., 2024). The combination of these two approaches enabled data triangulation, which is very important to ensure that findings can be used confidently (Bans-Akutey & Tiimub, 2021).

Data Collection: In-depth semi-structured interviews were conducted with Gen Z consumers in Greece, Bulgaria, North Macedonia and Serbia, gathering detailed stories and examples of their experiences with AR in luxury fashion. The interview guide included structured questions covering identity exploration, personalization, trust, realism and platform credibility. The detailed interview and questionnaire guide is available from the author upon request. The interviews were conducted online and in-person, audio-recorded with participant consent, and later transcribed for analysis. The open- ended online questionnaires were distributed to a larger sample of Gen Z consumers in the same four countries. Using both methods ensured breadth through questionnaires and depth through interviews.

Sampling and Participants: The participants in this study were Generation Z consumers (born 1996–2007) from the four South East European countries mentioned. These countries were selected to include a mix of EU and non-EU markets. For the sampling process, participants needed to have some experience using AR in luxury fashion or beauty, like virtual try-ons and AR filters, and an interest or involvement in luxury fashion. In total, 100 online questionnaires were completed - 25 per country – and 20 interviews were conducted in total - 5 per country. The participant pool therefore consisted of 120 Gen Z respondents across four national contexts. Participants were recruited through purposive and snowball sampling, with eligibility based on age cohort, country of residence, familiarity with AR try-on or filter tools, and relevance to luxury/fashion consumption. Because the study focused on qualitative depth rather than statistical representation, the sample should be interpreted as exploratory rather than representative of all SEE Gen Z consumers.

In reporting the results, interview participants are referenced as Respondent X (with X being an interview number), and questionnaire participants are referenced as Participant X (with X being an questionnaire number), to maintain anonymity.

Data Analysis: The data analysis for this research followed a thematic analysis approach, an analytical technique that qualitative researchers use to identify patterns across a dataset by organizing data into themes and sub-themes (Naeem et al., 2023). First, interview transcripts and questionnaire responses were read repeatedly for familiarisation. Second, initial codes were assigned to recurring ideas such as experimentation, personalization, realism, trust, platform credibility and purchase confidence. Third, similar codes were grouped into themes and checked against the research questions. Fourth, themes were compared across the four countries to identify shared patterns and minor EU/non-EU differences. To reduce analytical bias, the researcher kept an audit trail of coding decisions, compared interview and questionnaire evidence before finalising themes, used anonymised participant labels and prioritised repeated patterns rather than isolated statements.

Findings

This section presents empirical findings only. Citations and theoretical interpretation have been moved to the Discussion section.

AR as a tool for self-discovery & identity formation

Many participants described their AR experience as a safe way to explore new looks that they would not normally consider. Respondent 19 (Serbia) said: "*I've tried some lipstick colors through AR that I never would have considered before*"; Respondent 14 (Serbia) noted that AR let them "*explore bold choices because I can preview them, so then I don't feel like I will make a problem if I actually choose something.*" Similarly, Participant 5 (North Macedonia) said: "*AR experiences like virtual try-ons and beauty filters have allowed me to experiment with different looks easily, helping me discover new styles and feel more confident about my choices.*" Even though some participants found AR to be a good tool for self-discovery, others felt that AR had little to no impact on their personal style or sense of identity. Respondent 10 (Bulgaria) explained: "*I don't think I have been very influenced by AR experiences. I am doing it more from curiosity... to actually try something.*" For these consumers, especially those engaging less frequently with AR, the technology remains a curious tool with minimal effect on their identity. The lack of realism makes it hard for users to truly imagine an AR look as part of their real identity. Respondent 13 (Bulgaria) mentioned: "*It's not a complete replacement for an actual in-store experience where you can go, try it on*."

Personalization of the AR experience

Many participants did not perceive current AR shopping tools as highly personalized. Participants felt that AR experiences were more "*one size fits all*" rather than tailored to their individual features or preferences. Respondent 13 (Bulgaria) said: "*If you are slimmer or if you're overweight, they cannot see that, and maybe things are gonna look different*" and Respondent 4 (Serbia) said that "*most still seem general and not fully adapted to my personal features or preferences.*" Other examples from the questionnaires include: "*I don't think they are personalized, it didn't scan my face properly*" (Participant 98 - Greece). On the other hand, a few participants did perceive some level of personalization in AR. Respondent 8 (Greece) stated that "*the whole concept of it is to personalize the product… they connect how the product will look to how I look… So, as long as it works, it does the job very well.*" For this respondent, seeing how products will look, even if not perfect, still gives a sense of personalization. Most AR consumers in this research also expressed a strong desire for better, more advanced personalization in AR marketing. Respondent 5 (Serbia) said: "*I think brands should focus on making AR more realistic and body specific. For example, if we could scan our body shape so we can really see how clothes would fit on us and certain body types.*" Participant 57 (Serbia) said: "*I'd like features that show accurate fit, color, and maybe suggestions tailored to my style, so it feels more personal and worth trying.*"

Realism, accuracy and trust in AR try-ons

Almost every participant highlighted that there is a lack of realism in their AR experiences. Even though the participants found AR interesting, they often did not feel that AR features were fully reliable. Respondent 2 (Bulgaria) said: "*They're not really precise. I mean, it gives you an overview, but it's not giving you an accurate, 100% accuracy*" and Participant 2 (North Macedonia) mentioned, "*I think that there are accurate try-ons and filters, but there are a lot of AR features that don't look realistic.*" Other participants gave specific examples of what is not realistic enough. Respondent 5 (Serbia) said: "*with clothing, or some other detailed, luxury items, I don't think it's accurate enough.*" The perceived realism differed by product category. Respondent 13 (Bulgaria) observed: "*It's good for basic things like sunglasses, maybe make-up for the women... But in some cases, it could be less accurate for clothes.*" Current limitations in realism directly impact user trust in AR. Respondent 6 (Greece) said that "*you cannot understand the product so much, it's still not the same as trying on site.*" These doubts suggest that, in the context of luxury fashion, AR try-ons currently function as

an additional tool rather than a replacement for in-person inspection. On the other hand, when consumers do find an AR experience realistic, the impact can be powerful. Respondent 18 (North Macedonia) shared that they purchased a product because the brand's AR feature looked realistic: "*I bought those RayBans, I used their AR and I ended up buying the same exact model. It was just very good.*"

Social influence and source credibility in AR adoption

A lot of participants suggested that luxury brands can enhance AR's awareness and credibility through celebrity or influencer endorsements and strong social media campaigns. Respondent 13 (Bulgaria) noted that "*brands might need to do some celebrity endorsements and work with celebrities just to market it [AR] better.*" Beyond endorsements, the source credibility of the platform itself also mattered. Gen Z participants from South East Europe noted that Instagram and official brand applications/websites were the most trustworthy options. Respondent 4 (Serbia) said: "*I would say that I prefer AR on Instagram or brand apps because they feel reliable and convenient.*" Participant 78 (North Macedonia) wrote, "*Instagram and brand apps are preferred for AR because they feel more polished, easier to use, and better aligned with luxury branding.*" In contrast, a large group of participants thought that "*Snapchat is fun, but less trustworthy for serious [shopping] decisions."*

Cross-country observations

The findings suggest more similarities than differences across the four countries. Participants from all countries valued experimentation but questioned realism, sizing accuracy and trust. Minor differences appeared in exposure and channel preference: non-EU participants reported slightly higher curiosity toward influencer-promoted AR tools, while EUparticipants more often linked AR credibility to official brand websites or applications. These differences should be treated cautiously because the sample is qualitative and exploratory.

Discussion

AR provides a safe and creative space for style experimentation, with low risk to try new looks or products. Many participants mentioned that they tried new styles because AR gave them confidence, which corresponds with the idea that AR can ease the consumer's self-discovery by making the process more enjoyable and fun. This aligns with Kim and Im's (2023) argument that virtual try-ons can increase self-concept adaptivity and with Lavoye et

al.'s (2023) view that virtual try-on experiences support self-explorative engagement. However, the findings also show that this self-discovery effect is conditional rather than automatic. Some participants saw AR only as a playful tool, suggesting that identity-related outcomes depend on the quality and credibility of the AR experience. Personalization emerged as a major limitation. Although AR is often presented as a personalized technology, participants frequently described current tools as generic. This supports Schapsis et al. (2024), who argue that Gen Z consumers expect personalization, entertainment and authenticity in digital shopping, and it also reinforces the importance of accurate body and product visualization highlighted in recent virtual try-on research (Batool and Mou, 2024; Chen, Ni and Zhang, 2024). For luxury fashion, weak personalization is especially problematic because luxury consumption relies on fit, aesthetic precision, symbolic value and emotional confidence. Consumer trust is central to AR adoption. Most participants did not find AR accurate enough to replace in-person shopping, particularly for clothing and detailed luxury products. This finding aligns with Taub et al. (2024), who show that AR can increase trust when it supports a "seeing is believing" effect, but also with Nawres et al. (2024), who suggest that AR effects vary across luxury product categories. In this study, AR appeared more convincing for lower-fit-risk products such as sunglasses or make-up than for clothing, where tactile and sizing uncertainty remains high. Source credibility also shaped participants' willingness to rely on AR. Participants often trusted official brand applications or websites more for serious purchase decisions, while Instagram and Snapchat were associated with fun, exploration and social sharing. This supports research on Gen Z luxury consumption showing the importance of social media actors and influencer credibility (Sun et al., 2022; Singer et al., 2023). However, this study adds nuance: influencers may improve awareness and social desirability, while official brand channels may be more important for final purchase confidence.

Theoretical Contribution

This study contributes to digital self-concept theory by showing that AR can support identity exploration among Gen Z consumers, but mainly when the experience feels realistic, personalized and credible. It therefore challenges an inevitable view of AR as automatically transformative and instead positions AR as a conditional identity tool. The study also contributes to innovation adoption research by identifying perceived realism and source credibility as key trust-building mechanisms in AR-enabled luxury fashion adoption. In the

SEE context, AR adoption is not only a question of technological novelty or usefulness; it also depends on whether the consumer believes that the digital representation is accurate enough to support a high-involvement luxury decision.

Managerial Implications

Luxury fashion managers should treat AR as part of the wider customer journey rather than as a standalone entertainment feature. AR can create discovery and engagement, but purchase confidence requires accurate fit, realistic colour, credible platform delivery and clear product information. Brands should prioritise official AR tools on brand websites or applications for purchase-oriented experiences, while using Instagram, TikTok or influencer-led AR activations for awareness, experimentation and community engagement. Influencer collaborations should be selected based on credibility and fit with the brand image, not only reach. Managers should also invest in more advanced personalization, including body-specific scanning, skin-tone sensitivity, realistic fabric movement and transparent data-use communication. These improvements can increase trust and reduce the gap between online experimentation and offline purchase validation.

Limitations

This study is qualitative and exploratory, so the findings cannot be generalised statistically to all Gen Z consumers in South East Europe. The sample includes participants with some familiarity with AR and interest in fashion/luxury, which may overrepresent digitally engaged consumers. The country comparison is also limited because the number of interviews per country was small. Therefore, EU and non- EU differences should be interpreted as indicative patterns rather than definitive national differences. Finally, the study focused mainly on trust, realism, source credibility and identity exploration; data privacy concerns were not explored in depth.

Future Research

Future research could use a mixed-methods design to test the relationships between perceived realism, source credibility, digital trust and purchase intention across larger samples. Comparative research could also examine whether SEE consumers differ from Western European consumers in AR adoption, luxury aspiration and trust in brand-led versus

influencer-led AR. Future studies should also investigate data privacy and consent in AR luxury fashion, especially where face scanning, body scanning or AI-based personalization are involved. Future research could also examine whether improvements in AR realism over time lead to deeper self-discovery, stronger brand relationships and higher luxury product adoption.

Conclusion

This study combines the digital self-concept and innovation adoption perspectives, enriching theory with culturally diverse insights from South East Europe. It provides qualitative evidence that AR can serve as a tool for Gen Z identity exploration, contributing to digital self-concept theory, while also reinforcing that AR features must be credible and realistic. The findings demonstrate that AR's impact is not automatic, but conditional upon perceived realism, personalization and source credibility. In particular, technical realism appears to function as a key factor that determines whether AR remains a playful engagement feature or becomes a meaningful influence on purchase decisions. Managers should integrate AR authentically into the customer journey, focusing on technical realism to build trust and deepen brand affinity. Future research should broaden qualitative inquiry to other emerging markets and use mixed methods to compare Gen Z's AR experiences across cultures.

THE INFLUENCE OF COMPENSATION INEQUITY ON CEO RETENTION

Rainville, Gabrielle[1]; Papadopoulos, Andrew[1]

[1]École des Sciences de la Gestion / UQAM, Montréal, Canada

Keywords: CEO, Retention, Inequity, Compensation, Performance

Introduction

Although CEO compensation is widely scrutinized, research has seldomly investigated how a CEO's *comparative* market position in actual total direct compensation (TDC) - not potential compensation - impacts the likelihood of resignation.

Purpose, Aim and Objectives

We explore whether CEOs are more likely to resign when TDC is misaligned with comparable CEOs.

Literature Review and Theoretical Framework

Grounded in Adams's equity theory (1963, 1965), Greenberg's organizational justice (1990), Vroom's expectancy theory (1968) and Lawler's discrepancy model (1971), we posit that CEOs evaluate their actual compensation relative to external referents to determine fairness, influencing their motivation and retention. Equity theory suggests that being relatively underpaid should increase dissatisfaction and departure. Organizational justice and expectancy theory propose that perceived fairness is central to behavioural outcomes; high CEO self-efficacy and strategic contribution should react strongly to such perceptions. Consequently, adverse external inequity in TDC increases the probability of CEO resignation.

Methodology and Methods

We employ a longitudinal design covering S&P/TSX60 Canadian firms from 2015–19 from publicly available sources. After excluding founder-CEOs and those holding more than 5% ownership, the final sample consists of 55 CEOs across 42 firms (210 CEO-years). The binary dependent variable is voluntary resignation while the key independent variable is external inequity in TDC (percentage deviation of a CEO's paid TDC from the market median). Additional independent control variables include age, short-term incentives, long-term

incentives (LTI), pension plan type, perks, company revenues, net income, share price performance, and market capitalization ranking.

Findings and Contribution

Only three resignations occurred over the five-year period, a rate consistent with the "stickiness" of CEO roles at large corporations. A logistic regression assessing resignation probability shows that inequity remains significant at the 90% confidence level ($p = 0.064$). Favourable inequity reduces resignation likelihood (odds ratio = 0.001), whereas the monetary value of perks increases resignation likelihood (odds ratio = 2.812). Our results confirm that both favourable and unfavourable forms of external inequity in TDC influence CEO retention; explanatory power remains modest due to few resignations.

Originality and Value

While prior studies focus on target compensation or cash pay, this research analyzes compensation received. By linking equity theory and organizational justice to executive retention, it addresses a clear empirical gap in shifting the debate from "how much CEOs earn" to "how relative pay positioning influences strategic turnover risk". External compensation matters as unique labour market dynamics often obscure behavioural determinants.

Research Limitations

Practically, the results underscore the importance for compensation committees of monitoring competitive pay positioning, especially given the heavy reliance (85% of TSX60 firms) on external compensation consultants. Firms should recognize that both under- and over-compensation relative to the market can influence CEO mobility, and that long-term incentives play a central role in shaping perceived equity.

Theoretical and Practical Implications

We extend Adams' equity theory by applying it to top executives and external market comparisons rather than internal referents. It also integrates insights from Jerald Greenberg's organizational justice framework and expectancy theory, showing that distributive perceptions at the market level can influence voluntary departure decisions. The findings suggest that even highly compensated CEOs respond to perceived under- or over-equity. Theoretically, this

nuances assumptions that executives are driven primarily by absolute pay levels, reinforcing the importance of relative positioning in compensation research and governance studies. Practically, the findings signal to boards and compensation committees that market positioning matters—not only for attraction but for retention by considering how deviations from median pay may shape CEO exit risk. Although pay inequity explains only a limited portion of resignation probability, it is a controllable governance lever. The broader message is disciplined design: compensation strategy should balance competitiveness, fairness perceptions, and long-term organizational performance, rather than reacting mechanically to peer escalation pressures.

MEASURING WORKPLACE HAPPINESS: EMPIRICAL VALIDATION OF THE GASP MODEL

Di Prima, Christian[1]

[1]Dipartimento di Management "Valter Cantino", Università degli Studi di Torino, Unito, Turin, Italy

Keywords (up to 10): workplace happiness; employee wellbeing; exploratory factor analysis (EFA); scale development

Happiness has increasingly gained attention in organizational research as a critical factor influencing employee well-being, engagement, performance, productivity, commitment, and turnover (Diener, 2000; Fisher, 2010; Warr & Nielsen, 2018). Despite this, organizational happiness is often addressed through fragmented constructs, without a comprehensive framework integrating both individual and organizational levels.

To address this limitation, the GASP model was recently proposed as a multidimensional framework conceptualizing workplace happiness as a dynamic process built on four core pillars: Godersela (enjoying experiences), Accogliere (embracing challenges and learning), Sognare (goal orientation and shared vision), and Persone (relationships and social connection). These operate simultaneously at two interconnected levels: the individual level, reflecting employees' psychological experience of work, and the organizational level, reflecting organizational practices and cultural dynamics supporting well-being. The conceptual foundations of the model draw from several established research streams: positive psychology, highlighting the importance of subjective well-being, positive affect, and meaningful engagement in promoting human flourishing (Diener, 2000; Seligman, 2011); Self-Determination Theory (Deci & Ryan, 2000), emphasizing the importance of autonomy, competence, and relatedness in fostering well-being; the Job Demands–Resources model, highlighting the role of supportive organizational environments in sustaining employee motivation and engagement (Bakker & Demerouti, 2017). The GASP integrates them by proposing a multidimensional structure of happiness combining hedonic enjoyment, psychological acceptance, future-oriented motivation, and relational connectedness, translating these psychological dimensions into actively manageable organizational practices.

This study pursues three objectives: to develop reliable measurement scales capturing the four GASP dimensions at individual and organizational levels; to investigate the factorial structure

of the scales through exploratory factor analysis (EFA); to assess the internal consistency and reliability of the resulting constructs and their relationship with general happiness.

Data were collected through 351 surveys administered to employees participating in GASP training programs within Italian organizations. EFA were conducted using Principal Axis Factoring with oblique rotation in IBM SPSS, following methodological recommendations for scale development (Fabrigar et al., 1999; Costello & Osborne, 2005). Sampling adequacy was assessed using the Kaiser–Meyer–Olkin statistic and Bartlett's test of sphericity. Item refinement was conducted iteratively based on communalities, factor loadings, cross-loadings, and reliability diagnostics. Internal consistency of the resulting scales was assessed using Cronbach's alpha (Nunnally & Bernstein, 1994).

The analysis confirmed the framework robustness. The general happiness scale demonstrated a clear unidimensional structure and excellent reliability ($\alpha \approx .90$). For the individual-level scale, iterative EFA procedures resulted in a refined four-factor structure consistent with the theoretical model. Items showing cross-loadings or weak contributions were removed, resulting in reliable subscales for the four dimensions (α from .79 to .84). The organizational-level scale showed extremely high sampling adequacy and strong internal consistency. Although the factor structure revealed a dominant general organizational factor, a four-dimension solution corresponding to the theoretical GASP pillars remained interpretable. Reliability coefficients were particularly high for the organizational dimensions (α from.92 to .97). Overall, the results support the multidimensional nature of workplace happiness and confirm the feasibility of measuring GASP constructs at individual and organizational levels.

This research provides one of the first attempts to operationalize workplace happiness through a dual-level measurement framework, integrating individual psychological experiences and organizational practices; from a practical standpoint, it offers validated measurement scales that organizations can use to systematically assess, monitor and foster workplace happiness.

ADAPTIVE LEADERSHIP IN TURBULENT ENVIRONMENTS: BUFFERING ORGANIZATIONS FROM EXTERNAL SHOCKS

Palmucci, Dario Natale[1]; Di Prima, Christian[1]

[1]Dipartimento di Management "Valter Cantino", Università degli Studi di Torino, Turin, Italy

Keywords: Leadership; Human Resources, Socio-politic challenges; STP leadership

Introduction

In recent years, organizations have been operating in an environment characterized by unprecedented levels of socio-economic, political, and geopolitical turbulence. Digital disruption, post-pandemic instability, climate crises, geopolitical conflicts, inflationary pressures, and rapid regulatory changes have profoundly altered organizational landscapes across all sectors (Vrontis et al., 2024). In this context, businesses in general and leadership in particular are no longer concerned solely with guiding internal transformation processes, but increasingly with protecting organizations from external volatility (Flint, 2021). It is to say that while recent models have emphasized sustainability, technology, and people as core areas of intervention (Palmucci et al., 2025), less attention has been devoted to the buffering role of leadership in absorbing external shocks and preserving organizational stability (Patsiaouras et al., 2026). The purpose of this study is to evaluate whether a recently proposed leadership model (e.g., STP Sustainability–Technology–People) which is focused on challenges and skills of the nowadays leaders (Palmucci & Ferraris, 2026) can be integrated in light of contemporary socio-economic and political disruptions. In other words, the aim is to explore whether the STP framework sufficiently captures the challenges faced by leaders in highly turbulent environments and/or whether additional dimensions and skills are required. Specifically, the objectives are: (i) to analyze the adequacy of STP leadership in addressing external turbulence; (ii) to identify missing leadership capabilities related to environmental uncertainty management; and (iii) to propose an extended conceptualization of leadership that incorporates a protective and stabilizing function.

Literature review and theoretical framework

Leadership studies have progressively evolved from traditional, hierarchical approaches toward more relational, adaptive, and human-centered models (Stone & Patterson, 2023). Within this stream of research, existing theories emphasize different dimensions of leadership, including leader–follower relationships (e.g., transformational and transactional leadership; Sarros & Santora, 2001), leaders' personal characteristics and values (e.g., servant and inclusive leadership; Gotsis & Grimani, 2016), contextual adaptability (e.g., situational leadership; Thompson & Vecchio, 2009), as well as innovation and digitalization processes (e.g., innovative and digital leadership; Erhan et al., 2022). Building on this body of research, the STP leadership model has been proposed to address this gap by integrating sustainability, technology, and people as the main areas of intervention for contemporary leaders, and by associating these domains with six key leadership skills: strategic thinking, flexibility, authenticity, coaching, change management, and inclusiveness (Palmucci et al., 2025). However, despite its relevance and its alignment with many of the challenges faced by today's leaders, the model seems to primarily focuses on internal organizational dynamics and implicitly assumes a relatively stable external environment – and prior studies have already highlighted that the most recognized leadership theories have not been extensively examined within global business studies (Ramsey et al., 2017). On this direction, this study argues that current socio-economic and geopolitical conditions require leaders to move beyond the role of change enablers and to act as shock absorbers, capable of filtering, interpreting, and mitigating external turbulence before it destabilizes organizational systems.

Methodology and main expected findings

The study adopts a research design consistent with prior studies that have examined and validated the STP model in different contexts (e.g., "Strategic management in the public sector: new leadership models to navigate the turbulent post-Covid era" - Palmucci et al., 2025). It combines a critical analysis of recent leadership literature with insights derived from interviews with organizational actors operating in complex and turbulent environments. The study is expected to show that, while sustainability, technology, and people remain fundamental pillars of contemporary leadership, they may not be sufficient to fully address the challenges posed by systemic turbulence. The analysis is anticipated to reveal the relevance of an additional, currently underexplored leadership domain, which can be defined as "environmental buffering". This domain is expected to capture the leader's ability to interpret

external signals, manage uncertainty, absorb shocks, and shield organizational members from destabilizing external pressures. If this will be found, then additional skills associated with this buffering function, including sensemaking, geopolitical and socio-economic awareness, anticipatory decision-making, emotional containment, and the orchestration of organizational resilience, could be identified. These competencies are expected to extend beyond the original framework and to reconceptualize leadership as a stabilizing force operating at the boundary between the organization and its environment.

Originality, research limitations and implications

This study is expected to contribute to leadership research by explicitly incorporating external turbulence into leadership theorization, potentially advancing a more holistic and realistic understanding of contemporary leadership challenges, and, most important, encouraging scholars to more explicitly integrate environmental instability into leadership models. It is to say that the proposed extension of the STP model is anticipated to respond to growing calls for leadership frameworks that better reflect the volatility, uncertainty, complexity, and ambiguity characterizing today's global context. Given its exploratory nature and the anticipated qualitative orientation, the study is not expected to produce statistically generalizable results. Rather, it may offer insights that future research could further examine through quantitative designs across different sectors and national contexts. In addition, longitudinal studies could be conducted to investigate how buffering capabilities evolve over time in response to prolonged and recurring turbulence. From a practical standpoint, it may suggest that leadership development programs should move beyond sustainability-, digital-, and people-related skills, incorporating training focused on crisis anticipation, uncertainty management, and organizational protection. In this sense, leaders may increasingly be required not only to transform organizations, but also to safeguard them in an increasingly unstable environment.

THE EMOTIONAL INTELLIGENCE OF THE TRANSFORMATIONAL LEADER AS A CATALYST FOR CREATIVITY AND ORGANIZATIONAL INNOVATION: A SYSTEMATIC LITERATURE REVIEW

Tselezidou Sofia[1], **Stafyla Amalia**[2], **Siachou Evangelia**[3]

[1,2]Department of Supply Chain Management, International Hellenic University, Katerini, Greece

[3]Department of Economics, National and Kapodistrian University of Athens, Athens, Greece

Keywords: Emotional Intelligence; Transformational Leadership; Creativity; Innovation; Systematic Literature Review

Introduction and Scope

Emotional intelligence (EI) has emerged as a critical capability for contemporary leadership, particularly within increasingly complex and innovation-driven organizational environments. Over the past decades, research has highlighted the importance of leaders' emotional competencies in shaping team dynamics, improving decision-making, and fostering creative and innovative outcomes.

Transformational leadership (TL), which emphasizes inspiration, vision, and individualized consideration, has been consistently associated with higher levels of employee engagement, creativity, and innovation. However, the mechanisms through which emotional intelligence enhances transformational leadership and ultimately contributes to organizational innovation remain an area of ongoing scholarly investigation.

The present study aims to synthesize the existing literature and explores how emotional intelligence functions as a catalyst enabling transformational leaders to promote creativity and innovation within organizations.

Methodology and Methods

This research adopts a Systematic Literature Review (SLR) methodology based on the framework proposed by Webster and Watson (2002). The review focuses on identifying and analyzing academic research that examines the relationship between emotional intelligence, transformational leadership, and innovation-related outcomes. Articles published between 1998

and 2026 were considered, as this period captures the major theoretical and empirical developments in the study of emotional intelligence in leadership contexts. The study follows a three-phase search strategy: (a) initial identification across ScienceDirect, Scopus, and Elicit using Boolean operators for keywords (EI, TL, innovation), (b) backward and forward citation tracking to ensure literature saturation, and (c) strict quality screening. The final corpus of 95 relevant peer-reviewed articles was analyzed using a "concept-table" approach to categorize findings into thematic clusters, ensuring a rigorous research design. Data extraction focused on identifying mediating variables and thematic clusters that link emotional competencies to innovative outputs.

Main Findings

The thematic synthesis of the 95 selected studies reveals that EI functions as a multi- level catalyst through three primary mediating mechanisms.

1. The psychological safety pathway: Leader's emotional regulation reduces fear of failure, allowing for risk-tasking and idea generation.
2. High – Quality LMX (Leader-Member-Exchange): Trust based relationships, rooted in empathy, facilitate the flow of non-redundant information.
3. Collective learning climates: EI driven transformational leadership fosters knowledge sharing and team adaptability.

The literature consistently demonstrates that emotionally intelligent leaders possess the ability to recognize, understand, and regulate both their own emotions and those of others, which enables them to activate the core dimensions of TL- idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration (Asmamaw and Semela, 2023; Por Pan *et al*., 2020; Saini and Goswami, 2019). Through these leadership behaviors, emotionally intelligent leaders inspire followers to transcend personal interests and align with collective organizational goals.

The theoretical foundation of emotional intelligence originates from the ability-based model developed by Mayer and Salovey (1995), which conceptualizes EI as a set of cognitive-emotional abilities. These abilities include emotion perception, emotion facilitation, emotional understanding, and emotional regulation. These competencies allow leaders to process emotional information effectively and use emotions strategically in decision-making and

interpersonal relationships (Mayer, Salovey and Caruso, 1999). In organizational settings, such capabilities enhance leaders' ability to communicate vision, manage conflict, and support employee development.

A key mechanism identified in the literature linking emotional intelligence and organizational outcomes is the development of high-quality leader–member exchange (LMX) relationships. Emotionally intelligent transformational leaders are more capable of establishing trust-based relationships with employees, characterized by mutual respect, open communication, and psychological safety (Hur *et al*., 2011; Gooty *et al*., 2010). High-quality LMX relationships create an environment in which employees feel valued and supported, encouraging them to share ideas, experiment with new approaches, and engage in innovative work behavior.

Furthermore, emotionally intelligent leadership contributes to team-level processes that facilitate innovation. Studies indicate that EI-driven transformational leadership enhances collective learning, knowledge sharing, and psychological safety within teams. These conditions are critical for creativity because they allow individuals to express novel ideas without fear of criticism or failure. By promoting emotional awareness and supportive interpersonal relationships, leaders foster collaborative climates that support experimentation and creative problem-solving.

The literature also suggests that the effectiveness of emotionally intelligent transformational leadership may depend on contextual factors such as organizational culture, industry characteristics, and the level of digital transformation. For instance, organizations operating in knowledge-intensive or technology-driven sectors may benefit more significantly.

Overall, the findings of this review support the view that EI plays a catalytic role in transformational leadership processes that ultimately lead to organizational creativity and innovation. Emotionally intelligent leaders influence innovation indirectly by strengthening leader–member relationships, fostering psychological safety, and promoting collaborative team dynamics. By integrating emotional intelligence with transformational leadership behaviors, organizations can create environments that support learning, adaptability, and innovation.

Study's Implications and Future Research

This study contributes to the leadership and innovation literature by synthesizing empirical evidence on the mechanisms linking emotional intelligence, transformational leadership, and organizational innovation. Future research should explore multi-level and dynamic models that examine how emotional intelligence operates across individual, team, and organizational levels. Additionally, researchers are encouraged to investigate emerging contexts such as digitally transformed organizations and hybrid work environments, where emotional competencies may play an increasingly important role in leadership effectiveness and innovation performance.

To address the limitations of relying on secondary data, future research should transition toward an empirical research design. We propose conducting a primary study using a mixed-methods approach, involving structured interviews with transformational leaders. This will allow for the empirical validation of the identified EI-innovation mechanisms in real-world, industry-specific contexts.

THE ADOPTION OF SUSTAINABLE AGRICULTURAL PRACTICES ACROSS MEDITERRANEAN COUNTRIES: AN INVESTIGATION OF STAKEHOLDERS' SUBJECTIVITY

Mirabella, Claudio[1]; Agosta, Martina[2]; D'Acquisto, Marcello[3]; Schimmenti, Emanuele[1]; Crescimanno, Maria[1]; Borsellino, Valeria[1]

[1]Department of Agricultural, Food and Forestry Sciences, University of Palermo, Palermo, Italy

[2]Council for Agricultural Research and Agricultural Economics Analysis (CREA-PB), Agricultural Policies and Bioeconomy, Rome, Italy

[3]Department of Agriculture, Rural Development and Mediterranean Fisheries, Regione Siciliana, Palermo, Italy

Keywords: Intercropping, Sustainability, Cross-Country Analysis, Q Methodology, Factor Analysis, Mixed Methods, Technology Acceptance

Introduction

Mediterranean regions are among those most exposed to climate change (Lazoglou et al., 2024), facing rising temperatures, soil degradation and extreme events that threaten food security (Alrteimei et al., 2022). Intercropping, the simultaneous cultivation of several species on one plot, reduces chemical inputs, improves soil fertility and promotes biodiversity (Glaze-Corcoran et al., 2020; Maitra et al., 2021), yet the motivations and barriers behind its adoption remain poorly understood (Kangogo et al., 2021). Work on the determinants of sustainable practice adoption underlines the weight of subjective perception (Ha et al., 2023), but no comparative study has examined this dimension across Mediterranean countries, where intercropping in arboreal systems could be particularly valuable.

Purpose, Aim and Objectives

The study maps divergent viewpoints on intercropping adoption among farmers, technicians and researchers in five Mediterranean countries, identifying contrasting patterns of perception across roles and national contexts.

Methodology and Methods

Q methodology combines by-person factor analysis with qualitative interpretation to map shared patterns of thought within a population of communicants. Statements were sampled from the concourse, the universe of opinion on the topic, through 10 semi-structured interviews and 12 written surveys with key informants. From these a Q-set of 32 statements was selected, four per thematic dimension (environmental, economic, social, agronomic), crossed with the two Technology Acceptance Model constructs, perceived usefulness and perceived ease of use (Davis, 1989). A purposive stratified P-set targeted 21 respondents per country (7 farmers, 7 researchers, 7 consultant agronomists) across Italy, Croatia, Portugal, Morocco and Israel; after five non-responses, 100 of the 105 invited returned valid Q-sorts. Statements were rank-ordered on a quasi-normal forced-choice distribution from −4 to +4, analysed by centroid extraction with varimax rotation (Figure 1).

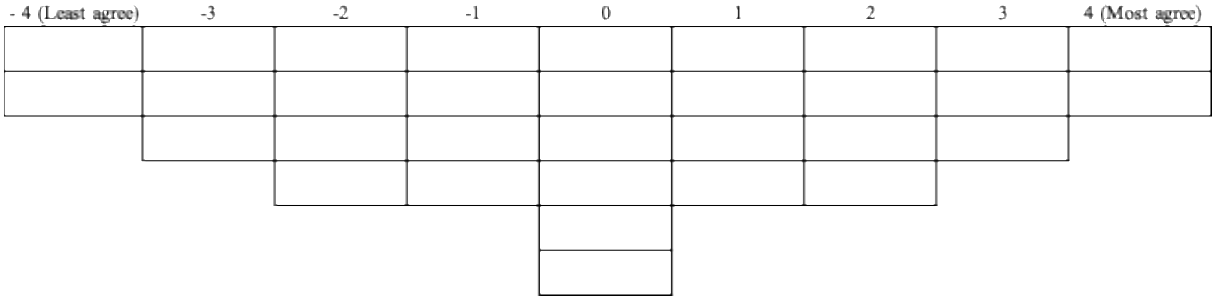

Figure 1 Q-sorting

Findings and Contribution

The five-factor solution accounts for 49% of variance, drawing on the 64 Q-sorts loading significantly on one factor alone (Table 1). Factor 1 (Pragmatic Agro-Ecological Optimist) frames intercropping as ecologically harmonious and compatible with modern production. Factor 2 (Market-Oriented Agronomic Moderniser) prioritises secondary income and voluntary CAP eco-scheme integration. Factor 3 (Reluctant Dissident) pairs scepticism toward market rationales with a normative insistence on mandatory adoption. Factor 4 (Ecological Moderniser) foregrounds biodiversity, climate services and accessibility. Factor 5 (Ambivalent Sceptic) values intercropping for employment and cultural preservation while doubting its fit with contemporary farming. One consensus statement holds throughout: agroecological practice yields a dual economic and social benefit. Factor membership cuts across country and professional role alike.

	Factor 1	Factor 2	Factor 3	Factor 4	Factor 5
Defining Q-sorts	12	23	5	20	4
Cumulative variance (%)	31	36	41	45	49

Farmers	3	8	2	7	2
Researchers	7	5	1	6	1
Technicians	2	10	2	7	1

Table 1: Summary of factor extraction and defining Q-sorts

Research Limitations

Q methodology generalises to the discursive space of the concourse, not to a population; the five countries reflect an existing project partnership rather than a sampling strategy for Mediterranean representativeness.

FROM ADOPTION PROPENSITY TO SCEPTICISM: BEHAVIOURAL PROFILES OF ITALIAN WINEGROWERS TOWARD PRECISION AGRICULTURE TECHNOLOGIES

Biondo, Adriano[1]; Maria Crescimanno[1]; Emanuele Schimmenti[1]; Mirabella, Claudio[1], Galati, Antonino[1]

[1] Department of Agricultural, Food and Forest Sciences, University of Palermo, Palermo, Italy

Keywords: precision viticulture; willingness to pay; technology acceptance; cluster analysis

Introduction

Growing environmental constraints, climate uncertainty, and the need for greater resource-use efficiency have increased interest in precision agriculture technologies (PATs) to improve farm resilience and reduce environmental impacts (Trendov et al., 2019). PATs are particularly relevant in viticulture, a sector with intensive fertilizer and pesticide use; notably, around 70% of fungicide use in the EU is attributable to viticulture (Eisenmann et al., 2023). Although site-specific management improves efficiency, yields, and grape quality, PAT adoption remains uneven. Research has mainly focused on technical and economic aspects, with limited attention to the beliefs and perceptions influencing winegrowers' adoption decisions (Sofia et al., 2025; Groher et al., 2020; González-Vivar et al., 2025). Previous studies show that PAT adoption is influenced by perceived usefulness, risk perceptions, and social norms, yet persistent heterogeneity in adoption highlights the need for more targeted policy and extension strategies (Tur Cardona et al., 2025). Against this background, this study aims to identify distinct belief-based profiles of Italian winegrowers regarding PATs and to characterise these groups according to familiarity with PATs, consortium-based access, willingness to pay, and socio-demographic and wineries characteristics using a cluster analysis approach.

Methodology and Methods

To address the research objectives, a two-step cluster analysis was performed on data obtained from a survey involving 272 Italian winegrowers. Clustering was based on seven standardized belief-related constructs: perceived usefulness (PU), perceived ease of use (PEOU), subjective norm (SN), risk perception (RISKPER), risk tolerance (RISKTOL), result demonstrability (RD) and image (IMG). A combined hierarchical and k-means cluster analysis was used to group respondents with similar attitudes and behaviors. Ward's method and squared Euclidean distance were applied, and ANOVA tested differences among clusters.

Findings and Contribution

Cluster analysis identified three segments of winegrowers. The first cluster, "Precision-oriented winegrowers," includes winegrowers with a strong propensity to adopt PATs, characterized by high levels of PU, PEOU, social norms SN, RD, and IMG, together with the highest WTP. Notably, 68.8% are willing to pay for at least one technology. "Pragmatic winegrowers" (Cluster 2) likewise demonstrate a favourable orientation toward PATs. However, their adoption stance appears more pragmatic and less socially motivated, as evidenced by lower SN and IMG effect relative to Cluster 1. "Risk-sensitive sceptics winegrowers" (Cluster 3) represents the most sceptical group, characterised by higher risk perception and the lowest WTP (30.9%). Clusters differ significantly in age, whereas no statistically significant differences emerge in education level or farm size. ANOVA confirmed significant between-cluster differences for all clustering variables (Table 1).

	Cluster		Error		F	Sig.
	Mean square between groups	df	Mean square within groups	df		
PU	101.322	2	0.790	269	128.22	0.000
PEOU	95.282	2	1.001	269	95.21	0.000

Table 1 - Analysis of variance (ANOVA) among and within clusters.

Conclusions

The results identify distinct clusters of winegrowers differing in age, familiarity with PATs, willingness to pay, and interest in consortium-based access. Older, less familiar winegrowers require targeted awareness and trust-building initiatives, while the other clusters appear more receptive to market- and consortium-based models. These findings should be interpreted considering the study's cross-sectional design, self-reported data, and non-probabilistic sample.

OF BLUE CRABS AND PINK OYSTERS: NARRATIVE REFRAMING AND GOVERNANCE CO-EVOLUTION AS DRIVERS OF SUSTAINABLE BUSINESS MODEL INNOVATION

Finotto, Vladi; Mauracher, Christine

Venice School of Management, Ca' Foscari University of Venice, Venice, Italy

Keywords: Sustainable business model innovation; Place-based business models; Strategic renewal; Agrifood transitions; Narrative reframing; Multi-stakeholder governance

Introduction

Regions whose economy is specialized in fishing and aquaculture face a structural challenge: how to initiate inclusive and durable transitions when small-scale firms and coastal communities operate under resource scarcity, carry identities tied to practices that are no longer ecologically or economically viable. A central but under-explored question for business and management scholarship is how marginal agrifood systems can redesign their business model along economic, environmental and territorial dimensions — that is, how a sustainable, place-based business model can emerge from crisis and become a vehicle for inclusive renewal and competitive resilience in challenging times.

We focus on firms located in the Sacca di Scardovari, a lagoon in the UNESCO Biosphere Reserve of the Po Delta (Veneto, Italy), where the invasive blue crab and climate change compromised the shellfish economy between 2021 and 2023, reducing the number of active fishers from roughly 1,500 to 980. The shock deepened territorial marginalisation but opened a window of opportunity for oyster aquaculture. Within three years, new firms entered the sector, incumbent institutions reconfigured, and a distinctive territorial product — the "Ostrica Rosa del Delta" — crystallized around a sustainable, place-based business model integrating premium food production, ecosystem services and slow tourism.

We argue that crisis-induced strategic renewal in marginal agrifood systems is made possible by the emergence of new firms whose business model is structured around two interrelated

processes. The first is a narrative reframing process through which new practices acquire cultural legitimacy and the meanings attributed to local products and professions are reconfigured: in our case the oyster shifted from non-native species to premium territorial product, carrier of cultural heritage and quantifiable provider of ecosystem services (water filtration, carbon capture). This enabled the simultaneous redesign of the three layers of the business model – economic, environmental and social and territorial. The second is a governance process: the co-construction of institutional arrangements able to sustain scale-up, regulate access to lagoon resources and coordinate competing interests between incumbents and new actors. Such a process requires close collaboration between firms and local institutions, in an attempt to foster the consolidation of a multi-stakeholder ecosystem. These two dimensions co-evolve: without new narratives, governance lacks legitimacy to mobilize stakeholders; without governance, the new business model concentrates benefits among pioneer firms and excludes the wider community.

The paper makes two contributions to business and management research. First, it develops an empirically grounded framework of crisis-induced sustainable business model innovation in marginal agrifood systems, where economic, environmental and territorial value are co-produced through the parallel reconfiguration of narratives and governance. Second, it identifies managerial and institutional mechanisms that enable inclusive scaling of place-based business models: cultural recognition schemes, collective territorial branding, institutional intermediaries bridging firm-level innovation and stakeholders, and funding architectures that transform pioneering business models into replicable templates for other marginal areas exposed to similar shocks.

Methods

The research combines semi-structured interviews with firm founders, institutional actors and local food operators, and analysis of policy documents, EU project materials, media coverage and market data. The analytical framework draws on the literature on sustainable place-based business models, value proposition redesign in agrifood firms, and stakeholder-driven governance of sustainability transitions. Respondents were selected among entrepreneurs (two oyster farmers, one restaurant owner), institutional representatives (three representatives from local promotion organizations), intermediary organizations (one respondent from the local consortium), managers of cooperative firms (four), until we reached theoretical saturation.

Interviews were transcribed and thematically analyzed together with texts from secondary sources.

Empirical findings

The 2015 UNESCO Biosphere Reserve designation acted as a critical resource for narrative transformation, offering a frame for place-based storytelling. Chef networks, national media and EU project funding accelerated the revaluation of the product and built the cultural infrastructure for new firm entry. At the governance level, the transition required reconfiguring pre-existing institutions: the fishers' consortium extended its mandate from shellfish concessions to oyster aquaculture, providing legal access to the lagoon and collective representation; the Delta Park emerged as a strategic intermediary mobilizing EU funding, with regional authorities contributing co-financing. This multilevel configuration allowed the new business model to scale beyond pioneer firms and constitute a genuine place-based food system.

SERVICE QUALITY PERCEPTIONS AT TOURIST DESTINATION AIRPORTS: ASPECT-BASED SENTIMENT ANALYSIS OF USER-GENERATED CONTENT AT GREEK ISLAND AIRPORTS

Korfiatis, Antonis[1]; Argyropoulou, Maria[1]
[1]Department of Tourism, Ionian University, Corfu, Greece

Keywords: airport service quality, aspect-based sentiment analysis, user-generated content, VADER.

Introduction

Airport service quality is a critical determinant of tourist satisfaction, representing an important experiential and service interaction point. Greece, welcoming approximately 32 million international tourists in 2023 and ranking fourth among EU destinations (SETE, 2024), relies on a geographically dispersed network of island airports to manage inbound leisure demand. Yet conventional measurement approaches—the SERVQUAL framework and the Airports Council International (ACI) Airport Service Quality (ASQ) programme—are resource-intensive, temporally limited, and difficult to scale. The proliferation of user-generated content (UGC) on platforms such as Google Maps, combined with advances in natural language processing, opens opportunities for scalable quality evaluation.

Purpose, Aim and Objectives

This study aims to evaluate service quality perceptions at Greek tourist destination airports through large-scale aspect-based sentiment analysis (ABSA) of UGC. Four research questions are addressed: (1) Which service aspects do tourists most frequently discuss? (2) How does overall sentiment vary across airports? (3) Which dimensions drive satisfaction and dissatisfaction? (4) What dominant topics emerge from topic modelling and how do they relate to airport-level performance?

Literature Review and Theoretical Framework

Airport service quality research is grounded in the SERVQUAL framework (Parasuraman et al., 1988) and the ACI ASQ programme (Airports Council International, 2022), which

identify cleanliness, staff behaviour, queuing efficiency, facilities, and physical infrastructure as core quality dimensions. Tourist destination airports represent a distinct typology (Graham, 2014): they serve predominantly leisure travellers under significant capacity constraints. The adoption of UGC platforms has created an alternative to survey data (Xiang and Gretzel, 2010), and advances in NLP—particularly the VADER lexicon-based sentiment analyser (Hutto and Gilbert, 2014) and Latent Dirichlet Allocation (LDA) topic modelling (Blei et al., 2003)—have made large-scale textual analysis feasible.

Methodology

A corpus of 118,943 Google Maps reviews for 15 Greek airports (2013–February 2025) was collected, of which 42,730 contained substantive textual content. ABSA was conducted across six dimensions derived from SERVQUAL and ACI ASQ: cleanliness, staff behaviour, queuing and waiting times, facilities, physical infrastructure, and operational organisation. LDA topic modelling with eight components was applied to identify recurring narrative patterns.

Findings and Contribution

Findings reveal pronounced heterogeneity across airports. Small island airports—Kefalonia (mean VADER compound = 0.200) and Lesvos (0.193)— outperform high-traffic destinations, with Mykonos (−0.006), Santorini (−0.013), and Kos (−0.055) recording negative mean sentiment consistent with overtourism-driven service degradation. Queuing and waiting times constitute the most frequently discussed aspect (22,951 mentions) and the most universally negative dimension. Staff behaviour remains consistently positive even at poorly rated airports, suggesting frontline personnel maintain quality under operational stress.

Originality and Value

This study provides quantified evidence that overtourism pressures at premium island destinations manifest directly in negative online sentiment, with immediate implications for airport capacity policy and demand management. Methodologically, the study demonstrates that UGC-based ABSA constitutes a scalable, cost-effective complement to conventional survey instruments.

Research Limitations

The study is restricted to English-language reviews, potentially excluding non-Anglophone tourist segments. VADER is a general-purpose lexicon not domain-adapted to the aviation context, and reviews represent a self-selected population of motivated contributors, which may skew sentiment distributions toward extreme experiences.

Theoretical and Practical Applications-Implications

The findings support demand-management interventions, including slot controls and seasonal airport charges, at chronically overcrowded island airports. The strong performance of small regional airports offers a model for scalable quality improvement independent of facility size. For airport operators and tourism policymakers, UGC-based monitoring provides continuous, granular quality intelligence at minimal cost.

Keywords: lifestyle entrepreneurship; rural tourism; community embeddedness; social innovation; territorial sustainability; place identity

Lifestyle entrepreneurship (LE) has become increasingly relevant in rural tourism, especially in low-density territories where conventional economic models struggle with depopulation, ageing, limited employment, and weak diversification. Unlike conventional profit-oriented entrepreneurs, these actors prioritise personal fulfilment, autonomy, quality of life, authenticity, and emotional connection to place, while creating value for local communities (Cunha et al., 2020). This study examines purpose-driven entrepreneurship in rural tourism as a socially embedded process through which personal values, community relations, and local resources are transformed into innovative tourism practices.

Although LE has received growing academic attention, important gaps remain. Existing studies often emphasise individual motivations, while giving less attention to community embeddedness, and community engagement is frequently discussed in broad terms, without clear operationalisation or indicators. Moreover, innovation in rural lifestyle entrepreneurship is often described descriptively, rather than connected to innovation frameworks. Addressing these gaps, this study investigates how LE in low-density

territories combine lifestyle aspirations, community embeddedness, and place identity to generate socially meaningful and territorially grounded innovation.

The research aims to: (1) analyse motivations driving LE in rural tourism; (2) explore how innovation emerges from entrepreneurial values, local knowledge, and territorial embeddedness. A qualitative multiple case study design was adopted, focusing on three tourism ventures in the Planalto Mirandês region of Portugal, a low-density territory with strong cultural and environmental assets but structural vulnerabilities. Data were collected through semi-structured interviews, document analysis, and field observations, and analysed through thematic analysis following Braun and Clarke's procedures (Braun & Clarke, 2006). The limited number of cases enables analytical depth rather than statistical generalisation; therefore, findings are exploratory and require future quantitative validation across broader and more diverse rural settings.

Findings show that LE is mainly driven by intrinsic motivations, including passion, personal fulfilment, autonomy, search for meaning, and emotional attachment to place. These motivations reflect the interaction between dissatisfaction with conventional work patterns and the attractiveness of rural territories (Cunha et al., 2020). Community engagement emerged as a central dimension of entrepreneurial practice. Drawing on Bowen et al. (2010), the study distinguishes between transactional engagement, based on occasional exchanges with local actors; transitional engagement, involving regular cooperation and mutual support; and transformational engagement, characterised by co-creation, shared decision-making, and visible community benefits.

Innovation appears as context-dependent and embedded in local resources rather than primarily technological or growth-oriented. The cases suggest that rural lifestyle entrepreneurs innovate by reinterpreting traditions, preserving vernacular architecture, creating educational and experiential tourism products, mobilising local narratives, and designing business models aligned with sustainability. These practices can be understood through complementary innovation frameworks: social innovation (community empowerment and cohesion); cultural innovation (reinterpretation and identity); product and experience innovation; and business model innovation (Dias & Silva, 2021).

The contribution includes an integrated view of LE in rural tourism as a purpose-driven, community-embedded, and territorially situated phenomenon. Its academic contribution lies in clarifying the relationship between motivations, transformational engagement,

innovation, and territorial sustainability. From a policy perspective, findings suggest actionable support mechanisms, including simplified administrative procedures, micro-funding, collaborative governance training, local partnerships, and destination policies that recognise LE as agent of rural regeneration.

EXPLORING THE ROLE OF SERVICESCAPE IN SHAPING EMPLOYEE EXPERIENCE IN HOSPITALITY SETTINGS

Papadopoulou, Georgia[1]; Argyropoulou, Maria[2]; Siomkos, George[1]
[1]Department of Business Administration, Athens University of Economics and Business, Athens, Greece
[2]Department of Tourism, Ionian University, Corfu, Greece

Keywords: servicescape, employee experience, hospitality industry, environmental psychology, Greece.

Introduction

Hotels operate within physical environments that shape employees' daily work practices, perceptions, and emotional states. Despite growing interest in Employee Experience (EX), limited empirical research has examined how the servicescape (Bitner, 1992) contributes to employees' holistic experience at work, particularly in hospitality settings. This gap is especially significant given workforce challenges faced by the hospitality sector, including staffing shortages, seasonality, and increased operational pressure. By focusing exclusively on employees and conceptualising EX as a composite construct, the study contributes to employee-centric servicescape research and provides context-sensitive insights for hospitality management.

Purpose, Aim and Objectives

The study aims to examine the role of servicescape in shaping Employee Experience in hospitality settings. The objectives are: (1) to conceptualise the servicescape as a multidimensional internal work environment; (2) to empirically assess the relationship between servicescape dimensions and Employee Experience; and (3) to derive context-sensitive implications for hospitality management under conditions of operational pressure.

Literature Review and Theoretical Framework

Building on servicescape and Employee Experience literature, this study proposes that the physical and atmospheric characteristics of hotel environments positively influence employees'

overall experience at work (Bitner, 1992; Wakefield and Blodgett, 1996; Maylett and Wride, 2017). The main hypothesis posits that servicescape dimensions are positively related to Employee Experience (H1), with sub-hypotheses proposing positive relationships with employee satisfaction (H1a), engagement (H1b), and discretionary effort (H1c).

The model is grounded in Social Exchange Theory (Blau, 1964), which posits that benefits provided by one party create an obligation to reciprocate. This reciprocal logic is reflected in the psychological contract, encompassing employees' beliefs regarding organisational promises, obligations, and expectations (Conway and Briner, 2005).

Methodology and Methods

The study draws on a structured employee survey conducted between May and July 2025 in four- and five-star hotels across Greece. Servicescape perceptions followed Kaminakis et al. (2019). Employee Experience was modelled as a second-order construct comprising satisfaction, engagement, and discretionary effort, measured using validated scales. Path analysis was employed to test the hypothesised relationships.

Main Findings and Contribution

Partial support was found for the main hypothesis. Ambiance and cleanliness exert statistically significant positive effects on Employee Experience, while functionality shows a positive but marginally non-significant relationship. Additional analyses reveal demographic and organisational differences, with higher evaluations reported by female and older employees and in higher-rated hotels. The study advances employee-centric servicescape research by demonstrating that not all environmental attributes exert equivalent influence on Employee Experience.

Originality and Value

By distinguishing between servicescape dimensions that actively support positive experiential evaluations and those that primarily establish acceptable working conditions, the findings offer a refined theoretical understanding of how workplace environments shape employees' experience in hospitality settings.

Research Limitations

The focus on four- and five-star hotels in Greece limits generalisability to other accommodation types. The cross-sectional design captures relationships at a single point in time; consequently, causal inferences cannot be firmly established, nor can changes in Employee Experience over time be observed.

Theoretical and Practical Applications and Implications

The results align with the stimulus–organism–response framework, which posits that environmental stimuli shape affective and cognitive responses that subsequently influence behavioural outcomes. The findings underscore the importance of a context-sensitive approach to servicescape management, with practical implications for hotel operators seeking to improve employee retention and wellbeing.

COVERT RESEARCH FOR SENSITIVE STUDIES: AN ETHNOGRAPHIC ACCOUNT

Leonidas Efthymiou[1], Andrew Michael[2], Epaminondas Epaminonda[1], Yianna Orphanidou[1], Alexander Pakhalov[1]

[1] University of Nicosia, Nicosia, Cyprus

[2] Department of Management and Marketing, American University of Cyprus, Larnaca, Cyprus

Keywords: Ethnography, Covert Research, Luxury Hotel, Methodology

Introduction

This study examines the ethical and methodological challenges of researching workplace resistance in a luxury hotel through ethnography. It focuses on a four-month study that began with covert participant observation and later moved towards gradual disclosure and overt research. The issue is important because formal ethical procedures rightly prioritise informed consent and transparency, yet fully overt access may alter behaviour or prevent the observation of concealed, risky, and sensitive practices.

Purpose, Aim and Objectives

The purpose of this study is to assess whether an initial covert phase of participant observation can be methodologically necessary and ethically defensible when researching workplace resistance. The aim is to examine how gradual disclosure affects trust, access, consent, confidentiality, and data quality. Its objectives are to: examine the rationale and ethical implications of covert entry; and consider the contribution of a context-sensitive approach to research ethics.

Literature Review and Theoretical Framework

The study draws on literature concerning workplace resistance, labour process theory, and ethnography. Sensitive research involves topics that may expose participants to risk through the collection or disclosure of information (Lee, 1993). Workplace resistance is sensitive because employees may face stigma, disciplinary action, greater managerial surveillance, or dismissal if their conduct is revealed.

Labour process theory highlights the continuing tension between managerial control and worker agency. Resistance may include humour, cynicism, withdrawal, working to rule, informal dissent, knowledge concealment, or minor acts of non-compliance. However, such behaviour can be difficult to distinguish from boredom, play, or routine dissatisfaction (Ackroyd and Thompson, 1999). Ethnographic immersion is therefore useful because it enables conduct to be interpreted within its organisational and relational context.

Goffman's distinction between frontstage and backstage behaviour also informs the analysis. Hotel employees may perform carefully managed identities in guest-facing settings while expressing critique, frustration, and solidarity in staff-only areas. These backstage interactions are particularly relevant to understanding concealed forms of resistance.

Methodology and Methods

The study used ethnography, specifically participant observation. The researcher entered a luxury hotel as an employee and worked alongside staff. This insider position enabled observation of routines, interactions, conflicts, informal conversations, and unguarded workplace practices.

Data collection involved observation, informal discussions, opportunistic and arranged interviews, and social interaction with workers outside the hotel. Field notes were initially recorded discreetly and later expanded into a detailed observational diary. To reduce potential harm, names were coded, identifying details were removed, and sensitive data were securely managed.

Findings and Contribution

The findings suggest that the initial covert phase enabled access to subtle and routine forms of resistance that may have been unavailable through fully overt research. These included informal complaints, humour, negotiated compliance, concealed actions, and everyday expressions of dissatisfaction. Participants appeared more willing to discuss sensitive experiences after the researcher had worked alongside them and was no longer perceived as an outsider or potential management representative.

Originality and Value

The study offers a reflexive insider account of research that moved from limited concealment to overt engagement in a luxury-hospitality workplace. It shows how ethical dilemmas emerge in practice and argues that ethical evaluation should consider necessity, proportionality, confidentiality, participant protection, and potential harm alongside formal consent procedures.

Research Limitations

The study concerns one luxury hotel and does not seek statistical generalisability. The researcher's dual role as employee and ethnographer may have influenced relationships and interpretation. The absence of full initial informed consent remains an important ethical limitation, while some observed practices may be open to alternative interpretations.

Theoretical and Practical Applications and Implications

The study supports labour process research by demonstrating that resistance among emotional and aesthetic labourers can be concealed within ordinary workplace interactions. For researchers and ethics committees, it highlights the need for careful, case-specific assessment of sensitive studies where full prior disclosure may compromise research access or increase risks for participants.

MORE THAN JUST EFFORT: COGNITIVE PATHWAYS TO THE IKEA EFFECT

Lamprinakos, Grigorios[1]; Halkias, Georgios[2]; Christofi, Michael[3]

1 Department of Marketing, University of Birmingham, Birmingham, UK
2 Department of Marketing, Copenhagen Business School, Copenhagen, Denmark
3 Faculty of Economics and Business Administration, Vilnius University, Vilnius, Lithuania

Keywords: IKEA effect, consumer effort, cognitive responses, online reviews, Elaboration Likelihood Model (ELM)

Prior research on the IKEA effect shows that self-invested effort often enhances product valuation, attitudes, and downstream behavioral intentions, yet it remains less clear when effort backfires and through which cognitive mechanism this occurs (Atakan et al., 2014; Fuchs et al., 2010; Norton et al., 2012; Pelled et al., 2026; Sarstedt et al., 2017). Drawing on the Elaboration Likelihood Model (Petty and Cacioppo, 1986), we address this gap by proposing that effort does not uniformly increase evaluations; rather, it amplifies the evaluative consequences of consumers' self-generated thoughts.

Across four experiments - one in-class study, one field experiment, and two online experiments with Prolific participants, three of which were pre-registered - we use a 2 x 2 factorial design to examine how effort and cognitive response valence jointly shape attitudinal and behavioral outcomes. Studies 1 and 2 establish the core pattern by contrasting favorable versus unfavorable cognitive responses under high- versus low-effort conditions across classroom and field settings. Studies 3 and 4 then isolate the negative pathway more precisely by contrasting negative versus neutral cognitive responses in pre-registered online experiments.

The findings both replicate and reverse the well-established IKEA effect. When consumers generate favorable cognitive responses, high effort enhances attitudinal and behavioral outcomes. However, when unfavorable cognitive responses emerge, high effort amplifies their negative evaluative consequences, producing more unfavorable attitudinal and behavioral outcomes. Further, in the two pre-registered online experiments, high effort intensifies the detrimental effects of negative relative to neutral cognitive responses, whereas under low-effort conditions these differences are attenuated.

These findings extend the IKEA effect beyond the dominant view that effort generally increases valuation by identifying a new mechanism: effort polarizes evaluations by amplifying the impact of consumers' self-generated thoughts. Managerially, the results suggest that self-assembly and co-creation strategies are most effective when firms first ensure favorable cognitive inputs - such as positive product information, supportive review

environments, and clear assembly cues - because effort can otherwise magnify dissatisfaction and reduce favorable behavioral responses.

Keywords: Virtual Brand Rituals, Digital Consumer Behavior, Ritual Adoption, Brand Experience Design, Social Contagion, Digital Transformation, Mixed-Methods, Consumer Ritual Theory

Introduction

Rituals transform ordinary consumption into meaningful experiences through prescribed behaviors, artifacts, and symbolic actions. In consumer research, brand rituals have been shown to deepen customer relationships and elevate mundane practices into sacred moments. While physical brand rituals are well documented, digital environments introduce new challenges and opportunities for translating ritual engagement into virtual contexts. This study examines how brands design and diffuse virtual rituals to enhance consumer experiences and strengthen brand relationships in digital environments.

Purpose, Aim, and Objectives

The study addresses two central research questions:

1. How can traditional principles of ritual design be effectively adapted for virtual brand experiences?
2. What mechanisms facilitate consumer learning and adoption of virtual brand rituals?

The aim is to develop a theoretical framework for virtual ritual design and adoption that bridges consumer ritual theory with digital affordance and contagion models.

Literature Review and Theoretical Framework

Consumer ritual theory (Rook, 1985; Belk et al., 1989) highlights artifacts, scripts, roles, and audiences as key dimensions of ritualized consumption. Digital transformation challenges these

assumptions. Virtual artifacts acquire meaning through personalization, visibility, and archival value (Belk, 2013). Digital affordance theory (Leonardi & Vaast, 2017) identifies immediacy, replicability, persistence, and visibility as crucial enablers of ritual performance in virtual spaces. Brand experience design frameworks (Brakus et al., 2009; Schmitt et al., 2015) emphasize sensory, affective, intellectual, behavioural, and relational dimensions. These dimensions must be reinterpreted in digital contexts. Psychological mechanisms such as anxiety reduction, heightened attention, and anticipation (Hobson et al., 2018) remain central but require digital analogues. Finally, social contagion theory (Centola, 2018) explains how rituals diffuse through repeated exposure and social reinforcement in digital networks.

Methodology and Methods

A sequential mixed-methods design was employed:

- **Phase 1:** content analysis of 30 virtual brand rituals using the Virtual Brand Ritual Framework (VBRF) to identify design and engagement patterns.
- **Phase 2:** Industry informants' interviews exploring ritual design strategies.
- **Phase 3:** Consumers' interviews triangulating the framework through participants' ritual experiences and diffusion behaviors.

Main Findings and Contribution

Preliminary findings indicate that effective virtual rituals combine familiar ritual elements with digital affordances, including personalization, visibility, and community validation. The study introduces the Virtual Brand Ritual Framework (VBRF). It explains how ritual design and platform affordances shape experiential, psychological, and engagement outcomes. The framework also examines how rituals spread through virtual networks. Additionally, it provides practical guidance for marketers designing scalable digital ritual experiences.

Originality and Value

This research is among the first to systematically investigate virtual brand rituals. It bridges ritual theory with digital consumer behavior. The study also offers practical guidance for designing authentic, engaging, and scalable ritual experiences in digital environments.

Research Limitations

Limited industries and platforms that may reduce the study's generalizability.

Theoretical and Practical Applications and Implications

Theoretically, the study explains how digital artifacts become sacred and how rituals diffuse in virtual networks. Practically, offers a framework for designing virtual brand rituals that encourage emotional engagement and community participation.

Keywords: Artificial Intelligence Adoption, Smart Social Media, Sustainable Digital Marketing, Sustainability, PRISMA Systematic Review, Technology Organization Environment Theory.

Abstract

Purpose – To explore how AI Tools can be used for Smart Social Media Platform Towards a more Sustainable Digital Marketing using A PRISMA Literature Review.

Design/methodology/approach – This research reviews PRISMA literature on how AI technologies promote smart social media platforms and sustainable digital marketing. Based on 67 peer-reviewed papers from 2020 to 2025, the review synthesizes digital marketing, social media, AI adoption, sustainability, and the Technology Organization Environment framework.

Findings – AI-driven predictive analytics, customization engines, and conversational interfaces improve marketing efficiency, customer engagement, and ESG alignment. The TOE paradigm also emphasizes technology capabilities, organizational preparation, and environmental pressures as AI adoption factors. Despite these benefits, ethical governance, data protection, and cultural adaption remain issues.

Originality/value – The study emphasizes the necessity for strong governance structures to integrate AI responsibly in marketing ecosystems.

Practical implications – This research bridges literature and practice to give marketers, policymakers, and academics concrete ideas for using AI for sustainable, inclusive, and ethical digital marketing.

Introduction

In today's hyper-connected digital landscape, social media (SM) platforms play a vital role in modern marketing strategies. They serve as essential tools for enhancing brand visibility, fostering customer engagement, and enabling data-informed decision-making (Shaheen, 2025). Despite their considerable potential, these platforms face enduring challenges that limit their long-term sustainability and overall effectiveness (Suprayitno, 2025). Many enterprises (SMEs) grapple with issues such as high marketing expenses, ineffective resource distribution, unclear marketing goals, and a lack of coherent content strategies that align with audience expectations (Sharabati et al., 2024). Additionally, many businesses invest heavily in digital tools without evaluating their outcomes or considering their alignment with broader environmental, social, and governance (ESG) objectives.

Kumar et al., (2025) claimed that classical marketing practices are often overly focused on short-term visibility metrics likes, shares, and impressions. This leads to inefficient, resource-intensive strategies that lack proper targeting and do not support ESG goals (Dwivedi et al., 2021). Moreover, a significant gap exists in integrating intelligent, sustainable marketing practices and Artificial Intelligence (AI) powered systems for building resilient and responsible SM ecosystems (Floridi & Cowls, 2019). In response to these challenges, smart AI tools provide transformative capabilities for building sustainable digital platforms.

Albeit the increasing interest in AI-driven SM marketing, current research shows a deficiency of contextual understanding of the influence of socio-economic and cultural aspects on AI adoption (Kumar et al., 2025). Ethical issues, including data privacy, algorithmic bias, and governance frameworks, remain inadequately examined, especially concerning sustainability goals (Li, 2025). Furthermore, the lack of interdisciplinary models connecting AI to SM, digital marketing, and sustainability underscores the necessity for more research related to this matter (Garg et al., 2025). Hence, come the following research questions:

- *What could be the challenges and difficulties faced within the classical SM and digital marketing strategies?*
- *What could be the factors affecting the adoption of AI tools for smart SM and sustainable digital marketing?*

Within this context, and through a PRISMA systematic literature review (SLR), this paper aim to study the existing literature between 2020 and 2025 about SM, digital marketing, and AI tools for digital marketing. This will help exploring the gaps and challenges that exist in the classical SM strategies and digital marketing and how the latest AI tools can fill these gaps and overcome the challenges while ensuring long-term sustainable strategies, based on the Technology-Organization-Environment (TOE) Framework that studies the factors that affect the adoption of AI tools in digital marketing.

The paper highlights the literature search methods and analysis based on the PRISMA SLR with inclusion and exclusion criteria along with the PRISMA flow diagram. This is followed by the literature found related to each key theme of our research: digital marketing, SM, AI and AI adoption, sustainability, and the TOE framework. The paper ends with a conclusion highlighting its implications, limitations, and research needed for the future.

Literature Search Method and Analysis

The PRISMA systematic literature review (SLR) method aims to improve the thoroughness, openness, and quality of systematic reviews (Page et al. 2021). The search formula employed is (“Digital Marketing” OR “Marketing Strategy”) AND (“Social Media Tools” OR “AI in Social Media”) AND (“AI Adoption”) AND (“Sustainability in Marketing”) AND (“Technology-Organization-Environment Framework”). We applied the following inclusion and exclusion criteria:

Aspect	Inclusion Criteria	Exclusion Criteria
Source	EBSCO and Scopus databases (Q3 journals and above)	Non-indexed or lower-ranked sources
Type	Peer-reviewed articles	Conference abstracts, theses, editorials, opinion pieces, grey literature
Year	Published from 2020 onwards	Published before 2020
Language	English	Non-English
Relevance	Focus on AI adoption, DEI, and sustainable societal practices	Not aligned with research objectives
Quality	Robust methodology and clear findings	Weak methodology or inconclusive findings

Table 1: Inclusion and exclusion criteria of the PRISMA approach.

Data extraction from the selected studies adhered to pre-established guidelines provided by PRISMA. The following data were mainly extracted from the selected articles: title, author, year, journal, research question and specific aims, conceptual framework, hypothesis, research methods or study type, and concluding points. Special attention was paid to the methodology to organize studies by study type category in the review results section. Furthermore, technical characteristics of the papers such as the type of the paper, the author(s), the year of publication, etc. were extracted. The use of PRISMA guidelines for data extraction has been demonstrated in various systematic reviews, such as the study by Liberati et al. (2009), which highlighted the importance of standardized data extraction to ensure consistency and reliability.

For the selection process, electronic databases including EBSCO - ALL and Scopus were used, focusing on journals ranked Q3 and above. The search covered research published between 2020 and 2025. This period was chosen to ensure the studies reflect current understanding of the subject. Some older publications were included when they provided essential historical perspective. The initial articles were screened using key inclusion criteria. For inclusion, articles had to be full-text publications in peer-reviewed journals. Book chapters, conference papers, extended abstracts, book reviews, and non-English publications were excluded. Duplicate and irrelevant articles that did not align with the research objectives were also removed.

The PRISMA flow diagram in appendix 1 illustrates the article selection process, from initial search results to final inclusion in the systematic literature review.

Results of the PRISMA Systematic Literature Review

The analysis of the PRISMA approach is structured around the principal themes that emerged from the evaluation process.

Digital Marketing

Over the past decade, digital marketing has evolved from simple online advertising to complex ecosystems that include SM, mobile platforms, and data analytics; this shift was part of the digital transformation of marketing which required organizations to adapt to stay competitive (Basimakopoulou et al., 2022). Wahyuni (2024) found that SM marketing, content marketing, and analytics dominate customer engagement. According to Pratama (2025), digital technologies and marketing processes interact, yet digital transformation studies lacked employee-centric

viewpoints. Digital marketing capabilities, especially when combined with digital tools, boosted business performance and customer engagement; these examples demonstrate the strategic importance of digital marketing for innovation and customer-centricity in dynamic company contexts.

Digital marketing has evolved into a multi-platform ecosystem that utilizes SM, interactive content, analytics, and omnichannel strategies to enhance customer engagement and deliver personalized experiences across multiple touchpoints (Dave & John, 2025; Kumar et al., 2025). However, organizations continued to face challenges such as data privacy concerns, skill shortages, infrastructural limitations, and resistance to technological change, which can hinder successful digital transformation (Pratama, 2025). Additional concerns included regulatory compliance, algorithmic transparency, and cybersecurity risks, particularly in highly competitive markets (Alkhalfan & Al Mubarak, 2025). Therefore, organizations must adopt strong governance mechanisms, invest in continuous upskilling, and implement adaptive strategies to ensure sustainable and ethical digital marketing practices (Patro, 2025).

Social Media

SM has transformed communication and marketing, becoming a key tool for brand engagement and customer interaction. Bartoloni and Ancillai (2023) found that SM marketing research has progressed from fragmented studies to integrated frameworks linking inputs, contextual factors, and outcomes. Similarly, Wirtz and Balzer (2023) described the evolution of SM marketing through four phases, emphasizing the importance of considering both consumer and managerial perspectives. Recent studies also highlighted challenges in evaluating SM effectiveness. Ascani and Ancillai (2025) argued that traditional metrics are insufficient for measuring interactive SM activities, while Rachmand and Dwita (2025) and Goyal (2024) demonstrated the importance of engagement-driven content and clear strategic objectives in achieving marketing success.

The emergence of "Smart SM" has further expanded the capabilities of these platforms through AI and advanced digital technologies. Liao et al. (2021) explained that AI-powered features such as sentiment analysis, misinformation detection, and inclusive design have transformed SM into influential socio-technical systems. Likewise, Żyminkowska and Zachurzok-Srebrny (2025) highlighted the role of AI in enabling real-time personalization, chatbots, and predictive analytics. Hasanuzzaman et al. (2025) and Leblanc and Roux (2024) further emphasized the growing

significance of AI tools in enhancing SM management and user engagement. Together, these studies suggest that organizations need strong strategic and measurement frameworks to maximize the benefits of increasingly intelligent SM platforms. The next section covers the AI for SM and digital marketing.

Artificial intelligence

Artificial Intelligence (AI) refers to the ability of machines to simulate human cognitive functions, including learning, reasoning, and problem-solving, enabling organizations to automate complex tasks and improve decision-making processes. Recent advancements have expanded AI applications across sectors such as healthcare, finance, marketing, autonomous systems, and natural language processing, making it a key driver of innovation and digital transformation (Savita et al., 2025).

In marketing, AI has become a strategic technology that enhances predictive analytics, customer relationship management, conversational commerce, and personalized consumer experiences (Jain & Kumar, 2024). AI-powered tools such as recommendation systems, chatbots, machine learning, and natural language processing have transformed how firms engage with customers, enabling real-time optimization, hyper-personalization, and improved campaign performance (Zhou & Jiang, 2025; Ziakis & Vlachopoulou, 2023). Frameworks such as the AI-Augmented Marketing Framework further highlight AI's role in personalized interaction, campaign automation, content creation, and ethical governance (Sundari et al., 2025). However, challenges related to organizational readiness, talent shortages, privacy concerns, and consumer trust continued to limit broader adoption (Masnita et al., 2024; Badawy et al., 2025; Spais & Chryssochoidis, 2025).

AI has also significantly enhanced SM marketing through predictive analytics, sentiment analysis, influencer analytics, content moderation, recommendation systems, and disinformation detection (Lyulyov et al., 2025; Leblanc & Roux, 2024). Studies showed that AI-driven personalization can improve consumer engagement, trust, satisfaction, and conversion rates, providing firms with a strong competitive advantage (Lyulyov et al., 2025). Nevertheless, concerns regarding algorithmic bias, data privacy, and ethical data use remained prominent, highlighting the need for transparent governance and responsible implementation to ensure sustainable and inclusive digital marketing transformation (Kumar el al., 2025).

Technology-Organization-Environment (TOE) Framework

The TOE framework is one of the most widely used models for explaining technology adoption and digital transformation (Tornatzky and Fisher, 2020). Recent studies confirmed its relevance in examining emerging technologies, organizational readiness, and external influences across different industries (Alsharif et al., 2023; Oliveira et al., 2022). Its flexibility and predictive power continued to make it a valuable framework for technology adoption research (Al-Qirim et al., 2024).

The TOE framework comprises three dimensions: technology, organization, and environment (Alsharif et al., 2023). Technology-related factors include compatibility, complexity, and perceived benefits, while organizational factors involve leadership support, resources, and culture (Al-Qirim et al., 2024). Environmental factors such as competition, regulations, and market uncertainty also play a significant role in shaping adoption decisions (Oliveira et al., 2022). Research further showed that organizations in highly regulated sectors are particularly influenced by environmental pressures when adopting new technologies (Alsharif et al., 2023). The figure below shows the TOE framework for AI tools adoption in digital marketing.

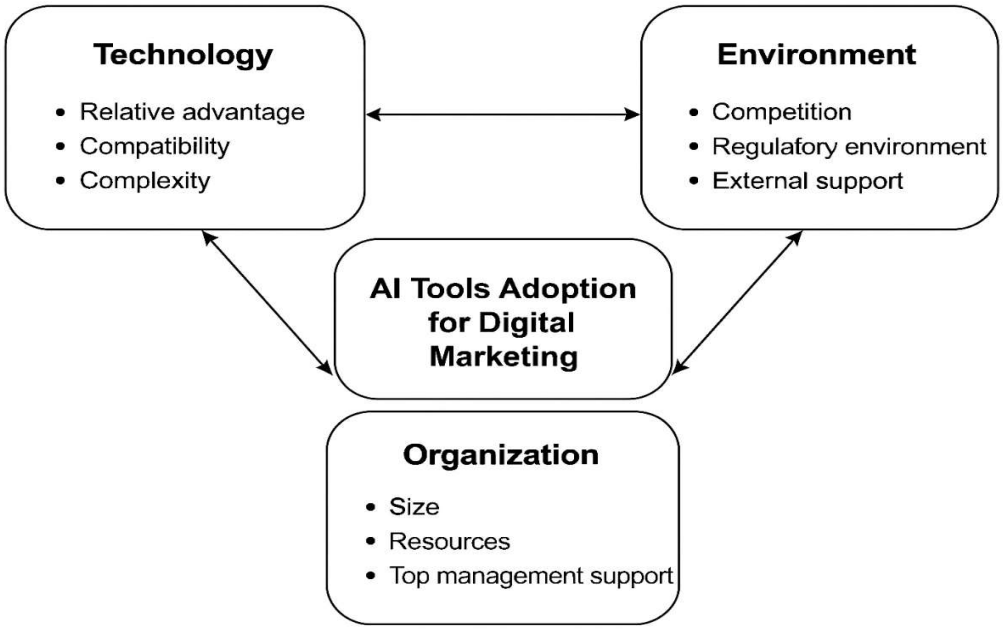

Figure 1: TOE framework for AI tools adoption in digital marketing (Tornatzky and Fleischer, 1990).

The TOE framework provides a useful lens for understanding AI adoption in digital marketing and smart SM. The technological dimension highlights AI capabilities such as personalization,

predictive analytics, and automation, while organizational factors such as leadership support, resources, and digital readiness influence successful implementation (Sundari et al., 2025; Ziakis & Vlachopoulou, 2023). Environmental factors, including competitive pressure and regulatory requirements, further drive AI adoption in SM and digital marketing platforms (Lyulyov et al., 2025). However, despite its strong predictive value, the TOE framework may not fully capture important issues such as ethical governance, transparency, customer trust, and sustainability, suggesting the need to extend the model beyond efficiency-focused adoption toward responsible AI innovation.

Sustainability

Sustainability is increasingly recognized as a strategic pillar in marketing, aiming to balance environmental, social, and economic goals while meeting present needs without compromising future generations. Recent studies showed that sustainable marketing extends beyond green product claims to include digital enablement, transparency, and responsible consumer engagement (Kumar et al., 2025). Technologies such as AI, IoT, blockchain, and digital platforms are further enhancing sustainable marketing practices and consumer experiences (Bindeebaa et al., 2025).

Despite growing interest, research highlighted several challenges in sustainable digital marketing. Studies reported inconsistencies in defining green initiatives, limited assessment of actual consumer behavior, and variations in methodological rigor (Gündüzyeli, 2025). While SM and AI support real-time engagement and marketing resilience, they also raise concerns related to privacy, bias, and ethical governance (Samuels, 2025).

Recent evidence suggested that AI can contribute to environmental, economic, and social sustainability through personalization, analytics, accessibility, and responsible consumption initiatives (Gündüzyeli, 2025). AI-supported transparency, eco-branding, and ethical data practices can strengthen consumer trust and sustainable decision-making (Li, 2025). However, effective implementation requires robust ethical oversight, process digitalization, and governance mechanisms to ensure long-term sustainability outcomes.

AI tools adoption for sustainable digital marketing practices

The PRISMA SLR showed that AI can be used for “social good” in marketing by reducing wasteful exposures, improving relevance, and improving societal/environmental outcomes if governance

balances personalization with fairness, transparency, and data minimization (Hermann, 2022). Organizations are increasingly adopting AI to demonstrate measurable environmental and social impacts, aligning marketing activities with ESG objectives, investor expectations, and responsible business practices (Lee et al., 2025). However, adoption alone is insufficient, as firms require appropriate governance, assessment mechanisms, and organizational maturity to achieve sustainable outcomes (Song & Majeed, 2023). AI-enabled personalization and natural language processing can further enhance consumer perceptions and loyalty toward sustainable brands, provided that ethical data practices and transparent AI models are maintained (Garg et al., 2025).

AI also contributes to sustainability by improving resource efficiency, emissions management, traceability, and campaign effectiveness through demand forecasting, recommendation systems, chatbots, and advanced analytics (Stallone et al., 2021). Studies emphasized that explainable AI, privacy-preserving analytics, and ethics-by-design approaches were essential for minimizing bias and ensuring responsible AI deployment (Kumar et al., 2025; Smith & Jones, 2023). Furthermore, digitalization, supply chain visibility, and AI-driven analytics can reduce waste and support ESG performance across the marketing value chain (Kumar et al., 2025). Collectively, these findings suggest that the sustainability benefits of AI depend not only on technological capabilities but also on strong governance, accountability, and ethical oversight. Table 2 below answers the research questions highlighted in the introduction.

Research Question	Synthesized Answers from PRISMA SLR
RQ1: Challenges & difficulties in classical SM/digital marketing	Over-reliance on short-term visibility metrics (likes, shares) with weak linkage to long-term value or ESG; fragmented omnichannel execution; skill shortages and organizational resistance; privacy and data-governance gaps; difficulty measuring SM performance with conventional metrics; resource waste from untargeted exposures and redundant impressions.
RQ2: Factors affecting AI-tool adoption for smart & sustainable digital marketing (TOE)	**Technology:** perceived benefits (personalization, predictive analytics, automation), compatibility with martech stack, complexity, need for explainability. **Organization:** leadership support, governance maturity, resources/talent, digital capabilities, risk culture. **Environment:** regulatory/compliance pressure, ESG scrutiny, competitive intensity, platform dynamics. These factors jointly determine responsible, scalable AI use in SM.

Table 2: Synthesized Research Questions Answers from PRISMA SLR

The PRISMA review highlighted that digital marketing has advanced rapidly through AI, SM, and sustainability initiatives. However, much of the existing research remains heavily conceptual, with

limited empirical validation. Furthermore, critical issues such as customer trust, employee perspectives, data privacy, algorithmic bias, and transparency remained underexplored despite their importance to long-term success. The findings also suggested that while AI-driven personalization and predictive analytics improve engagement and ROI, challenges related to organizational readiness, talent shortages, and regulatory compliance persisted. Although AI can support sustainability and ESG goals, weaknesses in governance, ethical oversight, and methodological rigor continued to limit its full potential, emphasizing the need for more inclusive and responsible digital marketing practices.

Conclusion

A PRISMA evaluation of 67 peer-reviewed research (2020-2025) revealed a coherent architecture linking AI technologies to engagement, efficiency, and ESG outcomes in SM. It identified recurring frictions (privacy, bias, skills gaps, measurement limitations) and showed how governance mechanisms and explainability mediated AI benefits (better targeting with lower resource waste), clarifying when AI produces sustainable value rather than incremental performance gains.

The PRISMA SLR and the TOE framework were used to examine the use of AI solutions for smart SM platforms and sustainable digital marketing. AI-driven solutions like personalization engines, predictive analytics, and conversational interfaces can improve classical marketing strategies, reduce resource waste, and align campaigns with ESG goals. Technological capabilities, organizational preparation, and environmental pressures are key adoption drivers of AI tools for smart SM and digital marketing.

Theoretical Implications

This study extended the TOE framework by integrating PRISMA-based evidence on AI-enabled SM and sustainable digital marketing. It expanded the technology dimension to include AI capabilities such as predictive analytics, personalization, and conversational tools; strengthened the organizational dimension through governance, ethics, and organizational readiness; and broadened the environmental dimension to encompass ESG pressures, data protection regulations, competition, and stakeholder expectations, providing a more comprehensive view of responsible AI adoption in marketing.

The findings highlighted that while the TOE framework remained relevant for analyzing digital marketing adoption, future theory must expand into socio-technical models that explicitly integrate ethics and sustainability, thereby aligning AI adoption, SM ecosystems, and sustainable marketing practices with contemporary debates on fairness, inclusivity, and responsible innovation.

Managerial Implications

The PRISMA SLR provides a practical guide for practitioners: (1) Establish leadership-anchored AI governance in marketing; (2) Prioritize modular capabilities (content generation, NLP sentiment, audience modeling) with explainability and data minimization; (3) Align KPIs with sustainability (frequency capping, deduplication, creative compression, accessibility) to reduce media and operational waste; and (4) Institutionalize cross-functional skills for responsible scaling across platforms. Firms can migrate from campaign-centric to system-centric SM operations, ensuring compliance, competitiveness, and ESG credibility.

Managers must reconcile the advantages of AI-driven digital marketing (predictive analytics, personalization, and omnichannel strategies) with challenges including skill deficiencies, organizational resistance, and regulatory compliance by integrating ethics-by-design, investing in workforce preparedness, and cultivating consumer trust to guarantee sustainable long-term value.

Limitations and Future Studies

This study relies on secondary data from published literature, which may not fully depict any socio-economic and cultural context. Focusing on 2020–2025 publications may have excluded new trends or unpublished industrial practices. The synthesis limits generalizability and does not empirically validate TOE framework linkages. For future research, the proposed model should be confirmed or enhanced qualitatively by conducting semi-structured interviews with key informants across the marketing and business domains to refine construct boundaries and surface context-specific mechanisms linking AI practices to sustainable outcomes in digital marketing. It can also be tested quantitatively estimating the effects of technology fit, organizational readiness, and environmental pressures on responsible AI adoption and on performance outcomes.
