The research also adopts an exploratory design, based primarily on descriptive analyses. Consequently, the results provide an initial overview of the organisational and economic characteristics of concert societies, but do not allow us to identify causal relationships between the variables considered, which could be explored further in future developments of our research.

Managerial implications. *Despite the aforementioned limitations, the research findings offer some useful insights for reflecting on the management dynamics of concert societies in the contemporary context. First, the analysis highlights significant heterogeneity among the organisations considered, both in terms of economic size and production capacity. This suggests that there is no single organisational model for these entities, but rather a multitude of possible configurations, determined by the combination of available resources, organisational structure, and local roots.*

The analysis, however, suggests the emergence of different organisational orientations among concert societies. While some organisations appear to maintain a more traditional model, characterised by stable governance structures, established audiences, and a strong reliance on public support, others appear more production-oriented, with broader artistic programming and greater organisational complexity. A third group appear more focused on audience development and community engagement, investing more significantly in educational activities, digital communication, and initiatives aimed at younger audiences. These profiles should not be interpreted as rigid categories, but rather as different strategic balances between artistic mission, organisational structure, financial sustainability, and audience engagement.

For managers of cultural organisations, this implies the need to develop flexible management models consistent with the specificities of the local contexts in which they operate.

What appears to be transversal, however, is an economic sustainability strongly tied to the contribution of public resources, particularly from the National Fund for Live Performances and local authorities. This finding underscores the importance of strengthening institutional relationships with public bodies and, at the same time, developing revenue diversification strategies by expanding public-facing activities and activating private support and fundraising. In particular, developing more structured relationships with donors, foundations, and local businesses could be an

important lever for reducing dependence on public resources and supporting the continuity of artistic programming. In this sense, fundraising should not be considered merely as an additional source of funding, but also as a tool for strengthening relationships between concert organisations and their communities. All this, however, requires managerial capabilities extending beyond artistic programming alone. Financial planning and resource management, fundraising, communication, partnership development, and audience management emerge as crucial dimensions of organisational sustainability, requiring dedicated organisational resources and specialised professional competencies.

Moreover, in the Italian context, obtaining Third Sector Entity (ETS) status may also facilitate fundraising activities and relationships with philanthropic actors through fiscal incentives.

Further insights emerge from the analysis of the correlations between the organisational, economic, and social variables considered in the study. First, the results suggest a positive relationship between the amount of public funding and the organisations' production capacity, measured by the number of scheduled performances and average costs per concert. This indicates that public support, for concert societies as well as other live performance organisations, not only impacts the institutions' survival but also contributes to the development of a broader and more structured artistic programming.

Second, the observed correlations indicate that organisations with a greater presence of young audiences tend to experience higher overall participation, as measured by the number of season ticket holders and tickets sold. This result, however, must be interpreted with caution, as it does not allow for causal relationships to be established and could be influenced by other factors, such as the size of the cities in which the organisations operate or the greater promotional capacity of more structured organisations. Nonetheless, the data suggest that strategies for engaging younger generations can be an important lever for strengthening concert societies' audience base.

Initiatives aimed at younger generations should therefore not be interpreted solely as educational or cultural missions, but also as long-term sustainability strategies aimed at encouraging audience renewal and strengthening participation over time.

This aspect appears particularly interesting also in light of the growing debate on the future of classical music and the ways in which musical institutions can expand and diversify their audiences. In this context, several studies highlight the importance of engagement and community relations activities as fundamental tools for fostering new forms of cultural participation and strengthening the bond between musical institutions and audiences (Dollman, 2023).

Finally, the findings suggest a relationship between staff structure and an organisation's ability to develop audience-oriented activities. Concert societies with a more stable organisational structure tend to demonstrate a greater ability to sustain programming and audience management activities. This highlights the importance of, where possible, investing in the professionalisation of organisational structures and the development of specific skills in cultural management.

Originality of the paper. *This study contributes to the literature on the management of cultural organisations by analysing a specific type of musical institution that has thus far received limited attention in management studies: concert societies. Despite their crucial historical role in disseminating classical music and shaping local musical life, and their widespread presence throughout the country, these organisations have rarely been the subject of systematic analysis.*

The originality of this study, therefore, lies primarily in its contribution to a better understanding of the functioning and activities of these organisations, which, like many others in the entertainment and music industry, currently face significant challenges to their survival, both in terms of audience regeneration and in securing the resources necessary for their operations. The study's originality also lies in its empirical approach, which integrates various analytical dimensions relating to organisational structure, artistic programming, audience characteristics, and the organisation's economic dimension. Specifically, the study combines analysis of data collected through questionnaires with an examination of the organisations' key accounting documents, allowing for an initial assessment of the concert societies' economic sustainability.

A further element of originality concerns the connection with a previous survey of concert societies conducted in 2014: the partial overlap between the two samples will allow, in future developments of this first short paper, a comparative reading of the data and will pave the way for future longitudinal analyses on the evolution of the organisational and economic models of Italian concert societies.

Acknowledgements: *This research originated from a previous study conducted in 2014 at the initiative of the Società del Quartetto di Milano. The authors would therefore like first to thank Filippo Cavazzoni, who made a significant contribution to that first study and strongly encouraged the development of this second edition.*

The authors are also grateful to music critic and musicologist Angelo Foletto and to Luisella Molina for their insightful suggestions in the development and revision of the research questionnaire. Angelo Foletto's recent passing makes this acknowledgement particularly meaningful.

Finally, the authors would like to thank Simone Oglietti for his valuable support to the research activities.

Destination Management in Active Conflict Areas: Governing Tourism in Ukraine

MICHELA SEGATO[1], SOFIIA PETROVA[2], ROBERTA MINAZZI[3], DANIELE GRECHI[4]

Abstract. *War tourism has progressively assumed a significant role in the destination management of territories previously affected by armed conflict. In the contemporary geopolitical scenario, however, digital communication and global interconnectivity enable the promotion of war-affected territories even before the formal conclusion of hostilities. This short paper examines how tourist destinations can be strategically managed during an active war, focusing on the Ukrainian context as an emblematic case of resilience and adaptive governance in conditions of instability.*

The research is based on the analysis of six semi-structured interviews conducted with four experts and representatives of two specialized organisations operating in Ukraine. The empirical material was examined through inductive thematic analysis, allowing for a systematic interpretation of the qualitative findings.

According to the perspectives gathered from the interviewed stakeholders, war tourism activities may be developed in territories previously impacted by armed conflict, and potentially even within the context of ongoing hostilities. The findings indicate that war tourism in this context is supported primarily as a narrative and governance instrument aimed at communicating the reality of the conflict internationally, while demand and supply patterns incorporate sustainability-oriented dimensions, including community-based engagement and solidarity-driven travel.

Keywords: *Destination Management; War Tourism; Tourism under Conflict Conditions; Sustainability; Russian-Ukrainian War; Semi-Structured Interviews*

Framing of the research. While war tourism encompasses multiple forms, including hot war travel, combat volunteering, non-combat volunteering, and virtual war travel, the present study takes the concept of "hot war" tourism (Williams et al., 2023) as its initial conceptual reference point, while acknowledging that the empirical phenomena examined extend beyond this single category. This form has been defined by Piekarz (2007) as travel to unstable destinations characterised by "the presence of high individual risks and where visitors experience the realities of war first-hand" and has also been associated with forms of voyeuristic engagement in war zones (Williams et al., 2023; Lisle, 2007). The present study examines it not through thrill-seeking motivations, but through the organisational, narrative, and socio-economic implications of tourism practices within active conflict settings.

Accordingly, the present study is theoretically positioned at the intersection of war tourism and destination management research, with destination management as the analytical lens. The study aims to investigate how governance mechanisms, stakeholder coordination, and strategic management practices operate within territories affected by ongoing armed conflict.

War tourism represents a broad and contested concept (Smith, 1998) that intersects with several related tourism typologies, including dark tourism (Lennon & Foley, 2000, p. 4), also referred to as thanatourism, as well as extreme and adventure tourism, and military tourism. Although these forms remain analytically distinct, the literature emphasises their conceptual overlap with war tourism, particularly in relation to travel to active or recently affected conflict zones and to practices associated with risk exposure, danger, and forms of political engagement. It may also display features commonly attributed to so-called "danger tourism" (Lisle, 2016; Mahrouse, 2016). Despite these intersections, the aforementioned tourism typologies cannot be treated as equivalent. Ethical and moral considerations, safety constraints, and logistical implications differentiate them substantially and require specific managerial approaches (Saribas, 2024). Tourism practices occurring within active conflict zones may not align fully with these typologies and may instead constitute broader forms of tourism taking place under conditions of conflict, characterised by mediated visits, solidarity-driven engagement, and narrative-oriented travel.

In this regard, destination management assumes a central role. According to the UNWTO (Fabricius et al., 2007), destination management is first defined as "the coordinated management of all elements that make up a destination", including attractions, amenities, access, marketing, and pricing policies. It should be implemented through collaboration between local authorities and other tourism stakeholders, in line with principles of good governance (Buhalis & Spada, 2000). The relationship between war tourism development and destination management is explicitly illustrated by Italian research conducted in the regions of Trentino and Alto Adige/Südtirol (Franch et al., 2016). The study highlights the relevance of destination management in the preservation of former battle sites and in the promotion of war heritage tourism among both domestic and international visitors, as well as the involvement of DMOs and local communities in shaping the collective perception of past conflict-related events.

The role of stakeholders was widely explored in literature from different point of view (see e.g. Franch et al., 2010; Del Chiappa & Presenza, 2013; Presenza et al., 2005) and, in this specific context they are widely recognised as a fundamental component in the post-war recovery of destinations and in the pursuit of their sustainable development trajectories, including the reconstruction of the tourism sector (Johnson, 1999; Chronis, 2012; Jones and Shaw, 2012; Causevic & Lynch, 2011; Causevic & Lynch, 2013;). A shared and collaborative vision among different stakeholder groups regarding the development of war-affected territories shapes not only the strategic orientation adopted, but also the very possibility of structured development processes (Dissanayake & Samarathunga, 2021). For instance, following the end of the war in the territory of the former Yugoslavia, the Republic of Croatia, and particularly its governmental institutions, chose to abandon the prospect of developing war tourism and instead prioritised the revival of leisure tourism (Shchuka et al., 2024; Naef & Ploner, 2016). In contrast, the tourism development strategies proposed for Ukraine by Kiziun et al. (2023) emphasise collaboration between the state, local authorities, business actors, and foreign experts, highlighting the relevance of destination management practices even within a wartime context. Moreover, Manner-Baldeon and Li (2024) demonstrate that communication by residents significantly influences tourists' perceptions of visited territories. In line with this perspective, Buda et al. (2014) underline the importance of local community involvement in war tourism development, arguing that such participation contributes to the effective management of destinations affected by armed conflict. This involvement enables first-hand storytelling, strengthens the emotional dimension of the visitor experience, fosters bonds between tourists and residents, and supports a more authentic representation of both the destination and the conflict events that previously occurred.

On the other hand, war tourism activities may generate psychological distress among both tourists and local communities, as well as physical health risks when conducted within active or potentially dangerous zones (Manner-Baldeon & Li, 2024). Under such circumstances, war tourism can produce adverse effects on the socio-cultural dimension of the destination, requiring structured destination management strategies capable of mitigating risks in conflict-affected areas.

The economic dimension represents another central component of destination management that must be carefully considered in the context of war tourism promotion (Novelli et al., 2012; Reddy et al., 2020; Boyd et al., 2023). According to Tymoshenko et al. (2024), different post-war recovery models may function as destination management tools aimed at sustaining tourist flows, given that certain strategic approaches also demonstrate potential to stimulate broader economic growth. Reimann et al. (2023) conceptualise war tourism development as serving both narrative and economic objectives and support the advancement of war-related tourism forms, particularly dark and commemorative tourism, even before the formal conclusion of hostilities. In this perspective, such initiatives may operate as educational and national-patriotic instruments primarily oriented towards the domestic market. Furthermore, Currie et al. (2004) and Šuligoj (2017), in their analysis of the Croatian case, identify a relationship between war and tourism dynamics. Their findings indicate that economic downturns within the tourism sector may be reversed within a relatively short timeframe and that, in specific circumstances, tourism revenues may even increase during wartime.

Finally, a recent study by Tan and Cheng (2025), using Qualitative Comparative Analysis, has identified eight specific issues concerning this topic regarding the impact on tourists and tourism industry or humanitarian aid and travel restrictions.

Purpose of the paper. This study examines the relationship between destination management and contemporary war tourism, with particular emphasis on contexts characterised by ongoing armed conflicts. Although destination management cannot fully operate under wartime conditions due to security constraints and the potential destruction of attraction sites caused by missile attacks, it may nevertheless contribute to the configuration of a new type of destination and function as a political and narrative instrument requiring structured governance. In this sense, war tourism, understood as a broad tourism form that is not commonly recognised as part of the tourism sector in countries temporarily engaged in war, such as Ukraine, represents a dynamic, rapidly evolving, and adaptive phenomenon worthy of systematic investigation.

The potential integration between destination management practices and current war or recently affected post-war sites may provide an alternative mechanism for preserving tourism flows in countries experiencing armed conflict, while simultaneously fostering the development of new destination management features, including endurance-oriented approaches and innovative sustainable practices. Considering the profound economic and social consequences of war, it is relevant to assess the overall sustainability profile of war tourism practices implemented in territories characterised by ongoing conflict.

Ukraine has been selected as the case study for the present research for several reasons. First, the protracted nature of the Russian-Ukrainian war enables a clearer understanding of the structural characteristics of the conflict, including its interaction with and impact on the national tourism sector. Second, a review of the existing literature and sectoral practices has revealed the presence of tourism organisations offering war-related tours within the context of ongoing armed conflict.

This research addresses the following research questions:

RQ1: How do destination management strategies and governance mechanisms operate within territories characterised by ongoing armed conflict, and which stakeholder-driven approaches support their implementation?

RQ2: What patterns of war tourism demand and supply characterise active conflict contexts, and to what extent do these patterns incorporate sustainability-oriented dimensions?

Methodology. This study adopts a qualitative research design based on semi-structured expert interviews (Karatsareas, 2022; Fylan, 2005) to explore the governance and sustainability dimensions of war tourism in an ongoing conflict context. A purposive expert sampling strategy was employed to identify participants possessing direct professional, institutional, or experiential knowledge relevant to destination management and war tourism in Ukraine. Six interviews were conducted: four with representatives from the Ukrainian tourism and political sectors and two with organisations actively involved in providing war tourism services.

The empirical context of this study concerns tourism activities occurring within the territory of Ukraine during the ongoing Russian-Ukrainian armed conflict. Specifically, the investigation focuses on organised and mediated forms of war-related travel, including guided visits to areas previously affected by military operations, solidarity-driven tourism involving volunteering and donation-based engagement, and narrative-oriented tours designed to communicate the realities of the conflict to international audiences. The primary destinations examined include the capital city of Kyiv, the principal entry point for foreign visitors, and frontline areas such as the Mykolaiv and Kharkiv regions, where the security situation remains volatile and access requires structured coordination with local authorities and tourism organisations. The target market consists predominantly of international visitors, including journalists, volunteers, and individuals motivated by solidarity with Ukraine.

The expert interviews were conducted in July 2025 using a semi-structured format. Interviews took place via videoconference (Zoom) or telephone, were audio-recorded with participants' consent, and transcribed verbatim. Two tourism organisations provided written responses by email following the same interview protocol. The inclusion of multiple respondent types enabled data triangulation across institutional, operational, and experiential perspectives.

Participants were selected through purposive sampling to capture analytically distinct stakeholder categories directly involved in, or affected by, the destination management of war-affected sites in Ukraine. The selection aimed to ensure representation across governance, academic, community, and operational perspectives, thereby enabling a multi-level understanding of war tourism development during ongoing conflict.

Interviewee 1 is the director of an enterprise supporting internally displaced persons from the Donetsk region. This participant was included to reflect the perspective of local actors working with communities directly affected by occupation and displacement, and to assess how war tourism may intersect with social recovery and community resilience.

Interviewee 2 is a Professor of Political Science and International Relations at Mariupol State University. The inclusion of this participant was motivated by the need to examine the narrative, diplomatic, and international image dimensions of war tourism, particularly in relation to memorialisation, communication strategies, and geopolitical framing.

Interviewee 3 is an individual who has experienced two instances of internal displacement and is currently engaged in a professional capacity with the United Nations World Food Programme. The participant was selected to provide the perspective of internally displaced persons, combining the lived experience of displacement with professional experience in international organisations. This profile facilitated the integration of experiential insight with institutional awareness, particularly regarding dignity, trauma, and community boundaries.

Interviewee 4 serves as Vice Head of Governance and Head of the Department for Tourism, Resorts, and Cultural Heritage Protection of the Donetsk Regional State Administration. This participant was included to provide an institutional destination management perspective, focusing on policy coordination, infrastructure, security mechanisms, and regional planning.

Interviewees 5 and 6 were two tourism organisations selected to represent different operational models within the supply side of war tourism. "War Tours Ukraine" operates as a volunteer-based public initiative responding to foreign requests to observe war realities, thereby offering insight into solidarity-driven and narrative-oriented tourism practices. "Visit Ukraine", a non-governmental organisation promoting Ukrainian tourism domestically and internationally since 2018, was included to provide a structured, professionalised perspective on demand management, logistics, and communication during wartime. Together, these cases enable comparison between grassroots and institutionalised organisational approaches.

Data were analysed using an inductive thematic analysis. An initial open coding phase was conducted to identify meaningful segments within each transcript. Codes were developed iteratively and refined through constant comparison across interviews. Emerging themes were grouped into higher-order categories corresponding to the research questions.

The interview protocol was structured into two analytical blocks reflecting the dual nature of the inquiry: the strategic-governance dimension and the operational-implementation dimension. The first block addressed macro-level perceptions related to the development of war tourism under conditions of ongoing conflict. It explored how stakeholders conceptualize the role of war tourism within broader destination management strategies. Four interrelated thematic clusters were identified: national image; war tourism and economic recovery; development, timing, and sustainability; and management tools. This block aimed to capture normative positions, strategic priorities, and governance logics. The second block shifted to the meso- and micro-level, focusing on the operational practices of tourism organisations currently offering war-related experiences. Six thematic areas structured this section: national image; travel willingness and perceptions; risk perception; travel planning; tourism preferences and sustainability; and development, timing, and sustainability. Here, the objective was to examine how abstract strategic concepts are translated into concrete practices, including safety protocols, communication strategies, visitor management, and support for local communities.

The integration of findings across both blocks enabled a systematic comparison between strategic intentions and practical implementation, strengthening the analytical alignment between empirical evidence and the research questions.

The limited sample of six interviews requires explicit methodological justification. Given the exploratory nature of the study and the restricted accessibility of the research context, namely an active conflict zone with significant logistical and security constraints, the sample size was determined by the availability of knowledgeable informants rather than by a predefined numerical target. While full data saturation cannot be claimed, the thematic recurrence observed across interviews, particularly regarding the narrative function of war tourism, the centrality of safety, and the role of stakeholder coordination, suggests that the principal patterns within the investigated context were identified. It should further be acknowledged that the sample is composed primarily of stakeholders who are directly involved in or supportive of war tourism development, which may introduce a positive framing bias. The perspectives of critical voices, including those of local residents opposed to tourism in conflict areas, displaced populations not engaged in tourism-related activities, and international observers with reservations about the ethical implications of such practices, are not represented. The findings are therefore interpreted as exploratory accounts of supply-side and institutional viewpoints rather than as generalisable claims about the demand side or local communities at large.

Results. The findings indicate that both experts and representatives of tourism organisations support the development of war tourism during wartime. However, this support is not framed primarily in economic terms. Rather, war tourism is conceptualised as a strategic narrative instrument aimed at disseminating the Ukrainian perspective and communicating the reality of Russia's aggression on Ukrainian territory. Storytelling mechanisms are not treated as symbolic additions but as core governance tools, already embedded in practice and considered highly relevant within the sphere of international relations. At the same time, a central concern emerging from the interviews relates to the pain and grief experienced by Ukrainian citizens. This dimension was consistently emphasised as a non-negotiable ethical boundary that must guide decision-making processes and delimit acceptable forms of tourism development (RQ1).

The interviews conducted with the tourism organisations were designed to examine the perceived demand–supply configuration of war tourism in the Ukrainian context (RQ2). The data reveal a structured and mediated demand rather than spontaneous curiosity-driven travel. Both "War Tours Ukraine" and "Visit Ukraine" report that foreign visitors express a willingness to observe the reality of the war firsthand and to support Ukraine economically, including through volunteering and donation-based activities. The capital emerges as the primary entry point for first-time visitors, functioning as an introductory stage. In contrast, frontline areas such as Mykolaiv or Kharkiv are typically visited by individuals who have previously travelled to Ukraine and possess prior contextual knowledge. This differentiation indicates a staged demand structure, in which visitor engagement deepens over time. Furthermore, the organisations underline that clear safety procedures, structured coordination, and guided accompaniment positively influence visitors' willingness to travel, suggesting that demand is strongly mediated by institutional reassurance mechanisms.

Regarding the implementation dimension of RQ1, experts were asked which actions destination managers should undertake to support tourism in war-affected regions and how development can proceed without compromising dignity or safety. The responses converge around the centrality of security infrastructure, particularly the establishment of shelters near tourist attractions and the expansion of air-raid warning systems. Social media is identified as a rapid communication instrument for disseminating behavioural guidelines and informing visitors about risks. Beyond operational safety, interviewees emphasise the need for coordinated governance across vertical and horizontal institutional levels, alongside the development of clear behavioural and legislative regulations. With regard to dignity, the preservation of local boundaries and the avoidance of intrusive or sensationalist practices are treated as structural principles rather than optional considerations. Tourism organisations confirm that safety constitutes the primary concern of first-time visitors and report that continuous assistance, transparent information, and English-speaking guides are essential in mitigating perceived risk. These findings reinforce the argument that structured destination management practices are a prerequisite for tourism activity in recently affected territories.

These combined findings on governance relevance and implementation strategies can be situated within the existing literature. The narrative prioritisation identified in the Ukrainian case resonates with the argument of Reimann et al. (2023), who frame war tourism as serving both narrative and economic objectives, but extends it by demonstrating that under conditions of active conflict the narrative function assumes primacy over economic motivations. The ethical boundary articulated by respondents aligns with the concerns raised by Manner-Baldeon and Li (2024) regarding the emotional dynamics of travel to conflict zones, though the present findings indicate that this boundary operates not merely as an individual traveller response but as a structuring principle within destination governance. The emphasis on collaboration between local authorities and tourism stakeholders corroborates the principles outlined by Buhalis and Spada (2000) and the multi-stakeholder collaboration model proposed by Kiziun et al. (2023) for Ukraine.

Finally, the interviews indicate that destination management of war-affected sites incorporates multiple sustainability-oriented features supported by both stakeholders and local representatives (RQ2). Visitors are reported to deliberately choose locally operated businesses, participate in volunteering initiatives, and engage in donation-based tours, thereby reinforcing local economic resilience. In addition, many visitors demonstrate interest in local authenticity and Ukrainian culture, framing such engagement as an act of solidarity. Importantly, sustainability in this context is not limited to economic recovery but intersects with narrative positioning and ethical responsibility, suggesting that communicative, social, and economic dimensions operate as interconnected components of war-related destination management.

From a destination management perspective, the staged demand structure implies that coordination of tourism flows in war-affected territories cannot rely on conventional marketing instruments but requires the deliberate design of graduated visitor pathways, supported by institutional mediation and trust-building mechanisms. This observation extends the stakeholder coordination argument proposed by Kiziun et al. (2023) and Dissanayake and Samarathunga (2021) by identifying demand-side patterns that actively shape the governance requirements of war-affected destinations. The convergence of sustainability-oriented practices with narrative positioning and ethical responsibility extends the post-conflict tourism recovery frameworks proposed by Reddy et al. (2020) and Boyd et al. (2023) by demonstrating that sustainability-oriented dimensions can emerge and function not only in post-conflict recovery phases but also during active hostilities.

Research limitations. Both methodological and temporal limitations characterise this research.

First, the topic under investigation and the empirical analysis are situated within a body of literature largely centred on past or "cold phase" conflict events. In contrast, academic contributions addressing ongoing conflicts remain limited and are often closely connected to researchers with specific territorial affiliations.

Second, a methodological limitation derives from the context-dependent nature of semi-structured interviews. While this approach has enabled the achievement of the research objectives, implementing a more extensive survey design could provide a broader basis for identifying and systematising potential destination management tools. In particular, future studies may examine the differences between the emotional and ethical perceptions of local populations and those of foreign visitors regarding the same war-affected sites.

Third, the dynamic and evolving nature of the conflict context constitutes an additional limitation. The absence of a post-recovery phase in the Russian-Ukrainian war restricts the scope of data analysis, as well as the formulation of recommendations and predictive assessments. The sensitivity of the context was also considered during data interpretation to avoid normative bias.

Finally, these six interviews represent a first exploratory step that precedes a future quantitative analysis. The limited sample size limits the generalisability of the findings and confines the present contribution to a preliminary mapping of recurring themes rather than a statistically representative account. A future phase of the research will extend the empirical base through semi-structured interviews addressed to a wider population of operators, institutional actors, and visitors.

Managerial implications. The findings indicate that destination management strategies retain their relevance and necessity even during the active phase of armed conflict. Given the function of war tourism as a narrative and communicative instrument, destination managers should deliberately integrate storytelling and narrative management within tourism strategies, ensuring that tourism activities promote accurate representation while maintaining ethical sensitivity toward local experiences of pain and loss (Tsurkan & Kryvenkova, 2023).

Given that first-time visitors tend to concentrate on relatively safer destinations, whereas repeat visitors are more inclined to travel to frontline regions, destination managers and tour operators may design itineraries that progressively introduce visitors to the Ukrainian context according to their prior experience. Across all interviews, safety emerged as the principal managerial priority. The strategic use of social media and digital platforms was identified as a rapid and effective instrument for disseminating safety information, behavioural guidelines, and real-time updates.

Additionally, the results underline the necessity of establishing clear behavioural rules, ethical standards, and legislative frameworks to ensure the balanced coexistence of local communities and visitors within war-affected territories. Finally, the study demonstrates a strong connection between war tourism and sustainability-oriented practices. Visitors travelling to Ukraine during the ongoing war actively contribute to local economies by selecting community-based businesses, participating in volunteering initiatives, and engaging in donation-oriented tourism activities. These dynamics create opportunities for destination managers to promote sustainable tourism models centred on community participation, economic resilience, and cultural authenticity.

From a theoretical perspective, the findings contribute to destination management scholarship by demonstrating that governance frameworks designed for peacetime contexts require substantive adaptation when applied to active conflict settings. Specifically, the study identifies three areas in which destination management theory and practice require extension: first, the incorporation of narrative and diplomatic functions as core governance objectives alongside conventional tourism promotion; second, the integration of security coordination structures, including military and humanitarian protocols, within destination governance mechanisms; and third, the recognition of graduated visitor engagement as a demand-side pattern that shapes managerial decision-making regarding itinerary design, risk communication, and access management. For practitioners, these findings imply that destination management organisations operating in conflict-affected territories should establish formal coordination protocols with security authorities, develop tiered visitor itineraries calibrated to risk levels and visitor experience, and institutionalise ethical review processes to ensure that tourism activities respect community boundaries and do not instrumentalise local suffering for commercial or promotional purposes.

Originality of the paper. The present study aims to contribute to destination management scholarship in the context of recent and ongoing armed conflicts, with particular attention to war tourism development and sustainability. While existing literature predominantly addresses the ethical dimensions of war tourism, its historical and storytelling relevance,

and the economic damage associated with conflict, destination management in active war contexts remains comparatively underexplored.

In particular, the study advances the argument that destination management in active conflict contexts operates according to a distinct governance logic, in which communicative, diplomatic, and ethical functions assume priority over conventional tourism promotion and visitor attraction. This represents a theoretical extension of the UNWTO (Fabricius et al., 2007) destination management framework, which presupposes conditions of relative stability and does not account for the specific governance requirements of territories experiencing ongoing armed conflict. By positioning the analysis at the intersection of war tourism and destination management scholarship, the study addresses a gap in both research streams: war tourism research has given limited attention to governance and management mechanisms, while destination management scholarship has not systematically examined its applicability under conditions of active armed conflict.

Likewise, the research does not exclude the applicability of tourism practices within existing war zones, despite the unpredictability and instability generated by wartime hazards. In the current literature, sustainable features of war tourism are generally discussed as isolated elements rather than as components of an integrated sustainable development approach. The findings of the present study indicate that war tourism may be interpreted as incorporating sustainability-oriented dimensions, particularly when it contributes to the social and economic support of local businesses and communities.

Finally, the paper provides empirical insights into existing practices and highlights the specific relevance of war tourism activities during an ongoing and unresolved armed conflict in Ukraine, expanding the understanding of essential conditions for its development in unstable contexts. The findings support the conclusions of Reimann et al. (2023), who emphasise the need to revitalise Ukrainian tourism during the ongoing armed conflict. By contrast, studies by Shchuka et al. (2024) and Tymoshenko et al. (2024) do not address war tourism development within the broader framework of post-war tourism system renovation.

Digital Transformation and Sustainability Paradoxes in Tourism: A Grounded Theory Study of the Italian Context

LUNA LEONI[1], ANTONELLA MONDA[2], ABDERRAHIM LAACHACH[3]

Abstract. *The rapid digitalization of the Italian tourism sector presents both significant opportunities and complex sustainability challenges. While digital technologies – such as AI, Big Data, blockchain, and immersive solutions – enhance operational efficiency, visitor experiences, and market access, they also introduce sustainability paradoxes, including increased energy consumption, unequal access to technology, and fragmented governance. This paper presents an ongoing research project investigating the interplay between digitalization and sustainability in tourism, integrating economic, social, and environmental dimensions. Adopting a qualitative grounded theory approach, the study will examine selected case studies encompassing tourist destinations, enterprises, and public–private initiatives that implement innovative digital solutions. The research will identify emerging categories and recurring patterns to explain how digital technologies can facilitate or hinder sustainable practices, highlighting the roles of governance, contextual factors, and stakeholder interactions. The expected findings will contribute to an empirically grounded understanding of how digital transformation influences sustainability outcomes in tourism, providing actionable insights for policymakers, practitioners, and the design of more responsible digital interventions.*
Keywords: *digital transformation; sustainable tourism; sustainability; paradoxes; grounded theory; Italy*

Framing of the research. *Tourism is increasingly positioned at the intersection of technological innovation and sustainability imperatives, as destinations and tourism organizations confront growing pressures related to environmental degradation, social equity, and long-term economic viability (Polese et al., 2018; Troisi et al., 2023; Tuyen, 2025). In recent years, the rapid diffusion of digital technologies – including AI, the Internet of Things, blockchain, big data analytics, and immersive platforms – has profoundly transformed how tourism systems operate, how destinations are managed, and how tourists engage with places and communities (Kumar et al., 2024; Fatema et al., 2024). These technologies have enabled real-time monitoring of tourist flows, enhanced personalization of experiences, and improved coordination among heterogeneous stakeholders across tourism ecosystems.*

At the same time, sustainability has become a central concern in tourism research and practice. While digital tools are often presented as key enablers of sustainable tourism, emerging evidence suggests that their impacts are far from unidirectional. Digital technologies may simultaneously promote social inclusion, environmental awareness, and operational efficiency, while also reinforcing digital divides, increasing energy consumption, and generating new governance and ethical dilemmas (Pan et al., 2021; Abdoh, 2024; Socratous et al., 2025). In this respect, digitalization introduces a paradoxical condition in which technological innovation can both support and undermine sustainability objectives. This paradox is particularly evident when considering the environmental footprint of digital infrastructures. Although smart technologies can reduce resource waste and optimize destination management, they also rely on energy-intensive systems, data centers, and algorithmic processes that contribute to carbon emissions and electronic waste (Balsalobre-Lorente et al., 2023). Similarly, while digital platforms promise greater inclusivity and access to tourism services, unequal digital literacy and technological readiness among stakeholders may exacerbate existing socio-economic inequalities and marginalize smaller actors (Abdoh, 2024; Nassanbekova et al., 2023). As a result, the tourism sector increasingly faces a tension between the promise of digital sustainability and the risk of digitally induced unsustainability.

Despite growing scholarly interest in these issues, the academic discourse remains fragmented. Much of the existing literature continues to analyze the effects of digital technologies on isolated dimensions of sustainability, often treating economic, environmental, and social outcomes separately and neglecting their interactions and trade-offs (Fatema et al., 2024; Zeqiri et al., 2025). Although some scholars have begun to conceptualize tourism sustainability from a systemic and co-evolutionary perspective (Paniccia & Baiocco, 2020; Leoni & Cristofaro, 2022; Baiocco & Paniccia, 2023), the dual and paradoxical role of digital transformation has yet to be fully integrated into a multidimensional theoretical framework capable of capturing the complexity of contemporary tourism systems. Furthermore, existing conceptual models often lack contextual sensitivity. Destinations are frequently treated as homogeneous entities, overlooking differences in digital maturity, institutional capacity, governance arrangements, and socio-cultural characteristics. This limitation reduces the explanatory power of current frameworks and constrains their usefulness in guiding context-specific digital sustainability transitions. Such shortcomings are particularly salient in tourism systems characterized by strong territorial embeddedness and structural heterogeneity. In this respect, the contribution by Kürüm Varolgüneş et al. (2025) provides a clear and timely research agenda. These authors explicitly argue that future research should

incorporate qualitative analyses and empirical case studies to validate the practical impact of digital technologies on sustainable tourism. They further identify the development of integrated theoretical models linking digital transformation and sustainability frameworks, as well as the analysis of success cases and barriers in the adoption of smart tourism technologies across different destination types, as key priorities for advancing the field. Responding directly to these calls, the present study conducts a qualitative analysis of Italian tourism case studies to identify the main enablers and barriers shaping the adoption of smart tourism technologies in urban and rural contexts.

Italy represents a particularly fertile empirical setting for this investigation. The Italian tourism system is characterized by significant variation in digital maturity across destinations, with advanced digital platforms in major urban areas coexisting alongside rural and community-based initiatives operating with lower levels of technological sophistication. At the same time, Italy is internationally recognized for its long-standing commitment to sustainable tourism practices, ranging from protected natural areas and responsible tourism festivals to certified sustainable villages. This combination of digital heterogeneity and sustainability richness makes Italy an ideal context for examining how digital transformation interacts with sustainability outcomes in practice.

Thus, this paper seeks to address a critical research gap by developing a multidimensional framework that integrates digital innovation with sustainable tourism development. Drawing on an ongoing qualitative research project, the study adopts a grounded qualitative approach to capture the complexity, paradoxes, and governance dynamics that characterize digitally mediated sustainability transitions in contemporary tourism systems.

Theoretical Background. The advent of digital technologies has catalyzed a paradigm shift in the tourism sector, profoundly reshaping destination management, tourist behavior, and stakeholder engagement. Digitalization in tourism should be understood not as a linear process of technology adoption, but as a socio-technical system, in which technological infrastructures, organizational practices, governance arrangements, and stakeholder relations co-evolve (Rodrigues et al., 2023; Schönherr et al., 2023). The diffusion of AI, big data, IoT, blockchain, and immersive technologies has accelerated this reconfiguration by embedding algorithmic decision-making and data-driven coordination into tourism value chains, transforming information asymmetries, coordination mechanisms, and power relations across tourism ecosystems (Asif & Fazel, 2024; Kürüm Varolgüneş et al., 2025). This shift reflects the growing conceptualization of tourism destinations as complex adaptive systems, where digital technologies act as structuring forces rather than neutral tools, and where sustainability outcomes depend on contextual, institutional, and organizational conditions rather than technological sophistication alone (El Archi et al., 2023; Paniccia & Baiocco, 2020; Leoni & Cristofaro, 2022).

Within this socio-technical perspective, digital technologies such as artificial intelligence, blockchain, the Internet of Things, virtual reality, and metaverse platforms have been widely recognized for their potential to enhance operational efficiency and sustainability performance. IoT-based systems allow destinations to monitor tourist flows and environmental indicators in real time, supporting more efficient resource allocation and mitigating ecological pressures (Gössling, 2020; Aguirre et al., 2023; Zhang & Deng, 2024). Blockchain technologies facilitate secure and transparent transactions, reinforcing trust among stakeholders and enabling more equitable participation by small and medium-sized enterprises (Ali, 2022; Polukhina et al., 2025). Immersive technologies such as virtual and augmented reality offer alternative experiential pathways that may reduce the environmental footprint of tourism by limiting physical travel while enhancing environmental education and awareness (Go & Kang, 2023; Rather, 2025). Through informational, coordination, and behavioral mechanisms, digital tools can enable predictive analytics, destination-wide integration, and responsible tourist conduct, thereby supporting sustainability-oriented innovation trajectories (Rahmadian et al., 2022; Rodrigues et al., 2023; Kummitha, 2025). An overview of the main digital technologies currently adopted in the tourism sector, together with their key characteristics and principal applications, is reported in Table 1, adapted from Monda et al. (2023).

However, the literature increasingly emphasizes the ambivalent nature of digital transformation in tourism. The infrastructure demands associated with digital ecosystems generate new environmental challenges, including rising energy consumption, electronic waste, and carbon emissions, while digital platforms intensify risks of monopolization, algorithmic bias, platform dependency, and data exploitation (Parra-Sanchez & Viviescas-Jaimes, 2025; Nassanbekova et al., 2023). Automation and algorithmic management enhance operational efficiency but may simultaneously undermine decent work, skills development, and employment stability, exacerbating socio-economic vulnerabilities (Myrovali et al., 2025). These dynamics give rise to sustainability paradoxes, in which the same digital technologies simultaneously generate sustainability gains and risks, captured by the emerging notion of digitainability (Myrovali et al., 2025). From this perspective, sustainability in tourism emerges not as a static outcome but as a dynamic balancing process, shaped by governance capacity, stakeholder alignment, and organizational learning mechanisms (Rodrigues et al., 2023; Schönherr et al., 2023).

From a multidimensional sustainability perspective, digital technologies influence tourism outcomes across interconnected economic, environmental, and social dimensions. Economically, digital platforms stimulate innovation and competitiveness by enabling SMEs to access global markets and develop new business models, contributing to inclusive growth and regional development (Ali, 2022; Kaur et al., 2024; Chen et al., 2025). Environmentally, data-driven solutions facilitate resource-efficient destination management by optimizing energy and water use and monitoring environmental pressures in real time (Rahmadian et al., 2023; Zhang & Deng, 2024). Socially, enhanced digital infrastructure fosters inclusivity by improving access to tourism services and enabling participation by marginalized groups, while digital communication of sustainability practices empowers more informed tourist choices (Tiago et al., 2021; Popova et al., 2023).

Table 1. Main digital technologies and related applications in the tourism field

Technology	Description	Main Application	References
Cloud computing	Delivery of computing resources – including servers, storage, databases - over the internet	• Data storage about tourist experiences and preferences as well as audio/video streaming, pictures/images regardless of video or image size • Data synchronization between platforms • Various cloud-based apps (e.g., car rental, hotel, airline reservation apps, map location guide app, journey planner app, weather information app) useful for tourism firms to provide tourists with personalized information to design and plan their holiday	Imhanwa *et al.* (2015) Nadda *et al.* (2020)
Big Data	Collection of large data (generated by users, devices, and operations), even unstructured and fast-moving, which cannot be managed with traditional approaches	• Big data analytics (e.g., tourist sentiment analysis; tourist spatial-temporal behavior analysis; effect estimation of weather on tourism) • Tourism marketing • Search engine optimization	Li *et al.* (2018)
Artificial Intelligence (AI)	Ability of a computer to perform cognitive functions (i.e., learning, reasoning, self-correction) usually associated with the human mind	• Voice assistant • Face detection and recognition • Self-service for information/check-in/check-out • Chatbots • Robots carrying out routine tasks (e.g., booking, managing rooms, drink preparation, information offering)	Grundner and Neuhofer (2021)
Internet of Things (IoT)	Variety of things or objects – such as Radio-Frequency Identification (RFID) tags, sensors, actuators, mobile phones – able to connect physical and digital entities (making them interact each other and exchange information)	• Internet-enabled appliances (e.g., for heating, lighting, and television) that can be turned on or off by tourists through a centralized device • Sensors and IoT devices for various services, including: – environmental monitoring – warning passengers at the airports about the localization of their luggage or restaurant staff when guests arrive – sending electronic key cards to hotel guests' phones, which, when used, automatically check them in – real-time information about the current status of essential devices to be repaired or replaced before they stop functioning	Ordóñez *et al.* (2022)
Immersive technologies	Virtual Reality: Use of computer-generated 3D realistic navigable virtual environments, that the user can interact with. Visualization, immersion, and interactivity are the three key elements of VR Augmented reality: Adds digital elements to a live view, that the user can interact with often using the camera on a smartphone equipped with GPS technology	Creation of virtual environments: • complementing real tourist experiences • creating virtual tourist experiences • planning and management purposes • promoting a destination or a site • getting access to information about places, restaurants, hotels, cultural monuments, tours • educational purposes • heritage preservation • gaming	Guttentag (2010) Beck *et al.* (2019) Loureiro *et al.* (2020)
Contactless technologies	Radio Frequency Identification (RFID) Remote data sending and receiving system through electromagnetic fields that automatically identify and track tags attached to objects Near Field Communication (NFC) Data transfer through electromagnetic fields that enable two devices (e.g., a smartphone and a payments terminal) to communicate with each other Beacon technology Wireless transmitters using Bluetooth and GPS that transmit signals to other smart devices nearby (e.g., smartphones).	• Access authorization • Cashless payments • Data collection • Deep analytics • E-ticketing • Data exchange (e.g., about transportation schedules, waiting times for arrivals) • E-wallets • Boarding passes, and ratings • Proximity marketing • Location-based services • Gaming	Egger (2013) Buhalis (2020)
3D printing	Existing objects are replicated in three-dimensional manner in various materials depending on the 3D printer used.	3D personalized souvenirs (mass produced, printed at a facility and also at home)	Anastasiadou and Vettese (2019)

Recent scholarship has further expanded the sustainability framework by emphasizing the relevance of additional dimensions. Civic participation and democratic governance have emerged as critical components, as digital platforms increasingly mediate interactions between citizens, policymakers, and tourism organizations. E-participation tools and open-data initiatives can enhance transparency, accountability, and collective decision-making, aligning digital transformation with local values and social cohesion (Errichiello & Micera, 2021; Ivars-Baidal, 2024). Similarly, culture and identity are increasingly recognized as integral to sustainable development. Digital technologies support the preservation and reinterpretation of cultural heritage through digital archives, virtual heritage experiences, and storytelling platforms, fostering cultural continuity and intercultural dialogue (Duxbury & Jeannotte, 2012; Nurse, 2006; UNESCO, 2015).

The effective integration of digital technologies into sustainable tourism systems ultimately depends on governance arrangements and organizational learning processes capable of managing complexity, mediating trade-offs, and fostering stakeholder alignment. Fragmented policymaking, limited data-sharing incentives, and legacy bureaucratic structures often inhibit the development of coherent digital sustainability strategies (Jokom et al., 2025; Socratous et al., 2025). Conversely, inclusive and adaptive governance models that engage public authorities, private firms, civil society, and local communities can align digital innovation with sustainability objectives, fostering trust, legitimacy, and collective learning (Allen et al., 2023; El Archi et al., 2023; Rahmadian et al., 2023). At the organizational level, sustainability-oriented digital transformation depends on human capital, absorptive capacity, and inter-organizational learning, which enable tourism firms to translate technological potential into concrete sustainability practices (Schönherr et al., 2023; Sharma & Sethi, 2025).

Despite the rapid expansion of digital tourism research, significant theoretical gaps persist. Existing studies remain fragmented across technological, managerial, and sustainability perspectives, often focusing on isolated technological implementations and short-term performance outcomes, with limited integration of governance dynamics, stakeholder interactions, and contextual contingencies (El Archi et al., 2023; Kürüm Varolgüneş et al., 2025). This fragmentation constrains theory development and limits the explanatory and prescriptive power of existing models. Addressing these limitations requires qualitative, inductive, and process-oriented approaches that uncover how digital technologies facilitate or hinder sustainable tourism practices across economic, social, environmental, cultural, and governance dimensions. In response to recent calls for empirically grounded qualitative research, this study adopts a grounded theory approach to develop an integrated, multidimensional framework explaining the paradoxical effects of digital transformation on sustainable tourism development.

Purpose of the paper. *The purpose of this paper is to investigate how digital transformation shapes sustainability outcomes in the tourism sector, with particular attention to the paradoxical effects that emerge from the adoption of smart tourism technologies. Rather than assuming a linear or inherently positive relationship between digitalization and sustainability, the study adopts a critical, exploratory perspective that conceptualizes digital technologies as socio-technical infrastructures embedded within complex tourism systems. Specifically, the paper aims to respond to recent calls in the literature for qualitative, empirically grounded research capable of validating the practical impact of digital technologies on sustainable tourism (Kürüm Varolgüneş et al., 2025). As part of an ongoing research effort, the study seeks to develop an integrated, multidimensional framework that links digital transformation with economic, social, environmental, cultural, and governance dimensions of sustainability, moving beyond fragmented and dimension-specific analyses that currently dominate the field (Fatema et al., 2024; Zeqiri et al., 2025). A further objective of the paper is to identify the key enablers and barriers influencing the adoption of smart tourism technologies across different destination types. By focusing on Italian case studies spanning urban and rural contexts, the research aims to capture how variations in digital maturity, institutional capacity, and governance arrangements shape sustainability trajectories. In doing so, the paper explicitly addresses the need to analyze success cases and obstacles in smart tourism adoption across heterogeneous destinations, as highlighted by Kürüm Varolgüneş et al. (2025). More broadly, the paper seeks to advance theoretical understanding of sustainable tourism research by reframing digital transformation as both an opportunity and a source of tension. Through a grounded theory approach, the study aims to uncover the mechanisms through which digital technologies simultaneously enable sustainable practices and generate sustainability paradoxes, thereby offering a more nuanced and realistic understanding of digitally mediated sustainability transitions in tourism systems. Finally, the paper aims to generate insights that are not only theoretically relevant but also actionable for practitioners and policymakers. By illuminating the conditions under which digitalization contributes to (or undermines) sustainable tourism development, the study seeks to inform the design of more responsible, context-sensitive digital interventions that balance innovation with long-term sustainability goals.*

Methodology. *This study adopts a qualitative research design grounded in grounded theory, which is particularly suitable for investigating complex, context-dependent, and under-theorized phenomena, such as the relationship between digital transformation and sustainability in tourism. The choice of a qualitative, inductive approach responds directly to recent calls for practice-based and empirically grounded research capable of validating the real-world implications of digital technologies for sustainable tourism development (Kürüm Varolgüneş et al., 2025). Grounded theory allows for the emergence of conceptual categories from empirical data, rather than imposing pre-defined theoretical constructs, thereby enabling a nuanced understanding of sustainability paradoxes and governance dynamics.*

Case Selection and Sampling Strategy. Cases will be selected through purposive theoretical sampling to capture variation across governance arrangements, levels of digital maturity, and sustainability orientations within the tourism sector. This sampling strategy is consistent with the logic of grounded theory, as cases will be chosen not for representativeness but for their potential to illuminate analytically relevant patterns and contrasts. In particular, the study will focus on tourism destinations, firms, and public–private initiatives that have implemented digital or are implementing innovations such as artificial intelligence, big data analytics, blockchain solutions, and immersive technologies, including virtual and augmented reality. Selection will be guided by observable impacts on economic, social, and environmental sustainability, as well as by the availability of rich qualitative data, including interviews, policy documents, strategic plans, and publicly accessible digital materials. Attention will also be paid to contextual diversity, ensuring the inclusion of cases operating in both urban and rural settings and encompassing different organizational forms, such as destination management organizations, tourism enterprises, and collaborative projects. By incorporating multiple actor perspectives within each case, the study aims to uncover sustainability paradoxes and governance mechanisms that tend to remain obscured in large-scale quantitative or bibliometric analyses. At the time of writing, specific cases are being identified in line with these criteria to build a comparative qualitative dataset that reflects the heterogeneity of digitally mediated sustainability practices within the Italian tourism ecosystem.

Rationale for Focusing on Italian Case Studies. The decision to focus exclusively on Italian case studies is theoretically and empirically motivated. Italy offers a particularly fertile context for examining the interplay between digital transformation and sustainable tourism, driven by a combination of structural, institutional, and practical factors. First, Italian tourism destinations exhibit substantial variability in digital maturity. Large metropolitan destinations and national-level platforms often exhibit advanced levels of digital adoption. At the same time, rural areas and community-based initiatives often operate with low to medium levels of technological sophistication. This variability creates favorable conditions for comparative qualitative analysis, enabling the examination of how different degrees of digital readiness shape sustainability outcomes and adoption trajectories. Second, Italy is internationally recognized for its rich and diverse sustainability practices in tourism. The presence of protected natural areas, national parks, responsible tourism festivals such as IT.A.CÀ, and certified sustainable villages under schemes such as Bandiera Arancione provides a wide range of empirically observable contexts in which economic, social, and environmental sustainability objectives are actively pursued. This richness enables a holistic investigation of sustainability outcomes and the paradoxes arising from integrating digital technologies into sustainability-oriented tourism models. Third, Italy's multi-level governance structure, encompassing national, regional, and municipal tourism policies, offers a valuable setting for exploring the role of institutional and policy enablers in shaping digital sustainability initiatives. Focusing on a single country enhances analytical comparability across cases while controlling for broader regulatory, cultural, and socio-economic conditions that could otherwise confound cross-national comparisons. Finally, practical considerations related to feasibility and data access support the exclusive focus on Italy. The physical presence of some authors in the country facilitates in-depth qualitative data collection, including semi-structured interviews with local stakeholders, site visits, and access to policy and strategic documents. This enables the development of a contextually rich and fine-grained understanding of the mechanisms, enablers, and paradoxes associated with sustainable digital transformation in tourism, which would be more difficult to achieve in a multi-country design.

Data Collection. Data will be collected using multiple sources to ensure triangulation and enhance the robustness of the analysis. Primary data will consist of semi-structured interviews with key stakeholders involved in digital and sustainability initiatives, including destination managers, tourism entrepreneurs, public officials, technology providers, and representatives of local communities. In addition to interviews, the study will employ a structured questionnaire primarily addressed to Destination Management Organizations (DMOs). The questionnaire is designed to explore the perceived advantages and disadvantages of adopting different digital technologies. For each technology considered (e.g., artificial intelligence, big data, IoT, immersive technologies), respondents will be asked to evaluate potential benefits and challenges across the three pillars of sustainability. This instrument aims to capture practitioners' perceptions of the trade-offs and tensions associated with digital innovation in tourism destinations. In addition to primary data, the study will draw on policy and strategic documents such as tourism development plans, digitalization strategies, and sustainability reports, as well as secondary data including organizational websites, digital platforms, and social media content.

Data Analysis. Data analysis will follow the iterative and inductive procedures of grounded theory. In the first phase, open coding will be employed to identify initial concepts and categories emerging from the data, with particular attention to digital practices, sustainability outcomes, governance arrangements, and perceived tensions. In the second phase, axial coding will be used to explore relationships among categories, focusing on conditions, actions, interactions, and consequences associated with digital transformation processes. Finally, selective coding will enable the integration of categories around core themes, resulting in a coherent conceptual framework that explains how digital technologies shape sustainability outcomes in tourism. Throughout the analytical process, constant comparison will be applied across cases and data sources, and analytical memos will document emerging interpretations and theoretical insights. This iterative approach will support theory building that is firmly grounded in empirical evidence and sensitive to contextual variation.

Results. *Preliminary insights from the ongoing analysis suggest that digital transformation may influence sustainability in tourism through a set of interconnected mechanisms that cut across economic, environmental, social, cultural, and governance dimensions. Rather than assuming uniform outcomes, the emerging evidence indicates that digital technologies tend to generate ambivalent effects and sustainability paradoxes, shaped by contextual conditions and governance arrangements. Across the cases, digital tools such as data analytics platforms and smart destination systems are expected to contribute to economic sustainability by improving operational efficiency, optimizing demand management, and enabling small and medium-sized tourism enterprises to access broader markets. These technologies may support innovation and competitiveness, particularly in destinations where digital strategies are aligned with broader sustainability objectives. At the same time, preliminary observations suggest that economic benefits may be unevenly distributed, with digitally advanced actors capturing disproportionate value, thereby potentially reinforcing existing inequalities within tourism ecosystems.*

From an environmental perspective, digital technologies may facilitate more sustainable resource management by enabling real-time monitoring of tourist flows, energy consumption, and environmental pressures. Smart mobility solutions and data-driven visitor management systems can reduce congestion and mitigate ecological impacts in sensitive areas. However, these gains may be partially offset by the environmental costs associated with digital infrastructures, including increased energy consumption and reliance on data-intensive systems. This emerging tension points toward a potential sustainability paradox in which digital efficiency coexists with digitally induced environmental burdens.

Socially, digital platforms may enhance accessibility, transparency of information, and stakeholder engagement, foster more inclusive tourism experiences, and enable community participation in destination management. Nevertheless, disparities in digital literacy and access may generate new forms of exclusion, particularly in rural and peripheral contexts. These preliminary insights highlight the importance of addressing digital divides as a prerequisite for socially sustainable digital transformation.

Governance appears to emerge as a critical mediating factor across all dimensions. Initial evidence suggests that cases characterized by strong public–private collaboration, participatory governance mechanisms, and strategic alignment between digitalization and sustainability objectives tend to display more balanced and resilient outcomes. Conversely, fragmented governance structures and weak institutional coordination may limit the transformative potential of digital technologies and exacerbate sustainability paradoxes.

Research limitations. *This study has several limitations. The qualitative and exploratory nature of the research limits the generalizability of the findings beyond the Italian context. The reliance on case studies may also introduce selection bias, as cases with visible digital initiatives are more likely to be included. Furthermore, the study focuses on perceived and processual sustainability outcomes rather than quantitatively measured impacts.*

Future research could address these limitations by adopting mixed-methods approaches, conducting comparative cross-country analyses, and integrating longitudinal data to assess the long-term sustainability effects of digital transformation in tourism.

Managerial implications. *The findings offer important implications for managers and policymakers. Digital transformation strategies should be explicitly aligned with sustainability objectives rather than pursued as isolated technological upgrades. Managers need to recognize and actively manage sustainability paradoxes, particularly those related to energy consumption, social inclusion, and governance fragmentation. Investments in digital literacy and capacity-building are essential to ensure that digital innovation contributes to inclusive and equitable tourism development.*

For policymakers, the results highlight the importance of governance frameworks that foster coordination, participation, and accountability. Supporting collaborative platforms, data-sharing mechanisms, and participatory decision-making processes can enhance the sustainability impact of digital initiatives and mitigate unintended consequences.

Originality of the paper. *This paper contributes to the literature by providing a grounded, empirically informed analysis of the paradoxical relationship between digital transformation and sustainability in tourism. By integrating multiple sustainability dimensions and emphasizing the role of governance and context, the study advances existing theoretical frameworks and responds directly to recent calls for qualitative, integrative research. The focus on the Italian tourism system offers nuanced insights into digitally mediated sustainability transitions in a structurally complex and territorially embedded context.*

Emerging Green Professions in Cultural and Creative Organizations

MARTHA FRIEL[1], ANGELO MIGLIETTA[1], GIORGIA NATOLI[1]

Abstract. *Cultural organizations are increasingly expected to reduce their environmental impact and embed sustainability into their operational practices. Yet the internal organizational conditions that support this transition remain poorly understood. This paper examines the organizational and contextual factors associated with the adoption of green human resource management (GHRM) practices − specifically, green staffing and green training provision − in the Italian cultural and creative sector.*

The study draws on data from the 4C−Cultural and Creative Carbon Cut questionnaire (Fondazione Santagata ETS, 2024), administered to a net sample of 634 Italian cultural and creative organizations. Associations between two independent variables − organizational size and network membership − and the two GHRM outcome variables were examined through chi-square tests and adjusted standardized residual analysis, following an exploratory data analysis approach.

Green staffing and training remain limited across the sector. Organizational size is positively associated with both practices, with micro-organizations significantly underrepresented despite their numerical dominance. Network membership is significantly associated with training provision, with networked organizations more than twice as likely to report offering it.

The non-probability sampling design limits generalizability. The cross-sectional structure precludes causal inference. Findings are exploratory and limited to two variables and the Italian context.

Professional networks represent an already-embedded, cost-effective mechanism for disseminating sustainability training. For micro-organizations, hybrid capacity-building strategies combining internal learning with sector-level support structures are the most realistic pathway toward developing green competencies.

This paper provides, to the best of the authors' knowledge, the first large-scale quantitative analysis of GHRM practices in the Italian cultural and creative sector, contributing an empirically grounded foundation for a dedicated research agenda at the intersection of cultural management, green skills, and organizational sustainability.

Keywords: *cultural and creative sector; GHRM; green staffing; green training; networks*

Framing of the research. *In recent years, literature on the cultural and creative sectors has highlighted the central role of human capital as a key factor in cultural organizations' ability to innovate, adapt to changing contexts, and generate economic and social value. Unlike many other productive sectors, cultural organizations have historically been characterized by a high intensity of skilled labor, creative skills, and symbolic capital, elements that make human resources a strategic component of their operations. In this context, cultural professionals tend to be hybrid and multidimensional, combining artistic, managerial, and entrepreneurial skills, and often operating in small organizations characterized by limited resources and a strong reliance on collaborative networks (Menger, 2006; Comunian & England, 2020; Borrione et al., 2024).*

From a broader perspective, the role of skills and human capital is increasingly important in contemporary knowledge-based economies. In such contexts, knowledge, skills, and competences (KSC) represent strategic resources for organizations, contributing to their capacity for innovation, adaptation, and competitiveness (Nuccio & Mogno, 2023). The development and updating of professional skills, therefore, become fundamental elements to enable organizations to respond to the major economic and social transformations underway, including digitalization and the transition to more sustainable development models.

This is particularly true, for example, in the context of the growing focus on environmental sustainability and the ecological transition that is also characterizing the world of cultural organizations and the creative industries, as well as, of course, many other sectors of the economy (ICOMOS, 2019). Indeed, a broad international debate has developed around the concepts of green jobs and green skills, which identify the set of knowledge, skills, and abilities necessary to support the transition to more sustainable production and consumption models (OECD, 2019; OECD, 2025).

In the case of cultural organizations, the relationship between culture and sustainability has progressively gained greater relevance both in academic debate and in cultural policies and organizational strategies (JULIE'S BICYCLE, 2021). In particular, museums and cultural organizations are increasingly called upon not only to promote environmental awareness through their cultural and educational activities, but also to reduce their environmental impact and adopt more sustainable management practices (Duxbury et al., 2017; Ernst et al., 2016).

However, the effectiveness of this process depends largely on the organizations' ability to integrate sustainability into their internal governance models, decision-making processes, and daily organizational practices (Domingues et al., 2023), also within the broader managerialization processes that are characterizing them (Palumbo et al., 2022). Without such integration, there is a risk that the commitment to sustainability will remain predominantly symbolic and will not translate into concrete changes in the operational activities of cultural organizations.

[1] Università IULM

In this context, one of the still relatively underexplored aspects concerns the role of human resource management practices in developing internal sustainability-oriented competencies. The literature on green human resource management (GHRM) highlights how practices such as green staffing − the introduction of roles or responsibilities dedicated to sustainability − and green training, understood as staff training on environmental issues and sustainable practices, can play a key role in supporting ecological transition processes within organizations (Renwick et al., 2013; Dumont et al., 2017). However, these practices have been studied primarily in industrial sectors or technology-intensive services, while they remain poorly explored in the cultural and creative sectors. This represents a significant gap in the literature, considering that cultural organizations present specific organizational characteristics − including often small size, heavy reliance on public or philanthropic resources, and hybrid professional structures − that can significantly influence the ways in which sustainability-oriented competencies are developed and integrated into organizational practices.

In light of these considerations, this study sits at the intersection of the literature on human capital in cultural sectors, that on green skills, and that on green human resource management practices. Specifically, the study aims to explore, with a focus on the Italian cultural sector, the extent to which cultural organizations are developing internal sustainability-oriented skills and which organizational and contextual characteristics are associated with the diffusion of these practices.

Purpose of the paper. *This paper presents preliminary findings from an ongoing study examining the organizational and contextual factors associated with the adoption of green human resources practice, in particular the presence of sustainability-oriented staff (green staffing) and the provision of sustainability training (green training). The study is guided by two research questions, approached as an exploratory agenda given the preliminary nature of the present paper:*

RQ1: What organizational characteristics are associated with the adoption of green human resource practices in Italian cultural and creative organizations?

RQ2: What contextual characteristics are associated with the adoption of green human resource practices in Italian cultural and creative organizations?

The study aims to map the current state of green human resources practices in the Italian cultural sector and to identify the organizational and contextual conditions under which such practices are more likely to be present. The specific objectives of the present paper are: (1) to describe the distribution of sustainability staffing and training provision across the sample; (2) to explore associations between two organizational and contextual characteristics − organizational size and network membership − and the two outcome variables; and (3) to identify which characteristics show the strongest exploratory signal, as a basis for future explanatory research across the full set of variables.

Methodology. *This study draws on data from the 4C−Cultural and Creative Carbon Cut questionnaire, conducted by Fondazione Santagata ETS (2024). The questionnaire is distributed online through a multichannel strategy. The questionnaire is structured into eight sections. The first one covers internal organizational characteristics, including size, legal form, and network membership, and contextual factors, including geographical area, municipal marginality code (defined according to the National Strategy for Inner Areas, 2020), share of university graduates in the region, and cultural sector. The remaining sections measure seven environmental dimensions on which cultural organizations can have an impact. One of these dimensions, Internal Processes, focuses on the organizational elements needed to manage activities sustainably. The present study examines variables from this dimension. Two variables capture the adoption of green human resources practices: 1) the presence of sustainability-oriented staff, and 2) the provision of sustainability training. We ask organizations reporting the absence of either practice to rate its perceived importance on a five-point Likert scale. Instead, organizations reporting the provision of sustainability training answer two follow-up questions: one on the topics covered, and one on the frequency of delivery. Both follow-up questions are closed, with pre-coded response categories.*

The cultural and creative sectors are delineated using the synoptic table developed by the Italian National Institute of Statistics (ISTAT) that maps economic activities according to the ATECO 2007 classification (updated 2022) across three perimeters: ISTAT 2022, ESSNet Culture, and Symbola. Sectoral composition follows the ESSNet Culture framework, operationalized through NACE Rev. 2 codes, adopted for data falling within the 2008–2024 reference period.

Organizational size is measured by adapting the Eurostat size classifications to the Italian landscape (Symbola & Unioncamere, 2024). Eurostat (2023) classifies enterprises with fewer than ten employees as micro, those with ten to forty-nine employees as small, those with fifty to two hundred forty-nine employees as medium-sized, and those with two hundred fifty or more employees as large. Since the Italian cultural sector is predominantly composed of micro and small enterprises (Symbola & Unioncamere, 2024), the original micro and small categories were further subdivided as follows: micro (fewer than five employees), micro-small (six to ten employees), small (eleven to twenty-five employees), and small-medium (twenty-six to fifty employees).

The analysis proceeded in two stages. During the first stage, we follow Tukey's (2018) exploratory data analysis (EDA) approach to identify patterns and distributional features before formal testing. During the second stage, we examine associations between the organizational and contextual characteristics and the two outcome variables. The three-category staffing variable was recoded into a binary measure (Field, 2018). The response categories "exclusively dedicated" and "not exclusively dedicated" were collapsed into a single "yes" category, yielding a 5×2 contingency

table. To identify which cells drove each significant association, adjusted standardized residuals were inspected (Field, 2018). Only statistically significant associations are reported in the Results. We conduct all analyses in IBM SPSS Statistics (version 29).

Results. *The gross sample comprised 804 organizations. Following two exclusion criteria−duplicates (C1) and organizations falling outside the ESSNet Culture perimeter (C2)−the net sample was reduced to 634 organizations. Primary acquisition channels included the Fondazione Santagata newsletter and a provider-sourced email list (44.3%, N = 281) and FAMU (39.0%, N = 247). Supplementary outreach was conducted via sector-specific intermediaries, including TrovaFestival (3.8%) and Ateatro (3.6%).*

Respondents predominantly occupied senior decision-making roles: legal representatives (19.4%), directors (15.9%), and project managers (9.8%); nearly half (46.4%) reported a tenure exceeding ten years. Self-identified green managers constituted only 3.0% of the sample (N=19). The sample achieves national coverage across all 20 Italian regions, with a greater concentration in the North (52.8%), followed by the Centre (27.6%) and the South and Islands (19.6%). Specifically, the highest regional concentrations are in Piedmont (17.2%, N=109), Lombardy (13.7%, N=87), Tuscany (13.1%, N=83), and Emilia-Romagna (7.4%, N=47). Organizations are almost evenly split between those operating at a regional scale (51.6%, N = 327) and those with national reach (48.4%, N = 307). The majority are located in category A areas (62.3%, N = 393), denoting relatively central and well-connected contexts. Category C accounts for 18.0% (N=114), while only 0.6% (N = 4) fall within the most marginal category F. Public institutions represent the largest governance category (28.9%, N=183), followed by Third Sector Organizations (18.1%, N=115), Social Promotion Associations (13.1%, N=83), and Foundations (11.7%, N=74). For-profit entities account for less than 15% of the sample. Foundation dates range from 1088 to 2024. Table 1 describes the sample's composition in terms of its cultural sector and summarizes the two variables used in the analysis, including organizational size and network membership. Cultural heritage organizations represent the dominant sectoral category (61.5%, N=390), followed by performing arts (24.8%, N=157), education (5.8%, N=37), visual arts (3.5%, N=22), audiovisual and multimedia (2.5%, N=16), and publishing and printing (1.9%, N=12). It is worth noting that micro- organizations predominate. Those with fewer than five employees account for 37.5% (N = 238); those with six to ten employees account for a further 28.1% (N = 178). Together, they comprise nearly two-thirds of the sample. Medium-sized organizations (51-100 employees) are marginal (11.5%, N=73). Finally, a majority of organizations (60.1%, N = 381) belong to at least one network; sectoral networks are the most prevalent type (49.1%).

Research limitations. *The vast majority of organizations (78.7%, N=499) report no staff dedicated to sustainability. A further 19.9% (N=126) have staff who address sustainability among other responsibilities. Only 1.4% (N = 9) employ exclusively dedicated personnel. Among organizations without dedicated green staff, the perceived importance of such a role was rated at a mean of 3.00 (SD=1.181), corresponding to "Moderately important" as both the median and modal response (28.2%). Whereas "Very important" was selected by 17.0% and "Almost irrelevant" by 10.7%. Sustainability training is similarly limited. Only 22.1% of organizations (N=140) report providing it. The most covered topics are waste material reduction (N=84, 13.2%), waste management (N=82, 12.2%), and environmental education (N=71, 11.2%). The most common format is the workshop (9.8%); the most frequently cited provider is external consultancy (N=69, 10.9%). Annual delivery is the most prevalent frequency (10.6%, N=67). Among organizations not currently providing*

training, perceived importance was rated at a mean of 3.37 (SD=1.181), with "Moderately important" as the modal response (24.0%), followed by "Very important" (20.8%) and "Fundamental" (15.8%). Almost irrelevant was selected by 6.0% (N=38).

Table 2 shows significant associations between organizational and contextual characteristics, such as organizational size and network membership, and GHRM practices, such as green staffing and training.

***Organizational Size and GHRM Practices (RQ1)**. Organizational size is significantly associated with both outcome variables. The chi-square test reveals a significant association between organizational size and the presence of sustainability-oriented staff (χ^2=40.768, df=4, p < 0.001; Cramer's V=0.254), indicating a small-to-medium effect size.*

Row percentages range from 11.9% among organizations with 26−50 employees to 24.4% among those with fewer than five. Adjusted residual analysis nuances this picture. Micro-organizations with fewer than five employees are significantly underrepresented (adjusted residual = -2.5). Small- medium organizations with 26−50 employees (adjusted residual= +3.4) and medium-sized organizations with 51–100 employees (adjusted residual=+3.4) are significantly overrepresented, both exceeding the ±1.96 threshold. It is worth noting that the highest raw prevalence of sustainability staffing (24.4%) is observed among the very smallest organizations (fewer than five employees); this apparent paradox is resolved by the adjusted residual analysis, which reveals that such organizations are in fact significantly underrepresented given their numerical dominance in the sample, confirming that size is positively associated with green staffing when distributional weight is accounted for. A significant association is similarly observed between organizational size and sustainability training provision (χ^2= 10.775, df= 4, p= 0.029; Cramer's V= 0.130), indicating a small effect size. Row percentages range from 9.3% among organizations with 26–50 employees to 31.4% among those with fewer than five. No individual cell exceeds the ±1.96 threshold. The strongest tendency towards overrepresentation is observed among organizations with 26–50 employees (adjusted residual= +2.1); micro-organizations with fewer than five employees tend towards underrepresentation (adjusted residual= -1.2), neither reaching cell-level significance.

***Network Membership and Green Training (RQ2).** Network membership is significantly associated with green training provision (χ^2= 7.351, df= 1, p= 0.007; Phi= 0.108), reflecting a small effect size. Among non-networked organizations, 30.0% (N= 42) report providing training (adjusted residual= -1.9). Among networked organizations, this figure rises to 70.0% (N= 98, adjusted residual= +1.5).*

Research limitations. *Several limitations of the present study should be acknowledged. First, the sample is a non-probability sample, which constrains the generalizability of the findings to the broader population of Italian cultural and creative organizations. Second, the cross-sectional design of the 4C survey does not allow causal inferences to be drawn from the associations observed. Third, the present paper reports exploratory findings for two variables−organizational*

size and network membership−as part of a broader ongoing study. Analyses for other variables, including legal form, territorial marginality, cultural sector, university graduates, and the perceived importance, will be reported in future work. Moreover, the operationalization of green human resources practices is narrow, focusing on staffing and training as observable organizational practices. Future studies should also move toward a more granular investigation of both green staffing and green training. The green staffing measure is based on a single survey item asking whether the organization employs personnel responsible for "the planning, implementation, management, and communication of activities aimed at reducing the ecological impacts associated with its operations." This generic operationalization does not capture the actual green-related tasks carried out by staff members, the distribution of environmental responsibilities within the organization, or the informal contributions of employees who engage in green activities without formally designated role. As concerns the green training variable, individual-level dimensions − such as managers' and employees' educational background in relation to Education for Sustainable Development (ESD), as well as their beliefs and attitudes toward sustainability − were not captured by the survey instrument. Incorporating such variables in future research would allow for a more comprehensive assessment of green HRM and its antecedents at the individual level. Finally, the study is limited to the Italian context, which, whilst distinctive in its sectoral composition and institutional framework, may limit comparability with cultural sectors in other national contexts.

Managerial implications. *The findings carry practical implications for cultural managers, sector intermediaries, and policymakers. The study is ongoing; the evidence presented here remains exploratory. The first implication concerns organizational size. In highly fragmented sectors such as the cultural and creative industries, the development of green human resources practices is unlikely to depend solely on organizations' internal resources. Rather, it is shaped by the broader availability of external support structures (Cles & Associazione Economia della Cultura, 2021). Micro-organizations are particularly exposed to this structural condition: given their limited internal capacity, sustainability competence development will rarely be achievable through internally driven strategies alone. Hybrid approaches−combining internal learning processes with shared services, subsidized training, and sector-level capacity-building initiatives- are therefore more realistic pathways for strengthening sustainability competences at this organizational scale. For cultural managers in micro and micro-small organizations, this implies that such external scaffolding is likely a necessary precondition for progress, rather than a supplementary option.*

The second implication concerns network membership. Networked organizations are more than twice as likely to provide sustainability training (70.0% vs. 30.0%). Professional networks are therefore already functioning as diffusion channels for green knowledge and practices, even if unintentionally.

Two distinct but complementary diffusion pathways can be identified. The first operates through sector-specific networks, which disseminate green knowledge horizontally among organizations sharing the same cultural domain. In the Italian context, ICOM Italia has developed guidelines and best practices for the integration of environmental sustainability into museum operations, promoting peer knowledge exchange across the national museum sector. At the international level, the Network of European Museum Organizations (NEMO), through its dedicated Working Group on Sustainability and Climate Action, has developed training programs on sustainable cultural management, facilitating cross-national knowledge exchange among museum professionals. Similarly, the European Theatre Convention (ETC), a network of European theatres, has adopted sector-specific sustainability standards and launched dedicated training programs for its member organizations, explicitly positioning the network as the primary vehicle through which green competencies are built and diffused. In the visual arts sector, Gallery Climate Coalition (GCC) brings together galleries, artists, curators, and cultural professionals around shared green standards and practices tailored to the national context, while the international coalition provides its members with free sector-specific guidelines, tools, and a dedicated carbon calculator.

A second pathway is represented by cross-sectoral networks, including the ECO Network, which has developed free capacity-building programs targeting organizations operating across the performing arts, visual arts, and cultural heritage sectors, providing shared methodologies and practical tools for green management.

The prevalence of sectoral networks in the sample (49.1%) suggests that Italian cultural organizations privilege the horizontal diffusion pathway.

The direct implication for sector intermediaries and policymakers is that existing cultural networks represent a cost-effective and already-embedded mechanism through which sustainability training content can be systematically disseminated rather than building a completely new infrastructure.

Originality of the paper. *This paper makes three original contributions to cultural management literature. First, it addresses a significant gap at the intersection of three areas of scholarship: human capital in cultural organizations, green skills, and green human resource management. Despite developing in parallel, these areas have rarely been brought into dialogue with one another, particularly with cultural and creative organizations, which remain largely absent from the empirical landscape. This study directly addresses this issue by providing, to the best of the authors' knowledge, the first large-scale empirical mapping of green human resource management practices, focusing specifically on sustainability staffing and training, across a nationally representative sample of Italian cultural and creative organizations.*

Secondly, the paper makes an empirical contribution that is both geographically and institutionally distinctive. Italy is a particularly relevant national context for this line of enquiry due to the scale and institutional complexity of its cultural sector, the prevalence of micro and small organizations, and the significant involvement of public institutions and third sector organizations in cultural governance (Symbola & Unioncamere, 2024). The findings suggest that there are conditions that substantially shape the adoption pathways of sustainability-oriented human resource practices. This institutional and structural specificity is an analytical asset in itself, enabling the study to examine how characteristics at the sector level — including organizational size and network embeddedness — mediate the diffusion of green practices.

Thirdly, the study contributes to practical and policy literature on cultural management by offering evidence based on empirical research that professional networks already function as channels for disseminating knowledge about sustainability. This suggests that intermediaries and policymakers in the sector need not develop new infrastructures from scratch, but can instead use existing network architectures as cost-effective ways of systematically building capacity.

Taken together, these contributions position the paper as an early but substantive step toward a dedicated research agenda on green human resource management in the cultural and creative sectors. Drawing on the full set of organizational and contextual variables collected in the 4C survey, future explanatory studies will extend the work.

Exploring governance in cultural cities: A comparative analysis of three cases in Italy

STEFANIA OLIVA[1], FRANCESCO CAPONE[1], LUCIANA LAZZERETTI[1]

Abstract. *Over the last few years, several scholars recognised the potential of cultural heritage and cultural organisations for shaping new trajectories of development in cities. However, limited attention has been paid to the role they play in shaping governance structures, although recent literature underlines the potential of their soft power. This paper aims to explore how governance operates in cultural cities and how cultural resources influence governance dynamics and management strategies. Building on the literature on governance and studies on the management of cultural heritage, the study proposes an analytical framework to examine governance configurations in heritage-rich contexts. Through an extensive review of the literature, the article develops an analytical framework that identifies crucial elements and dimensions of governance in cultural cities and empirically tests them through a comparative qualitative analysis of three Italian cities—Florence, Brescia and Pistoia. Data collection is based on semi-structured interviews with key stakeholders involved in the city governance. The results reveal how different configurations of actors, coordination mechanisms, and strategic priorities lead to distinct governance models. The paper contributes to the literature by identifying empirically grounded governance models that help explain how cultural resources shape strategies, objectives and priorities.*

Keywords: *governance; cities of art; cultural cities; cultural heritage management; Italy.*

Framing of the research. *In cities of art and culture, governance is not only guided by local government, but cultural organisations also play a crucial role in helping to shape the city's development trajectories and the management of cultural heritage, involving a multi-agentic perspective in the decision process.*

In the study of cultural and creative organisations, the topic of governance has been studied, focusing on different levels of organisational configurations, such as cultural and creative districts or clusters, cities of art or creative city (Costa, 2008; Sacco et al., 2009; Andres and Chapain, 2013; Pill et al., 2025). Among these systems, several elements have been considered from the relationships and roles among actors, forms of coordination, distribution of resources or the potential tensions that may arise (Lazzeretti and Cinti, 2009). According to this perspective, the governance of cultural cities can be analysed as a system in which cultural resources contribute to structuring priorities and relationships and developing policy instruments. Moreover, focusing on governance dynamics and processes can contribute to reorienting cultural heritage management strategies towards more sustainable approaches. This issue is particularly relevant for cities of art, where policymakers increasingly prioritise the sustainable management of tourism and visitor flows (Della Lucia, 2018; Pasquinelli and Trunfio, 2023).

The concept of city governance is multidisciplinary and concerns, among others, the fields of management, public administration, and urban studies. Urban governance, specifically, can be defined as the process through which collective objectives at the local level are formulated and achieved (Pierre et al., 2012). It can also be considered as a set of arrangements resulting from both formal and informal actions undertaken by governing bodies that guide the development of the city (Song et al., 2023). It identifies the relational process among a group of actors who jointly design actions aimed at public benefit (Redaelli, 2011), where this group of actors does not involve only the city hall (Hendriks, 2014). In a nutshell, urban governance refers to the process through which a set of key actors defines the developmental trajectories of the city.

Pierre (1999) distinguishes four main models of urban governance—managerial, corporatist, pro-growth, and welfare governance—which differ according to specific aspects such as participants, objectives, instruments, and outcomes. The managerial approach places market mechanisms at the centre, viewing local institutions as organisations that provide services to meet collective needs. The corporatist approach focuses on the interests of a group of organisations, while the pro-growth perspective is characterised by the structuring of concerted public–private actions aimed at boosting the local economy. Finally, welfare governance is typically associated with cities characterised by a passive style of politics and a stagnant local economy (Pierre and Peters, 2020; Branco et al., 2024).

Two additional crucial aspects of urban governance are its multilevel nature, which implies that local authorities maintain relationships with higher levels of government as well as with lower-level actors such as communities and neighbourhoods, and the political–administrative process, that is, the way decisions are implemented (Kearns and Paddison, 2000).

In the literature on cultural and creative cities, the issue of governance has mainly been addressed by examining aspects related to the management of cultural resources and strategies for urban development based on cultural and creative sectors (Lazzeretti, 2003). The role of cultural activities in cities can be interpreted by considering both the intrinsic value of culture and its importance for communities, as well as its capacity to regenerate declining sectors and

[1] Department of Economics and Management, University of Florence

support economic development, or its potential for cities' soft power and the contribution that cultural institutions give to political debate (Lazzeretti, 2023; Pill, 2025).

Research on governance in local contexts characterised by a strong presence of cultural resources and cultural and creative organisations—such as cultural districts and clusters, cities of art, and creative cities—has highlighted the importance of several elements. In this respect, governance in cultural and creative systems is shaped by heterogeneous organisational profiles whose roles and strategies differ in terms of actors, objectives and strategic orientation (Schieb-Bienfait et al., 2018).

A crucial aspect is related to the variety of actors involved in the governance process and the relationship among them. Lazzeretti and Cinti (2009) studied the multilevel governance of the city of Florence by observing the city's museum cluster. They describe a governance model in which cultural institutions and public institutions are complemented by a network of private actors—such as firms, spin-offs, and banking foundations—that are continuously involved in these relationships and perform complementary functions, including financial and technical support. These results are corroborated by recent research suggesting that, alongside local governments and cultural institutions, private actors can also play a crucial role as catalysts in shaping new development trajectories based on culture and creativity (Della Lucia and Trunfio, 2018). In parallel, empirical evidence also suggests a growing recognition of the need to extend governance processes to local communities, requiring the adoption of appropriate participatory mechanisms and tools (Sokka et al., 2005; Cerquetti, 2024). This plurality of agents contributes to increasing the complexity of objectives, interests and expectations among stakeholders (Gugu and Dal Molin, 2016), and consequently actions involved in the management of cultural heritage.

Moving beyond the typology of actors, part of the literature focuses on the strategies adopted to manage cultural heritage and cultural and creative organisations in order to support cities' development. Within this stream, scholars examine both the objectives of these strategies and the mechanisms through which they are implemented. A large part of research investigates cultural resources in supporting place rebranding or regeneration processes (Solima and Minguzzi, 2014; Brorström and Willems, 2023; Pasquinelli and Eshuis, 2025). From this perspective, the relationship between cultural resources and places appears to be mutually reinforcing and sometimes contested. On the one hand, cultural resources can be strategically mobilised to promote a new image of a place; on the other hand, the attractiveness and identity of a place can foster the emergence of new cultural and creative enterprises (Lazzeretti and Oliva, 2022; Pasquinelli et al., 2024). More recently, this perspective shifted toward the study of the city's reputation, showing that synergistic coordination among institutional, economic, and cultural agents may increase effective governance and positively influence the city's cultural reputation (Beccherle et al., 2025).

Finally, literature has identified the mechanisms that shape different typologies of governance in cultural and creative systems. According to Sacco et al. (2009), culture-based development can be represented through a bottom-up, self-organised model or through a top-down model in which cultural resources are mobilised through specific development strategies, often aimed at increasing attractiveness and tourism, with limited attention to impacts on the local community. Similarly, studying the Museums Quarter of Vienna, Abfalter and Piber (2016) evidence that a model based on a higher degree of flexibility in the strategic processes can lead to expected and innovative opportunities.

Costa et al. (2008) identify four approaches linking culture and creativity to territorial development. The first concerns explicit policies aimed at building the "creative city" through the promotion of creative industries, the attraction of talent, and the use of creativity as a development tool. The second includes broader interventions that use cultural activities—such as events, cultural spaces, and urban regeneration processes—to foster urban and regional growth. The third further broadens the perspective by considering cultural and creative activities as drivers of competitiveness and territorial dynamics, even independently of public intervention, emphasising clusters and local production systems. Finally, the broadest approach interprets culture in a wider sense, placing identity, heritage, urban image, and symbolic representation at the centre as key resources for territorial development.

Similarly, Smith and Warfield (2008) distinguish between a culture-centred approach, which prioritises public support for cultural and artistic institutions and a collaborative governance model, and an economy-centred approach, which focuses on strengthening cultural and creative sectors through the development of partnerships, networks, and collaborations (Andres and Chapain, 2013).

More recently, some scholars have focused on the issue of collaborative governance (Ansell and Gash, 2008; Ciangola and Giodano, 2025). In this perspective, the role of the local community becomes crucial for the governance of cities rich in cultural heritage. According to some authors, collaborative governance helps balance conservation and valorisation in heritage-rich contexts. In addition to the involvement of institutional, cultural, and economic actors, it also requires the active participation of the local community (Qiu et al., 2025).

Purpose of the paper. *Although effective governance can enhance efficiency and improve the allocation of resources, while enabling the development of strategies that balance diverse interests, such as those of local communities, government, and cultural organisations, the topic of governance in heritage-rich contexts has received limited attention.*

On the one hand, in the literature on governance, the role of cultural heritage and cultural organisations still remain marginal. Existing literature, however, highlights that urban development patterns are strongly shaped by the evolution of the sectors that historically characterise a city's economic structure, as well as by the broad set of institutions that support these sectors (Wolfe, 2010). Consequently, cities characterised by a strong presence of cultural organisations

may display specific features that shape their development trajectories in distinctive ways and, in turn, influence the forms of governance through which these trajectories are steered.

On the other hand, studies on cultural cities and creative cities have done little to investigate the context and elements of governance. Related to this aspect, however, globalisation has intensified competition among cities for resources, making distinctive local cultures increasingly important for attracting tourists, investments, and economic opportunities. As noted by Kearns and Paddison (2000), institutional fragmentation can foster innovative processes, and economic uncertainties can lead to the assertion and utilisation of local culture(s), values, and images.

Based on these considerations, the paper aims to fill this gap by answering the following research question: how does governance operate in cultural cities and what role do cultural resources play in shaping urban governance? Combining the literature on governance of cities and the field of culture and creativity, the study aims to define a model of governance for cultural cities and analyse it in the light of the case studies of three Italian cities, Florence, Pistoia and Brescia.

The paper wants to contribute to the literature by identifying the key dimensions that shape governance in cultural cities and by empirically analysing how these dimensions vary across three Italian cases, caracthereized by a specific context in terms of agents and cultural heritage management strategies. The theoretical contribution goes beyond the application of existing urban governance models to cultural cities but the paper proposes a revision and integration of these models including cultural heritage resources to identify how they shape governance configurations, actor coordination, and strategic objectives.

Methodology. *Based on the literature, the analysis firstly identifies some crucial dimensions in the governance of heritage-rich contexts that can shape local development trajectories and the relationship between actors involved in decision-making processes. These might involve the objectives of cultural policies (e.g., increasing competition, attracting tourism, engaging the community, etc.), the configuration of actors involved in decision-making processes, coordination mechanisms between actors (e.g., from top-down policy strategies to more network-based and collaborative forms of governance), and the role of the community.*

Secondly, the analysis adopts the methodology of comparative case studies to test the dimensions of governance on three Italian cultural cities, Florence, Brescia and Pistoia and identify crual theme among the dimsions. Data collection involved a total of 69 interviews collected between 2019 and 2024 among a set of different key-actors – local government, tourism and cultural organisations, firms and business associations - involved in the cultural heritage management and city governance. Interviewees were selected through a snowball sampling strategy (Noy, 2008). The research initially involved experts and professionals directly engaged in cultural heritage management and urban governance processes within the three cities. These initial informants subsequently suggested additional relevant stakeholders to be included in the study. The snowball process enabled the identification of a broad network of actors involved in governance dynamics allowed the research to progressively capture the plurality of perspectives and relationships. When no substantially new information emerged from additional interviewees during the data collection process, data saturation was considered achieved and no further actors were contacted (Bouncken et al., 2026; Elmholdt et al., 2026).

The three cases were selected through a most-different design within a shared national context. The cities of Florence, Brescia and Pistoia all recognise cultural resources as central to the development of new trajectories, yet they represent distinct strategies and governance configurations. While Florence represents a major international city of art facing intense tourism pressures, the cities of Brescia and Pistoia are medium-sized cities that have been recently appointed by the label of Italian Cultural Capitals and are experiencing two different paths in terms of culture-driven development. On the one side, Brescia is a post-industrial city that has strategically invested in culture as a repositioning strategy. On the other side, Pistoia is developing cultural initiatives to better define its identity, still fragmented. The differences between the three cases enable the identification of different governance models. The comparative logic aimed to identify how different governance configurations emerge under distinct development trajectories despite a shared national institutional context.

Interview data were analysed through a reflexive thematic analysis (Braun and Clarke, 2019; 2022). Reflexive thematic analysis is a qualitative method for identifying, analyzing, and interpreting themes within data. The analysis focused on identifying recurring themes among governance dimensions across the three cases, including actor configurations, strategic objectives, coordination mechanisms, and the role of communities.

Results. *The analysis reveals preliminary results that indicate significant differences in the governance of cities and the management of cultural heritage. A point of similarity is represented by the crucial role played by cultural heritage and cultural organisation in shaping the future development trajectories of the cities. The whole of the actors involved in the analysis highlight cultural heritage as a strategic asset in defining the identity of the place and past and present trajectories.*

In terms of strategic objectives, the three cities exhibit distinct trajectories shaped by their historical economic backgrounds and current tourism maturity. Brescia has embarked on a strategic process of repositioning, integrating its traditional industrial legacy with a new identity as a city of culture. This effort to diversify the city's image and global reputation led to the designation as the Italian Capital of Culture 2023 (Beccherle et al., 2024). Conversely, Pistoia has responded to the structural decline of its traditional manufacturing sectors by leveraging cultural resources to foster a new path of development. Following the year of Italian Capital of Culture in 2017, the city has focused on enhancing its heritage to increase tourism attractiveness, specifically positioning itself as a destination for niche and slow tourism and

an alternative to mass-market circuits (Oliva et al., 2026). In contrast, Florence, as a major global city of art, faces the pressures of overtourism. Its strategic focus is centred on the delicate reconciliation of heritage preservation and cultural valorisation, with an emphasis on achieving a more sustainable management of visitor flows with a large debate on carrying capacity and the role of new technologies in supporting a more effective governance and tourism management (Liberatore et al., 2023; Franco et al., 2026).

Regarding the configuration of actors and coordination mechanisms of the governance structure, significant differences emerge in their models (Table 1).

Table 1. Comparative governance dimensions across the three cases

Dimension	***Florence***	***Brescia***	***Pistoia***
Governance orientation	*Sustainable tourism and overtourism management*	*Culture-led repositioning strategy*	*Identity-building through culture*
Actor configuration	*Highly fragmented and multilevel stakeholder network*	*Coordinated network centred on cultural institutions*	*Weakly coordinated and fragmented local network*
Leading actors	*Public institutions and major cultural organisations*	*Museum foundation and local government*	*Museum and banking foundations*
Coordination mechanisms	*Complex negotiation among competing interests*	*Structured public–private coordination*	*Emerging and partially fragmented coordination*
Role of culture	*Heritage management and tourism regulation*	*Strategic tool for city branding and repositioning*	*Resource for territorial identity construction*
Community involvement	*Limited but increasingly debated*	*Moderately integrated through partnerships*	*Relevant but still weakly institutionalised*
Emerging governance model	*Fragmented multilevel governance*	*Strategic coordinated governance*	*Emerging identity-based governance*

Source: Authors' elaboration

The cities of Brescia and Pistoia are characterised by a relatively centralised governance framework for heritage management. In both cases, museum foundations serve as pivotal institutional actors, streamlining decision-making and coordination. On the other hand, the governance of Florence is notably more fragmented. It is defined by a complex stakeholder landscape where divergent—and often competing—interests between economic and institutional actors necessitate more sophisticated and multifaceted coordination efforts.

Research limitations. *The research has several limitations that can be summarised in three major considerations. First, although the study presents three different case studies, it remains largely context-specific and generalisation of the results can be limited. In respect to this point, given the qualitative nature of the study, the findings should are intended to provide an interpretative understanding of governance dynamics rather than statistically representative evidence. Second, even if the studies present a rich involvement of different typologies of agents among the key actors of the city governance, they may omit to take into account valuable city stakeholders. Further research should also include the citizen and community perspective, especially if collaborative governance and bottom-up processes are to be analysed. Third, the analysis mostly relies on qualitative data from interviews. This limitation can reflect subjective interpretation, and confirmation bias can emerge. For this reason, future development of the analysis should involve a rigorous triangulation of data sources.*

Managerial implications. *The preliminary results of the study suggest relevant managerial implications both in the context of cultural organisations management and on governance mechanisms. In the context of art and creative cities, cultural and creative organisations can be crucial actors in the city's governance model. In particular, they can act as a mediator, balancing the interests of the government, communities, and economic agents, and fostering collaboration between the different categories. In this regard, to consolidate their position within the city's governance, managers of cultural organisations should develop strategies aimed at actively participating in policy-making forums and continuously building relationships with local public institutions and businesses, in order to contribute effectively to the formulation of heritage management strategies. A further crucial aspect regards the need for coherent and continuous coordination mechanisms. The contemporary scenario, marked by fragmented, multilevel governance and short-term political cycles, increasingly requires city regions to have a clear and coherent long-term vision to guide their future development (Dixon et al., 2023). In the absence of the capacity to strengthen coordination mechanisms among public institutions, cultural organisations and economic actors, the risk is an increasing fragmentation and a disalignment between cultural objectives and local development strategies. Finally, effective governance in heritage-rich contexts requires drawing strategies to incorporate local communities in decision-making processes in order to balance economic development, heritage preservation and individuals' quality of life. It is therefore crucial for both cultural organisations*

and local institutions to define tools and strategies for stakeholder management, launching participatory projects and forms of collaboration with the community for the co-creation of value.

Originality of the paper. *The originality and innovative contribution of the paper are related to several aspects. First, the study combines two different strands of research, namely the literature on governance and the studies on the management of cultural heritage in cities. The merging of these perspectives allowed us to define an innovative analytical framework that identifies relevant dimensions of governance in cities characterised by a strong presence of cultural organisations. Moreover, the application to the context of cultural heritage suggests an innovative perspective on the role of culture-related factors in shaping governance configurations, coordination mechanisms, and development strategies. Finally, through a comparative analysis of three Italian cities, the research identifies distinct governance models that are empirically grounded and can further represent some ideal-types in the management of cities of art.*

From Erasmus Mobility to Destination Loyalty: The Role of Satisfaction

FEDERICO MERTOLI[1], POLINA BELOVA[2], ANDRZEJ BRATKOWSKI[2], WERONIKA JEDYNAK[2], LUIGI PIPER[3]

Abstract. *Erasmus+ mobility represents not only an educational experience but also a potential driver of future tourism and destination attachment. Students spending several months abroad experience the host country both as learners and temporary residents, which may influence their long-term relationship with the destination. This study investigates how Erasmus+ experiences translate into destination loyalty. Drawing on push–pull theory and the experience–satisfaction–loyalty framework, the research analyses survey data from 208 Erasmus+ students in Italy using a mixed-methods approach combining a qualitative phase and a path analysis. The results show that both push factors and pull factors positively influence students' satisfaction, while satisfaction strongly predicts destination loyalty. The findings suggest that Erasmus+ mobility can generate long-term connections between international students and host destinations, potentially transforming study abroad experiences into future tourism flows.*
Keywords*; Erasmus+ mobility; push and pull factors; student satisfaction; destination loyalty; tourism behaviour.*

Framing of the research. *International student mobility has become a central component of higher education internationalisation strategies. Over the past decades, universities and governments have increasingly promoted cross-border mobility programmes in order to enhance intercultural competencies, academic collaboration and global knowledge exchange. Within Europe, the Erasmus+ programme (hereafter Erasmus+) represents one of the largest and most successful initiatives supporting temporary student mobility. Since its introduction, Erasmus+ has enabled millions of students to spend a period of study abroad, fostering both educational development and intercultural integration (Teichler, 2012; Van Mol, 2014).*

Beyond its academic dimension, Erasmus+ also has important implications for the attractiveness of host countries and cities. Students who participate in Erasmus+ often experience the destination not only as learners but also as temporary residents and visitors. During their stay, they interact with the social, cultural and economic environment of the host location, forming perceptions that may influence their future behavioural intentions toward the destination and may contribute to future revisits and destination recommendation. In this sense, international students can be considered a hybrid category between traditional students and tourists, as their experience combines educational, cultural and lifestyle elements (Lesjak et al., 2015). After their mobility period, students may return to the destination as tourists, recommend it to others, or promote it within their social networks, thus contributing to the long-term visibility and attractiveness of the host location.

For this reason, research on international student mobility has increasingly drawn on theoretical frameworks originally developed in tourism and migration studies. Among these, the push and pull theory (Crompton, 1979) represents one of the most widely adopted approaches to explain mobility decisions (Eder et al., 2010). According to the theory, individuals' decisions to study abroad are influenced by two sets of factors. Push factors refer to internal motivations or circumstances that encourage individuals to leave their home country, such as the desire for international experience, personal development or academic opportunities. Pull factors, on the other hand, refer to the attributes of the host destination that attract students, including the reputation of universities, cultural heritage, lifestyle, climate and perceived quality of life (King & Ruiz-Gelices, 2003; Mazzarol & Soutar, 2002). Building on this framework, previous research has begun to explore the role of push and pull factors as direct determinants of destination loyalty (Prete et al., 2021).

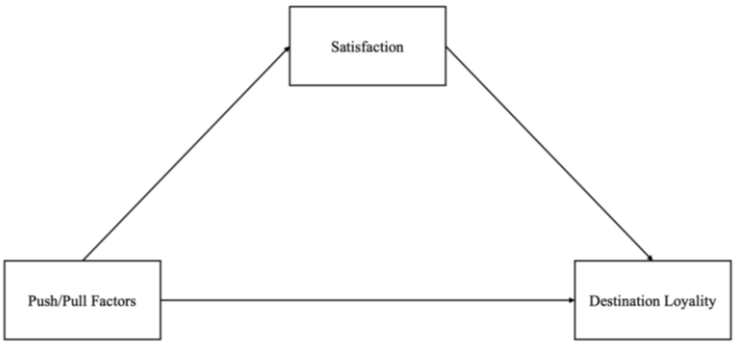
Tourism and service research has developed the experience–satisfaction–loyalty framework, which suggests that visitors' evaluations of their experiences strongly influence their satisfaction and subsequent behavioural intentions toward a destination. According to this perspective, satisfaction represents a key mediator linking individuals' expectations and perceptions with future loyalty, such as the intention to revisit a destination or recommend it to others (Baker & Crompton, 2000; Yoon & Uysal, 2005). This framework has also been applied to heritage destinations in Italy, confirming the central role of satisfaction in shaping tourists' behavioural intentions (Piper et al., 2022).

Despite the conceptual similarities between these research streams, relatively few studies have integrated push and pull factors with the satisfaction–loyalty framework in the context of international student mobility. Most existing research focuses either on the determinants of students' decisions to study abroad or on the academic outcomes of mobility experiences, while less attention has been devoted to understanding how the overall experience shapes students' long-term attachment to the host destination.

[1] University of Catania, Italy
[2] University of Warsaw, Poland
[3] University of Salento, Italy

Integrating these perspectives is particularly relevant in the case of Erasmus+. Exchange students typically spend several months in the host country, interacting extensively with local communities, cultural institutions and urban environments. Their perceptions therefore go beyond purely academic factors and include broader aspects of the destination experience. As a result, the mechanisms shaping their satisfaction and loyalty may resemble those observed in tourism contexts (Lesjak et al., 2015). In this respect, Italy represents a particularly interesting empirical context, as it is consistently one of the most popular Erasmus+ destinations in Europe, attracting large numbers of international students every year thanks to its combination of cultural heritage, lifestyle, climate and academic opportunities.

Purpose of the paper. *Building on the outlined theoretical background, this study aims to investigate the mechanisms through which Erasmus+ students develop satisfaction with their mobility experience and loyalty toward Italy as destination. While previous studies have largely focused on the determinants of students' decisions to study abroad, less attention has been devoted to understanding how initial motivations and destination attributes translate into students' evaluations of their experience and subsequent behavioural intentions toward the destination.*



In particular, this research integrates the push and pull theory commonly adopted in international student mobility studies with the experience–satisfaction–loyalty model developed in tourism and service research. By combining these perspectives, the study seeks to provide a more comprehensive explanation of how Erasmus+ students evaluate their experience in the host country and how these evaluations influence their future relationship with the destination.

Specifically, the paper examines the role of push factors and pull factors in shaping students' satisfaction with their Erasmus+ experience in Italy. Italy represents one of the most popular Erasmus+ destinations in Europe and therefore provides a particularly relevant empirical context for analysing how international mobility experiences may translate into satisfaction and destination loyalty (Mazzarol & Soutar, 2002).

In addition to examining their direct effects, the study investigates the mediating role of satisfaction in the relationship between motivations and destination loyalty. In line with the experience–satisfaction–loyalty framework, satisfaction is expected to play a central role in translating students' motivations and perceptions of the host environment into long-term behavioural intentions toward the destination, such as the intention to revisit the country, recommend it to others, or maintain a positive attachment to the host location (Yoon & Uysal, 2005).

By addressing these research objectives, the paper aims to contribute to the literature on international student mobility by bridging tourism and higher education perspectives and by providing empirical evidence on the determinants of Erasmus+ students' satisfaction and destination loyalty in the Italian context.

Figure 1. Conceptual framework

Methodology. *This study was based on qualitative research aimed at identifying push and pull factors among Erasmus+ students and on quantitative research aimed at examining the relationships between push factors, pull factors, satisfaction, and destination loyalty among Erasmus+ students who have spent a mobility period in Italy. For the qualitative phase, data were collected through a focus group involving eight participants (four males, four females; mean age = 24 years), all of whom had completed or were completing an Erasmus+ mobility period in Italy. During the session, participants were asked to reflect on their Erasmus+ experience and to respond in writing to two open-ended questions. First, the participants were invited to identify at least seven personal reasons or motivations that had led them to choose Italy as their Erasmus+ destination, with reference to internal aspects such as interests, emotions, goals, or personal needs (push factors). Second, they were required to list at least seven characteristics or features of Italy that had attracted them to the destination, with reference to external attributes such as cultural heritage, environment, events, or available opportunities (pull factors). The responses were analyzed by calculating the frequency of each factor mentioned across participants. Factors mentioned by at least 50% of participants were retained for inclusion in the quantitative phase of the study.*

The quantitative phase was conducted through an online questionnaire administered to international students participating in Erasmus+ at Italian universities. A total of 208 valid responses were obtained and used for the empirical analysis. The questionnaire included three sections. The first section asked participants to rate the importance of the

factors identified through the qualitative phase on a seven-point Likert scale ranging from 1 ("Not at all important") to 7 ("Extremely important"). Push factors were measured through six items capturing the internal drivers for choosing Italy as an Erasmus+ destination: creating a wider social life and peer influence, personal growth and independence, willingness to experience different academic opportunities, Italian language learning, attitude to travel and connectivity, and personal openness to cultural experiences. Pull factors were measured through six items related to the attractiveness of Italy as a host destination: cultural heritage, food and cuisine, a hospitable community fostering social interaction and student engagement, beautiful landscapes and proximity to the sea, academic reputation and opportunities, and Mediterranean climate.

The second section measured satisfaction and destination loyalty on a seven-point Likert scale ranging from 1 ("Strongly disagree") to 7 ("Strongly agree"). Satisfaction was operationalized through four items capturing students' overall evaluation of their decision to undertake an Erasmus+ experience in Italy, namely: the perception of having made a wise decision, the sense of having done the right thing in choosing the Erasmus+, the sense of having done the right thing in choosing Italy as a destination, and the perception that Italy was exactly what was needed for the experience, drawing on Oliver (1980). Destination loyalty was operationalized through seven items reflecting behavioural intentions toward both the Erasmus+ and Italy as a host destination: saying positive things about the Erasmus+ experience in Italy to others, saying positive things about Italy to others, recommending the Erasmus+ experience in Italy to someone seeking advice, recommending Italy as a destination to someone seeking advice, encouraging friends and relatives to do an Erasmus+ experience in Italy, encouraging friends and relatives to visit Italy, and the intention to make the same choice again, drawing on Bigne et al. (2001).

The third section collected sociodemographic information, including age, gender, nationality, and field of study — classified as STEM or non-STEM. Participants also provided information on their self-assessed academic performance, the approximate amount of their Erasmus+ grant, and their average annual family income, which were included in the analysis as control variables.

The internal consistency of the measurement scales was initially evaluated using Cronbach's alpha coefficient. All constructs exceeded the recommended threshold of 0.70 (Nunnally, 1978), indicating a satisfactory level of reliability for the scales used. To further validate the measurement model, a Confirmatory Factor Analysis (CFA) was conducted. The results of the CFA confirmed that the observed variables significantly loaded onto their respective latent constructs, providing evidence of the adequacy of the measurement structure. All factor loadings were significant.

Following the validation of the measurement model, the hypothesised relationships between push factors, pull factors, satisfaction, and destination loyalty were tested using a Path Analysis. This approach allowed for the simultaneous estimation of direct and indirect relationships between latent constructs and proved particularly suitable for testing mediation mechanisms within behavioural models. In the model (Figure 1), push factors and pull factors were specified as antecedents of satisfaction, while satisfaction was modelled as the main predictor of destination loyalty. Furthermore, the push and pull factors were also allowed to exert direct effects on destination loyalty, in order to evaluate both direct and mediated relationships.

Results. *Table 1 presents the correlations among the main variables included in the analysis. The results show that all constructs are positively and significantly correlated. In particular, satisfaction and destination loyalty show the highest correlation ($r = 0.833$, $p < 0.001$), providing initial empirical support for the existence of a strong relationship between students' evaluation of the experience and their behavioural intentions towards the host destination. Positive and significant correlations were also observed between push factors and satisfaction ($r = 0.598$, $p < 0.001$), between pull factors and satisfaction ($r = 0.650$, $p < 0.001$), and between push factors and destination loyalty ($r = 0.610$, $p < 0.001$). Similarly, pull factors show a positive correlation with destination loyalty ($r = 0.656$, $p < 0.001$). These results provide initial evidence supporting the hypothesised relationships in the research model.*

Table 1. Correlations

Variable	1	2	3	4
1. Push factors				
2. Pull factors	0.664			
3. Satisfaction	0.598	0.650		
4. Destination loyalty	0.610	0.656	0.833	

To rigorously test the proposed relationships, a Path Analysis was conducted. The results (as reported in Table 2) show that both push factors and pull factors significantly influence students' satisfaction with the Erasmus+ experience. In particular, the pull factors show the strongest effect ($\beta = 0.520$, $p < 0.001$), while the push factors also exert a positive and significant influence ($\beta = 0.297$, $p < 0.001$). These results indicate that both internal motivations and the characteristics of the host destination contribute to shaping the overall evaluation of the mobility experience by students.

Satisfaction, in turn, significantly predicts destination loyalty ($\beta = 0.658$, $p < 0.001$), confirming the central role of experiential evaluation in determining students' behavioural intentions towards the host destination.

The model also highlights more contained but still significant direct effects of push factors ($\beta = 0.108$, $p < 0.05$) and

pull factors (β = 0.166, p < 0.01) on destination loyalty. However, the analysis of indirect effects indicates that both push factors and pull factors influence destination loyalty primarily through satisfaction, highlighting the mediating role of the latter in the relationship between motivations and destination loyalty. In particular, the indirect effect of push factors on loyalty through satisfaction is significant (β = 0.196, p < 0.001), as is the indirect effect of pull factors (β = 0.342, p < 0.001).

The results support the proposed conceptual model and confirm the joint importance of motivational and experiential factors in determining the satisfaction of Erasmus+ students and their loyalty to the host destination.

Table 2. Path Analysis results

Relationship			β	p-value
Push factors	→	Satisfaction	0.297	<0.001
Pull factors	→	Satisfaction	0.520	<0.001
Push factors	→	Destination loyalty	0.108	<0.05
Pull factors	→	Destination loyalty	0.166	<0.01
Satisfaction	→	Destination loyalty	0.658	<0.001

Research limitations. *Despite the contributions of this study, several limitations must be acknowledged when interpreting the findings. First, the empirical analysis focuses exclusively on Erasmus+ students studying in Italy. Although this allows for a deeper understanding of the Italian context as a host destination, the results may not be fully generalizable to other countries participating in the Erasmus+. Host destinations differ significantly in terms of academic structures, cultural environments, and living conditions, which can influence students' mobility experiences and perceptions (Teichler, 2012; Van Mol, 2014).*

Second, the study is based on cross-sectional data, capturing students' perceptions at a specific moment during or shortly after their mobility experience. Although this approach provides useful information on the relationships between pus and /pull factors, satisfaction, and loyalty, it does not allow for the analysis of how these perceptions evolve over time. Longitudinal studies would be particularly valuable to assess whether the loyalty intentions expressed by students translate into actual behaviours, such as revisiting the destination, continuing studies abroad, or developing long-term professional ties with the host country (Rindfleisch et al., 2008).

Third, the research relies on self-reported survey data, which may be subject to response bias. Students who had particularly positive experiences may have been more inclined to participate in the survey, which could lead to an overestimation of satisfaction levels. This limitation is common in studies based on voluntary participation in surveys within Erasmus+ (Van Mol, 2014). Moreover, the study does not account for the potential moderating role of negative experiences, which have been shown to significantly affect tourist loyalty (de Cosmo et al., 2023).

Overall, addressing these limitations in future research would contribute to developing a more comprehensive understanding of the dynamics shaping international student mobility and their long-term implications for host destinations.

Managerial implications. *The results of this study offer several managerial implications for universities, public policymakers, and destination managers interested in strengthening the long-term impact of Erasmus+. In particular, the results highlight the central role of student satisfaction in determining their loyalty towards the host destination. Although both push factors and pull factors influence the overall evaluation of the mobility experience, satisfaction emerges as the main predictor of destination loyalty. This suggests that attracting international students through promotional campaigns or the academic reputation of universities is not sufficient on its own. Universities and local institutions must also ensure that the experience actually lived by students during the mobility period is consistent with their expectations or even exceeds them. In practical terms, this implies investing in the quality of academic support, the efficiency of administrative services, and the creation of opportunities for social and cultural integration during the stay.*

The results also show how pull factors related to the destination play a particularly relevant role in determining student satisfaction. Elements such as cultural heritage, lifestyle, quality of life, and the overall attractiveness of the city significantly contribute to the evaluation of the mobility experience. This suggests that universities should not act in isolation, but develop forms of collaboration with local stakeholders, including local administrations, tourism organisations, and cultural institutions, in order to enhance the overall attractiveness of the destination for international students.

Another relevant element concerns the fact that push factors and pull factors influence destination loyalty both directly and indirectly through satisfaction. This indicates that the initial motivations of students in participating in the Erasmus+ continue to influence their experience even after the start of mobility. Universities could therefore benefit from a better understanding of students' expectations before their arrival, by developing orientation programs and communication strategies capable of aligning the academic offerings and mobility experience with those expectations.

Furthermore, an important implication concerns the potential role of Erasmus+ students as long-term ambassadors of the host destination. Students who report high levels of satisfaction and loyalty are indeed more likely to recommend

the destination to others and to return in the future, both as tourists and for further study or professional opportunities. From a strategic perspective, this implies that Erasmus+ can contribute not only to the internationalisation of higher education but also to broader place branding and talent attraction strategies.

Overall, the results suggest that the long-term benefits of Erasmus+ depend not only on the ability to attract international students but also on the management of the overall quality of their experience during their stay. Improving both the academic and experiential dimensions of mobility can help enhance student satisfaction and transform a temporary study experience into a lasting bond with the host destination.

Originality of the paper. *This study contributes to the literature on international student mobility by offering an integrated perspective on the dynamics connecting students' motivations, the mobility experience, and their subsequent behavioural intentions towards the host destination. In particular, the work connects two lines of research that have often been examined separately: on one hand, the push and pull framework, widely used to explain students' motivations to undertake study abroad experiences, and on the other hand, the experience–satisfaction–loyalty model, traditionally applied in tourism and service studies. The integration of these perspectives allows for a more comprehensive understanding of how individual motivations and destination characteristics contribute to influencing the overall evaluation of the mobility experience and the subsequent behavioural intentions of students.*

The study also contributes to the emerging literature that considers international students not only as students but also as temporary residents and visitors of the host destination. Analysing the satisfaction and loyalty of Erasmus+ students through a behavioural framework typically used in tourism studies, the research brings into dialogue two fields of study that are rarely integrated: that of the internationalisation of higher education and that of destination management.

An additional element of originality concerns the fact that the analysis is based on primary empirical data collected from Erasmus+ students in Italy, one of the main destination countries of the Erasmus+. While many previous studies have primarily focused on the motivations that drive students to participate in Erasmus+, this study shifts the attention to the phase following their arrival at the destination, highlighting the role of satisfaction as a key mechanism that connects students' initial motivations to their loyalty towards the destination.

Overall, the study proposes an innovative perspective on Erasmus+, showing how the integration of motivational and experiential factors can help generate long-term bonds between international students and host destinations, transforming a temporary study abroad experience into a lasting relationship with the territory.

How do the use of colors and emotional connections influence the image of rural destinations on Instagram? An AI-Based Analysis of Institutional and Visitor-Generated Visual Narratives

GINEVRA TESTA[1], FILIPPO MARCHESANI[2]

Abstract. *In today's social media landscape, the image of tourist destinations is increasingly influenced by the interaction between official institutional communication and visual narratives created by visitors. This dynamic is particularly significant for rural destinations, whose identity is closely linked to heritage, authenticity, and emotional connection. Based on the distinction between institutional visual governance and experiential narratives, this study explores how colors and the emotions they evoke contribute to shaping the cognitive, affective, and conative dimensions of the image of rural destinations on Instagram.*

The research adopts an AI-based image analysis approach to examine 660 Instagram photographs shared by municipalities and visitors in 33 rural villages located in Italy and France. A machine learning AI BOT was designed to extract the dominant color palettes from each image and associate them with emotional dimensions derived from color-emotion theory.

The results highlight a consistent divergence between institutional visual narratives and those generated by visitors. Institutional communication relies predominantly on neutral and desaturated color palettes, including gray, brown, and black, which reinforce a cognitive representation focused on heritage preservation and historical continuity. In contrast, images shared by visitors tend to feature brighter and warmer tones, particularly green, blue, beige, and yellow, which emphasize natural environments, relaxation, and the experiential aspects of rural tourism.

These findings suggest that, although both narratives contribute to the formation of the destination's image, their partial misalignment reflects a tension between identity preservation and experiential storytelling. This divergence appears more pronounced in Italian villages than in French ones.

The study contributes to the literature on destination image and visual storytelling by conceptualizing color as a pre-cognitive narrative mechanism through which destination identity is negotiated within digital environments. From a management perspective, the results indicate that rural destinations can benefit from a more strategic alignment between institutional visual communication and visitor-generated narratives to promote more consistent and emotionally engaging representations of the destination.

Keywords: *destination image; color psychology; visual narratives; Instagram; rural tourism; BOT AI*

Framing of the research. *The image associated with a tourist destination is not static; it evolves over time and is the result of the growing role of social media in shaping the perception of tourist destinations (Garay, 2019). In the context of social media, the identity of a destination is strongly influenced by multiple narratives, both institutional and those of tourists, who increasingly contribute to the creation of destination images through the content they generate (Hays et al., 2013). As a result, destination narratives are no longer produced exclusively by institutional communication but rather emerge from the interaction between multiple actors within digital environments (Lund et al., 2018).*

The image of a destination has been widely recognized in literature as a subjective and multidimensional construct, as it reflects individuals' perceptions, beliefs, and emotional responses to a place (Pike, 2017). According to Gartner (1994), the image of a destination consists of three interconnected dimensions: cognitive, affective, and conative (Stylidis et al., 2017; Tasci et al., 2007). The cognitive dimension refers to the knowledge and beliefs that individuals have about the characteristics of a destination, such as its landscapes, cultural heritage, or infrastructure. The affective dimension reflects emotional responses to the destination, including feelings such as relaxation or nostalgia. The conative dimension represents behavioral intentions, such as the desire to visit, recommend, or revisit a destination over time. Although these components are often described sequentially, recent research suggests that emotional responses may precede cognitive evaluations, particularly in visually mediated contexts (San Martín & Del Bosque, 2008). Emotional reactions to visual stimuli operate through rapid and largely automatic processes that influence attention, memory, and decision-making (Trauer & Ryan, 2005).

In the social media landscape, visual communication has become increasingly important (Qian, 2025). Social platforms such as Instagram favor images as the primary mode of communication (Leung et al., 2013), influencing travel decisions (Joyner et al., 2018) and destination perception, as well as shaping the cognitive and affective image of the destination (Garay, 2019). Social media platforms allow a multitude of actors to participate in the storytelling of the destination, thereby reducing the control previously exercised by institutional authorities (Lund et al., 2018; Zhao & Agyeiwaah, 2024).

[1] University of Genoa, Italy, ginevra.testa@unige.it
[2] University of Chieti-Pescara, Italy, filippo.marchesani@unich.it

Among the elements that characterize visual communication, color is one of the most powerful stimuli capable of influencing perception and emotional response (Barnes, 2022; Yu et al., 2020). Research in the fields of marketing and psychology has shown that colors can influence purchasing intentions (Bagchi & Cheema, 2013; Huang & Lu, 2016), shape product evaluations (Labrecque et al., 2013; Puzakova et al., 2016), and contribute to the perception of brand personality (Labrecque & Milne, 2012). In digital contexts, color also affects how users interact with online content, including browsing behavior and click-through rates (Jalali & Papatla, 2016). Colors in images can elicit emotional responses in viewers, often through automatic and unconscious processes (Poels & Dewitte, 2019). Through these mechanisms, visual storytelling can convey symbolic meanings, evoke emotional states, and promote lifestyles or cultural values (Salazar, 2012). Recurring color patterns in visual images help define how destinations are interpreted and remembered. These patterns can reinforce brand identity and influence the perceived attractiveness of places (Legendre et al., 2019; Poels & Dewitte, 2019). Among different colors, for example, blue is commonly associated with calm and serenity, while yellow evokes happiness and optimism. Red is often associated with passion and intensity, while green is linked to nature, safety, and environmental harmony (Labrecque et al., 2013; Singh, 2006).

According to Plutchik's theory of emotions (1980, 1985, 1994), emotional responses can be classified into eight primary emotions that interact to generate more complex affective states. These emotional associations have been widely applied in research exploring the relationship between colors and emotions (Mohammad & Turney, 2010). Brighter, more saturated colors are typically associated with positive emotional responses such as joy and relaxation, while darker or desaturated tones can evoke emotions related to sadness or nostalgia (Jonauskaite et al., 2020; Bruno et al., 2022). Thus, such signals and color palettes can influence visitor engagement by shaping the emotional interpretation of destinations (Yu et al., 2020).

Rural tourism is often characterized by landscapes rich in natural, historical, and cultural resources (Carneiro et al., 2015; De Aranzabal et al., 2009). These destinations are commonly perceived as places where slower rhythms of life persist, allowing tourists to temporarily escape the pressures of urban environments (Xu & Chan, 2010). Such experiences often evoke emotional responses related to well-being, tranquility, and nostalgia (Kim et al., 2015). Nostalgia itself represents a complex emotional state that combines both positive and negative feelings, including warmth, longing, and reflection on the past (Holak & Havlena, 1998). Rural destinations often elicit nostalgic emotions because they preserve traditions, lifestyles, and landscapes associated with earlier historical periods (Christou et al., 2018). Through visual storytelling on social media, these symbolic meanings are incorporated into digital narratives that shape how rural destinations are perceived by a wider audience.

Despite the growing attention devoted to visual communication in tourism research (Arefieva et al., 2021; Filieri et al., 2021; Lee, 2020; Picazo & Moreno-Gil, 2019), studies focusing on the use of colors remain highly descriptive and fragmented. Building on these considerations, this study contributes to the emerging literature on visual destination communication by investigating the role of color as a key narrative and emotional cue in social media imagery, while also providing insights that may support destination management organizations in developing more coherent and emotionally resonant communication strategies. Accordingly, the following research questions are proposed:
RQ1: What are the dominant colors in images shared by municipalities and visitors on Instagram relating to Italian and French rural villages?
RQ2: What emotional cues are associated with these visual representations?
RQ3: To what extent are institutional and visitor-generated visual narratives aligned or divergent?

Purpose of the paper. *The purpose of this article is to explore the visual narrative generated between institutional channels and visitors to a destination to see which aspects coexist and overlap and which diverge. The context taken as a reference is the rural context.*

Rural destinations represent an interesting context for the study of visual storytelling, as they are characterized by strong symbolic identities linked to nature, heritage, and authenticity (Royo-Vela, 2009). At the same time, these destinations often face structural constraints, such as limited marketing resources and reduced visibility in global tourism markets. Social media platforms are therefore important tools for promoting rural tourism and improving the visibility of destinations (Kasemsarn & Nickpour, 2025). In recent years, municipalities and tourists have increasingly shared images of rural villages on social media platforms, simultaneously contributing to the formation of the destination's image (Marchesani & Testa, 2026; Trunfio et al., 2022). However, it is still unclear how these different visual narratives align or diverge in their representation of rural destinations. To address this goal, this study investigates how colors used in Instagram photographs shared by municipalities and visitors influence the perception of rural tourism destinations.

By combining tourism theory with artificial intelligence–based image analysis, the study aims to contribute to the understanding of how visual elements shape destination identity in digital environments. The study focuses on small Italian and French villages, analyzing them using an innovative methodological approach based on a BOT AI that uses machine learning to extract the dominant colors within images. The study aims to contribute to the theory of destination imagery by conceptualizing color as a narrative tool.

Methodology. *The empirical context of the study consists of rural villages located in Italy and France. These villages were selected because they possess a rich cultural and historical heritage that has led to their recognition by prestigious associations such as I Borghi più belli d'Italia (The Most Beautiful Villages in Italy) and Les Plus Beaux Villages de la*

France (The Most Beautiful Villages in France). These associations identify villages characterized by high architectural, historical, and cultural value.

The overall sample contains 33 villages, located in different geographical areas of the two countries to ensure regional diversity. One village was chosen for each Italian and French region and macro-area, resulting in a selection of 20 Italian and 13 French villages.

To maintain consistency in the analysis of rural contexts, the selection process gave priority to villages with a relatively small population. This criterion ensured that the sample represented small rural communities rather than larger centers. However, if the smallest village did not have an official Instagram profile, the next smallest village was selected to ensure the availability of institutional visual content. The population of the villages included in the study ranges from less than 100 inhabitants to approximately 9,000 residents. This sampling strategy allows the research to capture variations in tourism development, economic context, and geographic location, while maintaining a consistent focus on rural destinations.

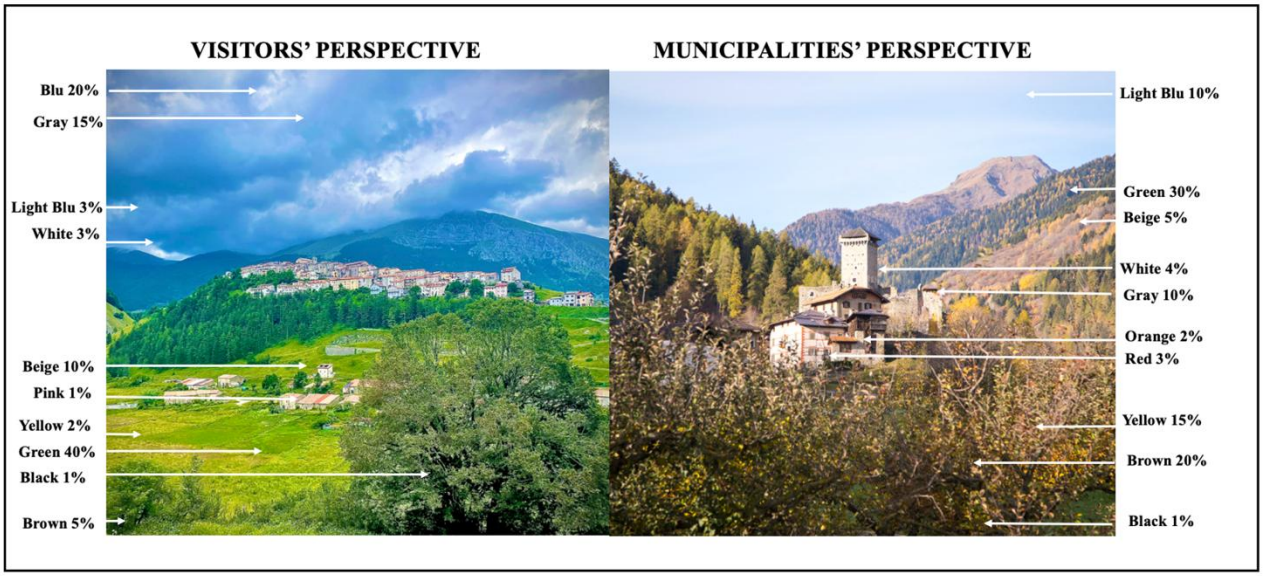
The empirical analysis focuses on visual content shared on Instagram, a platform that favors image-based communication (Poels & Dewitte, 2019; Varkaris & Neuhofer, 2017). Unlike other social platforms where textual communication plays a central role, Instagram emphasizes visual representation through images as the primary mode of communication. On this platform, institutional actors such as municipalities and visitors simultaneously contribute to the creation of narratives about destinations (Jansson, 2018).

Municipalities use official accounts to promote their territories, while visitors share personal experiences through geotagged images and hashtags. This coexistence of narratives allows us to explore the visual narrative developed by these multiple actors.

For each village included in the sample, two types of visual content were collected: 1) images shared by the municipality's official Instagram account; 2) images shared by visitors using the village's location as geotagging.

For each category, the ten most recent and most popular images were selected. Instagram's algorithm determines the visibility of posts based on engagement metrics such as likes, comments, and interactions, as well as recency and relevance (Cotter, 2019). To ensure consistency in the dataset, several inclusion and exclusion criteria were applied. Images containing large amounts of text, advertising content, or promotional material were excluded from the sample. Photo albums and commercial posts related to product marketing were also removed. When an image was excluded, the next available image was selected. After applying these criteria, the final dataset consisted of 660 photographs, of which 330 images were shared by municipalities and 330 images were shared by visitors. Of these, 400 images correspond to Italian villages and 260 to French villages. All images were archived and cataloged for subsequent analysis.

To analyze the visual characteristics of the collected images, the study uses an artificial intelligence-based methodology designed to extract the dominant colors present in each photograph. Traditional visual content analysis often relies on manual coding by researchers, introducing subjectivity and limiting scalability. In contrast, machine learning techniques allow for systematic analysis of large datasets while reducing potential observer bias.



For this study, an AI BOT called "Detecting_Color" was developed to automatically identify the dominant color palette of each image. The BOT was trained using a color classification system capable of recognizing a wide range of color variations.

The analysis process consists of several steps. First, the BOT scans each image and divides it into smaller segments to evaluate the color composition. Second, the algorithm calculates the proportion of each color within the image. Third, the system identifies the ten most visually dominant colors based on their relative coverage within the image.

To improve analytical accuracy, the BOT incorporates a weighted scoring mechanism that prioritizes colors that occupy larger portions of the visual frame. If an image contains fewer than ten relevant colors, the remaining positions are assigned a value of zero percent. This automated procedure allows for consistent extraction of color information from the entire dataset, minimizing human interpretation.

In addition, thanks to the learning and testing phase, the BOT has also made it possible to classify different shades of colors in a similar way, managing to understand the visual elements included in an image (such as different shades of green for vegetation, different shades of blue for the sky, etc.). Figure 1 shows the extraction of colors for each image.

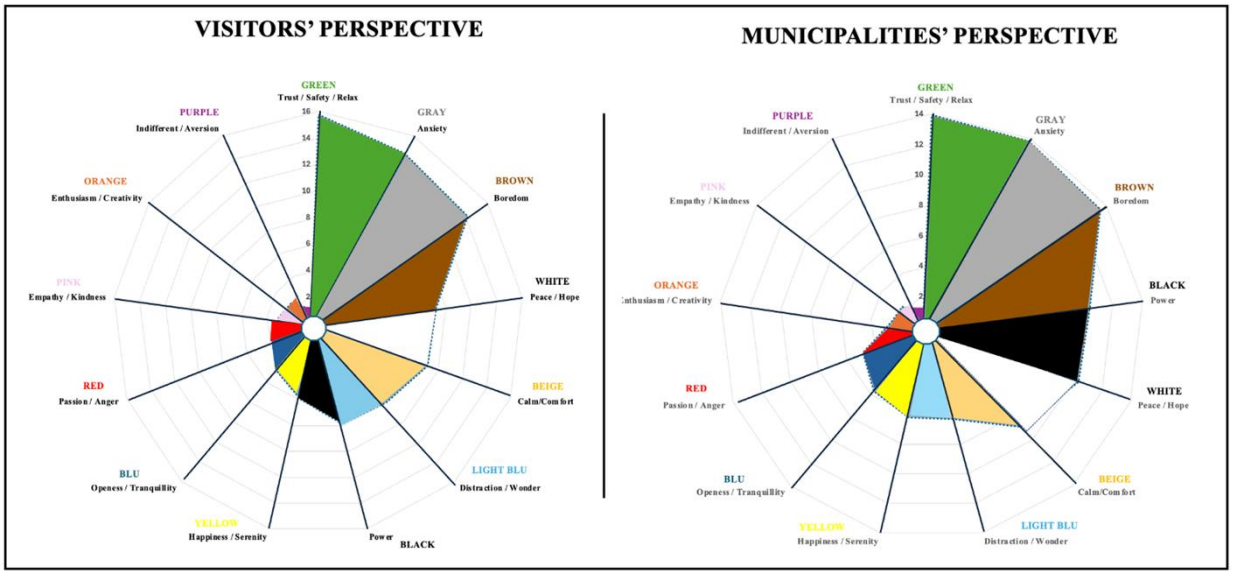


Figure 1. Example of colors extracted from Instagram photos posted by visitors and municipalities

Source: *Authors' elaboration based on AI BOT Detecting_Color*

Results. *Figure 2 reveals different patterns related to the use of colors in Instagram images shared by municipalities and visitors. Across the entire dataset, the most frequent colors are green, gray, brown, black, and white, followed by secondary colors such as beige and light blue. These colors reflect the natural landscapes, architectural elements, and atmospheric characteristics typical of rural villages. However, significant differences emerge when comparing institutional visual narratives with those generated by visitors.*

Figure 2. Percentage of colors collected from the total images published by visitors and municipalities

Source: *Authors' elaboration based on AI BOT Detecting_Color*

Municipal images tend to be based on neutral and desaturated color palettes. Gray, brown, and black appear particularly frequently, while green is mainly used to represent the surrounding landscapes. Black and white also appear in a relatively high percentage of institutional photographs. This color composition reflects the types of scenes emphasized by municipalities. Many images depict historic buildings, churches, traditional streets, and architectural monuments. These representations highlight the cultural heritage and historical identity of the villages. Municipal accounts also often share photographs related to traditional events, festivals, and cultural celebrations. These events are often represented

through formal or documentary images that emphasize historical continuity rather than experiential engagement. In addition, municipalities often publish black-and-white photographs, including historical images that illustrate how little the villages have changed over time. This visual strategy reinforces narratives about heritage preservation and timeless identity.

In contrast, images shared by visitors show a different visual emphasis. Visitor photographs feature more vibrant and saturated colors, particularly green, blue, beige, and yellow. These colors are commonly associated with natural landscapes, outdoor activities, and leisure experiences. Green appears as the most prominent color in visitor-generated content, reflecting the strong presence of forests, fields, and natural environments surrounding rural villages. Blue is also more visible in visitors' images, often representing open skies, water features, or scenic viewpoints. Visitors' images often depict activities such as hiking, biking, outdoor dining, or relaxing in natural settings. These scenes emphasize the experiential and emotional aspects of rural tourism. Beige and brown tones are often associated with seasonal landscapes, particularly during autumn, when fields and forests display warm natural colors. These colors help to represent rural destinations as spaces of tranquility and authenticity.

Although the overall distribution of colors does not differ significantly between institutional and visitor narratives, the interpretation and emotional meaning of these colors differ significantly. Institutional images tend to emphasize the historical and symbolic identity of the destination, while visitor images highlight the experiential and emotional dimension of rural tourism.

The findings suggest that the visual narratives produced by municipalities and visitors reflect different communicative priorities.

Institutional communication often focuses on preserving and promoting the cultural heritage of rural villages. This emphasis is reflected in the predominance of neutral and desaturated colors, which convey stability, tradition, and historical continuity. However, these color palettes may also create a sense of emotional distance. Cooler tones such as gray and brown can evoke feelings of detachment or nostalgia rather than excitement or engagement (Bruno et al., 2022). The use of black-and-white images further reinforces narratives of tradition and historical memory. Monochromatic photographs often evoke nostalgia by connecting viewers with the past (Boyd & Gorman-Murray, 2023; Grainge, 1999). While these representations strengthen the cognitive dimension of destination image, they may not fully capture the experiential potential of rural tourism.

In contrast, visitor-generated images emphasize colors associated with nature and emotional warmth. Green landscapes, blue skies, and warm natural tones communicate feelings of relaxation, safety, and well-being. These visual narratives highlight the experiential dimension of rural tourism by portraying activities and lifestyles associated with slower rhythms and outdoor leisure. Research suggests that images featuring brighter and more saturated colors tend to generate higher engagement and more positive attitudes among viewers (Yu et al., 2020). Consequently, visitor narratives may play an important role in stimulating interest in rural destinations.

The coexistence of these two narratives illustrates how destination image emerges through multiple visual interpretations rather than through a single coherent narrative. If institutional communication remains disconnected from visitor experiences, the resulting destination image may become fragmented. In such cases, municipalities risk losing control over how their destinations are represented in digital environments (Munar & Jacobsen, 2014).

Research limitations. *Future research could extend the analysis to other cultural contexts where color symbolism may differ significantly, for example by extending the sample to neighboring countries such as Spain and Germany, or even countries further afield such as China and Japan, to highlight potential differences in color interpretation depending on cultural differences or similarities.*

Further studies could explore the reaction to these images by examining the number of likes, comments, and shares to understand which narrative is most appreciated by the public and whether certain differences may be particularly appreciated by specific consumer targets (e.g., based on age, gender, interests, etc.).

In addition, future studies could go beyond color analysis to examine the elements depicted in the images (e.g., forests, sea, rivers, museums, churches) to better understand the narrative and the most frequently depicted objects. This analysis could also be shifted to the perspective of videos to explore the digital narrative developed on social media such as TikTok or YouTube.

Managerial implications. *From a managerial standpoint, the results suggest that rural destinations could benefit from integrating institutional and visitor-generated narratives more strategically. Municipalities and destination management organizations may enhance their communication strategies by incorporating visual elements that better reflect the experiential and emotional dimensions of rural tourism. Greater attention to the chromatic composition of visual content may help communicate specific atmospheres and values associated with rural experiences, such as authenticity, tranquility, and connection with nature. Encouraging a more structured dialogue between institutional communication and visitor storytelling may therefore contribute to the development of more coherent and emotionally engaging destination narratives across social media platforms.*

By exploring how color palettes embedded in Instagram images contribute to the construction of destination image, this study provides both theoretical insights into visual destination communication and practical guidance for destination

managers seeking to align institutional visual storytelling with visitor-generated narratives and to leverage color-based visual cues as a strategic component of digital destination branding.

Originality of the paper. *This study investigated how colors and visual narratives shared on Instagram contribute to the formation of rural destination image. By comparing images shared by municipalities and visitors, the research demonstrates that destination identity in digital environments emerges through the interaction of institutional communication and experiential storytelling.*

Institutional visual communication primarily reinforces the cognitive dimension of destination image by emphasizing heritage, authenticity, and historical continuity. Visitor-generated content, on the other hand, activates the affective dimension by highlighting emotional experiences associated with nature, relaxation, and well-being. These affective representations may ultimately influence the conative dimension of destination image by encouraging travel intentions and word-of-mouth communication.

Human Receptionist or AI-Chatbot? Trust-Based Effects on Hotel Check-In Evaluation and Purchase Responses

VERONICA MAROZZO[1], ALFONSO VARGAS-SANCHEZ[2], VALERIA SCHIFILLITI[3], AUGUSTO D'AMICO[4]

Abstract. *This research examines whether replacing a human receptionist with an AI chatbot at hotel check-in changes guests' purchase-related responses and, more importantly, through which psychological mechanism this effect occurs. Drawing on a Stimulus-Organism-Response perspective, we conceptualize service agent type as the stimulus, trust and related internal evaluations as organismic states, and purchase intention and purchase behavior tendencies as responses. We test the model through a between-subjects scenario-based experiment comparing chatbot-based and human receptionist check-in in a five-star hotel context. Results show that the human receptionist condition generates significantly higher trust than the AI-chatbot condition. Performance expectancy and perceived quality also emerge as strong antecedents of trust. Serial mediation analyses further show that the impact of service agent type on purchase intention and purchase behavior tendencies is fully indirect: higher trust strengthens attitude toward the check-in service, attitude increases purchase intention, and purchase intention predicts behavioral tendencies such as first-choice preference and willingness to pay more. The study contributes causal evidence to the hospitality AI literature by clarifying that trust is the key lever through which frontline automation affects commercially meaningful outcomes. Managerially, the findings suggest that chatbot check-in should be designed not only for efficiency but also to signal reliability, service quality, accountability, and seamless human fallback. The paper further differentiates itself from the broader literature on service robots and AI-driven purchase intentions by focusing on a high-contact hotel check-in touchpoint and by showing that the commercial consequences of AI substitution are not direct, but operate through a trust-attitude-intention sequence that culminates in purchase behavior tendencies.*
Keywords: *hospitality digitalization; AI-chatbots; trust; attitude; purchase intention; hotel check-in.*

Framing of the research. *Hospitality firms are redesigning frontline service systems through digital technologies intended to increase efficiency, accessibility, and consistency. At the same time, AI-enabled interfaces such as chatbots, service robots, and voice assistants are increasingly entrusted with customer-facing interactions once handled by employees (Buhalis & Moldavska, 2022; Ali & Ali, 2025). In hospitality, however, technology adoption cannot be assessed only in terms of process speed or labor savings. Customer evaluations are strongly shaped by relational and psychological elements that emerge during salient moments of truth, and hotel check-in is among the most consequential because it frames first impressions of service quality (Viglia & Dolnicar, 2020; Kim et al., 2023).*

Check-in is not merely an administrative task. It involves identity verification, reservation confirmation, room allocation, information exchange, and the management of uncertainty at the start of an experience-intensive service process. When a hotel replaces a receptionist with a conversational agent, it changes both the delivery mode and the symbolic cues surrounding accountability, empathy, and reassurance. Prior studies suggest that consumers evaluate human and nonhuman service agents differently because human employees are perceived as more responsive and socially present, whereas chatbots may be seen as less capable of handling exceptions or nuanced requests (Markovitch et al., 2024; Tsai et al., 2021).

Recent studies highlight that research on robots and AI in hospitality and tourism is expanding rapidly and already addresses several outcome domains, including forgiveness after robot service failures (Wang et al., 2025), customers' autonomous behaviors in tourism services (Liu et al., 2025), users' intellectual experiences with humanoid service robots (Wu et al., 2025), service automation in tourism and hospitality more broadly (Sharma et al., 2026), and revisit intentions in hybrid human-robot service settings (Zhang et al., 2026).

Recent research in tourism and hospitality also highlights trust as a pivotal issue in interactions with AI-enabled service agents. Trust matters because customers must decide whether the system is reliable, safe, and worthy of reliance in contexts where personal data, service outcomes, and experiential quality are at stake (Park, 2020; Della Corte et al., 2023). At the same time, trust in AI-mediated services is not built through social cues alone. It also depends on competence-related and quality-related inferences, such as whether the system appears useful, accurate, efficient, and professionally designed. This resonates with research showing that performance beliefs and trust jointly shape technology acceptance and reliance (Venkatesh et al., 2003; Venkatesh et al., 2012; Gefen et al., 2003; Pavlou, 2003).

Despite the rapid diffusion of conversational AI, two limitations remain visible in the literature. First, many studies are correlational and do not establish whether chatbot deployment causally changes commercially relevant responses in hospitality settings (Viglia & Dolnicar, 2020). Second, prior work often focuses on adoption or satisfaction without

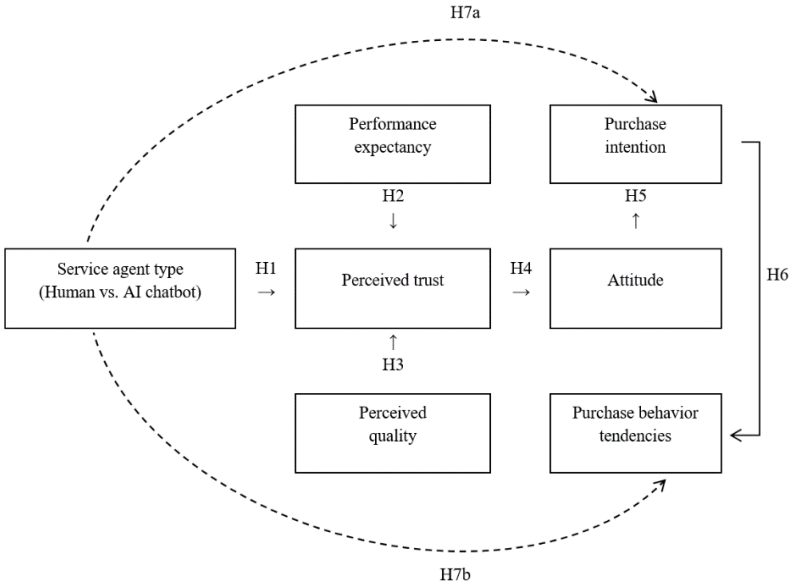
clearly isolating the mechanism through which service agent type translates into downstream behavior. Responding to calls for stronger experimentation and mechanism-based testing in hospitality and tourism research (Viglia & Dolnicar, 2020; Kim et al., 2023), this paper develops a trust-centered process model suited to a frontline context in which both reassurance and operational confidence matter. Therefore, against this increasingly crowded background, the present paper sharpens its contribution by moving from the general question of whether customers accept robots or AI to the more specific question of how substituting a receptionist with an AI chatbot at hotel check-in affects purchase-related responses through trust.



Purpose of the paper. *Although previous studies have examined robot and AI effects on purchase intentions, less is known about the trust-based psychological chain that connects a specific frontstage substitution decision - human receptionist versus AI chatbot - to commercially meaningful outcomes in the check-in phase. Then, the purpose of the paper is to examine the causal impact of AI chatbot-based hotel check-in, compared with human receptionist-based check-in, on guests' purchase-related responses and to clarify the psychological sequence through which this impact unfolds. The study asks whether chatbot substitution changes purchase intention and purchase behavior tendencies directly, or whether these outcomes depend on a trust-centered chain involving attitude formation.*

To address this objective, we adopt a Stimulus-Organism-Response framework. Service agent type (AI-chatbot vs. human receptionist) is conceptualized as the stimulus. Trust represents the central organismic state because it captures the guest's willingness to rely on the check-in service in a context characterized by uncertainty and service dependency. Performance expectancy and perceived quality are modeled as antecedents of trust because they reflect competence-related and excellence-related signals that can strengthen perceived reliability. Downstream, trust is expected to enhance attitude toward the check-in service, attitude should increase purchase intention, and purchase intention should predict purchase behavior tendencies.

Based on this logic, seven hypotheses are advanced. H1 predicts that a receptionist-based check-in increases trust relative to an AI-chatbot-based check-in. H2 and H3 predict that performance expectancy and perceived quality positively influence trust. H4 states that trust positively affects attitude toward the check-in service. H5 predicts a positive effect of attitude on purchase intention, while H6 predicts a positive effect of purchase intention on purchase behavior tendencies. Finally, H7 proposes that the effect of service agent type on purchase intention and purchase behavior tendencies is indirect, operating through the sequential path trust → attitude → purchase intention → purchase behavior tendencies (see Figure 1 for the conceptual model).

This research, therefore, aims not only to determine whether chatbot-based check-in works, but also to explain why it works better or worse than human service at a critical hospitality touchpoint. This explanatory goal is especially relevant when hotels must decide whether to automate frontstage interactions that are highly visible to guests and potentially consequential for revenue generation.

Figure 1. Conceptual model

Indirect effects
H7a: Service agent type → Perceived trust → Attitude → Purchase intention
H7b: Service agent type → Perceived trust → Attitude → Purchase intention → Purchase behavior tendencies

Methodology. *The empirical study relies on a 2 x 1 between-subjects scenario-based experiment implemented in Qualtrics. Participants were informed that they would evaluate a tourism service scenario and were asked to imagine themselves in the described situation. They were then randomly assigned to one of two conditions: AI chatbot check-in or human receptionist check-in. Both scenarios described the arrival at a five-star hotel for a one-night stay and were*

matched in wording, sequence, and outcome. The only substantive difference concerned the service agent delivering the interaction (i.e., an AI-chatbot vs. a human receptionist). The full wording of both experimental stimuli is reported in the Appendix.

All focal constructs were measured using established multi-item 7-point Likert scales. Purchase intention, purchase behavior tendencies, and attitude toward the service were adapted from Zhong et al. (2020). Performance expectancy was measured using items adapted from Zhang et al. (2021). Perceived quality drew on Snoj et al. (2004) and Arreza (2022). Trust was measured through two items adapted from Ohanian (1990), capturing confidence in and reliability of the hotel service. The questionnaire also included manipulation checks for perceived agent type and basic socio-demographic items.

Data were collected in February 2026 through a non-probability recruitment strategy combining convenience sampling and snowball sampling. This approach facilitated access to respondents but also introduced the usual trade-offs in terms of representativeness and possible network homophily (Etikan et al., 2016; Biernacki & Waldorf, 1981; Bornstein et al., 2013). A total of 476 questionnaires were obtained. After screening and removal of incomplete responses, 342 usable questionnaires remained, corresponding to a retained response rate of 71.8%. With this sample size, the two-condition design offers adequate statistical power to detect small-to-moderate effects (Cohen, 1988).

The analytical strategy followed three main steps. First, manipulation checks verified whether respondents correctly identified the service agent condition. Second, reliability was assessed through Cronbach's alpha, with all scales exceeding accepted thresholds (Nunnally & Bernstein, 1994; DeVellis, 2016). Composite scores were then computed for each construct, consistent with common practice in multivariate analysis (Hair et al., 2019; Kline, 2016). Finally, to test H1-H3, an ordinary least squares regression predicted trust from agent type, performance expectancy, and perceived quality. To test H4-H7, serial mediation analyses were conducted with Hayes' PROCESS macro (Model 6) using 5,000 bootstrap resamples. One model estimated purchase intention as the dependent variable, while a second model estimated purchase behavior tendencies.

Results. *The manipulation checks confirmed that participants correctly perceived whether the check-in service was delivered by an AI chatbot or by a human receptionist. Reliability levels were high across all constructs, supporting the internal consistency of the measures. The regression and mediation analyses then provided coherent support for the trust-centered process model.*

The OLS regression predicting trust explained a substantial share of variance ($R^2 = .748$; $F(3, 338) = 334.36$; $p < .001$). In line with H1, the human receptionist condition generated significantly higher trust than the chatbot condition ($b = .586$, $p < .001$). Supporting H2 and H3, performance expectancy ($b = .377$, $p < .001$) and perceived quality ($b = .485$, $p < .001$) were both positively associated with trust. Trust, therefore, appears to be shaped by both relational cues linked to the service agent and competence-related evaluations linked to usefulness and service excellence.

The first serial mediation model examined purchase intention as the dependent variable. Trust positively predicted attitude toward the check-in service ($b = .7666$, $p < .001$), and attitude positively predicted purchase intention ($b = .7499$, $p < .001$), supporting H4 and H5. The direct effect of service agent type on purchase intention was not significant ($b = .0730$, $p = .3887$). Bootstrap analyses showed that the serial indirect effect through trust and attitude was significant (indirect effect = .3764; 95% bootstrap confidence interval [.1895, .5707]). The evidence indicates that the human condition improves purchase intention primarily because it fosters trust, which then generates a more favorable attitude toward the service.

The second serial mediation model extended the mechanism to purchase behavior tendencies. Trust again positively predicted attitude, attitude predicted purchase intention, and purchase intention positively predicted purchase behavior tendencies ($b = .2735$, $p = .0003$), supporting H6. The direct effect of service agent type on purchase behavior tendencies was not significant ($b = .0701$, $p = .5434$), whereas the full serial indirect effect was significant (indirect effect = .1029; 95% bootstrap confidence interval [.0278, .1999]). In other words, the effect of service agent type on behavioral tendencies is fully indirect and unfolds through the chain trust → attitude → purchase intention → purchase behavior tendencies. The following Table 1 summarizes the main results.

Overall, the results support a consistent interpretation. Human receptionist check-in does not outperform chatbot check-in because of a simple residual preference for human service. Rather, it performs better because it creates stronger trust, and this higher trust propagates through attitude and intention to influence commercially meaningful outcomes.

The pattern of results is theoretically meaningful because it suggests that service agent type is not acting as a simple preference cue. Once trust and the attitudinal-intentional sequence are modeled, the direct paths from agent type to purchase-related outcomes disappear. This means that frontline automation influences outcomes insofar as it changes the internal states through which customers interpret the service encounter. In the present context, trust is the primary gateway. This interpretation is consistent with work arguing that customers rely on trust to reduce uncertainty in technology-mediated and robot-enabled service encounters (Park, 2020; Della Corte et al., 2023).

The results also clarify the role of competence-related evaluations. Performance expectancy and perceived quality do not simply coexist with trust; they contribute to building it. This is important because hospitality managers may be tempted to frame chatbot adoption in purely utilitarian terms, focusing on speed or 24/7 availability. The findings instead suggest that competence signals matter because they help guests infer whether the service is safe and dependable. In other words, usefulness and quality become commercially relevant partly through the trust they enable, which echoes the broader information systems literature on technology acceptance and electronic exchange (Gefen et al., 2003; Pavlou, 2003).

Table 1. Summary of hypothesis testing

Hypothesis	Path / Effect Tested	Evidence	Supported
H1	Human (vs. chatbot) → Trust	b = .586, p < .001; 95% CI [.422, .751]	Yes
H2	Performance expectancy → Trust	b = .377, p < .001; 95% CI [.289, .465]	Yes
H3	Perceived quality → Trust	b = .485, p < .001; 95% CI [.405, .566]	Yes
H4	Trust → Attitude	b = .7666, p < .001	Yes
H5	Attitude → Purchase intention	b = .7499, p < .001	Yes
H6	Purchase intention → Purchase behavior tendencies	b = .2735, p = .0003	Yes
H7a	Agent type → Trust → Attitude → Purchase intention	Indirect = 0.3764; BootCI [.1895, .5707]	Yes
H7b	Agent type → Trust → Attitude → Purchase intention → Purchase behavior tendencies	Indirect = 0.1029; BootCI [.0278, .1999]	Yes

Source: Authors' elaboration

Research limitations. *The study has some limitations that should guide interpretation. First, the use of convenience and snowball sampling supports feasibility but limits statistical generalizability beyond the recruited pool. The sample may underrepresent guest segments with different levels of digital familiarity, service expectations, or cultural norms regarding automated interaction. Future research should therefore test the model across more diverse populations and in cross-cultural settings. In addition, the effects identified in this study may not be uniform across customer profiles. Socio-demographic and individual characteristics, such as age, may act as relevant boundary conditions, as they can proxy different levels of familiarity, confidence, and prior experience with AI-based solutions. Other customer-level variables, including digital literacy, technology readiness, innovativeness, and prior exposure to automated services, may also moderate the proposed relationships. Future studies could therefore employ multigroup analyses to examine whether the effects of service agent type, perceived trust, attitude, and downstream behavioral outcomes differ across guest segments.*

Second, the design is scenario-based, and the dependent variables are self-reported intentions and behavioral tendencies rather than observed transactions. Although such proxies are common in hospitality experiments and are theoretically meaningful when actual purchase data are difficult to capture (Viglia & Dolnicar, 2020; Kim et al., 2023), further work should validate the model using field experiments, transactional data, or post-stay longitudinal outcomes. Future studies could therefore observe actual choices in booking platforms or hotel apps, experimentally manipulate AI-chatbot versus human check-in in a field setting, and measure revealed outcomes such as completed reservations, upgrade purchases, ancillary spending, complaint behavior, revisit behavior, and willingness to pay based on actual transactions.

Third, the experimental manipulation compares only two service configurations in a five-star hotel context. This setting is strategically relevant because reassurance may be especially important in luxury hospitality, yet it may also accentuate the relative advantage of human delivery. Future studies should examine lower-category hotels, mixed-service formats, and moderators such as chatbot anthropomorphism, transparency about AI identity, privacy assurances, or the visibility of human fallback.

Managerial implications. *The findings indicate that chatbot-based check-in should not be evaluated solely as an efficiency device. For managers, it is a trust-management decision. In this study, the human receptionist condition produced stronger trust, and that difference ultimately shaped purchase intention and purchase behavior tendencies. Hotels should therefore assess chatbot deployment not only through completion times or labor savings, but also through post-interaction confidence, perceived reliability, and guests' willingness to continue the relationship.*

If trust is the crucial lever, chatbot interfaces should visibly communicate control, competence, and reassurance at each step of the process. This includes clear reservation validation, explicit confirmation of guest identity and payment status, unambiguous room allocation messages, transparent progress indicators, and immediate reassurance about data security and error handling. The interface should make its capabilities and limits legible rather than opaque, because ambiguity can quickly undermine confidence at a high-stakes touchpoint.

The strong effects of performance expectancy and perceived quality on trust also suggest that technical and experiential design should be treated together. A chatbot that is fast but confusing, or accurate but impersonal, may still fail to produce downstream commercial benefits. Hotels should invest in dialogue quality, frictionless task completion, coherent wording, and professional interface design, while preserving a seamless escalation path to a human employee. Even when rarely used, a visible human fallback can function as a reassurance cue and reduce perceived risk.

Originality of the paper. *This paper contributes to the hospitality and tourism literature in three main ways. First, it provides experimental evidence on a frontline AI application that is operationally important yet underexamined with mechanism-based causal designs. In doing so, it responds to methodological calls for stronger experimentation and process testing in hospitality research (Viglia & Dolnicar, 2020; Kim et al., 2023).*

Second, the study advances a parsimonious trust-centered explanation of how service agent type affects downstream commercial outcomes. Rather than treating chatbot check-in as a purely technological feature, the model shows that its consequences depend on whether it can generate sufficient trust to support favorable attitudes and intentions. This

positions trust as the pivotal organismic state linking frontline automation to behavior, while clarifying the supporting role of performance expectancy and perceived quality as trust-building cues.

Third, the paper translates these insights into a managerial logic that is especially relevant in the current phase of AI diffusion in hospitality. The results suggest that successful automation at check-in depends less on substituting labor and more on designing credible, reassuring, and high-quality interactions. By integrating service evaluation, trust, and purchase-related responses in a single process model, the study offers a compact framework that future research can extend to other touchpoints and service contexts.

More specifically, the paper contributes beyond existing studies on robots, AI and purchase intentions in three respects: it isolates a precise hospitality touchpoint rather than treating automation as a generic service feature; it compares AI-chatbot and human receptionist check-in under experimentally controlled conditions; and it signals that the effect on purchase-related responses is fully indirect, with trust functioning as the key mechanism through which service agent type becomes commercially relevant.

APPENDIX

AI-chatbot check-in scenario

You have booked a one-night stay at V Hotel (a five-star hotel), where you have not stayed before. When you arrive at the hotel, you approach the AI-chatbot service to check in. You have the following conversation with the service robot:
AI-chatbot: "Welcome! What can I do for you?"
You: "I have made a reservation for one night at this hotel, so I would like to check in."
AI-chatbot: "Okay, now I need to confirm your check-in information. Please insert your ID card into the reader."
(You take your ID card and insert it into the reader)
AI-chatbot: "Good. I have checked your reservation information. The room has been paid for one night. Your room number is 209, and our facial recognition system will allow you to enter the room."
You: "Okay, thank you."
AI-chatbot: "You're welcome. Have a pleasant stay."

Human receptionist check-in scenario

You have booked a one-night stay at V Hotel (a five-star hotel), where you have not stayed before. When you arrive at the hotel, you approach the receptionist to check in. You have the following conversation with the receptionist:
Receptionist: "Welcome! What can I do for you?"
You: "I have made a reservation for one night at this hotel, so I would like to check in."
Receptionist: "Okay, now I need to confirm your check-in information. I will need your ID card."
(You take out your ID card and show it to the receptionist)
Receptionist: "Good. I have checked your reservation information. The room has been paid for one night. Your room number is 209, and these are the keys to enter the room."
You: "Okay, thank you."
Receptionist: "You're welcome. Have a pleasant stay."

I nuovi frequentatori della montagna: aspettative degli ospiti pernottanti e ruolo dei rifugi per la salvaguardia dell'ecosistema alpino

UMBERTO MARTINI[*], FEDERICA BUFFA[•], GIULIA CAMBRUZZI[♠]

Abstract. *Il paper presenta i risultati preliminari di una ricerca – attualmente in progress – che mira a cogliere, dal lato della domanda (obiettivo 1), tendenze e comportamenti che caratterizzano i nuovi frequentatori della montagna, e, dal lato dell'offerta (obiettivo 2), scelte di gestione e pratiche di sostenibilità adottate nei rifugi di montagna. Il tema affrontato dalla ricerca si inserisce nel più ampio dibattito scientifico volto a cogliere nuove tendenze della domanda turistica a seguito dei numerosi cambiamenti macroeconomici e di stili di vita che hanno interessato il contesto turistico montano, nonché le scelte di gestione adottate dalle imprese per acquisire, mantenere e difendere il vantaggio competitivo.*

In tale scenario l'attenzione ai rifugi di montagna attribuisce originalità alla ricerca, permettendo di indagare scelte strategiche e l'adozione di pratiche di sostenibilità da parte di imprese ibride inserite in contesti tanto fragili quanto complessi. La prima fase di ricerca, finalizzata alla ricostruzione dei profili motivazionali e comportamentali dei frequentatori della montagna che pernottano in rifugio, è stata condotta in Trentino nell'estate 2025. I questionari somministrati presso 19 rifugi, selezionati avvalendosi di un piano di campionamento che garantisse rappresentatività geografica, sono stati 861. Un primo livello di analisi ha permesso di analizzare: a) motivazioni, esperienze e percezioni dei frequentatori della montagna; b) scelte organizzative e comportamenti dichiarati; c) sensibilità ai temi della sostenibilità e della fragilità della montagna. Il contributo evidenzia le implicazioni manageriali della ricerca nonché gli elementi di originalità e le limitazioni dello studio.

Keywords: *turismo montano; nuovi trend; profili di domanda; rifugi alpini; Trentino*

Framing of the research. *Negli ultimi anni il turismo montano ha fatto registrare una crescita significativa e costante (UNWTO, 2025), alimentata da una complessa interazione di dinamiche sociali, culturali, ambientali ed economiche. Tale tendenza espansiva risulta particolarmente evidente nell'arco alpino e, nello specifico, nell'area dolomitica, la quale ha riportato uno dei più consistenti incrementi post-pandemici negli arrivi turistici in Italia (ISTAT, 2024).*

Un fattore primario alla base di tale espansione è rappresentato dal progressivo sviluppo e ammodernamento delle infrastrutture di trasporto e di accesso (Paunović & Jovanović, 2017; Bausch & Gartner, 2020). Il miglioramento dell'accessibilità ha ridotto le barriere fisiche e logistiche, ampliando così il bacino di potenziali visitatori e attraendo segmenti di domanda non tradizionalmente legati agli ambienti montani. Parallelamente, le piattaforme social (Tang et al., 2024; Leung et al., 2013) hanno svolto un ruolo determinante nel ridefinire la visibilità delle destinazioni. Attraverso la rapida diffusione di contenuti visivi d'impatto e narrazioni esperienziali, località un tempo periferiche hanno acquisito risonanza internazionale, trasformandosi in mete turistiche di alto profilo, mentre le mete già consolidate hanno spesso trovato una nuova e più forte forma di promozione e diffusione della propria notorietà e capacità di attrazione.

Questo trend è ulteriormente consolidato dai mutamenti negli stili di vita contemporanei (Steiger et al., 2024): l'accelerazione dei ritmi quotidiani, l'aumento dei livelli di stress e la crescente urbanizzazione hanno intensificato il desiderio di evasione temporanea dai contesti metropolitani (Juschten et al., 2019), e le aree montane vengono progressivamente percepite come spazi di rigenerazione fisica e psicologica, in grado di offrire silenzio, isolamento, contatto diretto con la natura ed esperienze in netto contrasto con gli ambienti altamente antropizzati.

Un ulteriore fattore di accelerazione è riconducibile alla pandemia da COVID-19 (Romeo et al., 2021), che ha profondamente rimodellato le percezioni del tempo libero e di tutte le forme del turismo outdoor. L'emergenza sanitaria ha favorito, infatti, un rinnovato apprezzamento per l'ambiente naturale, considerato essenziale per il benessere psicofisico individuale, incentivando la preferenza verso destinazioni percepite come più sicure, meno affollate e maggiormente orientate alle attività all'aperto, tra cui spicca l'ambiente montano (Lukoseviciute et al., 2024).

Infine, anche il cambiamento climatico (Steiger et al., 2022) e il conseguente innalzamento delle temperature medie estive stanno influenzando in modo significativo le scelte turistiche. In particolare, la crescente frequenza delle ondate di calore sta orientando una quota crescente della domanda verso località caratterizzate da una percezione termica più moderata, come le aree montane e le zone d'alta quota, sempre più configurate come forme di "rifugio climatico naturale".

Grazie anche ad un'offerta turistica diversificata e adattabile, il contesto montano emerge perciò come una destinazione capace di soddisfare motivazioni eterogenee (Romeo et al., 2021). Esso accoglie un ampio spettro di

esperienze, che spaziano dall'escursionismo ricreativo alle discipline tecniche come l'arrampicata, dalla ricerca di solitudine e immersione nella natura al coinvolgimento nelle tradizioni locali, nel patrimonio culturale e nella vita di comunità. Infine, la dimensione della convivialità e dell'ospitalità - spesso percepita come autentica e distinta dalle routine urbane - rafforza ulteriormente l'attrattività delle destinazioni montane nei mercati turistici contemporanei.

Tutti questi fattori hanno contribuito ad aumentare significativamente il numero dei visitatori in molte delle località alpine più note, mettendo talvolta a dura prova la capacità di carico di un territorio montano già caratterizzato dalla fragilità geologica ed ecosistemica. I fenomeni di imitazione e le nuove forme di sightseeing legate ai social media (Urry e Larsen, 2011), il desiderio di vivere e condividere alcune esperienze specifiche, fino a provare una forma di ansia sociale derivante dalla percezione che gli altri stiano vivendo esperienze gratificanti dalle quali si è esclusi, come accade se non si vedono determinati hot-spot o si vivono certe esperienze (concetto psicologico racchiuso nell'acronimo FoMO, Fear of Missing Out, Przybylski et al., 2013; Tandon et al., 2021), hanno provocato fenomeni sempre più diffusi di overtourism, ancorché localizzati in spazi ristretti del territorio montano, e un significativo aumento del carico antropico nelle alte quote.

Si considerino, a titolo esemplificativo, le Dolomiti - e in particolare paesaggi iconici quali le Tre Cime di Lavaredo - intese come caso paradigmatico di come una morfologia suggestiva e l'unicità geologica possano determinare un riconoscimento e una forza di attrazione globale. In misura crescente negli ultimi anni, i flussi turistici non sono alimentati esclusivamente dalle opportunità legate all'alpinismo e alle discipline sportive outdoor, bensì dal valore estetico intrinseco del paesaggio stesso. I turisti ricercano con frequenza esperienze immersive focalizzate su diverse declinazioni del turismo (gastronomia, benessere, contemplazione e fotografia), e il contesto alpino dell'alta quota diviene un contenitore simbolico in cui inserire varie attività ed esperienze (Arnberger et al., 2018; Ruzzo et al., 2021).

Emerge quindi un nuovo profilo dei visitatori della montagna, non più attratti dall'attività alpinistica tout-court, quindi adeguatamente preparati e attrezzati, come accadeva nel recente passato, ma alla ricerca di esperienze a diretto contatto con la natura, grazie al fascino dell'alta quota e dei panorami alpini, fino al desiderio di immersione nelle tradizioni culturali ed enogastronomiche non solo nei paesi del fondovalle alpini, ma anche nei rifugi. Un cambiamento nel profilo del visitatore che genera conseguenze evidenti non solo nel concetto di "servizio atteso", ma anche in termini di impatto sulla sostenibilità ambientale, in un contesto caratterizzato da elevatissima fragilità ecosistemica, nel quale l'impronta ecologica di una fruizione di massa rischia di essere del tutto insostenibile (Río-Rama et al., 2019).

In questo processo di trasformazione nella frequentazione delle alte quote, il rifugio alpino riveste un ruolo centrale e strategico. Storicamente, tali strutture sono nate come presidi di supporto per l'alpinismo: luoghi di ricovero e punti di riferimento per alpinisti ed escursionisti, destinati a fornire ospitalità essenziale, approvvigionamenti e protezione dalle avverse condizioni meteorologiche. La loro funzione originaria era primariamente legata alla sicurezza e al soccorso in ambiente montano. Di conseguenza, i primi rifugi erano organizzati in modo semplice ed essenziale, privi di complessità architettonica o di una marcata elaborazione estetica, riflettendo sia la loro funzione primaria sia le necessità pratiche per cui erano stati concepiti (Duglio & Beltramo, 2019; Romeo et al., 2021).

Con l'evoluzione del turismo montano e il consolidamento delle tendenze precedentemente descritte, il ruolo del rifugio è progressivamente mutato, così come la sua percezione da parte dei visitatori e, in una certa misura, dei gestori stessi. Oggi, il rifugio può essere considerato a tutti gli effetti un attore economico, tenuto a perseguire la sostenibilità finanziaria per garantire continuità operativa e redditività nel lungo periodo. Parallelamente, esso continua ad assolvere una funzione fondamentale di accoglienza, presidio territoriale e tutela ambientale e sociale. Ne deriva, che il rifugio manifesta una natura intrinsecamente ibrida (Haigh & Hoffman, 2014), collocandosi tra una logica orientata al profitto e una vocazione non-profit radicata nei valori del servizio, della conservazione e della responsabilità territoriale. Il rifugista opera, pertanto, all'interno di una complessa dualità, ulteriormente intensificata dai numerosi vincoli imposti dal contesto ambientale e sociale, tra cui l'isolamento geografico, le difficoltà logistiche, la fragilità degli ecosistemi, la stagionalità, i rigidi quadri normativi e le crescenti aspettative della domanda turistica.

La mutazione del profilo del visitatore, alimentata dal fenomeno del FoMO e dalla ricerca di esperienze estetiche altamente notiziabili sui social media, genera una tensione diretta con la gestione tradizionale dei rifugi. L'utente contemporaneo, spesso appartenente ai nuovi segmenti di domanda meno avvezzi ai contesti d'alta quota, tende a traslare in montagna le aspettative di servizio tipiche dei contesti urbani (Romeo et al., 2021). Tale fenomeno costringe il rifugio a un delicato equilibrismo: da un lato, la necessità di rispondere a standard di ospitalità sempre più elevati (comfort, connettività, offerta gastronomica ricercata) per garantire la propria sostenibilità economica; dall'altro lato, l'imperativo di preservare la propria identità di presidio territoriale e la propria vocazione alla semplicità e alla sicurezza, elementi che definiscono la sua natura intrinsecamente ibrida.

Purpose of the paper. *Alla luce delle trasformazioni descritte, l'obiettivo del presente studio, che si propone come un working progress, è duplice. In primis la ricerca mira ad analizzare come l'emergere di nuovi segmenti di visitatori, spesso motivati da esperienze estetiche, ricreative e socialmente condivisibili attraverso i social media, stia modificando le aspettative nei confronti dei rifugi e influenzando, di conseguenza, scelte di gestione dei rifugisti. Il passaggio da una frequentazione prevalentemente legata all'alpinismo tradizionale a una domanda più ampia ed eterogenea richiede, infatti, una ridefinizione delle modalità di gestione, dell'offerta di servizi e dei modelli organizzativi, scelta che non sempre è facilmente e socialmente accettata dai gestori dei rifugi anche in luce del fatto che il contesto alpino, seppur condividendo una serie di fattori comuni e distintivi, non è omogeneo, pertanto richiede scelte e decisioni differenti a seconda dei fattori strutturali e contestuali specifici che caratterizzano i singoli gruppi di rifugi.*

Parallelamente, il secondo obiettivo della ricerca è investigare le scelte gestionali adottate dai gestori dei rifugi alpini proprio in risposta a questo mutamento del profilo dei frequentatori della montagna. L'analisi muove dal presupposto che il rifugio alpino operi all'interno di un contesto organizzativo eterogeneo, ma intrinsecamente ibrido, nel quale la sostenibilità economica deve necessariamente conciliarsi con l'obiettivo principale del rifugio ovvero quello di essere presidio della montagna e quindi tutelarla dal punto di vista ambientale e della responsabilità sociale, soprattutto in ecosistemi d'alta quota caratterizzati da elevata fragilità. Di conseguenza, la ricerca approfondisce come i gestori dei rifugi alpini affrontino le tensioni generate da tali trasformazioni e quali strategie adottino per bilanciare le esigenze di sostenibilità economica con la necessità di preservare l'integrità ambientale e il valore sociale e culturale del contesto montano.

Attraverso l'analisi dell'intersezione tra evoluzione della domanda turistica e scelte manageriali, lo studio intende contribuire innanzitutto ad arricchire la letteratura relativa all'evoluzione del turismo montano, evidenziando quali siano oggi le nuove tendenze e i nuovi profili dei frequentatori della montagna. Conseguentemente, sulla base di tali evidenze, il lavoro mira a sviluppare una maggiore comprensione del ruolo dei rifugi alpini come attori chiave nella gestione sostenibile delle destinazioni turistiche montane, chiamate a confrontarsi con questo nuovo elemento della domanda che enfatizza la complessità del contesto competitivo nel quale operano.

Methodology. *La prima fase della ricerca mira a rispondere al primo obiettivo, ossia identificare i profili motivazionali e comportamentali dei nuovi frequentatori della montagna al fine di comprendere se e come essi impattano sulle scelte di gestione dei rifugisti. La ricostruzione dei profili dei frequentatori della montagna si è focalizzata specificatamente sugli ospiti che pernottano presso il rifugio. La considerazione di tale target permette infatti di approfondire motivazioni, comportamenti e percezioni del frequentatore della montagna cogliendo informazioni e valutazioni di individui che hanno potuto usufruire di molteplici servizi offerti dal rifugio (considerandone pertanto sia le aspettative, sia le percezioni) ed hanno altresì avuto la possibilità di interagire con il rifugista e gli altri ospiti del rifugio. Questo permette di cogliere informazione riguardo alla dimensione relazionale dei frequentatori della montagna contribuendo in modo significativo alla ricostruzione dei profili. Oltre alla rilevazione di informazioni che permettono di ricostruire il profilo sociodemografico dei pernottanti in rifugio, la ricerca approfondisce tre focus principali:*

a) *Motivazioni, esperienze e percezioni: il primo focus approfondisce il motivo principale connesso alla scelta di trascorrere la notte in un rifugio, rileva informazioni riguardo al tipo di esperienza (es. un solo pernottamento o tappa di un trekking in alta quota) e all'attitudine a sperimentare vacanze in quota, percezioni riguardo al livello di esperienza in ambiente montano e alle proprie capacità.*
b) *Scelte organizzative e comportamenti dichiarati: il secondo focus analizza composizione del nucleo turistico, modalità di raccolta delle informazioni, fonti utilizzate, processo di prenotazione del pernottamento in rifugio, importanza attribuita a specifici servizi offerti dal rifugio, utilizzo dei social media per raccogliere e/o diffondere informazioni.*
c) *Sensibilità ai temi della sostenibilità e della fragilità della montagna: il terzo focus indaga il livello di consapevolezza rispetto a specifiche tematiche ambientali che impattano sullo svolgimento dell'attività in alta quota e rilevano percezioni riguardo agli escursionisti incontrati durante l'itinerario per raggiungere il rifugio.*

L'area di indagine della ricerca coincide con il territorio del Trentino che, oltre ad essere una destinazione turistica che presenta elementi distintivi del contesto alpino, è anche la destinazione italiana con il maggior numero di strutture alpinistiche (oltre 180 se si considerano rifugi alpini, rifugi escursionistici e bivacchi)[1].In Trentino si rileva altresì una crescita dei flussi turistici nella stagione estiva (ISPAT, 2026) connessi anche alle nuove tendenze di fruizione della montagna oggetto di dibattito scientifico internazionale (come richiamato in apertura del presente lavoro).

La ricerca sul campo è stata condotta attraverso una survey nell'estate del 2025. Per la rilevazione si è definito un questionario composto da 32 domande a risposta chiusa (domande multiple-choice e domande con utilizzo di scale di valutazione), predisposto in lingua italiana, tedesca e inglese, in coerenza con i principali mercati incoming (turismo domestico e mercato tedesco) ed emergenti. Per la somministrazione è stata fondamentale la collaborazione dei rifugisti, che hanno somministrato personalmente il questionario ai frequentatori pernottanti, consegnandolo in coincidenza con la fase di registrazione per il check-in. Il questionario è stato erogato in forma cartacea poiché, essendo la connessione wi-fi in alta quota non garantita, la somministrazione online avrebbe precluso la raccolta capillare dei dati.

Unità di rilevazione sono state i rifugi alpini del Trentino (complessivamente 149). A garanzia della rappresentatività dei dati raccolti, il piano di campionamento è stato definito considerando, oltre alla disponibilità di posti letto dei rifugi, la distribuzione geografica (in modo da coprire proporzionalmente l'area orientale, occidentale e meridionale del Trentino) e l'accessibilità (raggiungibilità a piedi, in auto, con utilizzo di impianti a fune).

Le unità di rilevazione (rifugi) così identificate sono state 19. I questionari raccolti dal 14 giugno al 19 ottobre 2025 sono stati 861. Coerentemente con i criteri di selezione adottati in fase di campionamento, il Trentino orientale concentra il 50,87% dei questionari, il Trentino occidentale il 27,29% e il Trentino meridionale il 21,84%.

L'analisi dei dati è attualmente in progress. Nella sezione che segue si presentano i primi risultati emersi dall'analisi delle frequenze e da alcuni approfondimenti condotti con analisi bivariata. L'adozione di tecniche di analisi statistica

[1] Si veda quanto riportato sul sito della Provincia autonoma di Trento nella sezione dedicata alle "Strutture alpinistiche" www.provincia.tn.it/Argomenti/Turismo-e-sport/Strutture-alpinistiche

multivariata permetterà di ricostruire i profili degli ospiti pernottanti nei rifugi considerando i focus di approfondimento oggetto della ricerca.

Results. *I frequentatori della montagna che hanno pernottato nei rifugi del Trentino si distribuiscono in modo equilibrato rispetto al genere (48,28% uomini; 47,46% donne) e alla nazionalità (52,4% italiani; 47,6% stranieri). Rispetto ai mercati esteri, la Germania è il bacino principale (38% degli ospiti internazionali), seguono Olanda (15,5%), UK (8,3%) e Stati Uniti (15,5%). A questi si aggiungono frequentatori pernottanti provenienti da aree geografiche prettamente alpine (come l'Austria e la Svizzera) e dalle aree scandinave. Minori sono invece le presenze di ospiti provenienti dall'Europa orientale e meridionale e da Paesi extraeuropei.*

Da un punto di vista anagrafico prevalgono i rispondenti nati tra il 1966 e il 1980 (32%) e tra il 1981 e il 1994 (29,3%). Circa un quarto dei rispondenti (23,50%) è composto da frequentatori più giovani, nati tra il 1995 e il 2007. Con riferimento alle principali generazioni, si osserva che tra gli ospiti pernottanti nei rifugi vi è una presenza significativa di escursionisti appartenenti alle generazioni Gen X, Gen Y e Gen Z, alle quali si affiancano i nati prima del 1965 (Baby Boomer), che rappresentano circa il 14% dei rispondenti.

Con riferimento ai tre focus di approfondimento, i risultati preliminari della ricerca sono sintetizzabili come segue:

a) *Motivazioni, esperienze e percezioni: la maggioranza dei rispondenti dichiara esperienza consolidata rispetto al pernottamento in rifugio: il 47% vi ha soggiornato, infatti, "molte volte". La scelta del rifugio è guidata principalmente da fattori tecnico-funzionali, come il percorso o l'obiettivo alpinistico (indicato come prioritario dall'85,2%), mentre gli aspetti di socialità sono considerati secondari. La maggior parte si autodefinisce trekker (32,2%) o escursionista di alta quota (22,5%); meno ricorrente, invece, la definizione di alpinista (13,7%).*
b) *Scelte organizzative e comportamenti dichiarati: il nucleo turistico si compone in prevalenza di amici (43,76%) o di componenti della famiglia (23,53%). Le prenotazioni si polarizzano su due canali dominanti: il contatto diretto con il gestore (34,40%) e il sito web della struttura (30,10%). Dato quest'ultimo, avvalorato anche dall'elevata importanza attribuita alla prenotazione online, che si colloca tra i servizi offerti dal rifugio considerati più rilevanti. Oltre il 20% dichiara di non aver gestito la prenotazione in prima persona, evidenziando una chiara tendenza alla delega o all'organizzazione di gruppo. Marginali risultano invece le prenotazioni attraverso altri canali, social network inclusi.*

   La maggior parte dei rispondenti raggiunge il rifugio a piedi e dichiara di aver sostenuto uno sforzo fisico alla portata delle proprie capacità. La pianificazione dell'escursione (itinerario e livello di difficoltà) avviene in modo accurato, con la raccolta di informazioni gestita direttamente dai frequentatori della montagna pernottanti (che si avvalgono anche dell'esperienza maturata in precedenti escursioni) o con l'ausilio di accompagnatori. Le principali fonti utilizzate per raggiungere il rifugio sono Internet (23,21%), carte di sentieri e rifugi (21,53%) e la segnaletica (21,17%). La tipologia di percorso e l'obiettivo alpinistico sono elementi determinanti per la scelta del rifugio (85,12%), ai quali si affiancano la collocazione geografica e il panorama in cui il rifugio è inserito (78,1%). Minore attenzione rivestono invece le dimensioni connesse alla ricerca di socialità (conoscenza di nuove persone; condivisione dell'esperienza con appassionati) che guidano la scelta di una percentuale contenuta di rispondenti (circa il 20%). Le caratteristiche del rifugio (in termini di comfort e stile) si pongono in posizione intermedia, così come la proposta culinaria e l'interazione con il rifugista, che rappresenta, per la maggior parte, un interlocutore esperto (49,11%) o una persona del luogo in grado di fornire informazioni (21,56%).
c) *Sensibilità ai temi della sostenibilità e della fragilità della montagna: i rispondenti dichiarano che accoglierebbero favorevolmente limiti alla frequentazione della montagna, in particolare riferiti all'obbligo di riportare a valle i propri rifiuti e all'introduzione di controlli sul rispetto della natura. Pareri favorevoli si riscontrano anche in merito a limitazioni all'accesso dei veicoli nel fondovalle. Pareri meno favorevoli emergono invece con riferimento all'accesso ai parcheggi e al rifugio solo previa prenotazione.*

   I frequentatori della montagna, infine, dichiarano un alto livello di consapevolezza riguardo ai problemi nella gestione dei rifugi connessi alla scarsità d'acqua, al riscaldamento climatico e allo scioglimento dei ghiacciai, al cambiamento delle stagioni e dell'andamento meteorologico, così come al costo dell'energia e dei trasporti. Con riferimento ai soggetti che possono contribuire ad attenuare tali problematiche, la maggior parte dei rispondenti (45,4%) identifica nelle istituzioni locali (Regioni, Province, Comuni) i principali referenti. Segue, con il 34%, il riconoscimento di una responsabilità diretta in capo ai frequentatori stessi, sottolineando l'importanza dei comportamenti individuali e collettivi nell'affrontare tematiche di tale portata.

Le prime evidenze basate sull'analisi bivariata delineano alcune differenze tra i frequentatori della montagna con riferimento alla nazionalità e all'organizzazione dell'esperienza in rifugio. Gli italiani prediligono le escursioni di prossimità e il pernottamento in rifugio partendo da casa. Il rifugio rappresenta pertanto, la meta dell'esperienza, ed essi si identificano prevalentemente con la figura dei trekker o dei turisti occasionali. Per gli stranieri, invece, si delinea uno scenario diverso, in cui i frequentatori pernottanti, che si identificano principalmente con l'escursionista di alta quota o l'alpinista, sono coinvolti in percorsi di trekking plurigiornalieri che prevedono il soggiorno in rifugi diversi.

Alla luce di questi primi risultati, che richiedono ulteriori approfondimenti avvalendosi di analisi statistiche multivariate, emergono specificità degli ospiti pernottanti nei rifugi, che avvalorano l'interesse scientifico ad approfondire le motivazioni e le aspettative maturate in relazione alla fruizione della montagna e alla scelta del rifugio come luogo di soggiorno, al fine di cogliere nuove tendenze della domanda e indagarne le implicazioni manageriali per le imprese.

Research limitations. *Lo studio presenta alcune limitazioni connesse prevalentemente alla fase in progress di analisi dei dati. Ulteriori approfondimenti sono necessari per indagare relazioni e associazioni tra variabili, avvalendosi di analisi statistiche multivariate al fine di ricostruire in modo articolato i profili degli ospiti pernottanti nei rifugi in ambiente alpino. Ulteriore limitazione è connessa alla focalizzazione dell'analisi sugli ospiti che pernottano in rifugio che non necessariamente esprimono motivazioni, comportamenti e attenzione alla salvaguardia dell'ambiente alpino in linea con il più ampio segmento dei frequentatori della montagna. Si ritiene tuttavia che la ricerca sia un primo step di analisi che può contribuire a mettere in luce evidenze che potranno trovare ulteriore approfondimento ampliando l'analisi anche ad un bacino più ampio di frequentatori della montagna.*

Una terza limitazione riguarda la natura relativamente recente e in evoluzione del fenomeno oggetto di indagine. L'espansione del turismo montano e l'emergere di nuovi segmenti di visitatori, influenzati da dinamiche legate ai social media, ai cambiamenti negli stili di vita contemporanei e alle trasformazioni delle pratiche turistiche successive alla pandemia, rappresentano processi ancora in fase di consolidamento. Di conseguenza, anche il quadro teorico e le evidenze empiriche disponibili nella letteratura scientifica risultano ancora parziali. In relazione a ciò, anche la comparazione dei risultati con studi precedenti presenta alcune criticità.

Infine, la ricerca si concentra sul contesto territoriale del Trentino, che, pur presentando caratteristiche tipiche del sistema alpino, può essere influenzato da specificità strutturali, organizzative e culturali non necessariamente generalizzabili ad altri contesti montani. Pertanto, l'estensione dell'analisi ad altre aree alpine potrebbe rappresentare un utile sviluppo futuro della ricerca, contribuendo a rafforzare la robustezza risultati.

Managerial implications. *Comprendere come i gestori dei rifugi alpini si confrontano con il mutamento dei trend del turismo montano e quali decisioni strategiche adottano in un contesto organizzativo di natura imprenditoriale ibrida, consente di sviluppare strumenti di supporto alla gestione più strutturati e orientati alla sostenibilità. In particolare, l'analisi delle pratiche manageriali adottate dai rifugisti permetterà di individuare approcci gestionali capaci di integrare la sostenibilità economica con la tutela ambientale e la responsabilità sociale, tenendo conto delle specificità operative e territoriali che caratterizzano il contesto dell'alta quota.*

In questa prospettiva, l'identificazione dei profili motivazionali e comportamentali dei frequentatori della montagna rappresenta un passaggio cruciale, poiché consente di comprendere più accuratamente le aspettative della domanda e di interpretare le logiche che orientano le scelte gestionali dei rifugisti.

Le evidenze del lavoro possono contribuire alla definizione di linee guida manageriali utili a supportare i gestori nel bilanciare le crescenti aspettative della domanda con la necessità di preservare l'equilibrio ecologico e culturale dei territori montani. In questo senso, il contributo dello studio non si limita al contesto specifico dei rifugi alpini, ma si inserisce in un più ampio filone di ricerca sul turismo sostenibile e sulla gestione dell'ospitalità in contesti caratterizzati da elevata fragilità ambientale e da vincoli logistici e infrastrutturali rilevanti.

Le implicazioni emerse possono inoltre essere trasferibili ad altri contesti turistici emergenti o in fase di sviluppo, nei quali la crescita della domanda non è ancora pienamente consolidata, ma nei quali risulta comunque necessario adottare modelli di gestione attenti alla sostenibilità e alla capacità di carico del territorio. In tali situazioni, l'esperienza dei rifugi alpini può rappresentare un laboratorio particolarmente significativo per comprendere come coniugare sviluppo turistico, sostenibilità e gestione responsabile di ambienti naturali sensibili.

Originality of the paper. *Nonostante il crescente interesse scientifico per il turismo montano e le trasformazioni che stanno interessando le destinazioni alpine, la letteratura ha finora dedicato un'attenzione limitata all'analisi sistematica dei profili emergenti dei frequentatori della montagna, in particolare alla luce delle recenti dinamiche che stanno ridefinendo le modalità di fruizione degli ambienti d'alta quota. La crescente diffusione dei social media, i cambiamenti negli stili di vita contemporanei e la ricerca di esperienze immersive in contesti naturali stanno infatti contribuendo a modificare progressivamente le motivazioni, le aspettative e i comportamenti dei visitatori della montagna.*

In questo contesto, la presente ricerca si propone di contribuire al dibattito scientifico attraverso l'analisi dei profili motivazionali e comportamentali dei nuovi frequentatori della montagna, con particolare riferimento agli escursionisti che pernottano nei rifugi alpini. L'identificazione e la comprensione di tali profili rappresentano un passaggio fondamentale per interpretare l'evoluzione della domanda in alta quota e per comprendere come essa possa influenzare le dinamiche di gestione e le scelte organizzative delle strutture di accoglienza alpine.

A partire da questa prospettiva, lo studio contribuisce inoltre ad ampliare la riflessione sul ruolo dei rifugi alpini interpretandoli attraverso la lente delle imprese ibride. Tale approccio consente di considerare il rifugio non soltanto come infrastruttura di supporto al turismo montano, ma come un attore organizzativo complesso, chiamato a conciliare sostenibilità economica, tutela ambientale e responsabilità sociale all'interno di un contesto territoriale caratterizzato da elevata fragilità ecosistemica.

Luxury Brands as Cultural Actors. Heritage, Creative Cities, and Tourism Ecosystems in the Luxury Economy

ANNAMARIA ESPOSITO*, AMALIA NANGERONI•

Abstract. *Luxury brands are increasingly operating at the intersection of cultural production, heritage valorisation, and tourism development within global creative cities. Moving beyond their traditional role as producers of high-end goods, they act as culturally embedded actors that mobilise heritage resources and artification strategies to generate symbolic value and institutional legitimacy.*

This paper examines how luxury brands integrate intangible cultural heritage into branding practices and how these processes contribute to the development of tourism ecosystems. Adopting an institutional and cultural perspective, the study conceptualises luxury brands as actors embedded in networks of cultural production, symbolic legitimisation, and destination development. A qualitative multiple case study approach is employed, focusing on two Italian firms—Buccellati and Molteni Group— to illustrate heritage-based branding practices.

The findings show that heritage serves as an institutionalised organisational resource, embedded in archives, museums, and structured cultural practices, while artification functions as a mechanism for constructing legitimacy at the field level, aligning brands with institutionalised cultural frameworks. Furthermore, corporate cultural spaces and heritage initiatives enhance the symbolic appeal of creative cities and contribute to the development of tourism ecosystems.

This study makes three key contributions to the literature: (1) it reconceptualises intangible cultural heritage as an institutional resource; (2) it advances the understanding of artification as a mechanism of legitimacy construction; and (3) it bridges luxury branding and tourism research through an ecosystem-based perspective. In doing so, it positions luxury brands as cultural mediators operating between cultural production and destination development.

Framing of the research. *The luxury industry has undergone significant transformations as globalisation, digitalisation, and evolving consumer expectations have reshaped brand management strategies. Luxury brands now compete not only through product quality and exclusivity but also through symbolic value, cultural meaning, and experiential engagement (Kapferer & Bastien, 2012).*

As competition intensifies, firms are differentiating themselves more through narratives that convey authenticity, creativity, and cultural depth. Consequently, luxury consumption has therefore evolved beyond product acquisition to encompass experiences, and storytelling (Batat, 2019; Kumar & Swain, 2025). In response, companies are integrating craftsmanship traditions, historical archives, and cultural collaborations into their branding strategies. This links contemporary products to cultural identities and reinforcing authenticity and distinctiveness (Beverland, 2005; Dion & Borraz, 2014).

Within this context, luxury brands operate as cultural actors that contribute to the creation and dissemination of meaning (Holt, 2004). Rather than functioning solely as commercial organizations, they engage with museums, cultural institutions, artists, and creative communities, positioning their products within the aesthetic and symbolic frameworks traditionally associated with the arts. This shift reflects a broader transformation in which luxury firms extend their role beyond market activities to become participants in cultural ecosystems.

A key resource enabling this transformation is intangible cultural heritage, which includes craftsmanship traditions, artisanal knowledge, and cultural practices transmitted across generations (UNESCO, 2003). In luxury industries, such heritage functions both as a production resource and as a source of symbolic value, reinforcing authenticity, cultural depth, and legitimacy (Kapferer, 2014; Throsby, 2001).

At the same time, luxury brands operate within creative cities—urban environments where cultural production, creative industries, and tourism intersect (Richards, 2011). These cities host dense networks of designers, cultural institutions, and tourism infrastructures that shape global cultural economies. Within these contexts, luxury brands contribute to cultural life through exhibitions, heritage spaces, and collaborations with artistic and institutional actors.

These initiatives increasingly form part of urban tourism ecosystems. From an ecosystem perspective, tourism can be understood as a configuration of interdependent actors whose interactions co-create value at the destination level (Richards, 2011; Richards, 2021). Recent studies further emphasise that such ecosystems are structured through economic and relational interdependencies linking industrial activities, cultural production, and territorial development (Platania et al., 2025).

The concept of artification is particularly useful for interpreting these dynamics. Artification refers to processes through which objects or practices originally perceived as non-art acquire artistic legitimacy through aesthetic framing and institutional recognition (Shapiro & Heinich, 2012). In luxury industries, it reinforces perceptions of rarity,

* Associate Professor of *Management and Marketing* - IULM University – Italy, e-mail: annamaria.esposito@iulm.it

• Ph.D Student in *Communication, Market and Society* - IULM University – Italy, e-mail: amalia.nangeroni@studenti.iulm.it

creativity, and symbolic value, as brands collaborate with artists, organise exhibitions, and curate heritage spaces (Massi & Turrini, 2020). These practices blur the boundaries between commerce and art and position luxury products within cultural frameworks associated with artistic production. Artification can be interpreted as a field-level mechanism through which organizations align with institutionalised cultural frameworks, thereby reinforcing legitimacy and symbolic value. It can also be understood as a form of boundary work through which luxury brands negotiate the distinction between art and market domains. Despite growing scholarly interest in luxury branding, cultural heritage, and creative cities, limited research has examined how luxury brands simultaneously contribute to cultural production and tourism ecosystems. Existing research remains fragmented across branding and tourism studies, calling for more integrative approaches (Zhang et al., 2026). Much of the existing literature has focused on brand authenticity, heritage branding, or consumer perceptions, while less attention has been devoted to the broader cultural and territorial role of luxury firms. Similarly, tourism studies have often analysed destination attractiveness and cultural experiences without fully considering the role of luxury brands as actors shaping cultural infrastructures and tourism imaginaries.

This paper advances a theoretical reframing of luxury brands by conceptualising them not merely as cultural actors, but as institutional producers of cultural legitimacy. In this perspective, heritage infrastructures and artification processes are not simply branding strategies, but organisational and field-level mechanisms through which firms stabilise symbolic value and actively shape cultural and tourism ecosystems.

This study addresses this gap by examining how luxury brands mobilise heritage resources, artification strategies, and cultural initiatives to position themselves within creative city ecosystems. Adopting a cultural and institutional perspective, the paper investigates how heritage-based branding practices are embedded in organisational structures and how they contribute not only to symbolic legitimacy but also to tourism ecosystem development.

The present study makes three key contributions to the existing literature. Firstly, it reconceptualises intangible cultural heritage as an institutionalised infrastructure embedded in organisational practices, which stabilises legitimacy over time. Secondly, it advances the understanding of artification by interpreting it as a field-level mechanism of institutional alignment and legitimacy transfer across cultural and market domains. This enables luxury brands to embed their products within recognised cultural frameworks. Thirdly, it combines luxury branding and tourism research by adopting an ecosystem-based perspective, demonstrating how luxury brands actively shape tourism ecosystems by co-producing symbolic value. The study provides a comprehensive framework that integrates these perspectives, establishing a clear link between branding, cultural legitimacy and territorial value creation.

Purpose of the paper. *Building on an ecosystem-based and institutional perspective, this paper examines how luxury brands mobilise intangible cultural heritage within branding strategies and how these practices contribute to tourism ecosystems in creative cities. In particular, the study investigates how heritage resources are embedded in organisational practices, how artification processes support the cultural positioning and legitimacy of luxury brands, and how these dynamics shape their role within urban cultural and tourism systems.*

By analysing the cases of Buccellati and Molteni Group, the research explores how craftsmanship traditions, design heritage, and corporate cultural spaces function as strategic resources that strengthen brand legitimacy while simultaneously contributing to the symbolic and experiential attractiveness of urban destinations.

To address these issues, the study is guided by the following research questions:

RQ1. How do luxury brands mobilise intangible cultural heritage as an institutionalised resource within branding strategies?

RQ2. How do artification strategies function as mechanisms of cultural positioning and legitimacy construction in luxury markets?

RQ3. How do heritage-based branding practices contribute to tourism ecosystems in creative cities?

Methodology. *Following the literature review, this study adopts a qualitative multiple case study approach to examine how luxury brands mobilise cultural heritage within creative cities and tourism ecosystems (Yin, 2018).*

The empirical analysis focuses on two Italian luxury brands: Buccellati, operating in high jewellery, and Molteni Group, operating in luxury furniture and design. These cases were selected through purposive sampling (Eisenhardt, 1989), as both firms actively integrate cultural heritage and creative production into their branding strategies while operating within the Milan design ecosystem. Although they belong to different sectors, they are analytically comparable in their use of heritage to connect brand identity, cultural production, and territorial attractiveness.

The unit of analysis consists of the organisational practices through which luxury brands mobilise cultural heritage and engage with cultural and tourism ecosystems. In particular, the study focuses on practices such as the development of corporate archives, museum initiatives, exhibitions, cultural collaborations, and heritage spaces, which allow observation of how heritage and artification are operationalised within organisational contexts.

Data were collected from multiple sources, including semi-structured interviews with communication and brand managers, corporate reports and publications, archival materials, exhibitions and cultural initiatives, academic literature, and industry reports. The use of multiple sources enables data triangulation and strengthens the reliability of the analysis (Yin, 2018). Interviews provide insights into managerial interpretations of heritage and cultural initiatives, while corporate documents and archival materials offer evidence on historical narratives, design traditions, and heritage infrastructures. Exhibitions, museums, and cultural spaces are analysed as organisational manifestations of artification and cultural positioning.

Data analysis follows an iterative and comparative process (Eisenhardt, 1989). First, empirical material is coded to identify practices related to heritage mobilization, artification strategies, and tourism-related initiatives. The coding process is structured around three analytical dimensions derived from the research questions: (1) heritage mobilization practices, (2) artification strategies, and (3) tourism-related initiatives. First-order codes emerging from the data (e.g., archives, exhibitions, museum activities) are subsequently grouped into broader themes reflecting recurring organisational mechanisms.

Second, within-case analyses are conducted to examine how each company institutionalises heritage and positions itself within cultural and urban ecosystems. Third, cross-case comparison enables the identification of recurring patterns and differences, with particular attention to how similar practices generate comparable outcomes in terms of legitimacy and cultural positioning.

Recurrent patterns—such as the institutionalization of heritage through archives and museums and the use of exhibitions as artification mechanisms—support the identification of mechanisms connecting heritage mobilization, legitimacy construction, and integration into tourism ecosystems. This approach allows findings to be grounded in empirical observations while contributing to theory development.

Literature review.

Intangible Cultural Heritage and Craftsmanship. *Intangible cultural heritage includes practices, knowledge, and skills transmitted across generations (UNESCO, 2003). Within creative industries, craftsmanship traditions represent a key form of such heritage, combining technical expertise, aesthetic sensibilities, and cultural continuity. In luxury industries, these traditions are central to brand identity, enabling the production of unique objects characterised by quality, rarity, and refinement (Kapferer, 2014).*

Artisanal knowledge develops through long-term learning processes, apprenticeships, and workshop-based transmission. Luxury brands increasingly invest in preserving this knowledge through archives, training programs, craft schools, and documentation initiatives, highlighting its role as both a production resource and a strategic cultural asset.

Beyond technical expertise, craftsmanship also functions as a storytelling resource. Narratives centred on artisanal knowledge, handwork, and historical continuity allow brands to communicate authenticity and cultural depth (Beverland, 2005). In this sense, intangible cultural heritage operates as both cultural capital and a mechanism of differentiation (Bourdieu, 1984; Dion & Borraz, 2017).

Artification and Cultural Legitimacy. *Artification is the process by which objects, practices, or activities not initially regarded as art are progressively constructed as art through material, symbolic, and institutional shifts, eventually attaining cultural legitimacy (Shapiro & Heinich, 2012). In luxury industries, it plays a central role in reinforcing perceptions of rarity, creativity, and symbolic value. Firms increasingly adopt artification strategies through collaborations with artists, museum exhibitions, and the curation of heritage spaces (Massi & Turrini, 2020; Green, 2025).*

When luxury products are exhibited in cultural institutions, they acquire meanings that extend beyond functional value. Research shows that artification enhances symbolic prestige and perceived legitimacy (Chailan, 2018), while also influencing consumer evaluations of durability and uniqueness (De Angelis et al., 2020).

Kapferer (2014) argues that artification represents a key strategy through which luxury brands recreate rarity and cultural value in markets characterised by increasing globalization, standardization, and competitive pressure. Artification contributes to positioning luxury brands within wider creative ecosystems, allowing products to be framed as cultural artifacts rather than purely commercial goods.

Creative Cities and Tourism Ecosystems. *Creative cities are urban environments where culture, creativity, and economic activities intersect, supported by dense networks of creative industries, cultural institutions, and tourism infrastructures (Richards, 2011). Events such as fashion weeks, design festivals, and art fairs enhance their international visibility and attract diverse audiences.*

Within these contexts, luxury brands contribute to cultural life through exhibitions, collaborations, and heritage spaces. From a tourism perspective, such initiatives form part of tourism ecosystems, where firms, institutions, creative professionals, and visitors interact (Richards, 2011; Richards, 2021; Platania et al., 2025). Brand museums, flagship spaces, and exhibitions increasingly become elements of cultural itineraries within creative cities.

Recent tourism research highlights the role of storytelling, heritage interpretation, and symbolic coherence in shaping visitor engagement and destination attractiveness (Guo et al., 2024; Sinha & Chinki, 2025). In this perspective, heritage should be understood not only as a cultural asset but also as a driver of tourism experiences, whose interpretation and staging contribute to experiential value creation within tourism ecosystems.

These dynamics are particularly relevant to luxury brands, as heritage spaces operate as hybrid environments combining storytelling, experience, and cultural consumption. At the same time, critical tourism studies underline that heritage valorisation may involve selective representation and commodification, especially when cultural resources are mobilised for market purposes (Richards, 2021; Kumar & Swain, 2025).

Recent contributions further emphasise the importance of integrated approaches linking heritage, branding and tourism development (Kumar & Swain, 2025), highlighting the need for systemic perspectives in analysing the role of luxury brands within tourism ecosystems.

Empirical cases.

Buccellati. *Founded in Milan in 1919, Buccellati represents a prominent luxury heritage brand deeply rooted in craftsmanship and artistic tradition. Its identity is strongly linked to goldsmith techniques such as rigato, telato, ornato, and segrinato, which create textile-like textures on precious metals. These techniques embody forms of intangible cultural heritage transmitted across generations and embedded in the firm's identity.*

Beyond craftsmanship, Buccellati integrates artification strategies into its branding approach. Drawing on artistic references from Renaissance and Byzantine traditions, the brand positions its jewellery as culturally significant artifacts rather than purely decorative objects. Heritage preservation plays a central role in this process. The Buccellati Historical Archive documents the company's legacy through sketches, historical pieces, and documentary materials, functioning both as a repository of the past and as an organisational resource supporting authenticity and continuity.

The brand also engages with cultural institutions through exhibitions and museum collaborations, with pieces displayed in venues such as the Museo degli Argenti in Florence and the Museo del Gioiello in Vicenza. These initiatives reinforce the perception of Buccellati's creations as cultural artifacts and illustrate how artification is operationalised through institutional recognition and aesthetic framing.

Empirical evidence from interviews and documentary sources indicates that these practices are strategically mobilised to reinforce legitimacy. Craftsmanship heritage is not only communicated symbolically but institutionalised through archives, cultural programming, and curated initiatives.

Located in Milan, Buccellati operates within a dynamic creative ecosystem characterised by fashion, design, and cultural production. Through exhibitions, collaborations, and participation in cultural events, the brand contributes to the symbolic landscape of the city and becomes relevant to visitors interested in Italian craftsmanship. These activities suggest its integration into broader tourism ecosystems.

Molteni Group. *Founded in 1934 in the Brianza design district, Molteni Group is a leading company in the luxury furniture sector, whose identity is shaped by collaborations with renowned architects and designers such as Gio Ponti, Aldo Rossi, Jean Nouvel, and Foster + Partners. Unlike Buccellati, whose heritage is rooted in artisanal craftsmanship, Molteni mobilises design heritage and architectural culture as the foundation of its cultural positioning.*

The company emphasises the historical significance of modern Italian design through initiatives such as the Heritage Collection, which includes re-editions of iconic furniture pieces. A central element of its strategy is the Molteni Museum, inaugurated in 2015 at the company's headquarters in Giussano. The museum preserves and communicates the firm's design heritage while hosting exhibitions and cultural events, functioning as both an archive and a platform for cultural engagement.

Molteni also collaborates with cultural institutions, including the Museo Poldi Pezzoli in Milan, and has developed Palazzo Molteni, a flagship cultural space in central Milan designed by Vincent Van Duysen. This space combines showroom, exhibition venue, and cultural hub, offering immersive environments where visitors experience design within curated domestic settings.

These practices support the interpretation of Molteni as a cultural actor embedded in Milan's design ecosystem. The company frames design as a cultural language and positions itself as a custodian of design heritage. As in the Buccellati case, legitimacy emerges from the organisational embedding of cultural resources rather than from symbolic narratives alone.

At the same time, Molteni's museum and flagship spaces contribute to the experiential attractiveness of Milan by offering visitors access to curated design environments that connect brand identity with urban cultural experience. Interview data and corporate documentation further indicate that these initiatives function as institutional platforms through which design culture is formalised and communicated to broader audiences.

The comparative analysis of Buccellati and Molteni Group highlights recurring patterns in how luxury brands mobilise cultural resources, engage in artification processes, and position themselves within urban cultural and tourism ecosystems. While the two cases differ in their sectoral focus—craftsmanship-based luxury versus design-driven production—they show converging organisational mechanisms through which heritage is institutionalised, artification is operationalised, and cultural initiatives contribute to broader ecosystem dynamics.

These patterns provide the basis for identifying key analytical dimensions that structure the findings of this study. In particular, the analysis focuses on (1) the institutionalization of heritage as an organisational resource, (2) the role of artification as a mechanism of legitimacy construction, and (3) the integration of luxury brands into tourism ecosystems within creative cities.

Results. *The findings provide insights into the evolving role of luxury brands within contemporary cultural and urban ecosystems. The analysis of Buccellati and Molteni Group shows that luxury brands operate not only as producers of high-end goods but also as culturally embedded actors within networks of cultural production, heritage preservation, and tourism development.*

While product quality, exclusivity, and craftsmanship remain central, contemporary strategies increasingly emphasise cultural meaning, heritage narratives, and experiential engagement (Kapferer, 2014; Batat, 2019). Luxury brands therefore extend their role beyond traditional marketing by engaging in exhibitions, cultural initiatives, and collaborations with artistic institutions.

The cases illustrate how intangible cultural heritage functions as a strategic resource generating symbolic value and institutional legitimacy. In both firms, heritage is embedded in formal organisational structures—such as archives, museums, and curated cultural initiatives—rather than being limited to symbolic narratives. Legitimacy is strengthened when heritage is institutionalised across organisational practices.

From a theoretical perspective, heritage and artification emerge as complementary mechanisms operating at different levels. Heritage supports authenticity and continuity at the organisational level, while artification operates at the field level by aligning firms with cultural institutions and symbolic systems. Together, these mechanisms enable luxury brands to achieve legitimacy within both market and cultural domains.

Interview data highlight that managers explicitly frame archives and exhibitions as tools for reinforcing brand legitimacy rather than mere communication devices.

Proposition 1 (heritage). *Luxury brands that institutionalise intangible cultural heritage through organisational infrastructures (e.g., archives, museums, formalised practices) transform heritage from a symbolic narrative into a legitimacy-stabilising mechanism, thereby reinforcing their institutional positioning within luxury fields.*

The analysis also highlights the role of artification in shaping contemporary luxury branding strategies. Both cases show how exhibitions, museum collaborations, and cultural programming position products within artistic contexts and connect brands with institutions that confer symbolic recognition. Artification operates as a mechanism of legitimacy construction by embedding products within institutional cultural networks. In this sense, artification enables luxury brands to align with broader cultural frameworks and access sources of symbolic recognition beyond the market domain.

Proposition 2 (artification). *Artification strategies—such as exhibitions, museum collaborations, cultural programming, and curated heritage spaces—function as mechanisms of institutional alignment, enabling luxury brands to transfer legitimacy from the cultural field to the market by embedding their products within recognised artistic and institutional frameworks.*

The findings further highlight the integration of luxury brands within urban tourism ecosystems. In Milan, both companies contribute to cultural life through exhibitions, heritage spaces, and institutional collaborations. Corporate museums and flagship spaces increasingly form part of cultural itineraries, attracting visitors interested in design, craftsmanship, and creative industries. These initiatives participate in the co-production of symbolic value within urban cultural ecosystems and contribute to shaping tourism experiences. At the same time, they influence the visibility of heritage by privileging specific narratives of taste, exclusivity, and cultural value. This suggests that heritage is not simply preserved but selectively constructed, raising questions about which cultural narratives are legitimised, which remain excluded, and how market logics shape these processes.

Proposition 3 (ecosystem). *By developing heritage infrastructures and cultural spaces, luxury brands act as institutional intermediaries within urban ecosystems, contributing to the co-production of symbolic value and the structuring of tourism experiences in creative cities.*

Finally, the findings emphasise the role of authenticity and historical continuity in sustaining luxury brand legitimacy. In both cases, heritage operates as a dynamic institutional resource that is continuously reinterpreted through exhibitions, collaborations, and curated spaces. This enables firms to balance tradition and innovation, maintaining relevance in highly competitive markets and reinforcing legitimacy over time.

Discussion. *The findings deepen the understanding of luxury brands as actors embedded within cultural and urban ecosystems by showing that heritage and artification operate as complementary mechanisms of legitimacy construction across organisational and field levels.*

Intangible cultural heritage emerges not merely as a narrative resource, but as an institutionalised infrastructure embedded in organisational practices such as archives, museums, and curated cultural initiatives. These infrastructures stabilise legitimacy over time by anchoring brand identity in historically grounded and socially recognised cultural forms. At the same time, artification operates at the field level as a mechanism of institutional alignment, enabling luxury brands to embed their products within recognised cultural frameworks and to access sources of symbolic recognition beyond the market domain.

Together, these mechanisms allow luxury brands to extend their role beyond market exchange and position themselves within broader systems of cultural production. In this sense, legitimacy is not only constructed through symbolic communication, but also through the organisational and institutional embedding of cultural resources.

The analysis also highlights the integration of luxury brands within tourism ecosystems in creative cities. Through heritage infrastructures and cultural initiatives, firms contribute to the co-production of symbolic value and to the structuring of tourism experiences. Corporate museums, flagship cultural spaces, and exhibitions increasingly function

as institutional interfaces between brands, cultural institutions, and visitors, shaping how heritage is interpreted and experienced within urban contexts.

The findings suggest that luxury brands should not be understood as passive participants in cultural and tourism ecosystems, but as institutional intermediaries that actively structure the production, interpretation, and circulation of cultural meaning. Through heritage infrastructures and artification processes, luxury brands contribute to defining the symbolic boundaries of cultural value and to shaping the experiential and representational dynamics of creative cities.

At the same time, this role is inherently ambivalent. The integration of luxury brands into cultural tourism may involve processes of selective representation, privileging certain forms of heritage aligned with exclusivity while marginalising others. Moreover, the transformation of heritage into curated experiences may lead to forms of commodification, raising questions about accessibility, inclusiveness, and the broader societal implications of market-driven cultural production.

These findings support an ecosystem-based interpretation of luxury branding, in which value creation emerges from the interactions among multiple actors embedded within destination systems. However, they also extend this perspective by highlighting the active role of luxury brands as institutional agents shaping the structure and meaning of these ecosystems. In doing so, luxury brands emerge not only as market actors, but as institutional agents that actively shape the production and valuation of culture within contemporary economies.

Research limitation. *This study presents some limitations that should be acknowledged. First, the research is based on a qualitative multiple case study focusing on two Italian luxury firms operating within the Milan context. While this approach enables in-depth analysis and theory building, it limits the generalizability of the findings to other geographical contexts, industries, or types of luxury brands.*

Second, the study relies on a combination of interviews, corporate documents, and publicly available materials. Although data triangulation strengthens the robustness of the analysis, access to internal strategic processes remains partial, and interpretations may reflect the perspectives of key informants and curated organisational narratives. In addition, the study does not directly examine audience reception, as it does not include empirical data on how visitors or consumers perceive and interpret heritage-based and artification practices in terms of legitimacy and symbolic value.

Third, the research adopts a cross-sectional perspective, focusing on current practices of heritage mobilization and cultural initiatives. Future studies could adopt longitudinal approaches to examine how these strategies evolve over time and how they influence long-term brand legitimacy and destination development.

Future research could extend this study by comparing luxury brands across different cultural and institutional contexts, exploring the role of digital technologies in heritage communication, and investigating the perspectives of visitors and consumers to better understand how heritage-based experiences are perceived and valued within tourism ecosystems.

Managerial implications. *The findings offer several implications for managers operating in luxury industries. First, they highlight the strategic importance of intangible cultural heritage as an organisational resource. Firms should move beyond symbolic storytelling and invest in the institutionalization of heritage through archives, museums, training programs, and structured cultural initiatives. This approach strengthens authenticity and supports long-term brand legitimacy.*

Second, the study emphasises the role of artification as a strategic mechanism for positioning luxury brands within broader cultural frameworks. Collaborations with cultural institutions, curated exhibitions, and artistic partnerships enable firms to reinforce symbolic value and gain institutional recognition beyond traditional market boundaries.

Third, the results suggest that heritage spaces and corporate cultural initiatives can function as platforms for engaging with tourism ecosystems. By developing museums, flagship cultural spaces, and experiential environments, luxury brands can contribute to the attractiveness of creative cities and attract visitors interested in craftsmanship, design, and cultural production.

At the same time, managers should be aware of the potential risks associated with heritage commodification and selective representation. Balancing cultural authenticity with market-oriented strategies is essential to avoid over-commercialization and to maintain credibility within both cultural and tourism contexts.

Originality and contribution of the paper. *This paper contributes to the literature by offering an integrated perspective on luxury branding, cultural heritage, and tourism ecosystems. It advances existing research by reconceptualising intangible cultural heritage as an institutionalised organisational resource embedded in structured practices, rather than as a purely symbolic narrative.*

Furthermore, the study extends the concept of artification by interpreting it as a field-level mechanism of legitimacy construction. This perspective highlights how luxury brands align with institutionalised cultural frameworks and gain recognition within broader cultural fields.

Finally, the paper bridges luxury branding and tourism research by adopting an ecosystem-based approach. It demonstrates how heritage-based branding practices contribute to tourism ecosystems in creative cities and positions luxury brands as cultural mediators operating between cultural production, symbolic value creation, and destination development.

By integrating these dimensions, the study responds to calls for more cross-disciplinary research and provides a coherent framework for understanding the intersection between branding, cultural legitimacy, and territorial value creation.

Managing Data in Tourism Systems: The Italian Tourism Digital Hub

STEFANIA DENISE ESCOBAR[1], NILOOFAR KAZEMARGI[2], FEDERICA CECI[3]

Abstract. *Data plays an important role in every industrial sector nowadays, and tourism destination management is not an exception. However, despite the increasing availability of digital tools, tourism data remain highly fragmented, dispersed across heterogeneous systems and controlled by multiple actors with limited coordination. Effective long-term sustainable tourism destination management requires a diverse set of reliable tourism data on consumption, production, and impact. However, significant gaps persist between the data required for strategic decision-making and the data actually collected and shared by tourism stakeholders, resulting in limited visibility over key dynamics of the tourism ecosystem. In this study, we explore the Digital Tourism Hub (DTH) developed by the Italian Ministry of Tourism as part of the effort to develop a data platform that integrates different data sources to ensure evidence-based managerial decisions. Employing an exploratory case study methodology, this research aims to untangle the DTH's complexity by analysing its stakeholders and their interactions within the data ecosystem. Preliminary findings show how data are governed as well as how multiple stakeholders interact with and exchange data at different levels, of different types and regarding different tourism components.*

Keywords: *Data Governance, Data sharing, Data Ecosystem, Smart Tourism Ecosystem, Case Study, Research in progress*

Framing of the research. *Tourism destinations are complex multi-product and multi-market system entities that need extensive data on tourist spatial production and consumption to effectively plan long-term sustainable governance and management (Gonzalez-Reverte, 2019; Coca-Stefaniak, 2021). However, many destinations suffer from low levels of information on tourism characteristics, market profile, key supporting infrastructures, and tourism impact which leads to public institutions to be uninvolved and unaware of the full cycle of tourism activities (Pradhan et al., 2018). The fragmented tourism data make tourism management a challenge, often resulting in issues such as strong discontent among residents who are most vulnerable to the impacts of tourism activities (Aleshinloye et al., 2021). For example, residents protests in many tourism destinations show how the consequences of inadequate tourism management are reflected in a diminished quality of life for the citizenship (Armas-Díaz et al., 2024; Liberatore et al., 2023).*

To this end, previous research advocate for the pressing need to have reliable, updated and integrated tourism data to develop evidence-based decisions and policies and promote a proactive and systemic approach to tourism management which is leading to many destinations to develop tourism data ecosystems (Gobierno de España, 2024; McLeod, 2024; Xu et al., 2025). These data ecosystems are based on data retrieved from tourism destinations which are complex systems where actors develop a plurality of interconnected relationships (Iandolo et al., 2019; Bellato et al., 2022; Hartman, 2023) and therefore have a high level of qualitative and quantitative complexity (Bianchini, 2023). Data ecosystems are defined as being complex systems because they entail a large number of components that are strongly interrelated among each other (Bianchini, 2023). This study aims to untangle the complexity of a data ecosystem by analyzing its stakeholders interaction within the ecosystem. In particular, this study aims to show how data can be governed in complex data ecosystems in which different organizations interact and exchange data at different levels and of different types.

To structure the initial phase of our analysis and provide a coherent lens through which to examine the DTH, we began by clarifying the foundational elements of the ecosystem. We first mapped the actors involved and their respective roles, as this represents a necessary step for beginning to untangle the complexity of the data ecosystem under investigation. At this stage of the research we adopted the destination competitiveness framework (Boes et al., 2016; Başer et al., 2019) to start investigating the typology of tourism data exchanged in the ecosystem. This framework describes a destination as being structured into 6 main components: Attractions (natural, artificial or cultural), Accessibility (entire transportation network), Amenities (all services that ensure a comfortable stay, from accommodation to dining), Available packages (service bundles offered by intermediaries), Activities (available experiences) and Ancillary services (services not explicitly intended for tourists). This conceptual structure served as an analytical anchor for interpreting the data exchanges, enabling us to link specific stakeholder interactions to distinct dimensions of destination competitiveness and to develop an initial understanding of how governance mechanisms emerge within such a complex, multi-actor environment.

Purpose of the paper. *Through an exploratory approach, this research in progress analyses the case of the Digital Tourism Hub (DTH), a tourism data ecosystem developed by the Ministry of Tourism in Italy. The project started in 2021 and currently involves more than 20 thousand tourism operators as well as a diverse set of public and private entities (Italiadomani, 2025). This study will contribute to the call of Grewatsch et al. (2023) for research to go beyond*

[1] Catholic University of the Sacred Heart, e-mail: stefaniadenise.escobar@unicatt.it

[3] University G. D'Annunzio, e-mail: niloofar.kazemargi@unich.it

reductionist thinking and to embrace a systemic lens to understand the interactions among multiple actors within complex ecosystems. Moreover, this study contributes to the data governance literature by offering empirical insights on how data are governed within large-scale, multi-stakeholder ecosystems. It reveals how governance arrangements emerge, evolve and adapt over time, how responsibilities and decision rights are distributed across public and private actors, and how different types of data, i.e. open, proprietary, institutional and value-added, are integrated, shared and controlled in practice. In doing so, the study enriches current debates on data management by illustrating the concrete mechanisms, challenges and trade-offs involved in governing data in a complex, interoperable tourism platform.

Through the Next Generation EU funding, the ministry of Tourism in Italy allocated 114 mln euros to build the DTH (Senato della Repubblica, 2023; Camera di Commercio Genova, 2024; Italiadomani, 2025). This hub aims to enhance the competitiveness of Italy as a tourism destination, hence the ability of Italy to provide an improved travel experience for the tourist while building a better living environment for its residents through the use of data (Butler, 2017; Dioko and So, 2017; Senato della Repubblica, 2023).

To this end, the DTH will help develop a unified and cohesive branding strategy across Italy with authenticity and sustainability as guiding principles (Ministero del Turismo, 2025). In addition, the new hub aims to reduce the digital divide that affects Italian tourism businesses and the lack of knowledge regarding tourism systems activities (Pradhan et al., 2018). Proper destination branding and management needs a comprehensive knowledge of both tourism spatial consumption and production (Coca-Stefaniak, 2021). Indeed, if tourism products (either endowed or created) are crucial components for the appeal of a destination, tourism services are just as important given that they greatly impact the tourism experience and the quality of life in destinations (Goffi et al., 2023).

Italy´s destination branding has been particularly fragmented in its storytelling (Angeloni, 2013). To develop a cohesive and unified destination branding, Italy needs to face many challenges such as having a tourism business ecosystem with a significantly lower number of employees per firm compared to the European average which affects the ability of tourism businesses to innovate. In addition, many Italian tourism stakeholders lack the digital skills necessary to adopt advanced functionalities in their internet sites and social networks to attract visitors and promote their attractions (Goffi et al., 2023; OECD, 2025). A smart tourism ecosystem like the DTH could help Italian tourism ecosystem to enhance its competitiveness in terms of destination branding, destination management and governance by helping on the one hand tourism stakeholders to interact, exchange information, and promote their existing tourism offer and on the other hand policy makers to gain knowledge on the tourism system they aim to manage and promote (Boes et al., 2016; Baggio et al., 2020; Buhalis et al., 2023). According to the Ministry of Tourism (2023), the DTH represents a bridge between tourism supply and demand connecting the whole tourism sector through one platform (OECD, 2025).

Methodology. *This research employs a case study methodology with an exploratory design focused on gathering rich, qualitative data (Yin, 2017). We collected secondary data and semi-structured interviews with key actors of the data ecosystem to triangulate data ensuring a comprehensive and credible analysis (Ridder, 2017). In terms of primary data, this research will collect semi-structured interviews to enable participants to express their insights in an open and comprehensive manner (Creswell & Creswell 2018). At the moment of submission, 4 interviews have been conducted with stakeholders from the DTH: 4 interviews with groups of Ministry Officials (Interviewee 1, 2, 3, 4, 5, 6, 7) and one interview with a Tourism Operator (Interviewee 8). Additional interviews are being scheduled for the upcoming months with an expected number of 15 interviews with groups of ecosystem stakeholders to be completed before the Conference which will allow us to reach a sample of 20 interviewees.*

For secondary data, we collected data from different sources, such as ministry reports, official websites, and academic publications to help triangulate and integrate primary data, enhancing the contribution and robustness of the case study analysis (Table 1). We also included 6 official reports, 2 ministry websites and the national tourism platform Italia.it.

This research analyses primary and secondary data through a content analysis that will entail identifying codes within the data that reveal patterns in the content, whether manifest or latent (Krippendorf, 2018). The preliminary analysis of the data allowed to identify the relationship between different stakeholders in the ecosystem together with the kind of data and the type of tourism data exchanged.

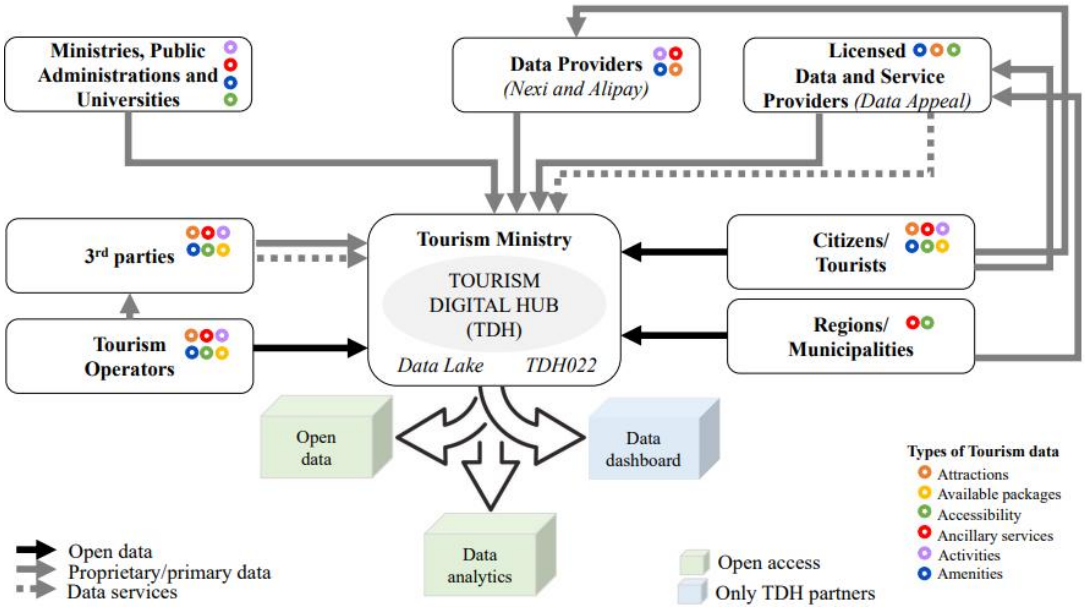

Table 1. Secondary sources employed in this study

Results. *In terms of outcomes, the DTH performs two essential activities: destination branding and destination management. Figure 1 provides a visual representation of the complexity of the DTH data ecosystem in terms of type of data and tourism data as well as number and interconnectedness of the stakeholders involved in the ecosystem.*

Figure 1. Visual representation of the DTH (Own elaboration)

The DTH collects primary data from more than 20 thousand tourism operators (Camera di Commercio Genova, 2024; Italiadomani, 2025). These operators share tourism data that pertains to multiple destination components (accommodation, activities, amenities, available packages, accessibility and attractions). The process of data collection from these tourism operators is done by a third-party entity that the Ministry of Tourism appoints to select the most relevant information useful for developing destination branding and destination management strategies. The data involved in this process is primary data that is afterwards shared with tourists under the form of destination components offering and to regions and municipalities that use this data to enhance their tourism management strategies.

The DTH is also fuelled by interinstitutional data provided by other Ministries and public entities (universities) and proprietary data from private entities such as Nexi and Alipay. Finally, the Hub is fuelled by Value-added services from private entities such as Data Appeal that provide services that can be integrated into the data destinated to both destination management and branding. The relationship with stakeholders such as Data Appeal changed in the development process of the DTH due to the influence of regulatory entities such as the European Data Space. Indeed, due to regulations imposed by the European Data Space, the relationship in terms of interactions and exchanges with stakeholders such as Data Appeal shifted from a data provider to service provider kind of relationship which reflects the complexity of the ecosystem. This data relates to airport arrivals, bookings, tourism value, tourism sentiment, and seasonality.

However, the interconnectedness of the ecosystem is visible by the additional manifest and latent exchanges of data happening in the DTH. Indeed, stakeholders such as tourists, regions, municipalities and tourism operators also provide data to the ecosystem either directly under the form of open data integrated in the Hub or indirectly through private

entities such as Nexi and Alipay or Data Appeal that gather data through tourism activities. Our analysis shows that the Ministry has the main authority and responsibility for making decisions about data products. DTH has developed three data products to support destination branding and management for different stakeholders. The first was open data on accommodations, tourism professions, and religious paths, with the aim not only of increasing transparency but also of fostering innovation. The second was analytics in the format of reports and infographics for destination management (e.g., the report on the tourist tax). The third was a data dashboard to provide a detailed analysis of the Italian tourism sector. While the first two data products are publicly accessible, the third was accessible only to partner organizations. However, we observed strong interactions and collaboration between the Ministry and other stakeholders for other data-related decisions. The Ministry aimed to align the interests of a diverse set of actors.

As for governance mechanisms, the Ministry developed a new boundary resource known as TDH022 to ensure interoperability. The Ministry of Tourism held responsibility for defining, sharing, and updating interoperability technologies and the API management framework. Moreover, the Ministry provided detailed guidelines for data creation. The aim was to ensure that all data inserted by tourism operators is of high quality and appealing for tourists. These guidelines acted as a coordination mechanism to standardize data creation practices.

The main incentive structure adopted by the Ministry was the provision of value. Indeed, all stakeholders, such as tourists, regions, municipalities, and tourism operators, could enhance their decision-making processes by accessing data, data analytics, and data dashboard made available through the TDH platform.

Being innovation oriented, the Ministry seeks to promote the use of existing TDH services and providing new services. However, the findings show that data governance is not static. Any decisions about data come with trade-offs that, over time, need to be addressed. For instance, acquiring licensed data made sense at the development phase of TDH. But this decision is re-evaluated to ensure continuity of the platform. Another instantiation of continuous data governance was the effort to involve tourism operators, but also to make active participants on platforms to create real value.

Research limitations. *This study is limited by its exploratory case methodology, which constrains the generalizability of findings beyond the Italian tourism context. Another limitation of the study is that, at the moment, the findings are relying mostly on secondary data as the primary collection is still in progress. However, this limitation will be overcome in the upcoming months as we are currently scheduling and conducting multiple interviews.*

Managerial implications. *The findings highlight the need for destination managers and policymakers to prioritize data governance frameworks that enhance interoperability and trust among stakeholders. Managers can benefit from the DTH model to design more integrated and transparent data-sharing infrastructures that support sustainable tourism decision-making. In addition, this study can help destination managers to understand the typology of data available and how it can help in building evidence-based proactive management strategies (Leung et al., 2025).*

Originality of the paper. *This paper offers one of the first academic analyses of the Italian Digital Tourism Hub, contributing to understanding how national tourism data ecosystems function in practice. By applying a stakeholder-oriented lens, it extends current knowledge on digital transformation and data governance in destination management.*

Our study aims to underscore the need to move beyond static, top-down conceptions of data governance and instead consider it as a dynamic, relational process that unfolds through situated interactions among actors. In the upcoming months, this study will be enhanced by enlarging the primary data collection from 3 interviews to 15 interviews that will provide an interesting representation of the ecosystem. This addition will allow us to have a more in-depth and nuanced understanding of the data ecosystem and its role in enhancing destination branding and management. Additionally, the next step of this research will entail an in-depth study of the interactions and interconnections between ecosystem stakeholders employing a stakeholder theory lens together with an investigation of latent tourism data flows in the DTH and to unveil stakeholders' interactions and exchanges within these data flows.

Oleoturismo come strategia di rigenerazione territoriale: uno studio esplorativo sulle PMI agricole in Campania

ANTONIO APICELLA[1], ADELAIDE SENATORE[2], MASSIMILIANO BENCARDINO[3], AGOSTINO VOLLERO[4]

Abstract. *Il presente studio esplorativo indaga l'oleoturismo come strategia per la rigenerazione rurale, inquadrandolo all'interno del paradigma emergente del turismo rigenerativo. Nello specifico, la ricerca esamina il potenziale dell'oleoturismo attraverso le percezioni dei produttori in merito a valori identitari, cura territoriale e criticità implementative. Lo studio adotta un disegno a metodi misti multifase (multiphase mixed methods design) a dominanza qualitativa, coinvolgendo 18 imprese agricole locali distribuite nelle province della Campania. La prima fase concorrente ha affiancato interviste semi-strutturate a un'auto-valutazione quantitativa sulle principali attività oleoturistiche; la seconda fase sequenziale ha previsto l'analisi documentale delle proposte progettuali di sviluppo elaborate dai partecipanti. I risultati indicano un elevato interesse verso l'oleoturismo come opportunità di diversificazione economica e destagionalizzazione, confermando la fattibilità di esperienze come visite guidate, degustazioni sensoriali e laboratori interattivi. L'analisi tematica riflessiva rivela, inoltre, la centralità di dimensioni quali la cura del territorio, il mindset rigenerativo, lo storytelling place-based e la necessità di superare la frammentazione attraverso reti collaborative locali. Lo studio contribuisce alla letteratura manageriale sui modelli di business ibridi agro-turistici, suggerendo che l'oleoturismo, se supportato da un'adeguata governance territoriale integrata e allineato ai principi rigenerativi, può fungere da catalizzatore per la rivitalizzazione sistemica delle aree rurali e per la competitività delle PMI agricole.*

Keywords: *turismo rigenerativo; oleoturismo; rigenerazione rurale; PMI agricole; governance territoriale; place-based storytelling*

Framing of the research. *Il turismo rigenerativo si sta affermando come paradigma avanzato nello sviluppo turistico, spostando l'attenzione dalla sostenibilità alla rigenerazione attiva dei territori in modo da generare impatti netti positivi sui sistemi sociali, culturali ed ecologici locali, promuovendo al contempo modelli economici più inclusivi e resilienti (Inversini, Saul, Balet & Schegg, 2024; Bellato, Frantzeskaki e Nygaard, 2023; Sheldon, 2022). Il turismo rigenerativo può essere definito come un modello di sviluppo turistico che mira ad aumentare la capacità rigenerativa di comunità ed ecosistemi attraverso pratiche integrate e trasformative, radicate in una visione ecologica dei sistemi viventi. Le radici epistemologiche del turismo rigenerativo si fondano sulla teoria dei sistemi viventi, che concepisce i territori come organismi complessi interconnessi con capacità intrinseche di auto-rigenerazione (Bellato, Frantzeskaki, Briceño Fiebig, Pollock, Dens & Reed, 2022; Mang & Reed, 2012), e si riflettono concretamente nella necessità di adottare modelli di business e governance capaci di generare trasformazioni positive sui territori (net positive impact), stimolando la rigenerazione del capitale naturale, sociale e culturale anziché la mera sostenibilità (Bellato & Pollock, 2025). L'approccio rigenerativo si distingue dal paradigma della sostenibilità poiché si orienta non solo verso la mitigazione degli impatti ma verso il ripristino degli ecosistemi e il rafforzamento del capitale sociale. Esso valorizza le identità culturali, incoraggia il coinvolgimento attivo delle comunità e adotta metriche di benessere collettivo (Bellato et al.,2023; Hes & Du Plessis, 2014). Le esperienze internazionali dimostrano come tali pratiche possano attivare economie circolari, integrare saperi locali e generare benefici condivisi, promuovendo esperienze trasformative e un rinnovato senso di appartenenza (Cave & Dredge, 2021).*

In questa prospettiva, diventa fondamentale analizzare concretamente le dinamiche dello sviluppo turistico rigenerativo, con particolare attenzione al settore agricolo come ambito privilegiato per sperimentare modelli di business e di governance condivisa (Tomassini & Cavagnaro, 2022; Mang & Reed, 2020). Diversi studi mostrano come il turismo rigenerativo richieda approcci collaborativi e interdisciplinari, integrando tecniche di gestione dei sistemi complessi e un rinnovato senso di responsabilità etica verso i luoghi e le persone coinvolte (Cave & Dredge, 2020; Pollock, 2019).

In tale quadro, l'oleoturismo rappresenta un interessante campo di applicazione dei principi del turismo rigenerativo, poiché unisce pratiche agricole sostenibili, valorizzazione del territorio e coinvolgimento diretto delle comunità locali. Esso rappresenta un fenomeno in espansione nell'ambito più ampio del turismo rurale e gastronomico, con particolare attenzione alla valorizzazione dei prodotti tipici e dei saperi locali (Millán-Vázquez de la Torre, Arjona-Fuentes, & Amador-Hidalgo, 2017; Alonso & Northcote, 2010). L'olio d'oliva si configura, infatti, non solo come prodotto alimentare ma come simbolo culturale fortemente radicato nel territorio mediterraneo, intriso di valori identitari, sociali e paesaggistici che hanno la capacità di veicolare narrazioni territoriali e di attrarre nuovi flussi turistici (Millán-Vázquez de la Torre et al. 2017). Diversi studi analizzano la tipologia di domanda e il profilo dell'oleoturista,

[4] University of Salerno, e-mail: avollero@unisa.it

*individuando cluster motivazionali multipli - legati alla ricerca di autenticità, curiosità culturale, esperienze enogastronomiche e interesse per la natura - e segmenti prevalenti composti da individui di medio-alto livello culturale attratti da offerte di esperienze diversificate (Murgado-Armenteros, Parrilla-González & Medina-Viruel, 2021; López-Guzmán, Cañero Morales, Moral Cuadra & Orgaz-Agüera, 2016). L'oleoturismo costituisce, quindi, un'opportunità per la diversificazione economica e la promozione dello sviluppo sostenibile delle aree agricole, combinando la tradizione produttiva dell'olio d'oliva con attività turistiche esperienziali e culturali (*Casado-Montilla, Pulido-Fernández, Carrillo-Hidalgo & Durán-Román, 2023). *Tuttavia, resta ancora poco indagato il ruolo attivo dei produttori nella definizione e nella trasmissione dei valori e delle narrazioni che sostengono tali esperienze (Di-Clemente, Campón-Cerro, Folgado-Fernández & Hernández-Mogollón, 2023).*

All'interno di questa cornice, l'oleoturismo può essere inquadrato come pratica concreta di turismo rigenerativo per una serie di ragioni. Da un lato, l'oleoturismo valorizza le produzioni agricole tipiche, intrecciando la promozione del prodotto con la conservazione dei saperi tradizionali e dei paesaggi rurali (Casado-Montilla et al., 2023; Millán-Vázquez de la Torre et al., 2017). Dall'altro, l'oleoturismo favorisce il rispetto dei cicli naturali, coinvolgendo attivamente le comunità locali come custodi dell'identità e della memoria territoriale, stimolando la rinascita economica e culturale dei territori marginali (Di Clemente et a., 2023). Tali pratiche che combinano produzione agricola, turismo enogastronomico esperienziale e processi di rigenerazione socio-ambientale sono paradigmatiche del turismo rigenerativo, affinché le comunità rurali possano prosperare sostenendo la memoria storica e migliorando la resilienza territoriale (Casado-Montilla et al. 2023; Millán-Vázquez de la Torre et al. 2017).

Come modello di business ibrido, l'oleoturismo integra produzione agricola, commercializzazione diretta e offerta turistica esperienziale. L'importanza di una pianificazione strategica e di marketing integrato diventa fondamentale per il successo di questi modelli (Millán-Vázquez de la Torre et al. 2017). Oltre a rafforzare la diversificazione economica degli imprenditori agricoli attraverso nuove fonti di reddito l'oleoturismo ha un impatto positivo anche sulla rivitalizzazione in chiave turistica delle aree rurali, spesso marginali. I casi studio di Spagna, Croazia e Australia confermano la capacità di attrarre nuovi segmenti di domanda e incrementare la notorietà delle destinazioni tramite prodotti enogastronomici esperienziali (Casado-Montilla et al., 2023; Čehić, Mesić & Oplanić, 2020; Alonso & Northcote, 2010).

Purpose of the paper. *Nonostante il potenziale riconosciuto, la letteratura evidenzia una scarsa integrazione degli imprenditori agricoli rispetto al coinvolgimento nella governance turistica locale, nonostante sia essenziale per la sostenibilità e la coesione dei sistemi territoriali. Molte aziende olivicole si avvicinano all'oleoturismo in modo non professionalizzato e/o con scarsa pianificazione strategica, limitandone l'efficacia e la fattibilità. La mancanza di formazione specifica e di analisi preliminari limita la capacità dei produttori di governare efficacemente le iniziative turistiche collaterali alla produzione agricola (Casado-Montilla et al., 2023). Studi empirici in contesti extra-italiani mostrano la necessità di una maggiore integrazione tra produttori agricoli e sistemi di governance turistica (DMO) per favorire la competitività e la valorizzazione locale (Casado-Montilla et al. 2023; Di Clemente et al. 2023; Millán-Vázquez de la Torre et al. 2017).*
L'obiettivo del presente working paper è duplice. In primo luogo, lo studio vuole verificare se nelle percezioni dei produttori lo sviluppo oleoturistico possa essere un vettore privilegiato di rigenerazione per le PMI agricole, in grado di offrire nuove opportunità di reddito, favorire la destagionalizzazione e costruire reti collaborative territoriali (Dancausa Millán, Sanchez-Rivas García & Millán Vázquez de la Torre, 2023). In secondo luogo, mira ad approfondire percezioni degli imprenditori agricoli rispetto all'adozione dell'oleoturismo, con particolare attenzione ai valori identitari, all'etica della cura territoriale, alle reti collaborative, oltre ad indagare le principali criticità percepite nell'implementazione di attività legate al turismo dell'olio.

Methodology. *Lo studio adotta un disegno a metodi misti multifase (multiphase mixed methods design) a dominanza qualitativa (Creswell, 2017), che appare particolarmente indicato per lo studio di ecosistemi turistici emergenti e complessi. La ricerca si articola in due fasi principali interconnesse. Nella prima fase, si è utilizzato un approccio concorrente nidificato (concurrent embedded design), in cui la raccolta di dati quantitativi di supporto (schede di auto-valutazione tramite scala Likert) è stata integrata simultaneamente all'indagine qualitativa primaria (interviste semi-strutturate), con l'obiettivo di misurare la fattibilità percepita e arricchire l'esplorazione (Creswell et al., 2003). Nella seconda fase sequenziale, si è proceduto con l'analisi documentale (document analysis) delle proposte progettuali di sviluppo oleoturistico redatte dai partecipanti. Questo disegno multifase ha permesso di triangolare i dati narrativi, le valutazioni numeriche e gli output progettuali pratici, garantendo una maggiore profondità interpretativa e una superiore robustezza analitica (Fetters et al., 2013).*

Context of research. Il settore olivicolo rappresenta una componente strutturale dell'agricoltura italiana e, in particolare, delle regioni del Mezzogiorno. Tra queste la Regione Campania occupa una posizione rilevante, contribuendo al 4% della produzione nazionale di olio. Il paesaggio olivicolo è un elemento strutturante del contesto campano dove il 12% della superficie agricola regionale è occupato dell'olivicoltura (Ismea, 2022). A livello economico, il 37% delle aziende agricole campane è costituito da aziende olivicole, che si concentrano nelle province di Salerno (21,3%) e Benevento (12%) (ISTAT, 2020). A questo si aggiunge una crescente tendenza alla diversificazione delle attività agricole: tra le aziende con attività connesse, il 39% si configura come agriturismo, segnalando così a livello regionale

una progressiva integrazione tra produzione agricola e offerta turistica. Questa dinamica si inserisce nel più ampio sviluppo del turismo enogastronomico in Italia, che negli ultimi anni ha assunto un ruolo sempre più rilevante nei processi di valorizzazione dei territori rurali e delle produzioni agroalimentari locali. Tra il 2021 e il 2024 la partecipazione ad attività oleoturistiche a livello nazionale è aumentata del 37,1% (Garibaldi, 2026). Le esperienze turistiche legate all'olio raccolgono anche l'attenzione di visitatori stranieri, in particolare tedeschi (57%), francesi (50%) e provenienti dall'area Austria-Svizzera (45%). La rilevanza dell'oleoturismo è riconosciuta anche a livello istituzionale. Le politiche di sviluppo rurale, sostenute dalla Politica Agricola Comune (PAC), hanno progressivamente incentivato la diversificazione delle attività agricole e la valorizzazione multifunzionale delle aziende olivicole. In Campania, nel corso dei diversi cicli di programmazione, sono stati destinati più di 25 milioni di euro per la valorizzazione e l'ammodernamento dei frantoi più rilevanti (Regione Campania, 2025).

Sample and data collection. La raccolta dati si è articolata attraverso interviste semi-strutturate somministrate a 18 partecipanti di PMI olivicole campane, selezionate mediante purposive sampling nell'ambito di un corso regionale sull'oleoturismo. Il campione garantisce copertura delle cinque province campane, catturando diversità paesaggistica e socio-economica. Gli intervistati ricoprivano ruoli diversi all'interno delle imprese (imprenditori, coadiuvanti familiari, collaboratori e tecnici), garantendo così una pluralità di prospettive sul tema.

Le interviste, condotte in presenza, sono state registrate e trascritte verbatim. La traccia di intervista è stata articolata in tre sezioni tematiche (contesto aziendale e territoriale, motivazioni e percezione dell'oleoturismo e barriere sistemiche e reti di collaborazione) e ha permesso di approfondire sia gli aspetti identitari e culturali legati alla produzione dell'olio, sia le dinamiche organizzative e relazionali connesse alla possibile integrazione di attività turistiche.

A integrazione delle interviste, ciascun partecipante è stato invitato a compilare una scheda di rilevazione volta a misurare il grado di interesse e la fattibilità percepita di diverse attività oleoturistiche (es. visite guidate, degustazioni sensoriali, laboratori di cucina, percorsi naturalistici, esperienze immersive o multimediali). La matrice di valutazione, strutturata su una scala Likert a cinque livelli (da "per nulla" a "moltissimo"), ha consentito di combinare dati qualitativi e quantitativi, facilitando una prima mappatura delle attività considerate più attrattive e sostenibili dagli operatori locali.

Parallelamente, per rafforzare la robustezza del quadro analitico e la triangolazione dei dati, sono stati considerati anche i materiali delle presentazioni dei progetti e delle proposte di sviluppo oleoturistico, utilizzati come ulteriori documenti qualitativi di supporto per arricchire l'analisi delle dinamiche e delle prospettive dell'oleoturismo. Questi documenti hanno consentito di verificare la coerenza tra le intenzioni dichiarate e le strategie di attuazione ipotizzate.

Data analysis and results. *L'analisi del corpus (n=18 interviste) ha seguito la reflexive thematic analysis (RTA), approccio iterativo e costruttivista (Braun & Clarke, 2006, 2022) che appare particolarmente indicato per analizzare narrazioni sulla rigenerazione territoriale. I risultati delineano pattern semantici emergenti, non generalizzabili statisticamente. La familiarizzazione è avvenuta tramite letture multiple dei dati accompagnate da note riflessive; è seguita una fase la generazione di codici induttivi iniziali, assistita da Skimle (skimle.com - piattaforma AI per highlighting tematico automatico, soggetta a revisione umana). Si è proceduto poi con la costruzione di temi candidati dall'aggregazione dei codici (ad esempio, "custodia e tutela"), la loro revisione per coerenza con l'intero dataset, la definizione e denominazione di cinque macro-temi finali e la produzione del report finale. Questa approccio ha permesso di esplorare le dimensioni valoriali, identitarie e sistemiche che caratterizzano la relazione tra produzione olivicola, territorio e potenziali percorsi di sviluppo oleoturistico. I risultati presentati rappresentano la prima fase di analisi con l'elaborazione del corpus narrativo raccolto attraverso le interviste; l'integrazione completa con le ulteriori fasi del disegno di ricerca, mediante elaborazione quantitativa e triangolazione con gli altri dati qualitativa, sono tuttora in corso per completare il quadro empirico complessivo. Di seguito si presenta una tabella che presenta esemplificazione del processo di coding delle interviste (Tabella 1).*

Tabella 1 - Esemplificazione del processo di coding

Estratti	*First-order themes**	*Second-order themes*	*Aggregate dimensions*
Io non sono più il produttore, ma io sono il contadino custode, quello che custodisce degli esseri viventi, ne prende i frutti con rispetto e li trasforma sempre con dolcezza	*Custodia e tutela*	*Cura e gestione sostenibile del territorio*	*Cura del territorio e rapporto uomo-natura*
Nasce dal recupero di un terreno di famiglia che dopo la morte di mio padre era finito completamente in stato di abbandono	*Recupero dei terreni agricoli abbandonati*	*Recupero e rigenerazione dei territori*	
Per quanto riguarda l'aspetto della cultura e la sua diffusione […] su questo ci credo tantissimo, per trasmettere alle future generazioni il sapere	*Trasmissione del sapere*	*Trasmissione generazionale e saperi tradizionali*	*Approccio sistemico e mindset*

Lavoriamo molto con i volontari, con [prodotti] buffer, per esempio, con tutte queste piattaforme di scambio di conoscenza sull'agricoltura organica e rigenerativa	*Pratiche sostenibili e tutela ambientale*	*Consapevolezza del valore della rigenerazione territoriale*	*rigenerativo*
Raccontare la storia fa sempre piacere perché noi raccontiamo la storia per immagini, con fotografie facendo vedere il frantoio vecchio *L'olio comunque porta con sé una storia che è quella del prodotto ma è quella anche dell'azienda, nonché quella del territorio*	*Eredità familiare e culturale* *Valore culturale e simbolico dell'olio*	*Narrazione e storytelling* *Identità e unicità territoriale*	*People place & Intelligence*
La sinergia tra i settori è una cosa molto utile, cosa che però nelle mie zone non si riesce ad ottenere perché sono sempre scontri continui *Perché penso che l'olio non è solo parlare di quello che fai tu, ma è collaborare tutti insieme*	*Frammentazione e difficoltà di collaborazione territoriale* *Propensione a fare rete*	*Ostacoli alla collaborazione* *Coordinamento e governance*	*Reti locali e collaborazioni territoriali*
Con l'oleoturismo si crea un indotto, resta qualcuno in più… *I bandi sono dispersivi, si focalizzano troppo su altre cose [...] La definizione del prodotto standard che era la condizione fondamentale per poter aumentare il punteggio, è stato un incubo…*	*Opportunità dell'oleoturismo* *Burocrazia e complessità amministrativa*	*Potenziale economico e territoriale* *Barriere burocratiche, normative e amministrative*	*Barriere percepite e prospettive di sviluppo*

**sono riportati solo le categorie di first- and second-order riferite agli estratti*

Cinque sono le dimensioni aggregate che sono state ricavate dal processo:

1. Cura del territorio e rapporto uomo-natura

Molti intervistati hanno sottolineato il legame profondo con la terra e la responsabilità di preservarne l'equilibrio ecologico. Il concetto di cura emerge come valore identitario e come prerequisito etico per qualsiasi forma di sviluppo turistico. Analogamente, altri partecipanti evidenziano come il lavoro agricolo non possa essere disgiunto dal rispetto dei cicli naturali, configurando una visione simbiotica e non estrattiva del rapporto uomo-natura.

2. Approccio sistemico e mindset rigenerativo. Dalle narrazioni emerge la tendenza a superare una logica puramente economica per abbracciare un approccio purpose-driven, orientato alla rigenerazione del capitale naturale e sociale. Emerge questo cambio di paradigma implica il passaggio da un modello di turismo sostenibile, focalizzato sulla riduzione dell'impatto, a un modello di turismo rigenerativo, orientato al net-positive impact: la creazione di valore aggiunto per l'ambiente, la comunità e le generazioni future. Tale prospettiva richiama i principi dell'agricoltura rigenerativa e del "living systems thinking", in cui l'impresa è intesa come parte di un ecosistema sociale e ambientale più ampio.

3. People e Place Intelligence. La dimensione umana e territoriale è percepita come nucleo generativo del progetto oleoturistico. L'attenzione alla formazione del personale locale, alla crescita comunitaria e alla narrazione identitaria dei luoghi rappresentano elementi chiave di autenticità. Il place-based storytelling diventa così uno strumento di rigenerazione culturale, capace di connettere visitatori e comunità attraverso esperienze trasformative e narrative autentiche.

4. Reti locali e collaborazioni territoriali. Un tema trasversale riguarda la necessità di costruire reti tra attori locali (aziende agricole, enti pubblici, operatori turistici, associazioni di categoria). Le interviste rivelano la consapevolezza diffusa dell'importanza di una "regia" istituzionale o comunitaria in grado di coordinare le iniziative e favorire sinergie e superare la frammentazione vista come ostacolo principale allo sviluppo delle attività.

5. Barriere percepite e prospettive di sviluppo. Accanto agli aspetti valoriali, gli intervistati hanno evidenziato criticità sistemiche legate a burocrazia, carenza di infrastrutture e accesso limitato ai finanziamenti. Tuttavia, la motivazione e la volontà di cooperazione appaiono forti, suggerendo un potenziale di crescita significativo se accompagnato da politiche territoriali mirate.

Tutte le aziende intervistate hanno espresso un interesse molto elevato ad aprirsi all'oleoturismo, identificando nell'offerta turistica una strategia chiave per diversificare il reddito e mitigare la stagionalità insita nella produzione olivicola. L'interesse degli intervistati verso attività oleoturistiche si esprime soprattutto nei format esperienziali quali visite guidate, degustazioni, laboratori interattivi, percorsi narrativi e multimediali, benché permanga una preferenza per l'esperienza reale rispetto a soluzioni tecnologiche avanzate. Gli intervistati evidenziano inoltre una crescente

consapevolezza dell'importanza di reti collaborative e una visione resiliente dell'agricoltura. Gli intervistati confermano la centralità del valore identitario dell'olio e del paesaggio olivicolo, sottolineando la necessità di coinvolgere il visitatore tramite la narrazione della storia aziendale, delle pratiche produttive, ed offrendo esperienze sensoriali autentiche e momenti rituali come la raccolta delle olive, laboratori di cucina tipica e degustazioni immersive.

Research limitations. *Questo studio presenta diversi limiti che devono essere riconosciuti. In primo luogo, la natura preliminare dei risultati deriva dalla prima fase di analisi qualitativa delle interviste raccolte, mentre l'integrazione completa con gli altri dati metodologici (schede di fattibilità, materiali progettuali) è ancora in corso, limitando al momento la completezza del quadro empirico. L'approccio qualitativo esplorativo, sebbene appropriato per indagare percezioni e significati, limita la generalizzazione a popolazioni più ampie di imprenditori agricoli.*

In secondo luogo, il focus geografico sulla Campania, pur fornendo approfondimenti contestuali dettagliati, potrebbe limitare l'applicabilità ad altre regioni italiane o contesti internazionali con diverse tradizioni olivicole, strutture di governance e stadi di sviluppo turistico. Tuttavia, questa delimitazione è coerente con il contesto di sviluppo dell'oleoturismo, che richiede condizioni abilitanti specifiche quali l'immersione nella natura d'impresa, la prossimità ai paesaggi rurali e una vocazione agricola radicata; tali precondizioni rendono particolarmente rilevante l'analisi di contesti come la Campania, dove tali elementi sono presenti, rispetto a territori in fasi avanzate di industrializzazione che presentano minori spazi per l'avvio di tali pratiche.

In terzo luogo, il campione estratto da partecipanti a un corso di formazione sull'oleoturismo introduce potenzialmente un bias di auto-selezione verso imprenditori già predisposti alla diversificazione economica mediante il turismo, sebbene questi attori rappresentino quegli agenti economici che fungono da "pionieri", fungendo da catalizzatori per l'avvio e la diffusione di tali pratiche e l'attivazione di rete territoriali a supporto.

Managerial implications. *I risultati offrono diverse implicazioni pratiche per le PMI agricole, i policy maker e le organizzazioni di gestione della destinazione. Per gli imprenditori agricoli, i risultati suggeriscono che l'oleoturismo rappresenta una strategia di diversificazione praticabile che richiede pianificazione strategica, formazione e approcci collaborativi. La priorità dovrebbe essere data alle attività esperienziali (visite guidate, degustazioni, laboratori) emerse come più attrattive e fattibili, sfruttando lo storytelling place-based per creare offerte autentiche e differenziate.*

In una prospettiva territoriale più ampia, lo sviluppo dell'oleoturismo può contribuire anche ad affrontare alcune criticità strutturali delle aree rurali, come lo spopolamento e il progressivo declino. La creazione di offerte turistiche legate al turismo culturale ed esperienziale, insieme allo sviluppo di forme di soggiorno alternative, può favorire una maggiore permanenza dei visitatori nei territori rurali e stimolare la scoperta delle loro peculiarità ambientali, culturali e paesaggistiche. In questo senso, l'oleoturismo può contribuire alla rigenerazione economica e alla rivalutazione dei luoghi, generando dinamismo e attrattività attraverso esperienze specifiche che, al contempo, promuovono la cura del territorio. Lo sviluppo di nuove forme di turismo con segmenti turistici di nicchia può inoltre favorire la creazione di destinazioni alternative e meno congestionate, contribuendo indirettamente a mitigare il fenomeno dell'overtourism nelle destinazioni turistiche più note e promuovendo modelli di turismo più sostenibili e distribuiti.

Per i policy maker e gli attori della governance territoriale, lo studio evidenzia la necessità di affrontare le barriere sistemiche attraverso procedure burocratiche semplificate, supporto infrastrutturale, meccanismi di finanziamento accessibili e programmi di capacity building allineati ai principi del turismo rigenerativo. Facilitare la creazione di reti tra produttori, DMO e altri stakeholder territoriali emerge come cruciale per costruire offerte oleoturistiche integrate e sostenibili. Per le DMO e i pianificatori turistici in aree a vocazione rurale, i risultati sottolineano l'importanza di integrare attivamente i produttori agricoli nelle reti di governance turistica, riconoscendoli come attori strategici capaci di contribuire alla competitività territoriale e all'identità autentica della destinazione rurali.

In questa prospettiva, lo sviluppo di framework integrati di valutazione, monitoraggio e controllo, che combinino indicatori di performance di marketing con metriche sociali e ambientali, può rafforzare i processi di miglioramento continuo delle iniziative oleoturistiche e delle altre connesse riguardanti il turismo enogastronomico. L'adozione di sistemi di reporting periodico potrebbe inoltre supportare le organizzazioni di gestione della destinazione e le associazioni di categoria nel valutare lo stato di avanzamento delle iniziative, individuare eventuali criticità e affinare progressivamente i modelli di sviluppo, favorendo nel tempo la definizione di pratiche e modelli replicabili per pratiche simile.

Originality of the paper. *Questo studio contribuisce alla letteratura sul turismo rigenerativo in chiave manageriale, proponendo indicazioni di governance per realizzare modello ibridi integrati che coniugano produzione agricola tradizionale, commercializzazione diretta mediante filiere corte ed economie circolari, e offerta turistica esperienziale.*

In primo luogo, lo studio adotta la prospettiva dei produttori agricoli sulla governance turistica, colmando un gap significativo nella letteratura che si è prevalentemente concentrata sull'analisi della domanda o su prospettive istituzionali, marginalizzando le voci dei produttori olivicoli nei processi di sviluppo turistico. La letteratura recente evidenzia infatti la scarsa comprensione del ruolo di questi attori nelle reti di governance locale, nonostante il loro contributo essenziale per la sostenibilità e lo sviluppo di determinate aree (Casado-Montilla et al., 2023). Questa ricerca esplora direttamente percezioni, valori e barriere riferite dagli operatori olivicoli campani, fornendo una base empirica per comprendere meglio il loro contributo strategico e le criticità sistemiche esistenti.

In secondo luogo, la ricerca inquadra esplicitamente l'oleoturismo nel paradigma rigenerativo, andando oltre gli approcci tradizionali di sostenibilità. Questa connessione teorica arricchisce la comprensione di come specifiche tipologie di turismo agroalimentare possano operazionalizzare principi rigenerativi attraverso pratiche concrete.

In terzo luogo, lo studio identifica temi emergenti di cura territoriale, mindset rigenerativo, place intelligence e collaborazione sistemica negli approcci degli imprenditori agricoli, offrendo insight preziosi sulle dimensioni culturali e valoriali sottostanti al successo delle iniziative di rigenerazione rurale e turistica.

Rethinking Sustainable Tourism in Protected Areas through Arts and Cultural Heritage: A Comparative Study of National Parks in Italy and the United States

MARA CERQUETTI, LEAH HAMILTON, SIMONE SPLENDIANI

Abstract. *Climate change is profoundly reshaping protected areas, altering ecosystems, landscapes, and tourism dynamics through rising temperatures, extreme events, and natural disasters. Existing research has examined vulnerability assessments and human-wildlife interactions, as well as strategies to address climate change, such as stakeholder engagement, sustainable entrepreneurship, and climate adaptation. However, limited attention has been paid to the role of arts and cultural heritage in fostering sustainable tourism transitions. This study aims to fill this gap through a comparative case analysis of the National Park of Monti Sibillini (NPMS, Italy) and Cumberland Gap National Historical Park (CUGA, USA), both recently affected by major natural disasters. Drawing on document analysis and qualitative interviews with park directors and key stakeholders, the research explores how climate change affects tourism, which adaptation strategies are implemented, and how cultural resources contribute to resilience. Preliminary findings highlight culture's dual role as both a vulnerable asset and a transformative driver, supporting integrated governance approaches that bridge environmental conservation, community engagement, and sustainable tourism development in protected areas.*

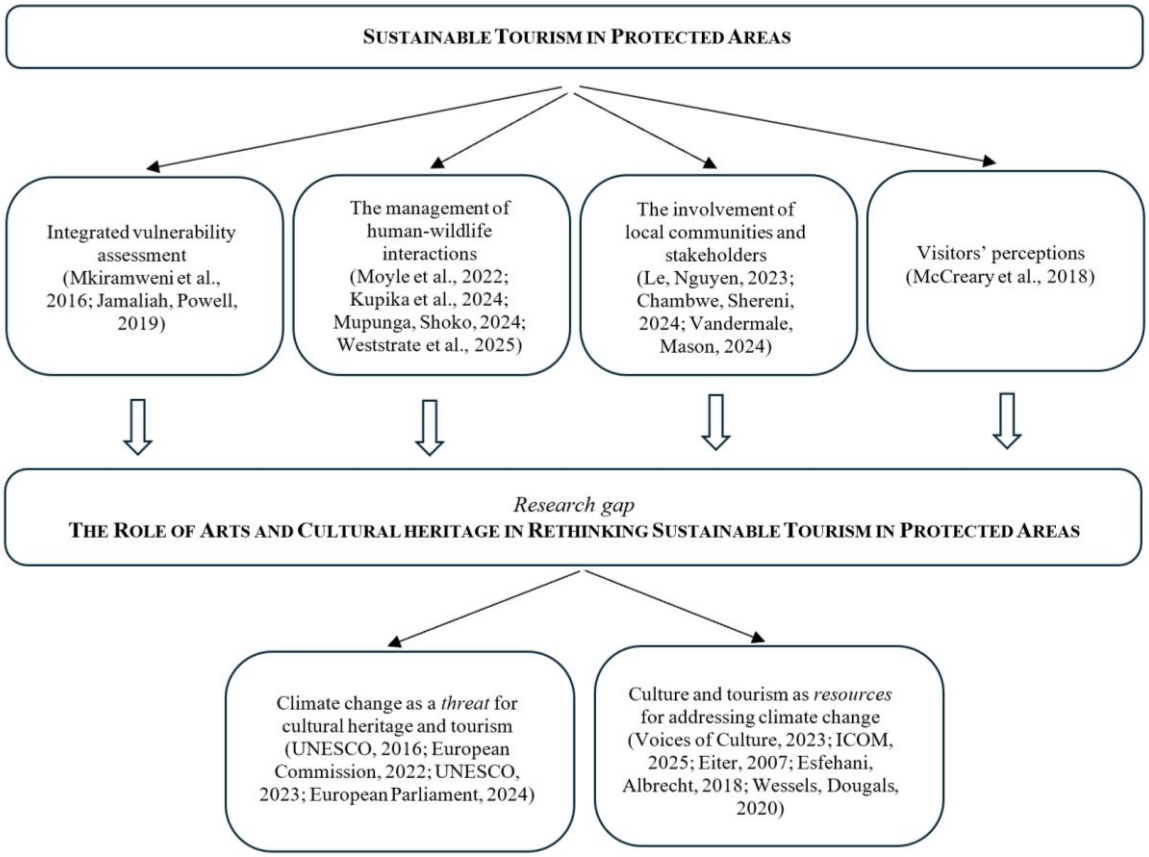
Framing of the research. *The United Nations' Intergovernmental Panel on Climate Change (IPCC) noted that "widespread and rapid changes in the atmosphere, ocean, cryosphere and biosphere" are creating notable weather and climate extremes around the world (IPCC, 2023, p. 5). Warming temperatures, more frequent and intense hurricanes, wildfires, and longer-lasting droughts are drastically altering protected areas and their fragile ecosystems. In this context, natural parks are called to revise and innovate their tourism strategies towards sustainability, also leveraging cultural resources.*

In recent years, scientific literature on sustainable tourism management has devoted increasing attention to strategies and actions, policies and practices to face this challenge through climate mitigation and adaptation. When coming to protected areas, scholars have focused on integrated vulnerability assessment (Mkiramweni et al., 2016; Jamaliah, Powell, 2019), the management of human-wildlife interactions (Moyle et al., 2022; Kupika et al., 2024; Mupunga, Shoko, 2024; Weststrate et al., 2025), the involvement of local communities and stakeholders (Le, Nguyen, 2023; Chambwe, Shereni, 2024; Vandermale, Mason, 2024), and the study of visitors' perceptions (McCreary et al., 2018). Scientific research has also enhanced the role of sustainable entrepreneurship (Buzzao et al., 2023), social sciences (Sharp et al., 2014) and the Theory of Change (ToC) as a mechanism for sustainable financing (O'Flynn et al., 2022). However, a few studies have examined the potential role of arts and cultural heritage in rethinking and reshaping sustainable trajectories for managing tourism in protected areas (Fig. 1).

Indeed, climate change, culture, and tourism are tightly linked by a two-way relationship. On the one hand, climate change is a threat for cultural heritage and tourism: these two resources and sectors, along with biodiversity and natural heritage, are among the most affected by climate change (e.g., the erosion of archaeological sites and historic buildings, migration of communities forced to abandon their physical cultural heritage, risking the loss of place-specific customs, traditions, and habits) (UNESCO, 2016; European Commission, 2022; UNESCO, 2023; European Parliament, 2024). On the other hand, culture and tourism are resources for addressing climate change: cultural institutions can play a leadership role in the fight against it (see the actions taken by climate activists, ICOM, 2022). The cultural and creative sectors can inspire change towards the green transition (Voices of Culture, 2023; ICOM, 2025), while arts and cultural heritage can help preserve cultural landscapes and promote traditions, practices, and knowledge systems (Eiter, 2007; Esfehani, Albrecht, 2018; Wessels, Dougals, 2020).

Purpose of the paper. *To address the identified gap, this paper investigates the role of cultural assets in rethinking and reshaping sustainable tourism strategies in protected areas, while balancing conservation needs with tourism development. Focusing on the cultural resources present in two parks – one in Italy and one in the United States – the research examines their potential contribution to answer the following research questions:*

RQ1. How do arts and cultural heritage function within tourism management frameworks in protected areas?



RQ2. What management approaches are used to balance conservation with tourism, particularly in relation to arts and cultural resources in and around protected areas?

RQ3. How are these management approaches reshaped in response to natural and climate-related disasters?

The findings will contribute to a deeper understanding of the role of arts and cultural heritage in sustainable tourism, highlighting the best practices and challenges in its management. Additionally, the research will offer policy insights to support the integration of arts and cultural heritage into broader management and adaptation strategies for protected areas. By bridging the gap between cultural and environmental conservation, this study aims to inform policymakers,

heritage managers, and tourism stakeholders on developing more holistic and sustainable approaches to heritage and nature conservation in the face of climate challenges.

Fig. 1. Theoretical framework (Source: own elaboration)

Methodology. *This research applies a comparative case study analysis (Knight, 2011; do Amoral, 2022) based on two protected areas—the Sibillini Mountains in the Marche and Umbria regions of Central Italy and Cumberland Gap National Historic Park in the tri-state region of Kentucky, Tennessee, and Virginia in the Southeastern United States. Both sites are federally protected areas and promote cultural heritage sites and community arts events to encourage visitors to engage with the parks' cultural and natural resources. Both areas have also been affected by recent natural disasters, including earthquakes in the Sibillini Mountains (2016/2017) and flooding caused by Hurricane Helene in Cumberland Gap (2024).*

Analysis of existing resources (e.g., websites, technical reports, etc.) and qualitative field research provides insights into existing conservation frameworks and their effectiveness in balancing cultural heritage preservation, sustainable tourism, and climate resilience. Qualitative field research is in progress and conducted through interviews with park directors and key stakeholders (e.g., local authorities, guides, cultural associations).

Interviews with the park directors are designed to explore the following areas: 1) The park governance, roles and responsibilities; 2) Arts and cultural heritage in the park, i.e., cultural heritage and artistic events; 3) Management strategies, sustainable tourism and climate change, such as strategies for balancing conservation needs and sustainable tourism development, impact of climate change, national/federal policies, impact of natural disasters; 4) Challenges and opportunities for the future.

Interviews with key stakeholders explored the roles of public and cultural actors, focusing on their relationships with natural and cultural assets, responses to previous crises and disasters, perceptions of tourists' awareness, forms of territorial collaboration, suggestions for innovating the cultural offer, and everyday challenges.

Results. *The Cumberland Gap National Historical Park (CUGA) in the United States and the National Park of Monti Sibillini (NPMS) in Italy represent two important protected areas that combine environmental conservation with the preservation of historical and cultural heritage. Although they share some common goals, their characteristics differ in terms of extension and location, mission, institutional framework, governance structure, and cultural heritage activities.*

Regarding extension and location, CUGA covers approximately 24,000 acres (9,712 hectares) and extends across three U.S. states: Kentucky, Tennessee, and Virginia. In contrast, the NPMS is significantly larger, covering 71,437 hectares across 16 municipalities and two Italian regions: Marche and Umbria.

The missions of the two parks reveal similar priorities, with some differences related to the typology of heritage they preserve. CUGA aims to preserve the cultural and natural resources of an area in and around "the Gap", a natural break in the Cumberland Mountain range that provided passage for animals, hunters, and early explorers of America in westward migration and expansion. In addition to conservation efforts of its natural ecosystems, CUGA's 80 miles of horse and foot trails, plus five backcountry camping areas provide recreational opportunities for visitors (NPS, 2025). CUGA also plays an important role in supporting the local economy, as visitor spending generates substantial economic benefits and employment for surrounding communities. In 2023, visitor spending at CUGA generated over $25.6 million in local community spending, supporting 312 jobs, and had a cumulative economic benefit of over $27.8 million to the local economy (NPS, 2024). Similarly, the NPMS focuses on environmental conservation, but emphasizes the protection of the landscape as historically and culturally shaped by human action. The park promotes sustainable development by preserving ecosystems, supporting traditional productive practices, and encouraging high-quality local social and economic activities.

In terms of its institutional framework, CUGA is a protected federal land area under the supervision of the National Park Service (NPS), a bureau within the US Department of the Interior (NPS, 2022). The NPS was established on August 25, 1916, when US President Woodrow Wilson signed the "Organic Act", which created a federal bureau within the Department of the Interior designed to protect and manage the nation's parks and monuments (NPS, 2022). The "Organic Act" established a dual mandate to conserve natural, historic, and wildlife resources while ensuring their enjoyment by future generations (NPS, 2022). By contrast, the NPMS is administered by the Ente Parco Nazionale dei Monti Sibillini, founded by Presidential Decree on 6 August 1993. The park authority has legal personality and operates under the supervision of the Italian Ministry of the Environment according to the Law of 6 December 1991 n. 394.

While both parks are publicly managed protected areas, they are embedded in different administrative systems—federal in the United States and national-regional in Italy, as confirmed by their governance structures. The Bodies of the CUGA Park Authority are the National Park Service (NPS) Director, the Deputy Directors (based on Regions), and the CUGA Park Superintendent. Management of the park and its resources is carried out by staff with various roles, including visitor and resource protection, interpretation and education, maintenance, science and resources management, and administration. The governance of the NPMS Authority is more complex and includes several governing bodies: a President, who is the legal representative of the Authority and coordinates the activities, carries out delegated functions and presides over the collegiate bodies; a Board of Directors, that outlines the programmatic guidelines for the management of the Park; an Executive Board, that supports the President in his functions; a Board of Auditors, an administrative and financial control and verification body; the Park Community representing local municipalities, and a Director responsible for technical and administrative management. This structure highlights the stronger involvement of local communities and multiple administrative bodies in the Italian park's decision-making process. Indeed, the governance of the NPMS is based on a collaborative and multi-level approach involving several institutional actors.

Finally, the two parks differ in terms of cultural heritage and activities. The US National Park Service, in its Climate Change Strategy for Cultural Resources, categorizes cultural resources as archeological sites, cultural landscapes, ethnographic resources, museum collections, and buildings and structures (Rockman et al., 2016). Within this framing, CUGA manages two primary ethnographic resources within its boundaries: the early Appalachian-living historic Hensley Settlement and Newlee's Iron Furnace. The remaining sites are cultural landscapes, including Gap Cave and its various Overlooks, with markers outlining historic events, people, and places. While CUGA organizes events such as guided tours and educational programs at its Visitor Center (NPS, 2024b), festivals and museums are organized and promoted through businesses and associations in neighboring communities. According to the Cumberland Gap Region Tourism Association, there are 11 Regional Arts and Cultural Heritage Sites (Cumberland Gap Region Tourism Association, n.d.a) managed by municipalities or nonprofit organizations around the Cumberland Gap National Park and 14 festivals/events managed by municipalities or nonprofit organizations around the Cumberland Gap National Park (Cumberland Gap Region Tourism Association, n.d.b). The NPMS, on the other hand, boasts a remarkable concentration of historical and cultural assets, including approximately 275 architectural and archaeological sites and museums, most of which belong to municipalities and the Church. More than 25 museums across 16 municipalities, along with castles and churches, form a widespread cultural network throughout the park. The park authority promotes events and celebrations that preserve and showcase local traditions and cultural identity.

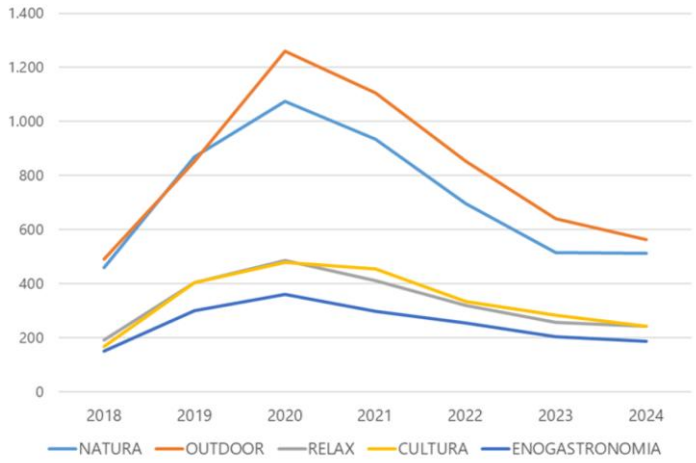
Desk research shows that both parks integrate environmental protection with cultural and historical preservation, but they do so through different institutional models and territorial contexts. CUGA emphasizes preservation of historical heritage and natural ecosystems via regulated recreational use, e.g., restricted, seasonal guided tours, within its centralized federal management system (NPS, 2025b), while the NPMS highlights landscape conservation shaped by traditional activities and features a governance structure that strongly involves local institutions and communities.

At the current stage of the research, the Director of NPMS has also been interviewed (September 26, 2025; 2.5 hours). The interview was transcribed and then manually analyzed to identify key themes and insights and answer the research questions.

The management and development of tourism and cultural activities in the park involve a wide range of stakeholders. These include the park authority, responsible for regulation, planning, and coordination; the municipalities, which own and manage local infrastructure and many cultural assets; regional administrations, often in charge of organizing exhibitions and cultural initiatives; local associations and Pro Loco organizations, which promote and coordinate events

and festivals; museums and other cultural institutions; and tourism operators and park guides. Together, this network of actors contributes to the governance of tourism and cultural heritage, often through collaborative arrangements and shared initiatives. More specifically, the park authority plays a coordinating and regulatory role, while many operational activities are implemented in cooperation with local municipalities and other public bodies. In several cases, investment funds provided by the Ministry are allocated to municipalities, which are responsible for implementing projects such as energy efficiency improvements in public buildings, cycling infrastructure, and sustainable mobility initiatives. This governance model relies on agreements between the park authority and local administrations. When projects are implemented directly by the park, the authority manages the entire process; otherwise, municipalities handle implementation on public property using allocated funds. Planning and management are complicated by the high degree of land fragmentation and the presence of private properties, which can limit the development of infrastructure such as hiking trails or visitor routes. This context requires negotiation and compromises in planning the park's system of visitor access and environmental interpretation.

Focusing on the role of the arts and cultural heritage (RQ1), the Director first highlighted that the NPMS is considered one of the most significant among Italian protected areas for its rich tangible and intangible cultural heritage. Many heritage sites and museums are integrated into the park's visitor center network and play multiple roles, supporting scientific research, environmental education, and cultural dissemination related to the park's natural heritage. The park primarily promotes them through indirect forms of collaboration. It facilitates accessibility, integrates some of them into the visitor center network, and promotes them through communication channels such as the park website and media platforms. This creates forms of co-marketing that increase the visibility of both the park and the cultural sites. Cultural heritage is considered a key resource for the park's identity and attractiveness. The park itself takes its name from the Sybil, a legendary prophetic figure associated with the traditions and folklore of the central Italian Apennines and thus part of the region's intangible cultural heritage. In some cases, cultural heritage may even be as important as the natural heritage, which remains the primary conservation priority of the park authority. For this reason, heritage interpretation plays a crucial role in the park activities.



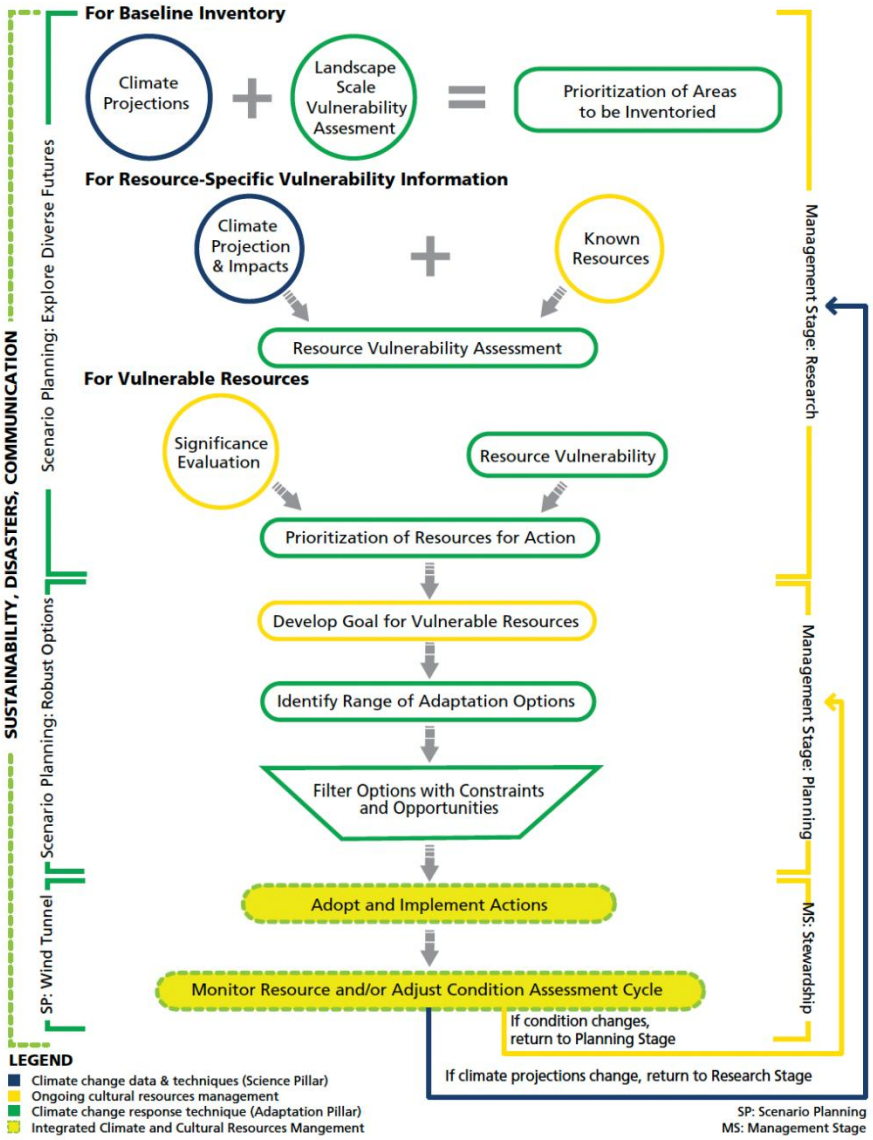
The integration of cultural activities, events and heritage sites into the visitor experience strengthens the park's appeal and diversifies tourism offerings. This approach helps attract broader audiences while supporting the socio-economic vitality of local communities. However, the park authority directly manages only a limited number of cultural events. Most exhibitions and cultural initiatives are organized by regional authorities, municipalities, local associations, or cultural organizations. In recent years, the number of artistic and cultural events taking place in natural environments has increased significantly. These include concerts, festivals, and other cultural manifestations organized by associations, local communities, and tourism stakeholders. Such events substantially enhance the area's attractiveness and draw visitors who might not otherwise visit the park. The park's role is mainly to authorize and support these initiatives while ensuring that they comply with environmental sustainability criteria. Events must respect the ecological carrying capacity of sites and avoid disturbing sensitive habitats, such as areas where birds nest on the ground. In some cases, the park collaborates with event organizers to identify suitable locations and time periods that minimize environmental impact. This collaborative approach has led to increasingly sustainable practices in event organization, such as reducing noise pollution and adopting renewable energy solutions (e.g., solar panels instead of diesel generators). These initiatives also help raise environmental awareness among visitors who may not usually frequent mountain environments.

Moving to RQ2, balancing conservation objectives with tourism development is a central challenge for the park. The NPMS is a member of the EUROPARC Federation. Through the awarding of the European Charter for Sustainable Tourism in Protected Areas, EUROPARC seeks to safeguard cultural and natural values by promoting high-quality sustainable tourism, fostering partnerships that support local livelihoods, raising awareness of the need for sustainability, and encouraging international cooperation (NPMS, 2024, Annex 1). Within this framework, the NPMS prioritizes protecting sensitive ecosystems while providing opportunities for visitor access and tourism experiences. Visitor management strategies aim to guide tourism flows toward suitable areas while avoiding excessive pressure on fragile ecosystems. In some cases, access to particularly sensitive sites is not formally prohibited but is intentionally not promoted through official signage or infrastructure. This approach allows the park to maintain ecological integrity while still supporting sustainable tourism. The park receives dedicated public funding, including resources specifically aimed at addressing climate change and sustainability measures. For example, more than €2 million were allocated for climate-related interventions in 2026, following similar investments in previous years. These funds support initiatives such as: energy efficiency improvements in public buildings; sustainable mobility solutions; cycling infrastructure; and environmental and climate adaptation measures. Investments are generally implemented through agreements between the park authority and municipalities.

When discussing the impact of natural and climate-related disasters (RQ3), the Director noted that the effects of climate change are not yet clearly evident in the NPMS, although several emerging trends are already observable. These include rising temperatures, milder winters, and reduced precipitation levels. The reduction in precipitation, particularly winter snowfall, is considered the most significant risk. Snow plays a crucial role in recharging groundwater and maintaining the hydrological balance of the area. A decrease in snow accumulation may therefore reduce water availability in springs and rivers. This reduction could have cascading impacts on ecosystems, habitats, and economic activities that depend on water resources, such as agriculture, hydroelectric production, and fish farming. Climate-related extreme events could also affect infrastructure and increase hydrogeological risks in certain areas of the park.

In this context, strengthening the integration of cultural heritage, artistic activities, and tourism is seen as a significant opportunity for the park's future development. Cultural resources can enhance visitor experiences and help diversify tourism beyond the still-dominant nature-based activities (Fig. 2), thereby transforming open-air activities into a more complete holiday experience and creating opportunities for visitors to engage with the local community. However, it is also necessary to develop new ways of experiencing these resources that go beyond post-earthquake reconstruction. The rebuilding process following the 2016 earthquake remains incomplete in some cases, and additional efforts are needed to promote initiatives that counteract the loss of local cultural traditions and knowledge (NPMS, 2024, p. 22). At the same time, integrating cultural events into protected natural environments requires careful planning to ensure environmental sustainability. This includes regulating visitor numbers, selecting appropriate locations and periods for events, and promoting low-impact organizational practices. If properly managed, cultural initiatives can contribute to both environmental awareness and the sustainable development of the territory.

Fig. 2. Product Cluster Selection – Historical Series 2018 – July 11, 2024 (Source: NPMS, 2024, p. 15)



The NPMS's management approach reveals that climate adaptation is inextricably linked to socio-cultural resilience. The evidence suggests that the park's response to climate change is not merely reactive but integrated into a broader framework of territorial regeneration following the 2016 seismic events.

At the current stage in the research, CUGA's sustainable tourism management approach is viewed through the lens of the centralized management approaches outlined by the National Park Service in the "Cultural Resources Climate Change Strategy", released in 2016, which recognized "climate change as 'the greatest threat to the integrity of our national parks that we have ever experienced'"(Rockman et al., quoting Jon Jarvis, p. 1). In alignment with NPMS's recognition that cultural initiatives contribute to environmental awareness, NPS's climate change strategy explicitly identifies cultural resources as a key source of primary data for understanding how humans interact with and experience environmental changes, while also acknowledging that climate-related impacts affect how cultural resources are preserved and maintained (p. 8) (RQ1). While the policy document does not outline sustainable tourism approaches specifically, outside of a brief mention of marine tourism development as a "combined stressor" related to climate change (p. 24), it does provide a management strategy related to cultural resources in relation to climate adaptation and resiliency (Fig. 3). The strategy outlines localized assessment of cultural resources within each park, based on scientific projections and vulnerability indicators to highlight cultural areas of priority. Based on the identification of vulnerable cultural resources, seven adaptation options are provided, ranging in scale from removing or mitigating environmental stressors, e.g., reducing shore erosion or forest management to reduce wildfire risk, to relocating or moving the resource, to "interpret the change" as a method of acknowledging and sharing the impacts of climate change on a particularly vulnerable resource (RQ3). The next phase of this research will examine how these management approaches are implemented within CUGA's current strategies under a new federal administration, particularly regarding tourism activities and cultural resources (RQ2).

Research limitations. *The research is still ongoing, and the interviews have not yet been completed or fully analyzed. Therefore, a comprehensive assessment of the roles of the different actors involved in the activities of the two parks is not yet possible. While cultural assets present opportunities for tourism development, their strategic role in rethinking and reshaping sustainable tourism strategies requires further investigation, particularly in order to highlight the key differences between CUGA and NPMS.*

Fig. 3. Cultural Resources Management-Climate Change Integration Flow Chart (Source: Rockman et al., 2016, p. 27)

Managerial implications. *Preliminary findings offer several critical insights into the management of protected areas, particularly in contexts facing the dual challenge of climate change and post-disaster recovery.*

A primary implication concerns the necessity of adopting integrated governance models that transcend the administrative boundaries of a Park Authority. To effectively implement sustainability projects, managers should formalize collaborative agreements with local municipalities, fostering a multi-stakeholder environment where cultural assets and natural trails are promoted through joint strategies. This is particularly evident in the NPMS, where planning and management are complicated by high levels of land fragmentation and the prevalence of private property.

Secondly, in the NPMS, the research highlights the imperative to diversify the tourism offering to mitigate the "snow-dependency" threatened by rising temperatures. Management should prioritize heritage as a tool to transform landscape and intangible assets into year-round attractions. By shifting the focus from seasonal "nature-exclusive" to "culture-integrated" tourism experiences, protected areas can stabilize visitor flows throughout the year and reduce the ecological pressure concentrated during peak seasons.

Furthermore, the integration of arts and cultural events into natural settings requires the development of rigorous sustainability guidelines. This involves adopting low-impact practices and carefully scheduling events, ensuring that the transformative power of art does not compromise the park's primary conservation mission.

Ultimately, the research demonstrates that a resilient management strategy must bridge the gap between cultural preservation and environmental adaptation, creating a holistic framework for sustainable tourism development.

Originality of the paper. *The research highlights the key role of cultural resources in rethinking and reshaping tourism strategies in protected areas towards sustainability. When analyzing management approaches to the promotion and*

preservation of arts and cultural heritage, it identifies the dual roles of governmental agencies and private businesses, including nonprofit organizations.

Slow storytelling in agritourism: insights on the design of coherent destination narratives

SERENA LONARDI[1], GIULIA GRILLINI[1], SERENA VOLO[1]

Abstract. *Although the fundamental role of narratives in the pre-travel phase of tourism experiences is well established, limited research has examined their antecedents. In the tourism contexts, where multiple stakeholders with various interests and communication capabilities contribute to the development of destination narratives, understanding how coherent narratives emerge becomes particularly important. Drawing on the slow storytelling approach (Gasparin et al., 2022), this work-in-progress short paper investigates how visual and textual narratives in the agritourism sector are constructed and whether, and to what extent, they are developed coherently. The study adopts a qualitative multi-method approach, combining qualitative content analysis of selected agritourism Instagram accounts and webpage with semi-structured interviews with those agritourism owners. In addition, the local agritourism organization, Gallo Rosso, is included in the analysis. Preliminary findings show that agritourism narratives prominently highlight agricultural activities, farm life, heritage, and sustainability, while strongly emphasizing family identity and the cyclical nature of time. Images represent the primary storytelling medium, while captions generally support and contextualize the visual content. Preliminary results also suggest a degree of narrative coherence across agritourism establishments, despite revealing different communication styles and relationships with Gallo Rosso. Moreover, the narratives communicated by individual agritourism structures resemble those promoted by Gallo Rosso. This study contributes to agritourism and destination marketing literature by adapting the slow storytelling approach to specific contexts and digital visual narratives. Further analysis of the interviews will provide deeper insights into the constraints and facilitators shaping the construction of coherent destination narratives.*
Keywords: *narratives; agritourism; slow storytelling; narrative coherence*

Framing of the research. *Tourism narratives play an important role in the pre-travel experience, when tourists are looking for possible destinations for their travel (Pachucki et al., 2022). Indeed, stories influence emotions (Huang et al., 2025), attitudes (Pachucki et al., 2022), brand perceptions (Can et al., 2025), experiences (Servidio & Ruffolo, 2016), opinions (Moreira et al., 2025), and behaviors (Huang et al., 2025). Thus, they are key to conveying a destinations' unique brand proposition (Grillini & Volo, 2024; Hartman et al., 2019).*

"The tourist gaze" (Urry, 1990) has long been recognized as central to the tourism experience, emphasizing its predominantly visual nature. However, the importance of images in this field has been exacerbated by the increasing use of visual social media platforms. For instance, pictures are considered particularly useful in TripAdvisor reviews (Vidaurreta-Apesteguia et al., 2025). Moreover, Instagram is built around instant sharing of photos, videos, and stories, that have the potential to significantly transform destination image and influence tourist behavior (Volo & Irimias, 2021).

Narrativity refers to the process through which individual content elements are connected and organized into a logical sequence, creating a coherent and meaningful whole (Pearce & Moscardo, 2020; Pachucki et al., 2021). A narrative typically consists of key elements such as a credible plot, identifiable characters, and a structure that includes an introduction, a climax, and an outcome (van Laer et al., 2014).

By stimulating emotional engagement and supporting the interpretation of experiences, narratives contribute to making tourism experiences more meaningful and memorable (Ben Youssef et al., 2019; Moreira et al., 2025; Moscardo, 2020). Recent research has shown how this also includes stories around historical events, family stories and local legends (Khater et al., 2026). Storytelling enables destinations marketing managers to communicate values that create strong emotional bonds with potential tourists, extending beyond the presentation of functional attributes (Hartman et al., 2019). Through engaging stories tourists can envision the potential tourist experience, thereby creating anticipation in the pre-travel phase and consequent intention to visit (Pachucki et al., 2022). In addition, narratives are fundamental in destination branding, by shaping destination image, reinforcing place identity, and strengthening the emotional connections between consumer and brand (Pachucki et al., 2022), with possible impacts on tourists' behaviours (Moin et al., 2020). In this context, visual storytelling enhances the power of narratives by conveying complex meanings and effectively synthesizing multiple ideas (Volo & Irimias, 2021; Wegerer & Volo, 2021). Research on visual narratives in nature-based tourism has largely focused on visual attention, demonstrating that elements such as natural landscapes and human–nature interactions play a significant role in shaping perceived attractiveness (Li et al., 2023).

Despite the growing attention given to storytelling in tourism research, relatively little is known about the antecedents of storytelling, like the mechanisms that enable the construction of coherent destination narratives (Zhang & Ramayah, 2024). Previous research has shown that narrative coherence represents a key determinant of narrative effectiveness, as it enables audiences to follow a story more easily, enhances perceived realism, and reduces cognitive dissonance (Huang et al., 2025). It refers to the degree to which the elements of a narrative are logically connected and free from

[1] Libera Università di Bolzano

contradictions, allowing the story to form a consistent and meaningful whole. In a destination context, the construction of coherent narratives often requires cooperation and interaction among multiple stakeholders, highlighting the importance of coordination and alignment in shaping consistent and meaningful destination stories (Hyvärinen et al., 2010). However, little is known on the mechanisms that enable the construction of a coherent narrative across various stakeholders within a destination.

Agritourism refers to tourism activities hosted on operating farms and closely connected to agricultural production. (Barbieri, 2016). While some studies have shown that some farms tend to present luxury amenities, combining comfort with rural settings (Streifeneder et al., 2023), most research highlight how agritourism businesses primarily traditional farm life (Andehn et al., 2021). Moreover, visitors who chose agritourism experiences are particularly interested in landscapes traditionally linked to agriculture and farms (Dat et al., 2024). The identity of agritourism businesses is often rooted in the history of the farm and the families who manage it (Mei et al., 2020). Agritourism experiences are marked by interactions between hosts, visitors, and the rural environment, often highlighting sustainability, authenticity and local culture (Andehn et al., 2021; Joyner et al., 2018). Practical activities, like assisting with animal care or harvesting fruits and vegetables, are especially appreciated by visitors and contribute significantly to the overall experience (Rong-Da Liang et al., 2020).

Agritourism research has also examined the role of storytelling. For instance, Mei et al. (2020) emphasize how storytelling during farm visits enhances tourists' understanding of agricultural lifestyles, traditions, and values. However, most existing research has focused on on-site or experiential storytelling, leaving digital and visual narratives underexplored, especially in pre-visit communication channels like social media and websites.

Within this context, slow storytelling has been considered as a useful framework to understand agritourism narratives. Through this lens, rural life and local heritage can be portrayed in a more nuanced and context-sensitive manner (Gasparin et al., 2022).

Purpose of the paper. *Although narratives in the tourism context have been widely studied (Grillini & Volo, 2024), some niches of tourism experiences remain underexplored. For instance, a deeper understanding of stories around rural and nature-based tourism experiences is getting more important, given their increasing popularity (Haukeland et al., 2023; Richards, 2025). In this regard, the authors focused specifically on agritourism narratives. Agritourism provides the ideal context for examining narratives, as tourists often show a strong interest in the stories associated with this lifestyle (Engeset & Heggem, 2015; Mei et al., 2020). Given agritourism emphasis on place identity, rural experiences and lived heritage (Mei et al., 2020), the slow storytelling approach (Gasparin et al., 2022) was deemed appropriate to examine agritourism narratives in greater depth.*

Narrative design in tourism is a complex process that involves multiple actors. DMOs, tourism businesses, residents, and tourists all contribute to shaping and communicating a destination's story (Pachucki et al., 2022). This plurality of voices makes the construction of coherent and consistent narratives particularly challenging, especially in fragmented contexts characterized by diverse stakeholders and uneven communication capacities. Consequently, aligning these narratives into a cohesive destination image remains a key challenge in tourism marketing (Hartman et al., 2019).

This work-in-progress short paper aims to explore how narrative elements are structured within the agritourism sector. Focusing on South Tyrol (Italy), the study adopts a qualitative multi-method approach that combines content analysis of selected Instagram accounts and official websites (Camprubí & Coromina, 2016; Wegerer & Volo, 2021) with semi-structured interviews with agritourism managers, as well as representatives of the DMO and the local agritourism organization. Through this approach, the research investigates whether and how destination narratives are constructed coherently through the lens of slow storytelling (Gasparin et al., 2022).

Methodology. Context of the study*: South Tyrol, an Autonomous Province in Northern Italy, provides an adequate context for this study due to the central role of agriculture and the increasingly strong link between agriculture, hospitality, and destination branding. South Tyrol has the highest density of agritourism establishments in Italy and ranks second in total number of facilities, after Tuscany (ISTAT, 2022). This underscores both the structural importance of agritourism for the local economy and its prominent role within the national tourism landscape (Grillini et al., 2023). A key role in the creation and promotion of agritourism in the area is played by Gallo Rosso / Roter Hahn, the official association representing agritourism. Beyond certifying agritourism farms, the association shapes their communication strategies through coordinated branding, storytelling guidelines, and digital platforms. Consequently, South Tyrol provides a valuable context for investigating how agritourism narratives are constructed visually and textually using the slow storytelling across Instagram and websites. Finally, South-Tyrol's agritourism sector is marked by fragmentation. While the provincial DMO maintains a strong brand identity and a prominent online presence, Gallo Rosso actively disseminates narratives about agritourism. Alongside these organizations, numerous small and medium-sized enterprises also contribute to the region's storytelling, each adopting diverse communication strategies, digital capacities, and approaches to narrative construction.*

Methodology

This study adopts a qualitative multi-method approach, combining the examination of current agritourism narratives through content analysis to the analysis of the opinions of relevant stakeholders via semi-structured interviews.

In the first study, a content analysis is conducted to examine agritourism narratives. Content analysis allows for a systematic analysis of selected content to reveal underlying patterns, themes, meanings, and biases (Krippendorf, 2009) and is widely used in tourism studies (Camprubí & Coromina, 2016).

First, Instagram was selected as the ideal platform for examining agritourism narratives due to its popularity (Conti & Lexhagen, 2020) and its strong role for storytelling (Lim & Childs, 2020), particularly through visual content (Volo & Irimias, 2021; Wegerer & Volo, 2021). Facebook was excluded from the analysis, since fewer agritourism had an active account in this social media. Other social media, like TikTok, Pinterest and Flickr, were also excluded because very few agritourism had an active account on those social media. The authors limited the analysis to the Dolomites, elected for their prominence as a visually distinctive region. Moreover, agritourism structures affiliated with the Gallo Rosso association were chosen. To further ensure a relatively constant presence online and a commitment to storytelling, the final dataset included only Instagram accounts that had published at least 12 posts in 2024.

Since the study also involves conducting interviews, only accounts whose owners agreed to participate in the semi-structured interviews were selected for the content analysis. To date, the study has examined five Instagram accounts, with a total of 156 posts. In addition to the individual agritourism accounts, their official websites were also analyzed through content analysis. The Gallo Rosso Instagram account (30 posts) and its website were similarly included in the analysis. Although the initial plan included the official DMO Instagram account, during the period analyzed (2024) it published only 14 posts explicitly related to agritourism out of a total of 311. As a result, it was not considered a significant contributor to agritourism narratives in South Tyrol and its account was excluded from Study 1.

Both the textual and visual content of the posts were then analyzed through the Gioia methodology (Gioia et al., 2013). Using MaxQDA, two researchers identified first-order codes, themes, and dimensions, ensuring coding reliability through cross-validation and discussion to resolve discrepancies. Captions were written in English, Italian, and German and were analyzed in their original languages, given the authors' proficiency in all three. Only relevant excerpts were translated into English.

Study 2 involved semi-structured interviews. To date, four interviews with agritourism managers have been conducted, with two additional interviews planned. Interviews with representatives of Gallo Rosso have also been completed, and an interview with the IDM (provincial DMO) is scheduled.

Interviews were conducted preferably in person at the agritourism establishments. However, due to logistical constraints, one interview was conducted online. Interviews were held in Italian or German, depending on the participants' preferred language. At the beginning of each interview, the purpose of the study and the procedures were explained to the participants, and written consent was obtained. With their consent, all interviews were recorded and subsequently transcribed. Only relevant quotes were translated into English. The interview data are being analyzed using the Gioia methodology (Gioia et al., 2013).

Results. *The findings highlight a clear predominance of content related to agricultural work and everyday farm life (Rong-Da Liang et al., 2020), with a prominence of images and text presenting the natural environment, farm work, like harvesting and caring for animals, as well as Alpine heritage and traditions. Both visual and textual stories shared on Instagram include, for example, one post announces the birth of a calf with the caption:* "Once again, there's a new arrival in the pasture. Welcome small Kawasaki"*, and honey harvest, e.g.* "Our bees were very industrious again this year, and we can enjoy delicious honey"*. Heritage narratives include elements like architecture, traditional clothing, gastronomy, living traditions and languages (Andehn et al., 2021; Joyner et al., 2018). Stories not directly linked to farm life are strongly linked to South-Tyrol, for instance by depicting mountain outdoor sport activities, like* "cycling in South-Tyrol"*. Moreover, sense of place (Martinus et al., 2024) is also conveyed through hashtags or frequent references to specific locations in the captions (e.g.* Kronplatz, #kastelruth, #seiseralm, Dolomiten-Bergkulisse*). Sense of place is also strongly connected to narratives centered on the family owning the agritourism, including generational continuity, personal stories and traditions. Those stories contribute to creating meaningful and distinctive experiences, by anchoring tourism experiences to specific landscapes, cultural practices, and local identities (Martinus et al., 2024; Mei et al., 2020). Finally, only a small portion of the stories focus on accommodation or wellness facilities. This contrasts with previous research, which suggests that agritourism tends to emphasize luxury amenities over farm-related activities in their communications (Streifeneder et al., 2023).*

Preliminary interviews analysis confirms agritourism managers' importance of sharing content about agricultural and farm-related activities. Interviewees confirm how tourists like to hear stories about the history of the farm and to participate in work activities like harvesting and animal care (Andehn et al., 2021). Some interviewees noted that they also share photos of the accommodations to give tourists an anticipation of their experience.

*A recurring element across the dataset is the temporal framing of everyday activities. Posts frequently situate farm practices within seasonal cycles, highlighting how agricultural life is structured around recurring natural rhythms. Frequent examples include "*summer in the mountains*", "*autumn activities*", "*evenings in the mountains*". In such cases, images and captions generally work together, with written text often echoing the message conveyed by the photograph. For example, one post has the caption "*Winter is back*," and depicts blossoms covered with snow, which wants to present the unusual temporal overlap between spring and winter.*

The findings suggest that the narratives communicated by individual farms largely correspond with those promoted by the Gallo Rosso association.

The study further examines how agritourism narratives are structured, revealing that South-Tyrolean narratives can be interpreted through the lens of the slow storytelling approach (Gasparin et al., 2022). A defining feature of slow storytelling in this context is the role of the organization itself. On their websites, where farms have greater space to communicate, the selected establishments consistently foreground family-centered narratives, suggesting a strong overlap between organizational and family stories (Mei et al., 2020). These narratives are anchored in two primary pillars: heritage and sustainability. Sustainability encompasses practices such as energy management, waste reduction, organic farming, sourcing of local products, and cultural preservation. Within this framework, more specific narratives emerge that highlight distinctive agritourism elements, including slow food, place-based references, and interactions with animals (Dat et al., 2024). The narratives also emphasize the cyclical nature of time, reflecting the rhythms of farm life. However, unlike Gasparin et al.'s (2022) model, South Tyrolean agritourism appears to place less emphasis on storytelling aimed at enhancing or actively engaging the visitor experience.

While textual elements play a role to identify meaning, this study emphasizes the prominence of visual narratives, with captions usually reinforcing the visual content. For example, a post showcasing the apple harvest through high-quality photographs is captioned merely "Autumn activities," thereby emphasizing the seasonal rhythm of the event rather than adding new narrative elements.

The third objective of this research was to examine narrative coherence in greater depth. On the one hand, preliminary results indicate a strong alignment between the content shared on the official Instagram accounts and webpages of the analyzed agritourism establishments and the aspects that interviewees identified as important. All interviewees reported that they primarily share content related to agricultural and farm-based activities, suggesting a coherence across the structures included in the study.

On the other hand, agritourism structures show diverse approaches to social media communication. Some prefer highly professional photographs accompanied by engaging captions, while others post spontaneous images with brief texts or simply hashtags. This difference reflects the various ways in which agritourism operators communicate their identity. Some interviewees noted differences between their own storytelling practices and those of other agritourism businesses, citing factors such as posting frequency or the perceived quality of content. On the contrary, other interviewees observed that most farms tend to share similar narratives, focusing on farm life, Alpine landscape, and locally sourced products.

Regarding the role of Gallo Rosso in promoting narrative coherence, preliminary findings reveal contrasting perspectives. While all interviewees appreciated Gallo Rosso's support, particularly during the initial phases, such as help with the booking system or financial obligations, opinions diverged regarding its narrative guidance. One manager criticized Gallo Rosso for favoring narratives that emphasize high-end amenities, such as infinity pools or saunas, whereas others highlighted the association's recommendations on which aspects of the agritourism experience should be given particular importance, such as breakfast featuring farm-produced or locally grown products. These recommendations were consistently reflected across all agritourism Instagram accounts and websites. One interviewee also noted participating in branding and marketing courses organized by Gallo Rosso.

Finally, all interviewees reported having little to no contact with the provincial DMO, which aligns with the relatively limited attention given to agritourism content on the DMO's Instagram account and website.

Research limitations. *This short paper has several limitations that should be acknowledged. First, given the exploratory focus of the research, the analysis relied on a relatively limited dataset. Future research should address this limitation by analyzing larger datasets, potentially through big data approaches, to systematically explore broader patterns and mechanisms underlying slow storytelling in agritourism narratives. Second, this study does not assess the effectiveness of slow storytelling in shaping tourists' attitudes or behavioral intentions. Future studies should therefore investigate slow storytelling from the tourists' perspective, employing methods such as experimental designs, big data analysis, or netnography to evaluate its impact on visitor perceptions and behaviors.*

Managerial implications. *The findings of this study offer several implications for agritourism owners. Framing narratives around the slow-storytelling approach with a focus on family-centered stories, heritage, and sustainability can help farms communicate a distinctive identity and a strong sense of place, creating emotional connections with visitors. Managers should consider aligning visual and textual content across platforms, such as Instagram and websites, to enhance narrative coherence and facilitate tourists' understanding of the narratives. Furthermore, organizations like Gallo Rosso should promote coordinated initiatives and branding and marketing training to support the crafted of a coherent destination narrative across multiple and diverse stakeholders.*

Originality of the paper. *This work-in-progress short paper investigates how visual and textual narratives in agritourism are structured through the lens of the storytelling approach (Gasparin et al., 2022). By applying this framework to a context with distinct characteristics, the study adapts it by introducing a hierarchical structure and incorporating concepts specific to the agritourism setting. In this context, slow storytelling is closely tied to family and intragenerational stories, which serves as a key aspect of organizational identity, while sustainability and heritage act as foundational pillars supporting this narrative and its associated elements. Within these pillars, the proposed framework also emphasizes the centrality of time and its cyclical nature as key components of slow storytelling.*

Through this adaptation, the study aims to make a theoretical contribution to both destination and agritourism marketing literature by demonstrating how agritourism narratives are structured according to the slow storytelling approach. Preliminary findings indicate that agritourism narratives in South Tyrol exhibit considerable thematic similarity across accounts. Nevertheless, additional data collection and more in-depth analysis are needed to better understand the constraints and facilitators shaping coherent narratives.

Slow Tourism and Digitalization: Enhancing Experiential Value Without Losing Authenticity – the Case of Apulia as an Emerging Slow Tourism Destination

DOMENICO MORRONE[1], ANNUNZIATA TARULLI[2]

Abstract. *Tourism is currently undergoing profound transformations driven by sustainability concerns, technological innovation, and evolving tourist expectations. Among emerging paradigms, slow tourism has gained increasing relevance as an alternative to the accelerated consumption patterns associated with mass tourism. Slow tourism promotes longer stays, deeper engagement with local culture, environmentally responsible mobility, and meaningful travel experiences. At the same time, tourism systems are experiencing rapid digitalization through platforms, mobile technologies, and smart destination management systems. Although slow tourism and digitalization may appear conceptually contradictory – one emphasizing slowness and reflection, the other speed and connectivity – recent research suggests that digital technologies can support slow tourism ecosystems when appropriately designed. Digital tools may facilitate access to information, support sustainable mobility, enhance cultural interpretation, and strengthen connections between tourists and local communities. This paper explores the relationship between slow tourism and digitalization, examining how digital technologies can enhance slow tourism experiences without undermining their core values. The research combines literature review with a case study analysis of Apulia (Italy), a region that has experienced significant tourism growth and has invested in slow tourism infrastructures such as walking routes and cycling tourism. The empirical analysis draws on the SWG–ARET Apulia report on slow tourism (ARET, 2025). The findings highlight key motivations driving slow tourism demand, including nature immersion, cultural exploration, relaxation, and personal well-being. The paper proposes a conceptual framework integrating slow tourism principles with digitalization processes, showing how digital technologies can support sustainable mobility, destination storytelling, community engagement, and experience management.*

Keywords: *Slow tourism; Digitalization; Smart tourism; Cycling tourism; Walking tourism; Destination management*.

Framing of the research. *Tourism represents one of the most significant sectors of the global economy, contributing to economic development, employment generation, and cultural exchange. Over recent decades, global tourism flows have expanded considerably due to improved mobility infrastructures, technological innovation, and the globalization of tourism markets. However, the rapid growth of tourism has also produced significant environmental, social, and cultural challenges for destinations. The expansion of tourism flows has intensified pressure on natural resources, contributed to environmental degradation, and produced phenomena such as overtourism and the commodification of local cultures (Gössling et al., 2021; Hall, 2019). Traditional mass tourism models, characterized by accelerated travel patterns, standardized tourism products, and short stays, have increasingly proven unsustainable. These models often encourage the rapid consumption of destinations rather than fostering meaningful engagement with local environments and communities (Sharpley, 2020). Consequently, tourism scholars and policymakers have increasingly explored alternative tourism paradigms capable of promoting more sustainable forms of tourism development. Among these paradigms, slow tourism has emerged as a particularly relevant conceptual framework within contemporary tourism research. Slow tourism represents a response to the acceleration of modern lifestyles and consumption patterns. Instead of prioritizing speed and efficiency, slow tourism promotes a philosophy centered on immersion, mindfulness, and meaningful engagement with places (Fullagar et al., 2012). The origins of slow tourism can be traced to the broader slow movement, which emerged through initiatives such as the Slow Food movement and the Cittaslow network. These movements promoted sustainability, quality of life, and the preservation of local cultural traditions (Petrini, 2007). Within tourism studies, slow tourism has been conceptualized as a form of travel characterized by longer stays, reduced travel speed, and deeper interaction with local environments and communities. Dickinson and Lumsdon (2010) describe slow tourism as travel in which the journey itself becomes a meaningful component of the tourism experience. Slow tourism is closely linked to sustainable tourism principles. By encouraging low-carbon mobility practices such as walking and cycling tourism, slow tourism contributes to reducing tourism-related environmental impacts (Conway & Timms, 2012; Gössling & Peeters, 2015). Furthermore, slow tourism promotes stronger connections between tourists and local communities by encouraging the consumption of local products and participation in community-based experiences (Sharpley, 2020). Beyond sustainability considerations, slow tourism also reflects broader transformations in tourism demand. Contemporary travelers increasingly seek authentic and meaningful experiences that allow them to connect with local cultures, landscapes, and traditions (Richards, 2018). Slow tourism experiences often involve activities such as walking tourism, cycling tourism, rural tourism, and gastronomic tourism. These activities enable visitors to explore destinations*

[2] LUM University, e-mail: tarulli@lum.it

at a slower pace while fostering deeper emotional connections with places (Shang et al., 2020). Research on tourist motivations further highlights the psychological drivers underlying slow tourism behavior. Oh, Assaf, and Baloglu (2014) conceptualize slow tourism as a goal-driven behavioral process through which travelers pursue psychological goals such as relaxation, self-reflection, escape from routine, and personal enrichment. At the same time, the tourism sector is undergoing a profound digital transformation. Digital technologies have reshaped tourism systems by influencing how tourists search for information, plan trips, navigate destinations, and share travel experiences (Buhalis & Law, 2008). The emergence of smart tourism destinations represents one of the most important developments in contemporary tourism research. Smart tourism destinations integrate technologies such as big data analytics, Internet of Things (IoT), artificial intelligence, and mobile connectivity to enhance tourism experiences and improve destination management (Gretzel et al., 2015; Buhalis & Amaranggana, 2015). However, digitalization also raises questions regarding experiential authenticity and meaningful engagement with destinations (Zhu, 2012; Tussyadiah, 2016). This tension is particularly relevant in the context of slow tourism. Nevertheless, recent studies suggest that digital technologies can support slow tourism development when designed to enhance experiential engagement rather than accelerate tourism consumption (Sigala, 2018).

Purpose of the paper. *This paper investigates the relationship between slow tourism and digitalization, with the aim of understanding how digital technologies can support and enhance slow tourism experiences while preserving the core values that characterize this tourism paradigm. Slow tourism has emerged within the broader framework of sustainable tourism as an approach that prioritizes environmental responsibility, cultural authenticity, local engagement, and a slower, more meaningful pace of travel. At the same time, the rapid diffusion of digital technologies—including mobile platforms, social media, digital storytelling tools, and smart destination management systems—has profoundly transformed how tourists plan, experience, and share their journeys. Within this evolving landscape, an important question arises: whether digitalization represents a potential contradiction to the philosophy of slow tourism, or rather a complementary mechanism capable of facilitating deeper, more conscious forms of travel.*

In this perspective, the paper pursues three interrelated objectives. First, it analyses the theoretical evolution of slow tourism within the broader literature on sustainable tourism, highlighting the conceptual foundations of the slow movement and its growing relevance in contemporary tourism studies. Second, it explores the role of digital technologies in shaping tourism experiences and destination management practices, examining how digital tools can enable more personalized, immersive, and community-oriented forms of tourism without undermining the principles of slowness, authenticity, and territorial embeddedness. Finally, the study investigates the case of Apulia as an emerging slow tourism destination. The region represents a particularly relevant empirical context due to its strong cultural identity, rural landscapes, local food traditions, and increasing commitment to sustainable and experiential tourism models. By analysing the Apulian case, the paper aims to provide insights into how digitalization can be strategically integrated into destination development processes in order to support slow tourism pathways and strengthen the relationship between visitors, local communities, and territorial heritage.

Methodology. *This study adopts a qualitative research approach combining literature review and exploratory case study analysis. The first stage of the research consists of a review of academic literature related to slow tourism, sustainable tourism, and digital tourism transformation. The literature review draws on peer-reviewed publications indexed in international databases such as Scopus and Web of Science. The second stage involves a case study analysis of the Italian region of Apulia, which has experienced significant tourism growth and has invested in slow tourism infrastructures such as walking routes and cycling tourism initiatives. The empirical analysis is based on secondary data derived from the SWG–ARET Apulia report on slow tourism (2025). The report includes survey data collected from more than 2,300 Italian tourists as well as international samples from France, Spain, Germany, and the United States.*

Literature Review: The academic debate on slow tourism has expanded considerably over the past two decades, reflecting broader transformations within tourism studies and the growing interest in sustainable and experiential forms of travel. Slow tourism has been widely interpreted as a response to the limitations of conventional mass tourism models, which are often characterized by rapid mobility, standardized tourism products, and limited engagement with local cultures and environments. One of the earliest conceptualizations of slow tourism can be traced to Dickinson and Lumsdon (2010), who describe slow tourism as travel that emphasizes gradual movement, longer stays, and meaningful interaction with destinations. In this perspective, the journey itself becomes a central component of the tourism experience, rather than merely a means of reaching a destination. Travelers engaging in slow tourism often choose land-based transportation modes such as trains, bicycles, or walking, allowing them to experience landscapes and cultural contexts more directly. Slow tourism is closely connected to the broader "slow movement," which emerged through initiatives such as the Slow Food movement and the Cittaslow network. These initiatives promoted a lifestyle philosophy centered on sustainability, quality of life, and the preservation of local traditions (Fullagar, Markwell & Wilson, 2012). Within tourism studies, these principles have been translated into travel practices that encourage mindfulness, cultural immersion, and slower forms of mobility. A significant portion of the literature highlights the relationship between slow tourism and sustainable tourism development. By encouraging low-impact mobility practices and longer stays in destinations, slow tourism can reduce the environmental impacts associated with tourism activities. Conway and Timms (2012), for example, argue that slow travel practices can contribute to reducing tourism-related carbon emissions by promoting alternatives to air travel

and private car usage. Similarly, Gössling and Peeters (2015) emphasize the importance of sustainable mobility systems for reducing tourism's environmental footprint. Beyond environmental sustainability, slow tourism also contributes to the economic and social sustainability of destinations. By encouraging tourists to spend more time in destinations and engage with local businesses, slow tourism can support local economies and promote more equitable distribution of tourism benefits. This aspect is particularly relevant for rural and peripheral regions that may not benefit from conventional mass tourism flows. Another important research stream focuses on the experiential dimensions of slow tourism. Contemporary tourism demand increasingly reflects a shift toward experience-based consumption. According to Pine and Gilmore (1999), modern economies have evolved toward an "experience economy" in which consumers seek memorable and meaningful experiences rather than standardized products. In the tourism context, this shift has led travelers to prioritize authentic experiences that allow them to connect with local cultures, traditions, and landscapes (Richards, 2018). Slow tourism experiences often involve activities such as walking tourism, cycling tourism, rural tourism, and gastronomic tourism. These activities allow travelers to engage with destinations at a slower pace while fostering deeper emotional connections with places. Lin (2018) suggests that slow tourism experiences can enhance tourist well-being by promoting mindfulness, relaxation, and personal enrichment. Research on tourist motivations further highlights the psychological drivers underlying slow tourism behavior. Oh, Assaf, and Baloglu (2014) conceptualize slow tourism as a goal-driven behavioral process in which travelers pursue psychological goals such as relaxation, self-reflection, escape from routine, and personal revitalization.

Qualitative Analysis: The qualitative analysis focuses on interpreting the findings of the SWG–ARET Apulia report on slow tourism (ARET, 2025) and examining their implications for the development of slow tourism experiences within the regional context. The report provides valuable insights into tourist motivations, travel behaviors, and perceptions related to walking tourism and cycling tourism. One of the most significant findings emerging from the analysis concerns the motivations driving tourists to engage in slow tourism experiences. The report indicates that contact with nature represents the primary motivation for a large proportion of travelers participating in walking tourism activities. Approximately one-third of respondents reported that immersion in natural environments and outdoor landscapes constitutes the main reason for undertaking walking tourism experiences. This finding highlights the importance of natural landscapes in shaping slow tourism experiences. In the context of Apulia, the region's diverse environments – including coastal landscapes, rural countryside, and historical pathways – provide ideal conditions for slow mobility practices such as walking tourism and cycling tourism. Cultural exploration also emerges as a key motivational factor. Many respondents indicate that walking tourism allows them to explore the history and cultural heritage of destinations more deeply than conventional tourism experiences. Walking routes often pass through historical villages, archaeological sites, and rural settlements, allowing visitors to discover aspects of local identity that may remain invisible in more conventional tourism itineraries. In addition to environmental and cultural motivations, psychological factors also play an important role in slow tourism experiences. The report highlights that many travelers perceive walking tourism as an opportunity to slow down daily rhythms, reduce stress, and temporarily disconnect from the pressures of modern life. These motivations reflect broader trends in tourism demand, as travelers increasingly seek experiences that promote personal well-being and emotional engagement. The report also reveals a growing interest in walking tourism among Italian travelers. A significant proportion of respondents indicate that they have already participated in walking routes, while many others express interest in undertaking such experiences in the future. This trend suggests that slow tourism represents a growing segment within the broader tourism market. From a geographical perspective, Apulia appears to be increasingly recognized as a destination for slow tourism. The report indicates that approximately one-fifth of Italian walking tourists have undertaken walking experiences in the region. This result reflects the growing visibility of the region's slow tourism infrastructures, including pilgrimage routes, historical trails, and rural pathways connecting coastal and inland territories. Another relevant aspect emerging from the analysis concerns the importance of service quality and infrastructural support for slow tourism experiences. Tourists highlight the need for well-maintained routes, clear signage, and accessible support services such as accommodation facilities and water points along walking itineraries. These elements are essential for ensuring the safety and comfort of travelers engaging in slow mobility activities. Within this context, digital technologies may play an important role in supporting the development of slow tourism ecosystems. Digital tools such as route navigation applications, digital mapping platforms, and online information systems can facilitate access to slow tourism infrastructures while enhancing visitor experiences. For example, mobile applications can provide tourists with real-time information about routes, weather conditions, nearby services, and cultural points of interest. Digital storytelling platforms can also contribute to enriching slow tourism experiences by providing visitors with contextual information about local heritage, traditions, and landscapes. Through multimedia content, podcasts, and interactive maps, tourists can gain deeper insights into the historical and cultural significance of the places they visit. Overall, the qualitative analysis suggests that Apulia possesses significant potential for developing slow tourism experiences centered on nature, culture, and local identity. At the same time, the integration of digital technologies may further strengthen the accessibility, visibility, and experiential quality of slow tourism destinations.

Conceptual Framework: The conceptual framework developed in this study seeks to bridge the principles of slow tourism with the opportunities offered by digital innovation in contemporary tourism systems. While slow tourism is traditionally

associated with reduced mobility speeds, deeper engagement with places, and a stronger connection with local cultures and environments, the increasing digitalization of tourism raises important questions about how technological tools can support these values without undermining the philosophy of "slowness." In this perspective, digital technologies are not interpreted as accelerators of tourism consumption, but rather as enabling infrastructures capable of facilitating more informed, accessible, and meaningful travel experiences. Within this framework, digitalization contributes to the development of slow tourism through four interconnected mechanisms. First, digital tools support sustainable mobility practices by facilitating access to information about walking routes, cycling itineraries, and alternative low-impact transport solutions. Digital mapping platforms, GPS navigation systems, and dedicated tourism applications enable travelers to plan and navigate slow mobility routes more efficiently, thereby reducing informational barriers and encouraging environmentally responsible travel behaviours. Second, digital technologies enhance the experiential dimension of slow tourism through digital storytelling. Multimedia platforms, interactive maps, podcasts, and augmented informational content allow destinations to narrate the cultural, historical, and environmental significance of places. Through these interpretative tools, visitors can gain deeper knowledge of the landscapes they traverse, transforming the travel experience into a process of cultural discovery and place-based learning. Third, digital platforms facilitate forms of community engagement by strengthening connections between tourists and local actors. Online platforms, social media networks, and digital marketplaces can support interactions with local communities, enabling visitors to discover authentic experiences such as local gastronomy, artisanal production, or cultural initiatives. These forms of digital mediation can foster more participatory tourism dynamics while simultaneously supporting local economic ecosystems. Finally, digital technologies enable the development of experience analytics, providing destinations with valuable insights into tourist behaviour, mobility patterns, and experiential preferences. Data generated through digital platforms and tourism applications can inform destination management strategies, allowing policymakers and tourism organizations to improve service quality, optimize infrastructure, and design tourism experiences that are more closely aligned with sustainability objectives. Overall, the proposed framework suggests that digital technologies can act as strategic enablers of slow tourism development. By supporting sustainable mobility, enriching narrative interpretation, strengthening community interaction, and providing data-driven insights for destination management, digital innovation can contribute to enhancing the accessibility, visibility, and experiential quality of slow tourism destinations while preserving the core values that define the slow tourism paradigm.

Results. *The empirical evidence derived from the SWG–ARET Apulia report (ARET, 2025) provides valuable insights into the motivations, behaviors, and expectations of tourists participating in slow tourism experiences. One of the most relevant findings concerns the growing interest in walking tourism among Italian travelers. A considerable proportion of respondents indicated that they had already participated in walking routes, while many others expressed interest in undertaking similar experiences in the future. Nature immersion represents the primary motivation driving participation in walking tourism activities. Approximately one-third of respondents reported that contact with natural environments and outdoor landscapes constitutes the main reason for choosing walking tourism experiences. This result highlights the central role of natural landscapes in shaping slow tourism experiences and confirms the importance of environmental resources for the development of slow tourism destinations. Cultural exploration also emerges as a key motivational factor. Many respondents indicated that walking tourism allows them to explore local history, traditions, and cultural heritage in greater depth than conventional tourism experiences. Walking routes often pass through historical villages, rural settlements, and cultural landmarks, enabling tourists to discover elements of local identity that might otherwise remain unnoticed. Psychological and experiential motivations also play a significant role. Respondents frequently mentioned relaxation, stress reduction, and the opportunity to slow down daily routines as important reasons for engaging in slow tourism activities. These motivations reflect broader societal trends in which travelers seek experiences that promote well-being and personal fulfillment. From a geographical perspective, the report indicates that Apulia is increasingly recognized as a destination for walking tourism. Approximately one-fifth of Italian walking tourists report having undertaken walking experiences in the region. This finding highlights the growing visibility of the region's slow tourism infrastructures, including pilgrimage routes, rural trails, and cultural itineraries. Overall, the results suggest that Apulia possesses significant potential for the development of slow tourism experiences centered on landscape, culture, and local identity.*

Research limitations. *Despite its contributions, this study presents several limitations that should be acknowledged. First, the research relies primarily on secondary data sources, particularly the SWG–ARET Apulia report (ARET, 2025). Although these data provide valuable insights into tourist motivations and behaviors, future research could benefit from primary empirical investigations such as interviews, focus groups, or survey-based studies specifically designed to explore the relationship between slow tourism and digitalization. Second, the study focuses on a single regional case study. While Apulia represents an interesting example of a destination investing in slow tourism infrastructures, the findings may not be fully generalizable to other destinations with different tourism dynamics or development strategies. Comparative studies involving multiple destinations could provide broader insights into how slow tourism and digital technologies interact across different contexts. Third, the conceptual framework proposed in this study requires further empirical validation. Future research could test the proposed relationships between digital technologies and slow tourism experiences through quantitative methods, such as structural equation modeling or large-scale survey research. Such*

approaches would allow researchers to better understand the mechanisms through which digital technologies influence slow tourism experiences and destination development.

Managerial implications. *The findings of this study provide several relevant implications for destination managers, tourism policymakers, and local stakeholders involved in the development of sustainable tourism strategies. First, the increasing demand for slow tourism experiences suggests that destinations should invest in infrastructures that facilitate slow mobility practices. Walking routes, cycling paths, and rural tourism networks represent key elements for developing slow tourism ecosystems. Ensuring the quality and accessibility of these infrastructures – through proper maintenance, clear signage, and safety measures – is essential for improving visitor experiences and encouraging longer stays. Second, the integration of digital technologies represents an important opportunity for enhancing slow tourism experiences. Digital tools such as mobile applications, GPS-based navigation systems, and interactive maps can significantly improve the accessibility of slow tourism itineraries. These technologies allow tourists to obtain real-time information about routes, nearby services, accommodation facilities, and cultural attractions. By facilitating navigation and planning, digital technologies can reduce uncertainty and encourage more travelers to participate in slow tourism activities. Third, digital storytelling platforms can play a crucial role in enriching the cultural and experiential dimensions of slow tourism. Through multimedia content, podcasts, augmented reality applications, and location-based storytelling, destination managers can communicate local narratives and cultural heritage more effectively. Such digital tools can enhance visitors' understanding of the historical and cultural significance of destinations without replacing the direct experience of place. Fourth, digital platforms can strengthen collaboration between tourism stakeholders and local communities. Online platforms that connect tourists with local producers, artisans, and service providers can support local economies while promoting authentic tourism experiences. This approach aligns with the principles of community-based tourism and can contribute to more inclusive tourism development. Finally, integrated governance approaches are essential for managing slow tourism ecosystems effectively. Collaboration among public institutions, tourism businesses, technology providers, and local communities can help destinations design coherent tourism strategies that balance economic growth with environmental sustainability and cultural preservation. Overall, the effective integration of slow tourism principles with digital innovation represents an important opportunity for destinations seeking to develop sustainable and competitive tourism models.*

Originality of the paper. *This research bridges two rapidly evolving fields: slow tourism and digital tourism transformation. By proposing a conceptual framework integrating these domains, the study contributes to tourism management literature and provides insights for sustainable destination development.*

Sostenibilità e turismo nautico: i risultati di una scoping review della letteratura economico-manageriale

MARTA IESTER[1], CLARA BENEVOLO[2], RICCARDO SPINELLI[3]

Abstract *Lo studio propone una scoping literature review sul tema della sostenibilità nel turismo nautico. Il turismo nautico rappresenta un comparto in crescita dell'industria turistica e svolge un ruolo sempre più rilevante per lo sviluppo economico delle comunità costiere; al contempo, solleva importanti questioni di sostenibilità sociale e ambientale, in ragione dei non trascurabili impatti generati. Alla luce di queste dinamiche, il presente contributo intende analizzare come la comunità accademica abbia esplorato l'area di ricerca che si colloca all'intersezione tra sviluppo sostenibile e turismo nautico, da una prospettiva di taglio economico-manageriale. A partire da un sample di 121 articoli (pubblicati tra il 1988 e il 2025), ci si propone di individuare i principali filoni di ricerca e i gap ancora presenti nella letteratura. I risultati evidenziano un corpus di articoli eterogeneo, caratterizzato da diverse prospettive: a numerosi studi di taglio ambientale o legati a problematiche di gestione delle risorse marine, si affianca un numero ancora troppo contenuto di lavori di taglio economico-manageriale. Tale carenza di studi si presenta con riferimento tanto ai soggetti dell'offerta (territori, attrattive, destinazioni e imprese del turismo nautico) quanto a quelli della domanda (turisti nautici). Nel complesso, la review mette in luce come numerose tematiche rilevanti per gli studiosi di management e marketing risultino ancora poco esplorate e costituiscano quindi potenziali direzioni di sviluppo per la ricerca.*
Keywords: *turismo nautico; porti turistici; sostenibilità; scoping literature review; nautical tourism; sustainability.*

Framing of the research. *Il turismo nautico rappresenta un comparto in crescita all'interno del più ampio turismo del mare che comprende anche forme quali il turismo crocieristico e sportivo. Esso rientra tra le diverse modalità di fruizione turistica del mare e degli spazi costieri e si caratterizza per l'utilizzo dell'imbarcazione da diporto come elemento centrale dell'esperienza turistica. In letteratura, il turismo nautico è definito come "a set of tourism activities performed on the sea (or other water spaces), in ports and on the coast with a pleasure boat, which is used both as a means of transport and self-accommodation, for the purpose of recreation, sports, entertainment or other needs" (Spinelli e Benevolo, 2022; p. 3). La definizione sottolinea la specificità di questa forma di turismo che si sviluppa non solo durante la navigazione ma anche nei porti turistici, che accolgono l'imbarcazione e i diportisti, e nelle destinazioni costiere raggiunte dal mare.*

*Il turismo nautico ha assunto un ruolo rilevante all'interno del settore turistico ed è oggetto di crescente attenzione da parte della letteratura scientific*a (*Martínez Vázquez et al., 2021; Spinelli e Benevolo, 2022). Dal punto di vista economico e territoriale, esso è strettamente connesso all'industria cantierista – sempre più orientata alla realizzazione di imbarcazioni performanti e sostenibili – al sistema delle infrastrutture portuali turistiche – vere e proprie strutture ricettive, alcune delle quali evolvono verso il modello "resort" (Lam-González et al., 2023) – e alle attività economiche che si sviluppano intorno a esse. In particolare, i porti turistici e le marine producono esternalità e impatti simili a quelli dei porti commerciali, seppur su scala più contenuta (Kovačić e Luković, 2007), e costituiscono nodi fondamentali per lo sviluppo del turismo nautico e delle economie costiere.*

Nel contempo, la navigazione tramite imbarcazioni da diporto può generare diverse forme di pressione sugli ecosistemi marini e costieri (Maglić et al., 2025). Le attività legate alla navigazione e alla gestione dei porti turistici possono infatti avere molteplici conseguenze sull'ambiente marino e i litorali, spesso sottovalutati anche dagli stessi gestori portuali (Petrosillo et al., 2010). Tra questi rientrano l'inquinamento delle acque dovuto a scarichi delle imbarcazioni, oli, vernici e prodotti antivegetativi, l'introduzione di specie aliene negli ecosistemi marini, le emissioni sonore e i fumi dei motori, nonché la produzione e dispersione di microplastiche e rifiuti solidi (Kasum et al., 2009; Łapko et al., 2019). Accanto agli impatti ambientali, emergono anche alcune dimensioni sociali in relazione, ad esempio, alla sicurezza, alla salute e all'interazione tra turisti nautici e comunità locali (Kovačić et al., 2011).

In questo contesto, la presenza di tali impatti rende quindi assai rilevante il tema della sostenibilità. Tuttavia, nonostante la crescente attenzione verso la sostenibilità nel turismo e nei trasporti marittimi, le questioni legate alla sostenibilità del turismo nautico e dei porti turistici risultano ancora relativamente poco esplorate nella letteratura scientifica (Spinelli e Benevolo, 2024; Spinelli et al., 2024; De-Juan-Vigaray et al., 2025). Ciò è dovuto anche alla natura interdisciplinare degli studi sul turismo nautico che si collocano all'intersezione tra turismo, economia marittima, gestione delle risorse costiere e scienze ambientali. Gli impatti ambientali e sociali associati alle attività nautiche rendono quindi necessario approfondire le modalità con le quali il settore può evolvere verso modelli di sviluppo più sostenibili; inoltre, la crescente sensibilità dei turisti rispetto alle conseguenze ambientali e sociali delle proprie scelte di viaggio rende il tema sempre più centrale anche dal punto di vista della domanda turistica.

Purpose of the paper. *Il turismo nautico rappresenta un'importante opportunità per molte destinazioni costiere, contribuendo alla crescita economica locale e alla valorizzazione delle infrastrutture portuali e dei servizi turistici; tuttavia, come si è illustrato in precedenza, può generare anche una serie di impatti negativi di carattere economico, ambientale e sociale. Rispetto alla produzione scientifica sul tema, precedenti studi (Spinelli e Benevolo, 2022) hanno individuato un nucleo di contributi dedicati alle problematiche di sostenibilità nel turismo nautico e caratterizzati da un approccio di tipo economico-manageriale. Il presente contributo intende estendere e aggiornare tale studio, esplorando in maniera approfondita l'area di ricerca all'intersezione tra sviluppo sostenibile e turismo nautico. A tal fine, l'analisi di concentra su come i temi della sostenibilità siano stati affrontati con riferimento a questa specifica forma di turismo, identificando gli ambiti di ricerca prevalenti e individuando quali temi siano meritevoli di maggior approfondimento.*

Methodology. *Per esplorare la letteratura all'intersezione tra sostenibilità e turismo nautico, è stata realizzata una scoping literature review, un approccio metodologico finalizzato alla mappatura di un ambito di studio ampio e in evoluzione i cui confini non sono ancora chiaramente definiti (Moher et al., 2015). Mentre le systematic review sono specifiche e meno esplorative, le scoping review considerano sia la profondità sia l'ampiezza della letteratura (Grant e Booth, 2009). Costituiscono quindi uno strumento ideale per determinare la portata o la copertura di un corpus di letteratura su un dato argomento e forniscono una panoramica della sua articolazione (Munn et al., 2018). Il presente studio, in ragione anche dell'eterogeneità e frammentazione della letteratura considerata, si propone proprio obiettivi di tipo esplorativo e trova quindi nella scoping review la metodologia più appropriata (Arksey e O'Malley, 2005).*

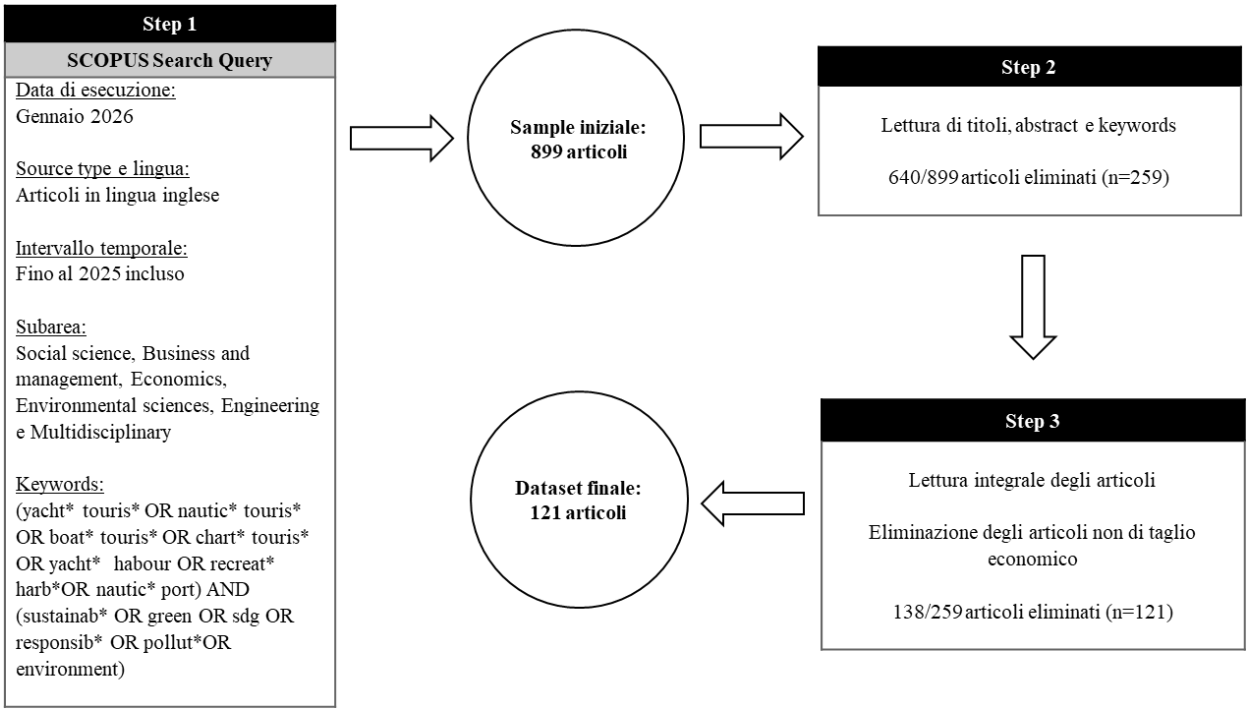
Per garantire rigore e robustezza alla procedura, si è seguito il framework in cinque fasi proposto da Arksey e O'Malley (2005): (1) identificazione dell'ambito dello studio, (2) identificazione della portata degli studi pertinenti, (3) selezione degli studi pertinenti, (4) registrazione e organizzazione dei dati e (5) sintesi e presentazione dei risultati.

Nella fase di pianificazione, sono stati definiti l'oggetto di analisi e il perimetro della review. Successivamente, è stato selezionato Scopus (Elsevier) come database di riferimento, in quanto ampiamente riconosciuto come uno dei principali strumenti per le ricerche bibliometriche e di letteratura in ambito turistico (Otoo e Seongseop, 2020). Al fine di garantire qualità scientifica e omogeneità delle fonti analizzate, la ricerca è stata limitata ai soli articoli in lingua inglese pubblicati su riviste scientifiche entro il 2025. Si è inoltre deciso di limitare la ricerca alle aree disciplinari "Social Science", "Business and Management", "Economics", "Environmental Sciences", "Engineering", "Multidisciplinary".

Un passaggio di rilevante importanza metodologica è stato la delimitazione della strategia di ricerca, finalizzata a individuare i contributi scientifici rilevanti. A tal fine, l'interrogazione del database è stata realizzata combinando due gruppi di parole chiave, costruiti in maniera inclusiva così da inserire sinonimi e variazioni di spelling dei termini considerati. Il primo gruppo include parole chiave riferite al turismo nautico, alla navigazione da diporto e alle imprese del turismo nautico: vi rientrano quindi – con tutte le loro variazioni – "yachting tourism", "nautical tourism", "boating tourism", "charter tourism", "yachting habour", "recreational harbour", "nautical port". Il secondo gruppo comprende termini riconducibili ai temi della sostenibilità, nello specifico – nuovamente con le loro variazioni di spelling – "sustainability", "green", "sdg", "responsibility", "pollution", "environment".

L'estrazione dei contributi è stata effettuata nel gennaio 2026 e ha restituito un totale di 899 articoli. Questo insieme iniziale è stato sottoposto a un articolato processo di selezione e filtraggio. In una prima fase, mediante la lettura di titoli, abstract e parole chiave, sono stati esclusi i contributi evidentemente estranei all'obiettivo della ricerca oppure relativi a forme di turismo diverse dal turismo nautico, quali il turismo costiero e balneare, il turismo crocieristico, il whale-watching e il diving tourism.

I 259 articoli rimasti sono stati sottoposti a un'analisi più approfondita, finalizzata a individuare quelli che esplorano gli aspetti di sostenibilità del turismo nautico con una prospettiva di matrice economico-manageriale. Sono stati quindi eliminati, tra gli altri, i contributi di taglio ingegneristico dedicati alla progettazione o alla costruzione sostenibile delle imbarcazioni, le ricerche di ambito chimico relative ai residui rilasciati dalle vernici nautiche e gli studi di carattere microbiologico riguardanti, ad esempio, la diffusione di alghe o di specie invasive nei porti turistici. A valle di questa seconda scrematura si è pervenuti al dataset finale, composto da 121 articoli.



La Fig. 1 schematizza questi primi tre passaggi del processo di esecuzione della review.

Nella Fase 4, è stata eseguita un'analisi tematica sui 121 contributi, analizzandone il contenuto completo.

Per ciascun paper, sono stati rilevati, oltre ai dati bibliografici, i seguenti aspetti: tema principale, tipologia di contributo (empirico o concettuale), area geografica oggetto di studio e campione analizzato. Inoltre, si è ritenuto utile riprodurre quanto proposto da Spinelli e Benevolo (2022), suddividendo i contributi in due gruppi in base alla prospettiva di analisi; si sono quindi distinti gli studi riferiti al lato dell'offerta o della domanda nel mercato del turismo nautico.

Tutti i dati raccolti sono stati riportati in un database MS Excel che è stato quindi analizzato per pervenire ai risultati descrittivi e tematici riportati nella Fase 5 del processo.

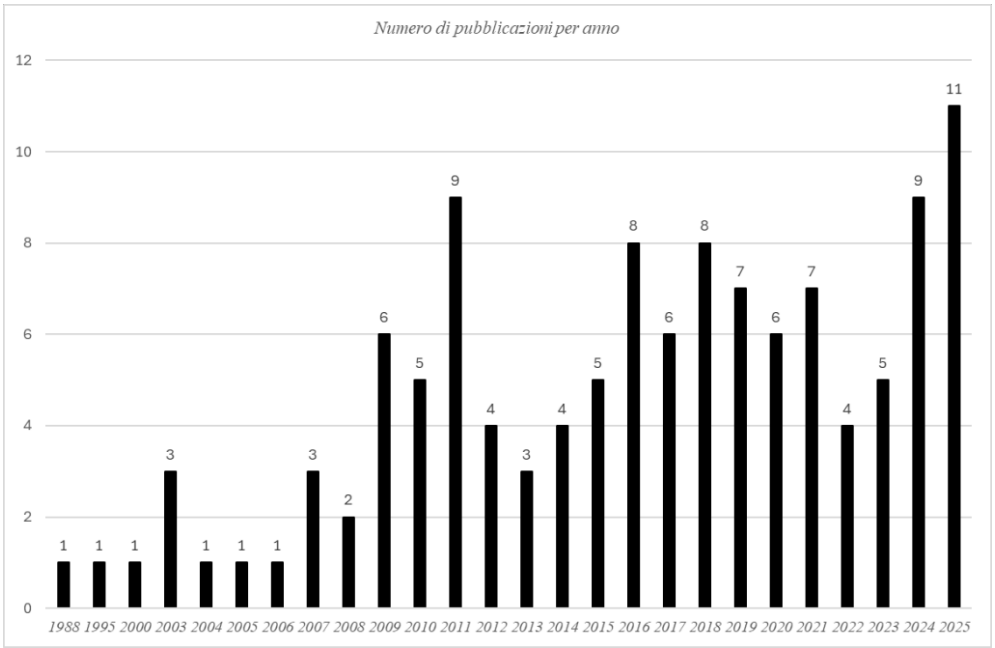


Figura 1: Fasi di esecuzione della ricerca bibliografica

Results. *I risultati della review restituiscono un quadro complessivo e articolato della letteratura esistente su sostenibilità e turismo nautico.*

La distribuzione temporale dei paper presenta un andamento altalenante con un trend crescente (Fig. 2).

Figura 2: Andamento delle pubblicazioni sulla sostenibilità nel turismo nautico

I 121 articoli sono distribuiti tra 54 riviste, riconducibili a tre principali tipologie: quelle con un focus interdisciplinare sul mare, le coste, la navigazione (con 49 articoli); quelle di matrice principalmente ambientale ed ecologica (47); quelle di taglio economico e turistico (25). Più di un terzo dei contributi è pubblicato in sole cinque riviste, peraltro di taglio non economico-manageriale e dal profilo accademico non particolarmente elevato: Sustainability (13 articoli), Marine Pollution Bulletin (9), Pomorstvo e Ocean and Coastal Management (8), WIT Transactions on Ecology and the Environment (7). La presenza nelle riviste di più alto impatto nel panorama accademico è più contenuta.

In relazione all'approccio metodologico, 107 studi sono di natura empirica mentre solo 14 sono di natura prettamente concettuale. I paper empirici sono basati prevalentemente su survey o case study, fatta eccezione per alcuni contributi con osservazione diretta sul campo (ad esempio, Gorzelany, 2004; Jett e Thapa, 2010). Nella maggior parte dei casi, i dati sono raccolti attraverso interviste o questionari e successivamente analizzati mediante strumenti statistici quali le regressioni, i modelli di equazioni strutturali e l'analisi delle componenti principali. Degno di nota è l'utilizzo dei sistemi informativi geografici (GIS) per analizzare la distribuzione spaziale delle barche (tra gli altri, Balaguer et al., 2011; Gray et al., 2011).

I campioni oggetto di studio includono solitamente diportisti e turisti nautici; meno numerosi sono gli studi che coinvolgono i soggetti dell'offerta – quali porti turistici (tra gli altri, Kasum et al., 2009; Spinelli e Benevolo, 2024), compagnie di charter (Trstenjak et al., 2020; Jiménez-Jiménez et al., 2024) o altre imprese che offrono servizi nautici (Stoll et al., 1988; Lam-González et al., 2019) – istituzioni pubbliche (tra gli altri, Grant-Smith e Mayes, 2017; Silveira et al., 2018) o residenti delle aree costiere e portuali (tra gli altri, Silveira e Santos, 2013; Ibabe et al., 2020),

Le aree geografiche oggetto di studio sono ampiamente distribuite; tuttavia, le più analizzate si trovano nel bacino del Mediterraneo (in particolare Croazia, Italia e Spagna), lungo la costa atlantica degli Stati Uniti e nella regione dei Grandi Laghi. Degno di nota è il fatto che, negli anni più recenti, siano stati effettuati studi sul campo anche in Paesi come Australia, Nuova Zelanda e Capo Verde.

Con riferimento al contenuto degli studi, abbiamo individuato 66 paper riferiti a tematiche di offerta e 55 aventi per oggetto aspetti della domanda nel mercato del turismo nautico.

I paper inerenti alle dimensioni dell'offerta possono essere ulteriormente divisi in due sottogruppi a seconda del livello macro (sistema turistico) o micro (imprese turistiche) considerato nell'analisi. Il gruppo "macro" include 41 contributi che analizzano il tema della sostenibilità nel turismo nautico con riferimento a uno specifico ambito geografico/Paese (ad esempio, Kovačić e Silveira, 2018) o nel quadro di politiche e strategie di destination management & marketing (tra gli altri, Gračan et al., 2018), attraverso l'integrazione del turismo nautico nel sistema di offerta turistica locale (tra gli altri, Ivanić et al., 2018). I 25 paper di offerta a carattere micro concentrano l'attenzione sulle imprese del turismo nautico. Prevalenti sono gli studi dedicati agli aspetti di sostenibilità nella gestione e marketing dei porti turistici (ad esempio, Donadić et al., 2025); tra i temi esplorati troviamo la comunicazione di sostenibilità tramite i siti web (Spinelli et al., 2024; De-Juan-Vigaray et al., 2025), l'adozione di certificazioni e standard ambientali (Ritchie et al., 2017; Spinelli e Benevolo, 2024) e la percezione dei rischi e della sicurezza ambientale da parte dei manager (tra gli altri, Petrosillo et al., 2009, 2010). Due articoli studiano il charter nautico, con riferimento all'allineamento tra l'offerta delle agenzie e le preferenze dei consumatori in tema di sostenibilità (Jiménez-Jiménez et al., 2024) e agli ostacoli all'adozione di soluzioni di efficientamento energico da parte delle agenzie stesse (Trstenjak et al., 2020).

I paper riferiti alla domanda si concentrano sul consumatore/turista nautico e approfondiscono aspetti quali i comportamenti dei diportisti e le loro percezioni rispetto a una fruizione sostenibile dell'esperienza turistica. In particolare, numerosi contributi analizzano le pratiche dei diportisti e il loro rispetto delle normative finalizzate alla tutela della fauna marina (tra gli altri, Flamm e Braunsberger, 2014; Jett et al., 2009; Jett e Thapa, 2010) o al contenimento della diffusione di specie invasive o non indigene (tra gli altri, Manyweathers et al., 2025; Moore et al., 2024; Martínez-Laiz et al., 2019). Un numero più limitato di contributi indaga il comportamento dei visitatori nelle aree marine protette (tra gli altri, La Manna e Sarà, 2019; Gray et al., 2010). Altro tema oggetto di studio è la distribuzione spaziale delle imbarcazioni da diporto e i relativi flussi di navigazione, con l'obiettivo di modellizzare le forme di utilizzo degli spazi marini e valutarne le implicazioni per la gestione sostenibile delle destinazioni costiere (tra gli altri, Gonson et al., 2016; Gray et al., 2011). Altri studi esplorano la "willingness to pay" dei diportisti in relazione a iniziative legate alla tutela ambientale e al ripristino degli ecosistemi marini (tra gli altri, Diedrich et al., 2013; Jiang et al., 2025). Ulteriori temi trattati sono, infine, specifici aspetti del comportamento dei turisti nautici quali le pratiche di manutenzione e gestione delle imbarcazioni (Wester e Eklund, 2011) o il rispetto delle norme di sicurezza a bordo (Bell et al., 2000; Virk e Pikora, 2011; Quistberg et al., 2014).

Nel complesso, l'analisi del campione di 121 articoli evidenzia un quadro frammentato e prevalentemente descrittivo. Numerosi studi si concentrano su aspetti specifici e spesso marcatamente operativi; sono limitate le letture d'insieme del fenomeno, capaci di coglierne le interdipendenze e la dimensione sistemica (Cardoso et al., 2023; Filimon, 2023). Ne deriva quindi una scarsa attenzione all'integrazione tra attori, pratiche e governance, che riduce la comprensione delle dinamiche complessive della transizione verso modelli e pratiche sostenibili.

L'analisi del corpus di letteratura evidenzia una significativa eterogeneità dei temi considerati; permangono, tuttavia, numerose e importanti aree di ricerca – soprattutto di matrice più strettamente economico-gestionale – non adeguatamente esplorate. Nello specifico, la dimensione ambientale della sostenibilità appare ampiamente trattata, mentre risultano ancora limitati gli studi che approfondiscono le dimensioni sociali ed economiche della sostenibilità nel turismo nautico. A livello macro, sono ancora poco esplorati l'impatto del turismo nautico sul benessere delle comunità locali, le sue ricadute economiche di lungo periodo nonché le modalità di intervento pubblico a favore di uno sviluppo più sostenibile di questa forma di turismo. Meriterebbe, inoltre, maggiore attenzione lo studio dell'overtourism nelle destinazioni nautiche e delle possibili strategie di gestione di tale fenomeno. A livello micro, la presenza di studi dedicati ai porti turistici risulta sottodimensionata rispetto al loro ruolo nel sistema turistico nautico. Oltre ad essere i principali attori dell'offerta, i porti intercettano i trend emergenti della domanda e la orientano verso approcci più sostenibili; al contempo, sono tra i principali destinatari della normativa di riferimento, dipendendo da loro una quota significativa degli impatti complessivi del fenomeno turistico nautico. Nello specifico, sono limitati gli studi sulla diffusione delle

pratiche di sostenibilità nei porti così come le analisi della loro percezione e valutazione da parte del management dei porti turistici, anche in relazione al possibile ruolo della sostenibilità quale leva di posizionamento competitivo. Con riferimento alle tematiche di domanda, il rapporto tra turisti nautici e sostenibilità è ancora poco esplorato: in particolare, appare rilevante indagare la possibile segmentazione dei turisti nautici in funzione del livello di attenzione e importanza attribuito a tali tematiche. Manca inoltre uno studio approfondito dell'impatto dei fattori legati alla sostenibilità sui processi decisionali dei turisti nautici, nonché della loro disponibilità a riconoscere un premium price per servizi e soluzioni più sostenibili.

A livello metodologico, infine, emerge l'esigenza di un più diffuso ricorso a studi comparativi, al fine di confrontare in prospettiva internazionale aspetti quali il ruolo delle normative, le politiche pubbliche e di destinazione, le strategie e politiche aziendali nonché i comportamenti del turista nautico rispetto ai temi della sostenibilità.

In questa prospettiva, future ricerche dovrebbero, da un lato, approfondire i singoli filoni ancora poco esplorati e, dall'altro, sviluppare approcci maggiormente integrati, capaci di restituire una lettura sistemica del fenomeno, attraverso l'analisi delle interazioni tra i diversi player coinvolti e la valutazione degli effetti della sostenibilità nelle sue dimensioni ambientale, economica e sociale.

Research limitations. *La ricerca presenta alcuni limiti, di natura prevalentemente metodologica. In primo luogo, la scelta delle parole chiave utilizzate per la selezione dei paper risulta determinante per la loro corretta ed esaustiva identificazione; sebbene si sia adottato un approccio fortemente inclusivo in termini di quantità e varietà dei termini, non si può escludere che alcuni contributi potenzialmente rilevanti siano rimasti esclusi. Analogamente, si è scelto di utilizzare il solo database Scopus: un'eventuale estensione ad altri, quali Google Scholar e Web of Science, potrebbe consentire di individuare ulteriori contributi significativi. Ancora, si è ristretto lo studio ai soli articoli su rivista scientifica, sebbene il tema sia affrontato anche in ulteriori tipologie di contributi quali atti di convegno, report di enti di ricerca e libri. In ultimo, va ricordato che nella rassegna sono stati selezionati solo paper in lingua inglese; il turismo nautico, tuttavia, è oggetto di studio da parte di comunità scientifiche nazionali che pubblicano anche nella loro lingua locale (soprattutto in croato, italiano e spagnolo); l'analisi di tali contributi – pur difficile per ragioni linguistiche – potrebbe portare a una visione più completa del corpus della letteratura in oggetto.*

Managerial implications. *Sebbene la natura del contributo lo collochi prevalentemente nel dibattito accademico, è possibile trarne alcune rilevanti implicazioni di carattere manageriale. In particolare, emerge la carenza di studi che integrino la prospettiva di operatori e turisti nello studio delle ricadute del turismo nautico in termini di sostenibilità; tale lacuna lascia i manager delle destinazioni e delle imprese nautiche privi di adeguati riferimenti operativi, linee guida e best practice a supporto dei processi decisionali in un ambito in rapida evoluzione. In risposta a ciò, si auspica una maggior attenzione a forme di collaborazione tra accademia e sistema produttivo, attraverso la co-progettazione di studi in grado di approfondire le diverse dimensioni del fenomeno e generare evidenze empiriche utili all'agire manageriale. Allo stesso tempo, risultano ancora limitati i contributi che affrontano il tema della sostenibilità nel turismo nautico nella prospettiva dei policy maker. In particolare, si rileva una scarsa attenzione alle dinamiche di coordinamento interistituzionale e alla declinazione delle linee di policy in strumenti operativi. In questo senso, una maggiore integrazione tra ricerca, istituzioni e decisori pubblici potrebbe favorire lo sviluppo di politiche più efficaci e coerenti con gli obiettivi di sostenibilità del settore.*

Originality of the paper. *Il presente studio rappresenta la prima review che analizza la produzione scientifica all'intersezione tra sostenibilità e turismo nautico. Il lavoro mette in relazione due ambiti di crescente rilevanza sia nel dibattito accademico sia nelle pratiche di gestione manageriale nell'industria turistica. In questo senso, il paper contribuisce a esplorare un ambito emergente nella letteratura, offrendo una prima sistematizzazione degli studi esistenti e individuando possibili direzioni di futura ricerca.*

The dual sides of artificial intelligence in hospitality industry processes: A qualitative analysis of organizational perceptions and operational applications

CLAUDIA COZZIO[1], MASSIMO MORELLATO[1], OSWIN MAURER[1]

Abstract. *This study examines the dual sides of artificial intelligence (AI) in hospitality industry processes by integrating evidence from two qualitative studies conducted in the hotel context and in the hotel food supply chain. The first study is based on open-ended questionnaire responses designed to elicit in-depth perceptions of AI adoption in hotels, with particular attention to prior experiences, expectations for future applications, and perceived benefits and barriers. Forty-four complete questionnaires were analyzed through NVivo, differentiating managers from non-managers and coding perceptions as positive, neutral or negative, while also developing secondary codes for familiarity, empirical applications, and benefits and barriers. Results indicate substantial role-based differences. Managers report higher familiarity and more frequent AI use, and they tend to evaluate AI's cost–benefit profile more favorably, associating AI with efficiency, error reduction, time savings, data management, competitiveness and support in contexts characterized by labor shortages. Non-managers display lower familiarity and a more cautious stance, often neutral rather than negative, with neutrality largely explained by limited knowledge and confidence. Across both groups, current applications cluster around generative AI for writing and communication, including multilingual guest information and responses to emails and reviews, as well as marketing content, segmentation, and follow-up activities. The second study is an exploratory investigation of AI in the hotel food supply chain, centered on the empirical application of an AI-powered platform (MenuMind). Eight semi-structured interviews with hotel managers and food suppliers highlight perceived potential for demand forecasting, procurement optimization, cost control, personalization of buffet and menu planning, and strengthened ties with local suppliers, alongside concerns related to data governance, privacy, system integration, cultural resistance in kitchens, and the need for flexible solutions that respect recipe heterogeneity. Overall, the findings portray AI as simultaneously enabling and challenging: it can improve operational performance and sustainability-oriented outcomes, but its real adoption depends on organizational readiness, training and change management.*
Keywords: *artificial intelligence; hospitality management; qualitative research; organizational perceptions; food supply chain; food waste*

Framing of the research. *Artificial intelligence has become a central force in the transformation of service industries, yet its diffusion is often shaped by sector-specific constraints. In hospitality this tension is particularly pronounced because hotels operate at the intersection of process efficiency and human-centered service* (*Acharya & Mahapatra, 2024; Vorobeva, 2024). The promise of AI is frequently articulated through its capacity to automate tasks, process data at scale, and support decision-making under uncertainty (Lin et al., 2020). At the same time, hotels are social systems in which service quality is co-produced by employees and guests, and in which routines, professional identities, and established ways of working can be disrupted by technological change (Buhalis & Sinarta, 2019; Gursoy et al., 2019). The adoption of AI therefore tends to display an ambivalent profile, generating both optimism about efficiency and concern about cultural, ethical, and relational consequences (Buhalis, 2025).*

This ambivalence is visible in two interconnected domains that are especially relevant for hospitality organizations. The first domain concerns the internal organization of hotel work, including front office operations, communication, marketing activities, and managerial planning (Al-Hyari et al., 2023, Mariani & Borghi, 2024). These processes are increasingly exposed to AI tools that can assist with writing, translation, personalization, and data analysis. The adoption of such tools depends on familiarity and perceived value, which often vary across hierarchical levels. The second domain concerns the hotel food supply chain (Morosan et al., 2024). Food service in hotels is a strategic area with direct implications for customer satisfaction, costs, and sustainability. It is also an area characterized by demand volatility, heterogeneous guest preferences, seasonality, and a persistent reliance on manual processes for inventory monitoring, menu planning, supplier selection, and expiration management. As a consequence, misalignment between demand and supply may lead to overproduction and food waste, creating both economic losses and environmental impacts. Prior work has emphasized that food waste in hospitality arises not only from operational inefficiencies but also from the complexity of consumption patterns and from planning practices that rely heavily on experience-based heuristics rather than systematic analytics (Micheli & Cagno, 2021). This is particularly salient in buffet settings, where forecasting quantities is structurally difficult because the service model encourages abundance while consumption remains uncertain.

This paper contributes to the understanding of these dynamics by integrating evidence from two qualitative studies that together explore the dual sides of AI in hospitality processes. Study 1 focuses on organizational perceptions within hotels by analyzing open-ended questionnaire responses from managers and non-managers, examining familiarity,

[1] Faculty of Economics and Management, Free University of Bolzano, Italy

perceived cost–benefit balance, and concrete examples of current AI use. Study 2 examines the empirical context of AI application in the hotel food supply chain through an exploratory interview study conducted in the context of the project "REAWAPE Reducing Waste, Optimizing Purchases" (funded by the Italian Fund for Digital Republic and Google.org) which developed the MenuMind platform. The integration of these two studies offers an empirically grounded lens on how AI is perceived and enacted across hotel roles and across an operational domain that is strategically important for sustainability and efficiency.

Purpose of the paper. *The purpose of this paper is to analyze the dual sides of artificial intelligence in hospitality industry processes by using qualitative evidence from two empirical studies. The first objective is to examine how managers and non-managers perceive AI adoption in hotels, focusing on their familiarity with AI, their evaluation of the balance between benefits and barriers, and the types of AI applications currently used in practice. The second objective is to explore how AI is perceived when applied to the hotel food supply chain, with particular attention to the potential of AI-enabled platforms (i.e., MenuMind) to reduce food waste, optimize purchasing decisions, enhance personalization of food offerings, and strengthen relationships with local suppliers, while also identifying the technical and cultural barriers that may hinder adoption. By combining these objectives, the paper seeks to clarify how AI can simultaneously act as an enabler of operational improvement and a source of organizational challenges, and how adoption pathways depend on knowledge, trust and change management.*

Methodology. *Study 1 is grounded in the qualitative analysis of open-ended questionnaire responses designed to investigate perceptions of AI adoption in hospitality. The questionnaire was structured to elicit both exploratory reflections and more focused assessments. In the first section, open questions invited participants to report their prior experiences and future expectations regarding AI use in hospitality, for example by asking about the type of experience they had with AI in the hotel context, where and how they imagined future AI applications in the sector, and which empirical examples or implementations they knew. This design was intended to capture participants' familiarity with AI, as well as their anticipatory views on how AI might evolve and diffuse in hotel operations. In the second section, the questionnaire explicitly addressed perceived benefits and barriers, including questions about the main advantages and obstacles to AI adoption in hotels and whether benefits were considered to outweigh barriers or vice versa. This combination of exploratory and focused questions aimed to elicit reflective, experience-near accounts while still enabling systematic comparison across respondents. After an initial screening, the dataset included forty-four questionnaires completed in full, which constituted the empirical basis for analysis. Responses were analyzed using NVivo as a qualitative analysis tool that supports coding and visualization of recurring patterns. A key methodological decision was the distinction between two macro-groups of respondents, namely managers and non-managers. Managers were defined as respondents holding supervisory positions and being responsible for coordinating the work of others, whereas non-managers were employees without direct managerial responsibilities. This distinction was central because it enabled an examination of whether perceptions of AI adoption differ across hierarchical levels and across degrees of involvement in decision-making processes related to technological change. The analysis also coded responses according to three perception categories, positive, neutral, and negative, and developed secondary codes related to familiarity, empirical applications, and benefits and barriers. This coding scheme facilitated a structured interpretation of role-based differences and supported the identification of themes that shape acceptance, caution, or resistance toward AI. A further analytical component of Study 1 was lexical frequency analysis in response to the question about empirical examples or implementations of AI used in hotel contexts. The frequency analysis aimed to identify the most recurrent terms used by respondents to describe current AI applications, providing an additional lens on how AI is practically enacted in hotel work. The interpretation of high-frequency terms was grounded in the qualitative context of the responses, enabling the analysis to connect lexical patterns to concrete practices such as writing multilingual guest information, responding to emails and reviews, creating marketing content, segmenting guests, and supporting management activities such as energy management and revenue management.*

Study 2 is an exploratory qualitative study conducted to investigate stakeholder perceptions regarding the integration of MenuMind into the hotel food supply chain. This study was developed within the broader project "REWAPE Reduce waste, optimize purchase" and conducted after a short presentation of the project and of the MenuMind prototype. The decision to present the platform prior to interviews was intended to ensure that all participants shared a minimum and comparable understanding of the tool being discussed, thereby improving the interpretive value of their responses: Eight key stakeholders were interviewed, including hotel managers and food suppliers. Participants were selected through purposeful sampling as "information-rich" cases in the sense of Patton (2002), on the basis of their professional experience and their expected contribution to understanding the phenomenon. Interviews followed a semi-structured format, beginning with general questions about experience with digital solutions or AI systems in tourism and hospitality and then moving to specific questions about MenuMind, including perceived benefits and barriers, expected effects on kitchen efficiency, and potential implications for strengthening the relationship between hotels and the local agri-food supply chain.

Interviews lasted between twenty and thirty minutes. The coding process followed the procedure outlined by DeSantis and Ugarizza (2000), which conceptualizes themes as abstract entities that provide meaning and coherence to recurring experiences and perceptions, rather than as simple lexical clusters. The analysis applied an open coding approach following Miles and Huberman (1994), involving systematic examination of transcripts and iterative comparison between

quotes and emergent categories. Through progressive aggregation, themes were derived inductively, avoiding the imposition of pre-established interpretive schemes and strengthening internal validity. This approach allowed the analysis to capture both convergences and differences between hotel managers and suppliers, and to articulate perceived benefits and barriers across internal operational perspectives and external ecosystem perspectives.

Results. *Study 1 reveals clear differences between managers and non-managers in both familiarity with AI and evaluations of its cost–benefit balance. Seventy-one percent of managers reported being familiar with AI and actively using it, whereas twenty-nine percent indicated limited knowledge and no current applications in their hotels. Among non-managers, familiarity was evenly divided: half reported using AI in their daily work, while the other half declared no familiarity or use. These results show that AI exposure is not uniform within hotel organizations and that hierarchical position strongly influences confidence and experience with technology.*

Differences also emerge in the perceived cost–benefit ratio. Among non-managers, half believed that benefits outweigh costs, while the other half adopted a neutral stance, mainly due to limited knowledge rather than active opposition. Managers expressed a more favorable evaluation: fifty-three percent considered benefits greater than costs, thirteen percent expressed negative judgments, and thirty-four percent remained neutral. Managers tended to frame AI in terms of operational efficiency, competitiveness, and strategic advantage, whereas non-managers' evaluations were more closely tied to direct experience and familiarity.

Lexical frequency analysis further clarifies how AI is currently used. Among managers, recurring terms included creation, texts, guests, systems, management, and marketing. AI is widely employed for generating multilingual content at the front desk, responding to reviews and emails, creating personalized offers, and supporting marketing activities such as newsletters and targeted campaigns. AI is also used for guest segmentation and follow-up communication, including chatbot-based interactions that ensure continuous availability. In more infrastructural applications, AI supports security systems, predictive maintenance for laundry equipment, energy management in smart rooms, human resource screening, review management, and revenue optimization. These examples illustrate that managers perceive AI not only as a communication tool but as an operational and strategic infrastructure.

Among non-managers, the most frequent terms were writing and ChatGPT. Their AI use concentrates on drafting emails, preparing newsletters, generating social media captions, and supporting guest questionnaires. ChatGPT is perceived as a versatile tool for producing and refining text in everyday tasks. Compared to managers, non-managers report fewer system-level applications, suggesting that access and visibility of AI tools differ by role, with managers more exposed to strategic and infrastructural uses and non-managers focusing on task-level support.

Regarding perceived benefits, managers emphasized efficiency, reduction of repetitive tasks, time savings, data management, and staff shortages. AI is seen as improving routine operations, reducing errors, optimizing resources, and addressing labor scarcity by freeing employees for higher-value relational activities. Managers also stressed the necessity of AI to remain competitive and to manage the growing volume of data collected by hotels. Non-managers similarly highlighted labor shortages, cost reduction, competitiveness, and faster task execution, but identified lack of familiarity and privacy concerns as primary barriers. Overall, managers display a more proactive orientation, while non-managers tend toward cautious neutrality. Both groups, however, recognize AI's relevance for competitiveness, revealing a dual dynamic: shared acknowledgment of potential combined with role-specific concerns about knowledge, trust, and human interaction.

The analysis extends to the hotel food supply chain, identified as a strategic domain with significant economic and environmental implications. Food management in hotels is complicated by demand volatility linked to guest demographics, nationality, dietary habits, and seasonality. This variability often leads to overproduction and food waste, generating both financial and environmental costs (Micheli & Cagno, 2021). Manual processes in stock monitoring, meal planning, and supplier selection further constrain optimization, while supplier choices often prioritize convenience over local value creation (Vegan & Saghafi, 2020).

Within this context, AI is presented as a tool capable of enabling predictive demand forecasting and real-time procurement optimization to eight key informants (Table 1).

Table 1: Study participants

Interviewee	Role	Age	Sex	Professional experience
1	Hotel Manager, P.I.	35	Male	4
2	Hotel Manager, G.S.	50	Male	12
3	Hotel Manager, R.F.	58	Female	16
4	Hotel Manager, V.I.	39	Female	8
5	Hotel Manager, A.Z.	34	Male	3
6	Hotel Manager, E.G.	53	Male	18
7	Food supplier, M.N.	51	Male	20
8	Food supplier, G.P.	65	Male	25

The project "REWAPE Reducing Waste, Optimizing Purchases", supported by the Italian Fund for Digital Republic and Google.org, developed a prototype platform (MenuMind) to reduce food waste and improve purchasing efficiency. MenuMind combines data on occupancy, guest preferences, recipe grammages, and leftover feedback to generate dynamic forecasts of raw material needs. Unlike traditional systems, it learns progressively, improving predictive accuracy over time.

Eight exploratory interviews identified four macro-categories: efficiency, personalization, sustainability, and barriers. Efficiency relates to automation and predictive capacity, including automated ordering, real-time monitoring, and cost-per-meal control. These functions are perceived as reducing manual errors, optimizing margins, and enabling timely corrective interventions. Personalization refers to adapting menus and buffet planning to guest preferences, especially across different nationalities. Interviewees emphasized that AI must remain flexible to accommodate recipe heterogeneity and local culinary identity, avoiding excessive standardization.

Sustainability emerged as a central theme. AI is seen as supporting local sourcing by integrating seasonality and regional availability into purchasing decisions, thereby benefiting both the environment and local economies. Waste reduction is framed not only as an economic objective but also as corporate responsibility toward customers and the planet. Stakeholders also associate AI with supply chain resilience in contexts of climate change and market volatility.

Barriers include privacy concerns, data governance uncertainty, integration with existing management systems, and cultural resistance, particularly in kitchens. Experienced chefs may prefer intuition over algorithmic recommendations, perceiving digital tools as intrusive rather than supportive. Successful adoption therefore requires training, involvement, and cultural alignment, as well as clear governance regarding data ownership and protection. Ecosystem challenges also emerge, as integrating small local producers into digitalized supply chains may require cooperation and capacity building.

Taken together, the findings illustrate the dual sides of AI in hospitality processes. AI is widely perceived as a driver of efficiency, personalization, and sustainability, yet its adoption raises concerns about privacy, integration, and cultural acceptance. AI implementation is therefore not a purely technical matter but a socio-technical transformation shaped by organizational roles, knowledge levels, and ecosystem relationships.

Research limitations. *This study presents several limitations. First, both empirical investigations rely on qualitative methods, prioritizing depth of interpretation over statistical generalization. The findings are therefore context-bound and cannot be extended automatically to all hospitality settings. Second, the results are perception-based. Study 1 captures reported familiarity, attitudes, and examples of AI use, while Study 2 explores expectations regarding the MenuMind platform. The research does not include longitudinal data or objective performance measures such as verified cost reductions or quantified decreases in food waste. Third, although data governance and system integration emerged as central concerns, the study does not empirically analyze specific legal, technical, or organizational governance models.*

Managerial implications. *The findings suggest that AI adoption in hospitality requires role-sensitive implementation strategies. Managers tend to perceive AI more positively, while non-managers often remain neutral due to limited familiarity. Consequently, targeted training and practical demonstrations are essential to build confidence and reduce uncertainty among operational staff. AI should be framed as a support tool that enhances, rather than replaces, human interaction. By automating repetitive tasks and improving data management, AI can free employees to focus on relational and service-oriented activities. Clear data governance and transparent integration with existing systems are also critical, particularly when AI platforms connect with PMS and involve guest or supplier data. Finally, in the food supply chain context, successful implementation depends on balancing efficiency and sustainability objectives with organizational culture, flexibility and collaboration with local suppliers.*

Originality of the paper. *This study is original in its integrated examination of AI's dual sides across two interrelated hospitality process domains using qualitative evidence. It contributes by connecting role-based perceptions of AI adoption within hotel organizations to an exploratory analysis of AI application in the hotel food supply chain through the MenuMind platform. The paper's originality lies in showing how the same technology category can be framed simultaneously as a solution to labor shortages, efficiency pressures, sustainability objectives, and as a source of organizational tension involving privacy, data governance, system integration and cultural resistance. By focusing on concrete reported applications such as writing support, guest communication, segmentation, and predictive procurement, the paper provides a process-level understanding of AI adoption that bridges internal organizational dynamics and external supply chain relations. In addition, the emphasis on recipe heterogeneity and culinary identity further highlights a distinctive hospitality-specific challenge: optimization must remain compatible with differentiation, authenticity, and craftsmanship, otherwise technological benefits may be offset by erosion of unique service value.*

The value of brand heritage in the Destination Management process: a comparative study of Italian Cultural Capitals

ENRICO DI TARANTO[1], VALENTINA DELLA CORTE[1], ELEONORA NAPOLANO[1], ELENA LUPOLO[1]

Abstract. *This study investigates the role of brand heritage in destination management, focusing on Italian cities that have received institutional recognition. The research examines how heritage-based elements contribute to strengthening territorial identity and competitive positioning by analyzing the fifteen Italian cities awarded the title of Italian Capital of Culture and the four Italian cities designated European Capitals of Culture.*

The research adopts a qualitative and comparative approach to investigate how heritage-related dimensions are incorporated into strategic planning and communication processes. The study is guided by the following research questions: how institutional recognition influence heritage-based branding strategies, and what similarities and differences emerge across these culturally recognized cities strategies. Specifically, it examines the use of cultural heritage, local traditions, historical narratives and identity-based storytelling as tools to enhance destination positioning within tourism and cultural markets. Preliminary findings suggest that the effective integration of brand heritage into destination management strategies strengthens territorial identity, improves narrative coherence and enhances perceived authenticity.

This study contributes to the literature on destination branding and cultural management by highlighting the strategic importance of brand heritage in territorial development processes, offering a conceptual framework that connects cultural recognition programs with heritage-based branding strategies and destination management practices. Furthermore, it conceptualizes brand heritage as a dynamic and process-based construct, distinct from related concepts such as destination image and place branding and interprets it as a strategic resource embedded in governance and long-term territorial development processes. The study is presented as work-in-progress, with further empirical insights to be developed through ongoing qualitative data collection.

Keywords: *Brand heritage, Brand authenticity, Destination Management, Sustainable competitive advantage, Qualitative study.*

Framing of the research. The concept of destination management has evolved from a traditional focus on marketing activities aimed at attracting visitors by highlighting natural resources, cultural attractions, or infrastructure to contemporary approaches that integrate managerial and strategic perspectives designed to create long-term value for territories (Reinhold et al., 2023). This evolution reflects a broader shift in how destinations are understood and managed, with increasing attention given to the role of cultural and heritage assets in shaping territorial identity (Groote & Haartsen, 2016; Perry, 2023). Early destination management research primarily adopted a structural perspective, focusing on tourism suppliers and service chains within a defined geographical context (Presenza et al., 2006; Zhang et al., 2009). Over time, the focus has progressively moved toward leveraging heritage and cultural resources to develop distinctive territorial brands that enhance recognition and competitiveness (Fyall & Garrod, 2020; Almeida & Almeida, 2023).

Communication and branding have assumed a central role in destination management strategies. Territorial branding initiatives are now widely implemented to differentiate destinations by emphasizing their unique cultural, historical and natural characteristics (Melewar & Skinner, 2020). Yet many strategies continue to rely on relatively homogeneous narratives, often limited to the promotion of tangible and intangible assets such as monuments, landscapes and gastronomy (Kim & Youn, 2017). This standardization can undermine the uniqueness of destinations and weaken their competitive positioning in increasingly saturated tourism markets (Liu et al., 2024).

In response to these limitations, scholars and practitioners have increasingly highlighted the importance of incorporating deeper identity-based dimensions into territorial branding processes (Botschen et al., 2017). Specifically, the growing relevance of cultural and symbolic elements has led to the development of approaches such as place branding and cultural branding, which emphasize the role of identity, meaning and narrative construction in shaping the perception of places (Wong et al., 2016; Botschen et al., 2017; Maffei et al., 2026).

The concept of brand heritage has emerged as a particularly significant dimension. Originating in corporate branding literature, brand heritage refers to the temporal depth, continuity, core values and historical roots associated with a brand (Pecot et al., 2016). These elements include aspects such as longevity, track record, symbolic assets and the consistent transmission of values over time (Rindell & Santos, 2021). Several studies have highlighted that brand heritage enhances perceptions of authenticity, credibility and legitimacy, factors that have become increasingly important in contemporary markets characterized by high competition and information asymmetry (del Barrio-Garcia & Prados-Peña, 2019; Chen et al., 2021; Shi et al., 2022).

Authenticity can be understood as the perceived genuineness and credibility of a destination, often associated with its cultural traditions, historical continuity and local identity (Chen & Lee, 2021). While authenticity has been extensively studied as a determinant of tourist satisfaction and destination attractiveness, its connection with brand heritage as a strategic managerial resource remains relatively underexplored. In this respect, brand heritage differs from related

constructs such as destination image, which refers to tourists' perceptions, and place branding, which concerns the overall strategic positioning of places. Instead, brand heritage is interpreted here as a temporally embedded and strategically enacted process through which the past is selectively mobilized to shape present and future positioning.

Moving from the recognition of cultural heritage as a key territorial resource, brand heritage can be interpreted as the outcome of a strategic process through which historical and cultural assets are translated into coherent narratives and identity-based positioning strategies. More specifically, this study conceptualizes brand heritage as a process articulated in phases of activation, interpretation and strategic communication, through which heritage elements are selected, given meaning and projected externally. This perspective extends beyond the mere preservation of heritage and emphasizes its role in shaping the symbolic and competitive dimensions of destinations.

Institutional initiatives aimed at promoting cultural identity have further reinforced the strategic importance of heritage in destination management. Programs such as the European Capital of Culture and the Italian Capital of Culture provide formal recognition to cities that demonstrate strong cultural vitality and innovative approaches to heritage valorisation. These initiatives not only enhance the visibility of destinations but also stimulate the development of long-term cultural strategies, investments in cultural infrastructures and the activation of local stakeholder networks.

The recognition associated with cultural capital titles can be interpreted as a strategic platform for activating processes of identity reconstruction and heritage-based branding, as cities receiving such titles are encouraged to rediscover, reinterpret and communicate their historical and cultural narratives, thereby contributing to the construction of a coherent territorial brand grounded in authenticity.

Despite these developments, the integration of brand heritage into destination management remains a relatively underexplored area of research. Most studies on destination management have only carried out analyses of destination image and tourism experiences, without explicitly addressing how cultural identity and storytelling can be leveraged as strategic assets within territorial contexts. Therefore, the present study aims to explore how brand heritage can be integrated into destination management to strengthen territorial identity and enhance competitive positioning. In doing so, the paper also aims to contribute by bridging brand heritage literature with destination management and cultural governance perspectives, offering a process-oriented and comparative understanding of heritage-based branding strategies.

Purpose of the paper. The main objective of this study is to investigate how brand heritage can function as a strategic resource within the destination management process, particularly in cities that have received institutional recognition for their cultural strategies. More specifically, the research aims to explore how the valorization of cultural heritage, historical identity and local traditions contributes to shaping territorial branding strategies and strengthening the competitive positioning of destinations. In line with this objective, the study addresses the following research questions: how institutional recognition influence heritage-based branding strategies and what similarities and differences emerge across culturally recognized cities.

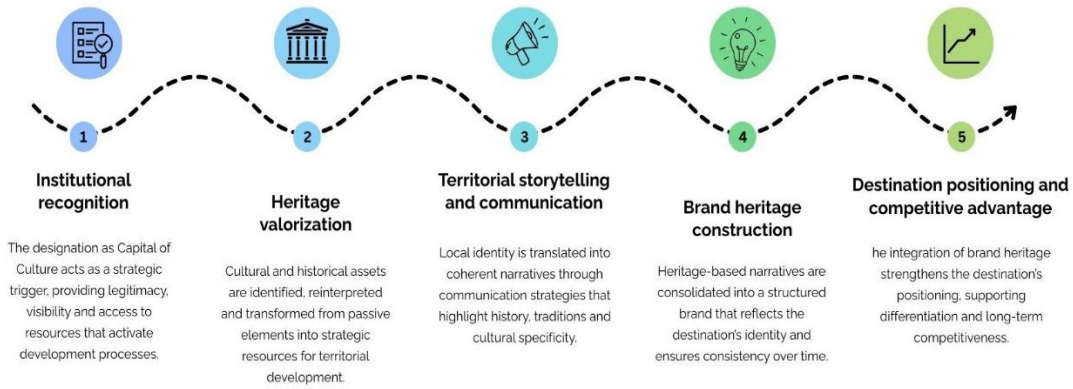
While the tourism literature has extensively analyzed destination image, tourist experiences and branding strategies (Folgado-Fernández et al., 2017; Huang et al., 2021), fewer studies have focused on the role of brand heritage as a strategic dimension in territorial communication and development. Therefore, this research aims to contribute to the existing literature by examining how cities awarded the title of Italian Capital of Culture or the Italian cities that have received the title of European Capital of Culture integrate heritage-based narratives into their destination management strategies. These cities represent particularly relevant cases for analyzing the relationship between institutional recognition, heritage valorization and territorial branding. They provide structured contexts in which cultural identity is explicitly mobilized as a lever for development and positioning.

Brand heritage, which includes tangible and intangible dimensions, contributes to shaping the symbolic and narrative dimensions of a destination's brand, allowing territories to communicate values, meanings and cultural identities that go beyond traditional promotional approaches (Rose et al., 2016; Qiu, 2023). By integrating these heritage-related dimensions into destination management processes, cities can potentially strengthen their authenticity, differentiate themselves from competing destinations and develop more sustainable forms of tourism development. In this perspective, brand heritage is not limited to the representation of the past but becomes a strategic mechanism through which destinations construct and project identity over time.

Building on these premises, this study proposes a conceptual framework that interprets brand heritage as a dynamic and processual construct within destination management, as shown in Figure 1. In doing so, the study contributes to the literature by extending the concept of brand heritage from corporate branding to territorial contexts and by framing it as a process-based and governance-related phenomenon. Specifically, brand heritage is conceptualized as the outcome of a sequence of interconnected stages through which cultural resources are activated, interpreted and strategically mobilized. In this perspective, the development of brand heritage depends on the ability of destinations to transform historical and cultural assets into coherent identity-based strategies.

The process is typically initiated by a triggering condition represented by institutional recognition, such as the designation of a city as Italian Capital of Culture or European Capital of Culture. These recognitions activate strategic processes within destinations by providing legitimacy, visibility and access to both tangible and intangible resources. They signal the cultural relevance of a city at national or international level, enhance its symbolic capital and encourage coordinated action among local stakeholders. At the same time, they often facilitate access to funding opportunities, governance structures and collaborative networks that support the implementation of cultural and development projects.

Subsequently, destinations engage in processes of heritage valorization, which represent a critical step in transforming cultural resources into strategic assets. This involves not only the identification and preservation of cultural elements but also their reinterpretation and communication. Cultural heritage shifts from a passive element to be preserved to an active resource capable of generating social and economic value. Through this transformation, destinations develop a more articulated and meaningful representation of their identity.



However, the existence of cultural heritage resources alone does not automatically generate competitive advantage. Their strategic value depends on the ability of destinations to communicate and narrate them effectively. For this reason, the next stage concerns the development of territorial storytelling and communication strategies. At this level, destinations select, organize and interpret elements of their past and identity in order to construct coherent narratives that can be shared with external audiences. Storytelling allows destinations to connect historical continuity with present meanings and future aspirations, translating heritage into symbolic representations capable of conveying authenticity and identity. This phase is characterized by a strong element of selectivity, as destinations strategically choose which aspects of their heritage to emphasize in line with their positioning objectives.

The interaction between heritage valorization and storytelling leads to the construction of brand heritage, which represents the core outcome of the process. At this stage, heritage becomes an integrated component of the destination's brand identity and can be understood as the synthesis of historical continuity, core values and symbolic meanings that define the essence of a place. Brand heritage strengthens perceptions of authenticity and credibility, as it reflects a coherent relationship between the identity communicated by the destination and its cultural roots. It should be emphasized that it is not a fixed condition but rather a dynamic construct that requires continuous reinforcement through consistent strategies and communication practices.

Finally, the development of brand heritage has direct implications for destination positioning and competitive advantage. By leveraging heritage-based narratives, destinations are able to differentiate themselves in increasingly competitive and standardized tourism markets. In this sense, brand heritage supports a shift from attraction-based competition to value-based positioning, where symbolic and experiential dimensions become central. At the same time, heritage-driven strategies tend to promote more sustainable forms of development, as they are rooted in local resources and encourage the involvement of communities in the preservation and enhancement of cultural assets.

Moreover, this framework highlights that the strategic value of heritage in destination management does not lie in its mere existence, but in the processes through which it is activated, interpreted and communicated. Institutional recognition, heritage valorization, storytelling and brand construction represent interdependent phases of a broader process that ultimately contribute to strengthening the identity, positioning and long-term competitiveness of destinations.

Figure 1 – Proposed conceptual framework

Methodology. This study adopts a qualitative research approach aimed at exploring the strategic role of brand heritage within destination management processes. In line with its exploratory nature, the study is guided by the following research questions:

RQ1. How do institutional recognition influence the development of heritage-based branding strategies?

RQ2. What similarities and differences emerge in the strategic use of brand heritage?

The research is based on a comparative analysis of Italian cities that have received institutional recognition for their cultural value through the titles of Italian Capital of Culture and European Capital of Culture. These recognitions provide particularly relevant contexts for analyzing how cultural heritage can be strategically integrated into territorial branding and destination management strategies.

The Italian Capital of Culture initiative was established by the Italian Ministry of Culture in 2014 with the aim of promoting cultural development, strengthening territorial identity and supporting urban regeneration through culture-led strategies. Each year, a city is selected through a national competitive process in which candidate cities present a cultural program outlining strategic projects, governance structures and long-term development objectives centered on cultural heritage and local identity. Since its introduction, fifteen cities have been awarded the title: Cagliari, Lecce, Perugia, Ravenna and Siena (2015, jointly designated); Mantua (2016); Pistoia (2017); Palermo (2018); Parma (2020–2021);

Procida (2022); Bergamo and Brescia (2023, jointly designated); Pesaro (2024); Agrigento (2025); and L'Aquila (2026). These cities represent diverse territorial, socio-economic, and cultural contexts across Italy, offering a heterogeneous set of cases through which to analyze heritage-based branding dynamics.

In addition, the study also considers the Italian cities that have received the title of European Capital of Culture: Florence (1986), Bologna (2000), Genoa (2004), and Matera (2019). The European Capital of Culture initiative, promoted by the European Union, aims to highlight the cultural richness and diversity of European cities while fostering cultural development and international visibility. For Italian cities, this designation has often acted as a catalyst for urban regeneration, cultural investment and the international repositioning of the destination brand.

The methodological approach involves an exploratory analysis of multiple secondary sources, including institutional documents, cultural programs, official communication strategies, policy frameworks and promotional materials associated with the cultural capital initiatives. The documentary corpus includes strategic plans, bid books, institutional reports, and official communication outputs produced by the selected cities. Particular attention is devoted to the ways in which these cities communicate their historical identity, cultural heritage and local traditions within territorial branding narratives. These materials allow the reconstruction of the strategic frameworks through which cultural heritage is interpreted and mobilized as a branding resource.

To strengthen the robustness of the analysis, the research adopts a data triangulation strategy that combines documentary analysis with qualitative insights gathered from primary sources. Specifically, semi-structured interviews will be conducted with key stakeholders involved in the design and implementation of the cultural capital initiatives, including mayors, project promoters, cultural program coordinators, local councillors responsible for culture and tourism, institutional representatives and other operators involved in the projects. Interviewees are selected based on their direct involvement in strategic decision-making and implementation processes related to the cultural programs. The interviews will be analyzed using NVivo software, allowing for a systematic coding process through which emerging themes and insights will be identified, categorized and grouped (Elliott-Mainwaring, 2021; Kraiwanit et al., 2023). This approach enables the organization of qualitative data into coherent analytical dimensions, facilitating the identification of recurring patterns and strategic orientations (Azeem et al., 2012; Maher et al., 2018).

The comparative analysis adopts a cross-case strategy aimed at identifying common patterns, strategic approaches, and distinctive practices across the selected cities (Palmberger & Gingrich, 2014; Roso-Llorach et al., 2018). In particular, the comparison focuses on similarities and differences in how heritage is activated, interpreted and strategically communicated within different governance and institutional contexts. By examining multiple cases within a shared institutional framework, this study aims to demonstrate how heritage-based narratives shape the identity, positioning and long-term development strategies of destinations.

Finally, it is important to note that this study is presented as work-in-progress. While the documentary analysis provides preliminary insights into the strategic use of brand heritage, the empirical investigation will be further developed through the ongoing interview phase, allowing for a deeper understanding of the underlying processes and governance mechanisms.

Results. Although the research is still ongoing, the preliminary findings highlight some emerging patterns across the analyzed cases. Destinations that integrate brand heritage into their destination management strategies tend to develop more coherent and structured territorial identities, particularly when heritage is consistently embedded within both strategic communication and policy frameworks.

The comparative analysis of the selected Italian cases shows that the valorization of cultural and historical assets is more effective when supported by strong institutional recognition and coordinated planning. In particular, cities with more structured governance mechanisms and formalized cultural strategies appear to achieve a clearer and more consistent positioning within broader cultural and development agendas, whereas less coordinated contexts display more fragmented and less strategically aligned narratives.

Within this perspective, the recognition associated with cultural capital titles emerges as a key catalyst for activating heritage-based processes. These designations encourage cities to systematize and reinterpret their historical and cultural narratives, strengthen governance structures, and implement cultural programs aligned with long-term development objectives. As a result, a more coherent strategic vision tends to emerge, grounded in local identity and supported by formal planning and institutional coordination.

Furthermore, the findings suggest that heritage-based branding strategies are inherently multi-actor processes, involving a wide range of stakeholders within the local ecosystem, including public administrations, cultural institutions, project promoters, and actors from the creative and cultural industries. The interaction among these actors appears to play a crucial role in shaping how heritage is selected, interpreted, and strategically communicated.

The analysis of institutional documents and communication materials also highlights the central role of strategic communication as a managerial lever. Cities tend to emphasize elements such as historical continuity, local traditions, and cultural production in order to construct coherent and recognizable narratives. These narratives contribute to structuring the symbolic dimension of destinations and to consolidating their positioning within national and international cultural frameworks.

Overall, the preliminary findings suggest that the integration of brand heritage into destination management goes beyond the promotion of cultural assets and involves a broader process of identity construction, strategic alignment, and governance, through which heritage becomes an active resource in shaping the development trajectories of territories.

The next phase of the research will deepen these insights through semi-structured interviews with key stakeholders, with the aim of further exploring the processes of heritage selection, interpretation, and communication, as well as the governance mechanisms underlying them.

Research limitations. Despite the research still being a work in progress, several limitations can already be identified. A primary constraint concerns the limited and fragmented body of academic literature specifically addressing brand heritage within the context of territorial and destination branding. While place branding and destination marketing have been widely explored, the role of heritage-based branding strategies remains only partially investigated, leaving important aspects of their strategic and managerial implications still underexamined.

A second limitation relates to the intrinsic heterogeneity of cultural capital initiatives and the diversity of strategies adopted by different cities. Each destination develops context-specific cultural programs and branding approaches, influenced by its historical trajectory, institutional setting and socio-economic conditions. Consequently, the identification of shared models or transferable best practices remains partial and largely interpretative.

Finally, the absence of standardized indicators or robust quantitative metrics for assessing the value and impact of brand heritage initiatives represents a significant methodological constraint. The lack of commonly accepted measurement tools makes it difficult to evaluate outcomes in a systematic and comparable way across different contexts. For this reason, the study relies predominantly on qualitative analysis and comparative interpretation of existing practices. While this approach allows for an in-depth understanding of processes and meanings, it also introduces a degree of subjectivity and limits the possibility of establishing causal relationships or measuring performance in strictly empirical terms. Future research could address this limitation by developing integrated approaches that combine qualitative insights with more structured evaluation tools.

Managerial implications. The study offers relevant implications for public institutions, destination management organizations and local stakeholders involved in cultural and tourism development. Specifically, the research highlights how brand heritage can be leveraged as a strategic resource within destination management processes, supporting the construction of coherent territorial identities and strengthening the positioning of cities in competitive contexts.

By promoting cultural traditions and local identity, heritage-based branding strategies enable destinations to develop consistent and meaningful narratives. These narratives, when supported by coherent communication and concrete territorial actions, contribute to the visibility and symbolic value of places, while also supporting the activities of local economic actors operating within the destination ecosystem.

Furthermore, the analysis suggests that institutional recognition programs, such as the Italian Capital of Culture and the European Capital of Culture, coordinate strategic actions among local stakeholders. The initiatives foster collaboration, encourage the alignment of strategic objectives and support the development of long-term cultural and territorial policies.

Overall, the study provides practical insights for policymakers and practitioners, suggesting that the effective integration of brand heritage into destination management requires communication efforts, consistent governance, stakeholder involvement and the implementation of actions aimed at the valorization of local cultural resources.

Originality of the paper. The original contribution of this ongoing research lies in its focus on the concept of brand heritage within the context of destination management and territorial branding, a perspective that remains relatively underexplored in existing literature. While prior studies have extensively addressed place branding and destination marketing, limited attention has been devoted to understanding how heritage-based narratives can be strategically integrated into destination management processes and translated into concrete positioning strategies.

In this study, brand heritage is conceptually distinguished from related constructs such as place branding, which focuses on the overall strategic positioning of places; destination image, which refers to tourists' perceptions; and authenticity, which concerns the perceived genuineness of experiences. Instead, brand heritage is interpreted as a temporally embedded and strategically enacted process through which the past is selectively mobilized to shape present and future positioning.

The paper makes three main theoretical contributions. First, it reconceptualizes brand heritage as a dynamic and process-based construct, framing it not as a static attribute linked to the past, but as a phenomenon that emerges through sequential phases of activation (selection of heritage elements), interpretation (meaning attribution), and strategic communication (external projection and positioning). Second, it extends brand heritage literature to the domain of destination management, highlighting how heritage can be intentionally leveraged in territorial branding strategies. Third, it connects brand heritage with governance and territorial development perspectives, showing how public actors, cultural institutions, and local stakeholders actively participate in the construction and management of heritage narratives.

Furthermore, the study adopts a qualitative and comparative approach that examines multiple Italian territories characterized by institutional cultural recognition, including both Italian Capitals of Culture and cities designated as European Capitals of Culture. By analyzing these cases within a shared institutional framework, the research provides a structured lens through which to observe how cultural identity, historical continuity, and local traditions are mobilized as strategic resources. This enables the identification of recurring patterns, divergences, and context-specific strategies across different territorial settings. In addition, the focus on formally recognized cultural cities introduces an institutional

dimension that is often overlooked in branding studies, highlighting the role of public policy and cultural governance in shaping branding processes.

Finally, this work in progress advances current knowledge by linking the concept of brand heritage not only to communication practices but also to broader processes of governance, identity construction, and strategic coordination. In doing so, it highlights how heritage can move beyond a symbolic or promotional function to become an active component in shaping the development trajectories and positioning strategies of destinations.

Understanding AI adoption among hospitality microentrepreneurs: Preliminary evidence from a Delphi study in Italy

MARA NORMANDO[1], ANGELO PRESENZA[2], ADRIANA APUZZO[1], MARIO TESTA[1]

Abstract. *Microenterprises dominate the hospitality sector yet remain underexplored in digital transformation research, particularly regarding Artificial Intelligence. In these owner-managed, resource-constrained settings, the transition from formal AI adoption to its substantive integration into operational routines constitutes a theoretically and empirically significant challenge. Drawing on an integrated framework combining UTAUT, the Technology-Organisation-Environment (TOE) framework, and Entrepreneurial Orientation (EO) theory, this paper investigates how Italian hospitality micro-entrepreneurs conceptualise AI, which adoption practices emerge in daily operations, and which factors enable or constrain substantive AI integration.*

The study adopts a Delphi-informed exploratory design. This paper reports preliminary findings from Round 1 of a multi-round Delphi study; open-ended responses from eleven experts were analysed through inductive thematic analysis guided by the UTAUT-TOE-EO architecture as sensitising categories.

Findings reveal three key patterns: widespread semantic ambiguity around AI, which distorts performance expectations; a structural bifurcation between implicit platform-mediated AI use and deliberate strategic adoption, inverting the standard UTAUT intention-to-use sequence and suggesting that environmental pressures precede individual-level acceptance mechanisms; and cognitive, identity-related, and structural barriers operating at distinct analytical levels. These preliminary findings extend UTAUT beyond its conventional individual-level application and contribute an empirically grounded, multi-level specification of AI adoption dynamics in tourism microenterprises.
Keywords: *Artificial intelligence; tourism microenterprises; UTAUT; Entrepreneurial Orientation; Delphi method; hospitality*

Framing of the research. *Tourism microenterprises represent the backbone of the global hospitality sector, accounting for the majority of accommodation providers while remaining systematically underexplored in digital transformation scholarship (Kc et al., 2021). In these organisational settings, typically family-run businesses with fewer than ten employees, the entrepreneur simultaneously embodies strategic decision-maker, operational manager, and frontline service provider, concentrating cognitive, relational and operational responsibilities within a single figure (Mohammad, 2021). This structural configuration renders digital transformation inseparable from the micro-entrepreneur's cognitive work: technology adoption influences how information is interpreted, decisions are formulated, cognitive load is managed, and the entrepreneurial role itself is constructed over time (Poulaki et al., 2024).*

Contemporary literature has progressively reconceptualised digital transformation from episodic technology adoption to cumulative organisational reconfiguration, emphasising that digitalisation outcomes depend on combinations of resources, competencies, and contextual conditions enabling persistent technology use (Grashof & Kopka, 2023; Li & Yu, 2025). Within this framework, Artificial Intelligence (AI) emerges as a potentially equalising technology, granting resource-constrained firms access to capabilities, content generation, predictive analytics, and automated customer interaction, historically reserved for larger organisations (Demir & Demir, 2025; Saydam et al., 2022). Yet empirical evidence suggests that AI's organisational value manifests not through technology per se, but through its incorporation into informational infrastructures and operational practices (Ardito et al., 2025). In microenterprises, such incorporation processes confront persistent constraints: limited financial resources, scarce digital competencies, temporal scarcity, and fragile organisational structures with minimal capacity to absorb uncertainty (Joseph et al., 2025). This disconnection between formal adoption, the mere presence of a tool and substantive use, its stable integration into consequential routines, constitutes the central empirical and theoretical problem addressed by this study.

Three interrelated theoretical frameworks are mobilised to address this problem. The primary explanatory lens is the Unified Theory of Acceptance and Use of Technology (UTAUT), proposed by Venkatesh et al. (2003) as an integrative synthesis of prior technology acceptance models, including the Theory of Reasoned Action (Fishbein & Ajzen, 1975), the Technology Acceptance Model (Davis et al., 1989), the Theory of Planned Behaviour (Ajzen, 1991), and the Innovation Diffusion Theory (Rogers et al., 2014). UTAUT identifies four core constructs - Performance Expectancy, Effort Expectancy, Social Influence and Facilitating Conditions - as primary determinants of adoption intention and technology use behaviour. In AI-specific contexts, the model has been extended to incorporate Trust and Perceived Risk as additional constructs (Kuberkar & Singhal, 2020; Lin et al., 2022; Tran & Nguyen, 2021), whose relevance is particularly acute in micro-hospitality settings where AI outputs directly affect guest experience and reputational standing. Venkatesh (2022) has explicitly grounded a research agenda for AI adoption in UTAUT, calling for contextualised applications that attend

[1] Department of Political and Communication Sciences, University of Salerno, Italy
[2] Department of Economics, University of Molise, Italy

to the antecedent individual, technological and environmental characteristics shaping AI use in specific organisational settings.

While UTAUT captures the mechanisms of individual technology acceptance, it does not systematically account for the organisational and environmental conditions that shape and frequently constrain the actualisation of adoption intentions. The Technology-Organisation-Environment (TOE) framework (Tornatzky & Fleischer, 1990) addresses this gap by disaggregating adoption determinants across three analytical dimensions: the technological context (relative advantage, complexity and compatibility of available technologies), the organisational context (firm size, resource endowment, managerial competencies and absorptive capacity), and the environmental context (competitive pressure, institutional support and infrastructural endowment). TOE has been extensively applied to digital technology adoption in small and medium enterprises (Ardito et al., 2025; Zuñiga-Collazos et al., 2025), and its tripartite logic maps productively onto the structural specificities of Italian tourism microenterprises, particularly in Southern regions characterised by documented North–South gaps in digital integration, limited access to advisory services, and persistent asymmetries in innovation ecosystem density (Bank of Italy, 2021). Integrated UTAUT-TOE models have demonstrated superior predictive validity compared to single-framework approaches in SME technology adoption contexts (Baker, 2012).

A third theoretical layer is introduced through the construct of Entrepreneurial Orientation (EO), understood here as a dispositional antecedent that modulates how UTAUT constructs are weighted and enacted by individual owner-managers. Drawing on Miller (1983) and Lumpkin & Dess (1996), EO captures the behavioural disposition of firms and in microenterprises, of owner-managers themselves along five dimensions: innovativeness, risk-taking, proactiveness, autonomy and competitive aggressiveness. Recent studies confirm that AI adoption in small hospitality firms is explained primarily by entrepreneurial cognitive orientations rather than structural firm characteristics (Kukanja & Planinc, 2025) and that EO significantly shapes the relationship between environmental conditions and digital technology adoption in SMEs (Williams et al., 2021). In the present framework, EO is positioned as a subordinate antecedent that modulates UTAUT construct salience: entrepreneurs characterised by higher innovativeness and proactiveness tend to form more favourable Performance Expectancy assessments and exhibit greater tolerance for the learning investment implied by Effort Expectancy; higher risk-taking propensity attenuates the inhibitory effect of Perceived Risk on adoption intentions. This positioning is consistent with Venkatesh et al.'s (2012) recognition that individual differences, including innovativeness, function as moderating antecedents within UTAUT.

This integrated theoretical architecture, UTAUT as the primary adoption mechanism, TOE as the contextualising structure, EO as the individual dispositional antecedent, responds to three gaps in existing literature. First, AI adoption research in tourism remains concentrated on sectoral-level trends or larger hospitality organisations, leaving microenterprise dynamics largely unexplored (Knani et al., 2022). Second, existing UTAUT applications in entrepreneurial contexts inadequately account for how territorial heterogeneity - digital infrastructure availability, institutional support quality, local innovation ecosystems - moderates individual adoption intentions. Third, the interplay among entrepreneurial cognitive orientation (EO), contextual embeddedness (TOE), and individual technology acceptance (UTAUT) remains empirically under-specified in resource-constrained service settings characterised by high relationship intensity and reputation sensitivity. The Italian tourism microenterprise context presents an empirically strategic case for addressing these gaps: Italy's hospitality sector is dominated by microenterprises (ISTAT, 2023), exhibits significant territorial asymmetry in digital infrastructure and institutional support, and faces intensifying competitive pressure from platform-mediated intermediaries requiring accelerated digital capability development (Esfandiar et al., 2024).

Taken together, these three strands of literature converge on a specific analytical omission: the conditions under which formal AI adoption in tourism microenterprises translates, or fails to translate, into substantive integration within operational routines remain empirically unspecified. Existing evidence documents adoption rates and sectoral diffusion patterns, yet the mechanisms linking entrepreneurial disposition, organisational constraint and territorial context to routine-embedded use are not systematically accounted for. This study addresses this omission by articulating a multi-level specification of AI adoption dynamics in Italian tourism microenterprises, thereby advancing both the theoretical integration of UTAUT, TOE and EO and the empirical mapping of adoption practices in this underserved segment.

Purpose of the paper. *This study pursues a dual aim: to explore how tourism micro-entrepreneurs in the Italian context perceive and conceptualise AI, and to identify the individual, organisational and environmental factors that enable or constrain the transition from formal AI adoption to its substantive incorporation into daily business practices. Guided by the UTAUT-TOE-EO architecture, the inquiry proceeds through three research questions, presented here jointly to make their interrelation explicit:*

RQ1: How do tourism micro-entrepreneurs perceive, conceptualise and attribute meaning to AI within their entrepreneurial activity?

RQ2: Which adoption and use practices emerge in the everyday activities of tourism micro-entrepreneurs within their operational reality?

RQ3: Which individual and organisational factors enable or inhibit AI adoption and substantive use in tourism microenterprises?

These three questions are conceived as analytically distinct yet sequentially interdependent.

RQ1 operates at the cognitive and interpretive level: it investigates how owner-managers define and make sense of AI, what functional boundaries they draw between AI tools and other digital technologies already in use, and what expectations, in terms of performance, effort, trust and risk, orient their initial attentional and evaluative dispositions toward the technology. Conceptualisation is treated not as a neutral preliminary phase but as a substantive object of inquiry, given that the cognitive frames through which micro-entrepreneurs apprehend AI constitute a foundational condition for any subsequent adoption dynamic (Giuggioli & Pellegrini, 2023). In this dimension, EO's innovativeness and proactiveness function as dispositional antecedents that shape the breadth and openness of AI sensemaking, consistently with UTAUT's Performance and Effort Expectancy constructs.

RQ2 shifts attention from intention to practice, investigating which AI applications are mobilised in the daily routines of tourism micro-entrepreneurs and across what functional domains - booking management, customer communication, content generation, dynamic pricing, operational coordination - they are deployed. Critically, this question targets the distinction between formal adoption and substantive use: the presence of a tool does not imply its integration into consequential decision-making routines, and the conditions under which this integration occurs remain poorly understood in microenterprise settings (Joseph et al., 2025). The organisational and technological dimensions of TOE are particularly operative here, directing analytical attention to the infrastructural and competence-related conditions that mediate between adoption intention and routine-embedded use (Ardito et al., 2025).

RQ3 addresses the enabling and inhibiting factors that modulate the adoption process across all three levels of the integrated framework. At the individual level, it investigates EO dimensions (innovativeness, risk-taking propensity, proactiveness), digital self-efficacy and tolerance for uncertainty as dispositional antecedents of UTAUT construct salience. At the organisational level, it examines resource endowment, absorptive capacity, data infrastructure quality and the degree of concentration of managerial functions, all structural features that distinguish tourism microenterprises from the SME populations on which UTAUT was originally validated. At the environmental level, it attends to competitive pressure, the availability and quality of institutional support, and territorial asymmetries in digital infrastructure, factors captured by TOE's environmental dimension and particularly salient in the Southern Italian context, where significant variation in innovation ecosystem density constitutes a structurally relevant moderating condition (Esfandiar et al., 2024).

Methodology. *This paper presents a preliminary stage of a broader ongoing research project and reports the design and initial findings derived from the first wave of data collection within an exploratory study informed by the Delphi tradition. The present phase of the project adopts an exploratory approach to elicit and compare a plurality of informed perspectives on the adoption of AI in Italian tourism microenterprises.*

The Delphi method is a structured, iterative group communication technique designed to elicit and refine informed judgment from a panel of experts through successive rounds of data collection, anonymous feedback and controlled convergence (Rowe & Wright, 1999; Linstone & Turoff, 2002). In its classical formulation, the technique rests on four defining properties: anonymity among panellists, iteration across rounds, controlled feedback synthesising group responses, and statistical or thematic aggregation of individual positions (Delbecq et al., 1975). While the present stage of the research does not yet employ the full iterative structure typically associated with a Delphi process, these methodological principles inform the study's broader design, particularly the elicitation of structured reflections from knowledgeable participants.

The choice of this exploratory consultation-based design is analytically motivated by the specific characteristics of the research problem. Understanding the conditions, practices, and barriers governing AI adoption in Italian tourism microenterprises involves a complex, empirically under-documented phenomenon that is not readily accessible through direct experimental or survey-based measurement. In such circumstances, collecting reflections from actors occupying different positions within the tourism ecosystem offers an empirically grounded way to map how the phenomenon is currently interpreted and experienced in practice. Approaches that gather structured reflections from informed participants have proven particularly valuable when research addresses emerging phenomena characterised by fragmented empirical evidence (Skulmoski et al., 2007). The present study, therefore, aims to assemble a heterogeneous set of perspectives able of illuminating how artificial intelligence is currently understood within the tourism sector, including the conditions perceived as enabling or constraining its diffusion and the operational practices associated with its adoption in micro-hospitality contexts.

The respondent pool is constructed according to a purposive sampling strategy combined with snowball recruitment procedures (Keeney et al., 2006). Initial participants were selected based on their professional involvement with tourism management, digital transformation, entrepreneurship, or hospitality operations. These respondents were subsequently invited to indicate additional individuals whose experience could contribute relevant insights, allowing the sample to expand through referral networks. Panel heterogeneity is a deliberate design choice: the research questions require perspectives spanning multiple registers of knowledge and practice, and panels involving actors with complementary forms of expertise are known to yield richer and more robust outputs than homogeneous configurations (Choi & Sirakaya, 2006; Foerster & von der Gracht, 2014). Accordingly, five stakeholder categories are represented: academic researchers; institutional actors; sectoral associations representing Italian hospitality operators; experienced consultants; and micro-entrepreneurs directly managing small hospitality businesses. The inclusion of micro-

entrepreneurs reflects the central role these actors play in shaping the practical conditions under which AI technologies are adopted within small hospitality firms.

The number of participants is guided by principles of purposive saturation rather than predetermined numerical targets (Giannarou & Zervas, 2014). Data collection, therefore, remains ongoing and will continue until additional responses cease to generate substantively new thematic insights. At the current stage of the research process, the material analysed in this paper corresponds to the first set of questionnaires returned by respondents recruited through the purposive and snowball procedure. These responses provide the empirical basis for the preliminary findings presented in this study.

The questionnaire was designed to elicit reflective responses through open-ended prompts aligned with the three research questions guiding the study. Participants were invited to reflect on their interpretations of the role of artificial intelligence in micro-hospitality businesses, the operational practices through which these technologies are currently adopted, and the contextual conditions that may facilitate or constrain their diffusion. All responses were collected and processed under conditions of strict anonymity to minimise reputational signalling and conformity pressures typically associated with direct expert interaction (Rowe & Wright, 1999).

Consistent with the exploratory orientation of the study, the open format of the questionnaire allows respondents to articulate their observations in their own terms while enabling the emergence of interpretive dimensions that may not yet be fully captured within the existing literature (Sekayi & Kennedy, 2017). Convergence will be assessed through the progressive stabilisation of themes across rounds; if required, a further iteration will be conducted to consolidate the emerging interpretive structure.

Data from this initial wave of responses are analysed through an iterative thematic analysis procedure. Responses are coded inductively, generating a thematic structure that maps onto the three research questions while remaining open to emergent categories not anticipated by the theoretical framework. The UTAUT-TOE-EO architecture serves as a set of sensitising categories that orient, without constraining, the interpretation of the empirical material. Findings derived from this first stage of data collection, which are presented in the following section, provide a first empirical contribution and lay the analytical foundations for the subsequent iterative rounds of the broader research programme. As additional responses are gathered, the thematic structure will be progressively refined, and the degree of convergence across perspectives will be assessed, in line with the multi-dimensional understanding of interpretive agreement recommended by Von der Gracht (2012) and Giannarou and Zervas (2014).

The validity of findings at this preliminary stage rests on the analytical function assigned to the first round within the Delphi-informed design. In its exploratory capacity, Round 1 is intended to surface the interpretive range across heterogeneous expert positions rather than to produce convergent judgment; its epistemic status is therefore diagnostic, mapping the conceptual territory within which subsequent consolidation will operate. Robustness is pursued not through the authority of a single round but through the iterative architecture of the overall study, in which successive rounds recontextualise individual positions against the aggregated pattern of prior responses, allowing dissent to be articulated, shared interpretations to stabilise, and residual divergences to be rendered analytically visible. The findings reported here should accordingly be read as foundational rather than conclusive.

Results. *The analysis of the responses allowed the identification of three main thematic areas, articulated into thirteen sub-themes corresponding to the three research questions guiding the study. The thematic structure maps onto the UTAUT–TOE–EO architecture introduced above, with findings for each research question read against the constructs they most directly engage: cognitive and acceptance-related mechanisms, organisational and technological conditions, and environmental constraints. The findings indicate that AI adoption among Italian hospitality micro-enterprises is already relatively widespread yet largely confined to specific applications. At the same time, considerable heterogeneity persists in how the technology is interpreted, used, and strategically integrated into business practices.*

Regarding the first research question, which concerns how small-scale entrepreneurs conceptualise AI, the results reveal a widespread interpretative uncertainty regarding the meaning of the term itself. Several experts noted that AI is frequently used as a generic label referring to any digital tool perceived as advanced, without a clear distinction between different technological categories. As one participant observed, "in the micro hospitality business segment, the term 'AI' is almost always misunderstood. There is a tendency to call AI anything that is perceived as a new technology". Similarly, another expert remarked that "at the moment, there is a lot of confusion, and everything tends to collapse into what an individual can directly do with ChatGPT". This semantic ambiguity affects entrepreneurs' ability to form informed expectations regarding the value of the technology and tends to limit a more systematic assessment of the opportunities offered by AI.

A second relevant finding concerns the distinction between implicit use and conscious use. According to several respondents, many micro-enterprises already interact daily with algorithm-based systems through digital platforms such as online travel agencies and booking management tools. However, this interaction often occurs without an explicit awareness of the role played by AI in operational processes. One participant summarised this dynamic effectively by noting that "in terms of unconscious use, diffusion is extremely high. Anyone working on Booking or Airbnb already uses AI every day in suggested prices, listing rankings, or automated responses". The same expert added, however, that "when it comes to conscious and autonomous use, diffusion is still very limited". This distinction suggests that exposure to the technology does not necessarily translate into deliberate integration within the firm's decision-making practices. Theoretically, this pattern inverts the canonical UTAUT sequence. In the original formulation, acceptance mechanisms

precede adoption, with Performance Expectancy, Effort Expectancy and Social Influence shaping intention before use occurs. The present evidence suggests the opposite trajectory in platform-mediated microenterprise settings: use is already in place, embedded in the infrastructural conditions of operation, and acceptance mechanisms are activated only when entrepreneurs move from ambient exposure to deliberate engagement. Adoption, on this reading, is environmentally anchored before it becomes cognitively intentional.

Alongside these interpretations, a third way of conceptualising AI also emerges, in which the technology is described as a tool able of amplifying the operational capabilities of the entrepreneur. In this perspective, AI does not replace human work but enables entrepreneurs to expand their ability to manage operational and communicative activities. One respondent described this function using a particularly illustrative metaphor: "I always think of my mountain bike with assisted speed. Without that small help, I would never have managed to climb certain mountains. I did it myself, but that assisted speed amplified my powers". Similarly, another participant defined AI as "a tireless and low-cost collaborator that democratizes tools that were once reserved for large hotel chains".

Regarding the second research question, the findings show that the use of AI in hospitality micro-enterprises is primarily concentrated in communication and content generation activities. Writing texts for OTAs, managing online reviews, translating customer messages, and producing content for websites or social media represent the most frequently mentioned application areas. As one expert explained, "the area where adoption is highest is undoubtedly written communication: responding to customers, automatic translation, descriptions for OTAs, or creating content for social media." Another participant noted that "many small entrepreneurs use AI to respond to reviews or translate messages in real time". In many cases, therefore, AI is employed to automate repetitive and linguistically structured tasks, generating immediate benefits in terms of time savings. A second application domain concerns revenue management and dynamic pricing, although its diffusion appears more limited. Some experts observed that algorithm-based tools allow even small operators to employ predictive models for price optimisation. However, these applications remain largely confined to more innovative firms or to operators already using more advanced management systems. As one participant noted, "the adoption of revenue management systems based on algorithms remains the prerogative of a more advanced minority". Another respondent pointed out that such tools enable "even small operators to work with predictive logics by adjusting prices to real market demand", although their implementation requires competencies and technological infrastructures that many micro-enterprises still lack. Results also highlight several areas in which AI adoption remains very limited. Accounting, administrative management, and strategic planning are consistently identified as domains where the technology is not yet used in a significant way. One expert observed that "accounting and administration are almost completely excluded from AI adoption, as they remain entrusted to accountants or traditional software". Similarly, another participant emphasised that AI is "still rarely used in areas such as accounting or the strategic management of the firm." In these contexts, caution is often associated with concerns regarding the reliability of the technology or the potential regulatory and reputational consequences of its improper use.

With reference to the third research question, the analysis reveals a set of factors influencing the diffusion of AI in micro-enterprises. Among the most frequently mentioned barriers are limited familiarity with digital technologies, the perceived complexity of AI tools, and the lack of time to experiment with new solutions. One participant observed that "the most widespread issue is distrust toward what is not understood," while another noted that "many micro-entrepreneurs fear that AI requires technical skills they do not possess". These constraints are distributed across the three analytical levels mobilised by the framework. At the individual level, they operate as Effort Expectancy penalties and as limits on the entrepreneurial dispositions captured by EO, particularly innovativeness and proactiveness. At the organisational level, they take the form of concentrated managerial responsibilities and restricted absorptive capacity, consistent with TOE's organisational dimension. At the environmental level, insufficient digital infrastructure in specific territorial contexts acts as a structural moderator of adoption feasibility. At the same time, experts identified several factors that may facilitate the diffusion of AI within the sector. These include the increasing accessibility of generative AI tools, their ease of use, and the possibility of obtaining immediate operational benefits. As one participant noted, "the adoption rate of generative AI has been extremely rapid, precisely because of its ease of use".

Respondents generally expect AI to progressively become part of the operational infrastructure of tourism firms over the coming years, although with differentiated outcomes. As one expert observed, "those who manage to integrate AI intentionally will gain an increasing competitive advantage, while those who remain inactive risk becoming progressively marginalised". This perspective suggests that the ability to learn and integrate new technologies will represent a crucial factor shaping the competitive trajectories of hospitality micro-enterprises.

Research limitations. *The findings should be interpreted considering several limitations. The analysis draws on an early stage of an ongoing research project. It therefore reflects an exploratory phase that will be further refined through additional rounds of data collection and analysis. The limited number of participants and the purposive sampling strategy prioritise diversity of perspectives rather than statistical representativeness. The empirical material mainly consists of expert assessments and professional reflections on sectoral dynamics, rather than direct observation of organisational practices within microenterprises. Moreover, the study is situated within the Italian tourism context, characterised by a high prevalence of microenterprises and marked territorial disparities in digital infrastructure and innovation ecosystems. These factors may affect the transferability of the findings to other settings.*

Theoretical and Managerial Implications. *On the theoretical plane, the paper contributes to the literature on AI adoption in tourism by developing a multi-level, multi-framework specification of adoption dynamics in a context that is simultaneously prevalent, where microenterprises dominate the Italian hospitality sector, and structurally underserved by existing theoretical models. The central theoretical contribution, within this specification, is the identification of a reversed acceptance–use trajectory in platform-mediated microenterprise contexts: environmental embedding precedes individual-level acceptance, rather than following from it. This finding directly addresses the omission identified in the literature, namely, the absence of an empirically grounded account of how formal exposure transitions into substantive routine integration. The value added by the integration lies not in the juxtaposition of three frameworks, but in the relationships the architecture establishes between them. TOE ceases to operate as a static inventory of contextual variables and becomes a set of conditions within which UTAUT constructs acquire differential salience; EO ceases to function as a stand-alone predictor of innovation outcomes and becomes a dispositional filter that modulates how entrepreneurs weigh Performance Expectancy, Effort Expectancy, Trust and Perceived Risk under given contextual configurations. Read together, these two reconfigurations articulate a nested architecture in which contextual, dispositional and acceptance-level mechanisms jointly shape substantive AI adoption rather than acting as parallel determinants. It extends UTAUT beyond its conventional individual-level application by embedding it within a TOE contextualisation sensitive to the territorial and institutional heterogeneity of Italian micro-hospitality, and by introducing EO as a dispositional antecedent that accounts for the heterogeneity in adoption orientations observable across owner-managers operating under analogous environmental conditions. This responds directly to Venkatesh's (2022) call for contextualised applications of UTAUT that attend to the antecedent individual, technological and environmental characteristics shaping AI use in specific organisational settings. On the practical plane, the study aims to produce evidence-based guidance for policy makers, training providers and sectoral associations whose interventions are most effective when calibrated not only to technological affordances but to the socio-cognitive and organisational conditions that determine whether AI tools become stably embedded in the daily practices of tourism micro-entrepreneurs or remain peripheral to their operational reality. Three operational priorities emerge from the evidence. First, the semantic ambiguity surrounding AI, widespread even among operators already exposed to algorithmic tools, suggests that capability-building initiatives cannot proceed from generic awareness campaigns but should begin with disambiguation work that separates genuinely AI-based functionalities from other forms of digital automation, enabling entrepreneurs to form accurate performance expectations. Second, because many microenterprises already interact with AI implicitly through platform infrastructures, the more consequential intervention is not first exposure but guided transition toward conscious use, through sectoral associations offering low-intensity advisory formats calibrated to the cognitive and temporal constraints of owner-managers. Third, the territorial asymmetries documented in the findings argue against uniform policy instruments: regions with thinner innovation ecosystems require stronger infrastructural investment and institutional support, whereas in denser ecosystems the binding constraint lies in organisational absorptive capacity, which is more effectively addressed through training and peer-learning mechanisms than through infrastructure provision.*

Originality of the paper. *This study offers a preliminary exploration of AI adoption in hospitality microenterprises, a segment central to the tourism sector yet still underexamined in digital transformation research. As a work in progress, it provides an initial empirical mapping of how AI is interpreted and operationalised within owner-managed hospitality businesses. By integrating UTAUT, TOE, and Entrepreneurial Orientation, the paper advances a multi-level perspective linking individual cognition, organisational constraints, and environmental conditions shaping AI use. The findings highlight the gap between implicit technological exposure through digital platforms and deliberate strategic adoption.*

Discovery to Attribution: Reputation in the AI era

FRANCESCA NEGRI[1]

Abstract. *This study adopts a prompt-based Comparative Experimental design to audit how leading generative AI systems reconstruct reputational crises and attribute responsibility. By replicating a standardized prompting protocol across multiple AI models, the research examines differences in crisis discoverability, responsibility attribution, and narrative framing. Results pointed out the Generative AI systems tend to converge in the reconstruction of crisis events but diverge significantly in the attribution and intensity of responsibility: they are emerging as secondary crisis interpreters, shaping how non-expert audiences understand responsibility in reputational crises.*
Keywords: *Artificial Intelligence; Algorithmic Reputation; Crisis Management; discoverability; responsibility attribution; AI-mediated experiment; AI audit study; Attribution Theory*

Framing of the research. In digital environments, reputation is no longer shaped exclusively by direct communication between organizations and stakeholders, nor solely by human-generated content such as reviews, media coverage, or word-of-mouth. Instead, it is progressively influenced by algorithmic infrastructures - including search engines, recommendation systems, social media ranking algorithms, and generative AI interfaces - that select, prioritize, summarize, and frame information. The amount of touchpoints continues to grow steadily, also reshaping the balance of credibility and trust attributed by individuals, thereby defining new equilibria within the information and communication ecosystem.

Within the stream of research on the evolution of the customer journey and customer experience management, among the many touchpoints that shape contemporary consumer-brand interactions, one in particular is emerging as pivotal: Artificial Intelligence. AI is increasingly and disruptively becoming embedded in individuals' customer journeys across all stages - before, during, and after the purchase process (McKinsey, 2025). According to the framework proposed by Lemon and Verhoef (2016), AI can be positioned within the category of social/external touchpoints.

In this scenario, by relying on the analysis of large volumes of data and the application of probabilistic learning models, AI systems are able to generate insights and predictions that support more informed and adaptive decision-making processes. AI intervenes along three key dimensions of the customer journey: 1. Reduction of decision-making effort 2. Perceived enhancement of informational quality/quantity 3. Personalization of the interaction/empathy.

AI enables dynamic and contextual personalization, grounded in the real-time analysis of behavioral, historical, and situational data. This allows the experience to be shaped not only according to who the consumer is, but also according to the specific moment, channel, and objective of each interaction. In this sense, the experience is not merely "adapted," but continuously recalibrated along the customer journey.

Given the pervasiveness and rapid diffusion of these technologies, awareness of algorithmic bias and of the hallucinations that may result from them remains relatively limited among customers. In this regard, literature suggests that the use of AI-based personalization systems "significantly enhances consumer purchase decision-making primarily through its positive influence on consumer trust," recognizing that trust in the system represents a crucial mediating factor between algorithmic recommendations and actual purchasing behavior (Singhal et al., 2025). When consumers perceive an AI system as competent, reliable, friendly, fast, well-informed, and respectful of privacy, their propensity to follow personalized inputs and recommendations increases. In doing so, AI can simplify the complexity of the customer journey and rationalize the decision-making process, in some cases even reducing or eliminating the use of other touchpoints perceived as less convenient or efficient.

This growing reliance on digital touchpoints (from online reviews to AI) can be interpreted as a form of cognitive delegation on the part of consumers, who increasingly entrust a significant portion of their evaluative and decision-making processes to external sources perceived as competent and trustworthy. The theoretical foundation of this study is grounded in the "theory of bounded rationality" (Simon, 1955), which provides a robust conceptual framework for interpreting decision-making processes in environments characterized by informational complexity, time constraints, and finite cognitive capacities. From this perspective, decisions do not rely on a form of "full" rationality; rather, individuals adopt adaptive strategies of simplification, such as heuristics, routines, and other cognitive shortcuts. Importantly - and this is particularly relevant for the present study - these strategies may also include forms of externalization of parts of the evaluative process.

A key methodological implication emerging from Simon's work is that cognitive delegation represents a functional response to environmental constraints: individuals delegate because a fully autonomous processing of information would be inefficient or impractical given the limitations of the decision-making context (the "Messy Middle" described by Google, 2023). Delegation therefore allows individuals to make choices in a sustainable way by transferring portions of the evaluative process to external actors that operate as intermediaries or mediators in the decision-making process. Within this stream of research, the concept of Automation bias in AI is introduced, as the human tendency to over-rely on

[1] Catholic University of Sacred Heart, Italy, e-mail: francesca.negri1@unicatt.it

automated systems, accepting AI-generated suggestions as correct even when they contradict common sense or contradictory information (Romeo & Conti, 2026). Trust in automation does not necessarily depend on an understanding of how the system operates; rather, it depends on its perceived reliability, the consistency of its outputs, and the ability of the automated system to integrate smoothly into the user's decision-making process (Parasuraman & Riley, 1997).

According to a recent report by McKinsey (2025), AI-powered search is rapidly becoming the "new front door to the Internet", fundamentally transforming how consumers discover information, evaluate brands, and make purchasing decisions. Around half of consumers already use AI-powered search tools, and by 2028 more than 75% of searches may include AI-generated summaries, shifting the decision-making process upstream within AI platforms rather than traditional websites. This transformation implies that 20-50% of traditional web traffic may be at risk, as users increasingly rely on AI-generated answers instead of navigating multiple sources directly. This shift also affects Search Engines, whose role as a key gateway to corporate touchpoints is gradually weakening. An increasing number of users now reach websites or content through AI systems in their various forms rather than through traditional search engines - most notably Google. Consequently, firms must move beyond traditional SEO toward Generative AI Engine Optimization (GEO), focusing on influencing the broader ecosystem of sources - such as publishers, user-generated content, and third-party platforms-from which AI systems synthesize their responses. According to WeAreSocial (2026) data, as of October 2025 in Italy 87.7% of Internet users use Search Engines each month, while 25.2% already use ChatGPT. The report also highlights the distribution of AI-generated web traffic referrals in Italy (October 2025) across a selection of leading large language model platforms. The data show a highly concentrated ecosystem, with ChatGPT accounting for the vast majority of referrals (84.05%), followed at a considerable distance by Microsoft Copilot (8.55%) and Perplexity AI (4.23%). Other systems, such as Gemini (2.08%), Claude (0.81%), and DeepSeek (0.28%), currently play a comparatively marginal role in directing traffic toward external websites. From a strategic perspective, these data suggest that AI platforms are emerging as new intermediaries in the information discovery process, with ChatGPT functioning as a dominant gateway through which users access online content. This concentration implies that a substantial portion of AI-mediated web traffic may increasingly depend on the visibility and representation of brands within the informational ecosystems accessed by these systems. In this context, GenAI systems are becoming "crisis interpreters", pointing out the construct of Algorithmic Reputation, conceptualized along three main dimensions (Visibility, Interpretation, and Attribution), also offering a novel theoretical lens for rethinking reputation management in AI-mediated environments. Consequently, organizations may need to reconsider traditional search and visibility strategies, extending beyond conventional SEO toward approaches that take into account the growing role of AI-driven discovery and referral mechanisms.

Purpose of the paper. The purpose of this paper is to examine how generative AI systems mediate the discovery and interpretation of reputational crises. Specifically, the research investigates differences in crisis discoverability, responsibility attribution, and narrative framing across leading generative AI platforms. As individuals increasingly rely on AI systems to access information about events, controversies, and organizational behavior, these technologies are becoming influential intermediaries in shaping public understanding of reputational incidents. In a context characterized by growing informational delegation, the way in which crises are discovered, reconstructed, and explained by AI systems may significantly influence stakeholders' perceptions of responsibility and, ultimately, the reputation of brands and organizations. By systematically comparing the outputs generated by different AI models, this study aims to provide insights into how AI-mediated narratives may affect the informational environment within which reputational judgments are formed.

Methodology. To pursue the research objective, an AI-mediated experiment (Matthes and Vranken, 2025) was employed. The first stage consisted of developing a coding scheme that integrated key contributions from the literature on crisis management and AI audit studies. In the second stage, the experimental protocol focused on designing a standardized prompting protocol (stimulus), which was subsequently administered to four leading generative AI models (GPT, Claude, Gemini, and Perplexity: treatment).

The coding scheme (Table 1) was developed to systematically assess how generative AI systems identify, reconstruct, and interpret reputational crises. The variables capture three main analytical dimensions: crisis recognition and factual reconstruction, attribution processes (the theory selection has been based on previous comparative theories discussion (Gistri 2018; Negri and Ieva, 2022)), and discursive framing of the crisis.

Table 1: The Coding Scheme

Variable	Operational definition	Coding scale/Categories
Crisis discoverability	Ability of the AI system to recognize the described event as a reputational or communication crisis	0 = not recognized; 1 = partially recognized; 2 = clearly recognized
Identification type of crisis ***(Crisis Communication literature) &*** **Crisis Framing** ***(Framing Theory, Borah 2011)***	Crisis category assigned by the AI Dominant interpretative frame used to describe the crisis	Reputational/Ethical failure /DEI/Product-harm/ Communication failure/Managerial failure/External attack/Systemic issue/Other

Accuracy of Crisis reconstruction (information reliability) and Completeness of reconstruction	Degree to which the AI correctly reconstructs the facts of the crisis	1 = very low *to* 5 = very high & number of words
Presence of hallucinations	Presence of false information	0 = none; 1 = minor; 2 = moderate; 3 = high
Responsibility attribution *(Attribution Theory (Coombs and Holladay, 1996; Zhang et al., 2026)*	Whether the AI attributes responsibility for the crisis	0 = none; 1 = implicit; 2 = explicit
Tone toward the organization (Discourse analysis)	Overall evaluative tone used toward the organization involved in the crisis	1 = defensive/favourable *to* 5 = strongly critical
Suggested crisis response *(Situational Crisis Communication Theory- Coombs, 2004)*	Presence and specificity of recommendations for crisis management and Alignment between attributed responsibility and recommended response strategies	0 = none; 1 = generic; 2 = wrong; 3 = specific/consistent
Overall self-reliability of output *(AI Audit Studies)*	Overall evaluation of the reliability of the AI-generated narrative	1 = very low *to* 5 = very high

This structure enables a comparative evaluation of both the informational reliability and interpretive patterns emerging from AI-generated outputs. Both the coding scheme and the prompt structure are the result of a triangulation process conducted by three independent coders (30% of the dataset has been analyzed: inter-coder reliability was assessed using Krippendorff's Alpha, yielding an average coefficient of $\alpha = .84$, indicating strong agreement. Krippendorff's Alpha has been selected for its robustness with nominal variables and multiple coders). In particular, the prompt was designed to incorporate the elements to be evaluated while also approximating as closely as possible the natural style with which users typically interact with generative AI systems: it was intentionally designed to mirror the natural conversational style typically used by non-expert users when interacting with generative AI systems. This choice was intended to enhance ecological validity, as the objective of the study is to assess crisis discoverability from the perspective of a non-expert audience.

The selection of crises (Table 2) was designed to cover a broad range both in terms of temporal span and geographical scope. Moreover, different types of crises were included, involving varying degrees and configurations of responsibility.

Table 2 – Crises selection

Crisis (Brand/Case)	Year	Type of crisis	Geographical scope
1. Barilla (Guido Barilla statements on same-sex families)	2013	Corporate values/DEI communication crisis	International (originating in Italy)
2. Tesco (horse meat scandal)	2013	Food fraud/supply chain integrity crisis	Europe (primarily UK and Ireland)
3. Volkswagen (Dieselgate emissions scandal)	2015	Corporate misconduct/regulatory compliance crisis	Global
4. Mutti (alleged arsenic contamination in tomato sauce)	2017	Food safety rumor/misinformation crisis	Italy
5. Lidl (Workplace misconduct by employees)	2017	Employee misconduct	Italy
6. Dolce & Gabbana (China advertising backlash)	2018	Cultural sensitivity/communication crisis	China/International
7. Meta (Cambridge Analytica data scandal)	2018	Data privacy/platform governance crisis	International
8. Veralab (loyalty points controversy)	2022	Loyalty program promotional crisis	Italy
9. Elisabetta Franchi (statements on hiring women)	2022	Gender equality/corporate culture crisis	Italy/International media coverage
10. Balenciaga (controversial advertising campaign)	2022	Ethical advertising/brand reputation crisis	International
11. "Open to Meraviglia" (Italian tourism campaign backlash)	2023	Nation branding/communication strategy crisis	Italy/International media coverage
12. Chiara Ferragni (Pandoro Balocco charity controversy)	2023	Influencer marketing/consumer trust crisis	Italy/International media coverage

In addition to the use of natural language - without any academic or technical terminology and resembling the style an average user would employ - the prompt was designed around three stages of progressive questioning, similar to what would occur in a real conversation:

Step 1: Crisis narration (ITA: Ho sentito qualcosa riguardo a una crisi che riguarda [brand/evento/persona]. Potresti spiegarmi cosa è successo? ENG: I heard something about a controversy involving [brand/event/person]. Could you explain what happened?)

Step 2: Responsibility attribution (ITA: Chi è il responsabile di quanto accaduto?; ENG: Who was mainly responsible for what happened?)

Step 3: Confidence/epistemic check (ITA: Quanto sei certo di questa spiegazione?; ENG: How certain are you about this explanation?)

The decision to consider multiple research scopes is connected to evidences, which show that different systems vary significantly from one another.

Table 3 - The research perimeter

AI	Description	Risk
ChatGPT (Auto)	Conversational assistant	possible mitigation of liability
Gemini (Gemini3)	Search-integrated AI	dependence on web source bias
Perplexity	AI search engine	risk of replicating dominant media framings
Claude (Sonnet 4.6)	Reason-focused AI	risk of over-neutralization

Practitioners pointed out distinct patterns in the attribution of responsibility across the generative AI systems analyzed, reflecting differences in their underlying design philosophies, safety policies, and information retrieval mechanisms. Some models tend to adopt a cautious and balanced framing, emphasizing the existence of multiple interpretations and avoiding direct blame attribution, likely as a result of stronger safety-oriented training. Others provide more contextualized responsibility attribution, embedding judgments within broader narrative explanations that reference public criticism or stakeholder reactions. Models more tightly connected to web-based information ecosystems often reproduce the dominant framing present in online sources, thereby reflecting the informational consensus emerging from digital media coverage. Finally, AI systems that explicitly cite external sources tend to produce more direct and evidence-based responsibility attributions, although this may also amplify prevailing media narratives. These differences suggest that generative AI systems do not merely reconstruct crisis events but also mediate the interpretation of responsibility, potentially shaping how non-expert audiences understand reputational controversies.

The study was conducted in February 2026 over several days in order to comply with the usage limits imposed by some of the models in their non-paid versions.

Results. The findings of this study highlight several relevant patterns in the way generative AI systems reconstruct and interpret reputational crises. Below (Tables 4, 5, and 6) are three illustrative cases selected from those analyzed, as they are representative of both national and international experiences, involving events that are more or less recent, and characterized by differing levels of responsibility and crisis management appropriateness.

First, the results indicate a substantial convergence in factual reconstruction of crisis events across the models analyzed. In most cases, the AI systems were able to identify the existence of a controversy and provide a broadly coherent description of the underlying events. However, important differences emerged in the depth and extent of the narrative reconstruction. Some systems tended to produce more detailed and contextualized explanations, including background information and stakeholder reactions, while others generated significantly shorter summaries that focused primarily on the most salient/legal aspects of the crisis. Furthermore, while ChatGPT also incorporates emojis and structures the text into clearly identifiable paragraphs (aesthetic mediation effect), the way in which the facts are presented is similar for Claude and Perplexity, both of which adopt a more plain, unembellished style. These formal and aesthetic differences in descriptive richness may influence how users understand the magnitude and complexity of reputational incidents. More pronounced divergences were observed in the attribution of responsibility, which represents one of the central dimensions of crisis interpretation. Certain models (Claude) displayed a tendency toward cautious or neutral framing, often presenting responsibility as debated or distributed among multiple actors. This pattern may reflect safety-oriented design choices aimed at avoiding potentially harmful or defamatory claims. Conversely, other systems were more inclined to formulate explicit attributions of responsibility (ChatGPT and Gemini), particularly when the crisis had been widely documented in public sources. In such cases, the AI output often reflected the dominant narrative emerging from media coverage. It is also noteworthy that only limited emphasis is placed on the recovery strategies and, more broadly, on the crisis management efforts of the companies or actors involved. The analysis also revealed the presence of informational and interpretative biases linked to the architecture and training strategies of the different models. Systems that rely more heavily on web-based information retrieval tended to reproduce the prevailing framing found in online sources, potentially amplifying dominant media narratives. At the same time, models optimized for safety and reasoning frequently exhibited a tendency toward over-neutralization, which may reduce the clarity of responsibility attribution even in cases where accountability is well established. Almost all models, in a more or less explicit manner, suggest the user's subsequent steps in the search process (suggestion-drivem navigation bias), thereby effectively shaping the perception and interpretation of what has occurred and guiding the decision-making path (guided sensemaking). In the specific case of Mutti, it is noteworthy that Gemini repeatedly suggested additional pathways - framed in an educational manner - to help users recognize and manage fake news. These findings suggest that generative AI systems not only act as information summarizers but also function as interpretative filters, shaping how crises are presented to users.

Overall, the results support the view that generative AI systems are emerging as secondary crisis interpreters, mediating the discovery and interpretation of reputational events for non-expert audiences. As individuals increasingly rely on AI systems to access information about controversies involving brands or organizations, variations in narrative framing, descriptive depth, and responsibility attribution may play a significant role in shaping public perceptions of corporate reputation.

Research limitations. This study presents several limitations that also point to directions for Future Research. First, the analysis focuses on a limited set of crisis cases (12), selected to ensure diversity in terms of temporal span, geographical scope, and crisis typology; however, a broader sample of events could further strengthen the generalizability of the findings. Second, the study examines the behavior of a restricted number of leading generative AI systems at a specific point in time. Given the rapid evolution and continuous updating of these models (and the opacity about the training data), future studies could replicate the audit longitudinally or include additional systems to assess potential changes in outputs over time. Third, the experimental design relies on a standardized prompting protocol intended to approximate the natural interaction style of non-expert users. While this approach enhances ecological validity, different prompting strategies might lead to different outputs, suggesting that future research could compare alternative prompting designs. Moreover, this process may underestimate the calibration of responses at the individual user level (user dependency), which could otherwise be adapted based on prior interactions and interaction history. Indeed, for the purposes of this project, a "clean" testing environment was created by accessing the main AI systems through a newly established email account, specifically set up to ensure that the responses would not be influenced by previous interactions. Finally, the evaluation of AI responses is based on a coding scheme derived from crisis communication and AI audit literature; although efforts were

made to ensure reliability through independent coding and triangulation, further research could refine these measures or complement them with computational text analysis techniques.

Managerial implications. The findings of this study carry several Managerial Implications for organizations operating in increasingly AI-mediated information environments. First, companies should recognize that generative AI systems are becoming important intermediaries in the discovery and interpretation of reputational crises. As users increasingly rely on these systems to obtain explanations about (controversial) events involving brands or organizations, firms must consider the AI-mediated discoverability of crises as part of their broader reputation management strategy. This implies the need to monitor how crises are reconstructed by generative AI platforms, to ensure that accurate and up-to-date information is available across digital ecosystems, and to integrate AI monitoring into existing digital listening and crisis communication practices. In addition, organizations should anticipate that AI-generated narratives may influence stakeholder perceptions, amplifying or reframing reputational risks even after the initial crisis has occurred. In this context, it becomes crucial to understand whether and how AI-generated responses can be influenced across different environments (e.g., snippets, SERPs, etc.), also with a view to potential paid investments. At the same time, organizations should seek to prevent data poisoning activities that could alter the informational ecosystem and negatively affect a company's reputation. The growing investments in Generative Engine Optimization (GEO), combined with the increasing opacity of algorithmic systems, raise significant ethical concerns related to manipulation, transparency, and responsible AI governance. As organizations attempt to influence AI-mediated visibility, discoverability, and reputational narratives, the boundary between legitimate optimization practices and manipulative interventions becomes progressively blurred. In this context, firms are required to carefully balance reputation management and crisis communication strategies with broader ethical responsibilities toward stakeholders and the information ecosystem. The limited transparency surrounding the functioning of generative algorithms further exacerbates concerns regarding accountability, bias amplification, and the potential distortion of public perception. Consequently, companies should adopt governance approaches that integrate reputational objectives with principles of transparency, fairness, and responsible AI use.

Second, the results also highlight important responsibilities for the developers and providers of generative AI systems. Given the growing informational authority attributed to these systems, it becomes crucial to refine training processes and governance mechanisms in order to minimize hallucinations, factual inaccuracies, and misleading attributions of responsibility. Particular attention should be devoted to the handling of sensitive reputational events, where algorithmic outputs may inadvertently assign blame or provide incomplete contextualization. From this perspective, improving epistemic transparency, uncertainty communication, and attribution handling represents a key challenge for AI developers seeking to enhance the reliability and societal trustworthiness of their systems.

Finally, the study also raises broader societal implications related to the increasing delegation of informational and evaluative processes to generative AI. As individuals rely more heavily on AI systems to interpret complex events and assign responsibility, there is a risk that informational and decision-making delegation may shape public understanding in ways that are not always transparent or critically examined. This dynamic may influence how reputational crises are perceived, discussed, and remembered within the public sphere. Consequently, the growing role of generative AI in mediating access to information reinforces the need for regulatory attention and policy frameworks aimed at ensuring transparency, accountability, and responsible deployment of AI systems in contexts that affect public discourse and reputational dynamics.

Originality of the paper. This paper shifts the focus to how crises are algorithmically interpreted: AI is not only a touchpoint, but an interpretative infrastructure, contributing to the emerging literature at the intersection of crisis communication and generative artificial intelligence and introducing a novel methodological approach to the study of reputational crises in AI-mediated environments. Specifically, it applies a Comparative Experimental design to examine how leading generative AI systems identify, reconstruct, and attribute responsibility in real-world crises. While prior research has largely focused either on organizational crisis management strategies or on the technical performance of AI systems, this study bridges these domains by investigating how AI systems act as secondary narrators and interpreters of crises for non-expert audiences that delegate to AI the discovery of facts/responsibilities. By combining insights from Attribution Theory, crisis communication scholarship, and algorithmic audit studies, the paper offers one of the first systematic attempts to evaluate the discoverability of crises and the attribution of responsibility within AI-generated narratives, thereby opening new avenues for research on the role of generative AI in shaping public understanding of reputational events. In light of the growing role of generative AI in the discovery of facts, events, and information, this phenomenon warrants careful investigation, as its reputational implications can be significant.

The paper also lays the academic foundations for the concept of "algorithmic reputation", referring to the process through which the reputation of organizations, brands, or individuals is increasingly constructed, mediated, and interpreted through algorithmic systems. Algorithmic reputation can be conceptualized along three dimensions: Visibility (what is shown), Interpretation (how it is framed), and Attribution (who is responsible). These systems determine which information becomes visible, which sources are considered authoritative, and how narratives about a brand are structured and surfaced to users. Consequently, algorithmic processes influence not only information discoverability, but also responsibility attribution, framing of crises, and the perceived credibility of sources.

This shift implies that reputation is increasingly shaped in contexts where stakeholders delegate part of their cognitive and evaluative processes to digital intermediaries. As users rely on algorithmically curated outputs - such as search results, AI-generated summaries, or conversational answers - the reputational landscape becomes partially governed by the logic, biases, and training data of algorithmic systems. Therefore, algorithmic reputation highlights the need to reconsider traditional reputation management frameworks, as organizations must now account not only for human audiences and media ecosystems, but also for the algorithmic agents that mediate visibility, interpretation, and narrative construction in digital environments, avoiding the loss of narrative control.

From automotive legacy to smart mobility: Agentic AI as a trigger of technological exaptation in the Turin ecosystem

LEA IAIA[1], MARCO PIRONTI[1], VERONICA SCUOTTO[2]

Abstract. *While ecosystems often rely on existing knowledge distributed across multiple actors and socio-technical arrangements, they must continuously renew that knowledge to allow the ecosystem to evolve and remain future oriented. In contexts where technology plays a central role, the risk for the ecosystem obsolescence is even higher. The present paper investigates how Agentic AI can act as a trigger for technological exaptation in an innovation ecosystem, enabling knowledge transformation and supporting the transition from manufacturing centric legacies to emerging urban smart mobility trajectories. We adopt an exaptation lens to explain this process as the re-functionalisation of technologies and competencies toward novel purposes and service configurations.*

Empirically, the paper is grounded in the Turin context, where Turin City Lab is interpreted as an exaptive space that concentrates heterogeneous actors and testing opportunities, while ToMove is conceptualized as an exaptive event that builds platform capacities through three demonstrators and an experimentation pipeline that also leverages Agentic AI. We focus on how Agentic AI-enabled trial triggers exaptive search and repurposing within demonstrators (e.g., decision environments, autonomous services, and adaptive operational behaviours), and how these exaptive moves contribute to the transformation of ecosystem knowledge into novel streams of business knowledge relevant for smart mobility.

As a work-in-progress contribution, the paper develops an initial mechanism model and a set of propositions that theorize Agentic AI as a trigger of ecosystem-level exaptation and explain knowledge transformation as the evolution of legacy automotive and manufacturing knowledge into service-oriented, data-intensive, and AI-enabled smart mobility capabilities. It also outlines a follow up research design (partner interviews and process tracing) to examine ecosystem level outcomes of knowledge transformation, including emerging complementarities, experimentation routines, and subsequent project pipelines (e.g., mobility data space trajectories).

Keywords: *Agentic AI; exaptation; innovation ecosystem; knowledge transformation; MaaS*

Framing of the research. *Research on innovation ecosystems has expanded significantly, and the domain is increasingly attracting interest as it promises important benefits to all the different actors in the system. The term "innovation ecosystem" refers to "a network of interconnected organizations, connected to a focal firm or a platform, that incorporates both production and use side participants and creates and appropriates new value through innovation" (Autio & Thomas, 2014). Therefore, the innovation ecosystem includes a set of individuals, communities, organizations, material resources, rules, and policies across different institutions in constant evolution that engage collectively to enable the knowledge flows (Bramwell, Hepburn, & Wolfe, 2012). From this perspective, ecosystem evolution is a matter of governance and coordination, but also a process of knowledge transformation through which existing ecosystem knowledge is reinterpreted, recombined, and stabilized into emerging technological, service, and governance configurations. In this study, such transformation is understood as the re-functionalization of legacy knowledge toward different purposes, leading to the emergence of innovative routines, complementarities, and trajectories.*

Although ecosystem interactions may spontaneously generate innovation, exaptation highlights the value of intentionally stimulating the application of novel functionalities to existing artefacts, organizations, scientific results, or cultural models (Bonifati, 2013). In the domain of biology, the term 'exaptation' has been employed to denote the process by which characteristics evolve to fulfil different functions, as the evolution of dinosaur feathers from their original function of thermal insulation to their subsequent co-option and adaptation for flight (Gould and Vrba, 1982). Exaptation explores the evolution mechanisms and dynamics that enable organisms to survive in response to environmental change (Beltagui, 2020). In management studies, exaptation extends known solutions to emerging problems by enabling ideas and artefacts developed in one field to be redeployed in another. In this sense, innovation shows two main traits, as it emerges when existing knowledge and artefacts are redirected toward unexpected applications (Andriani & Kaminska, 2021), and is driven by latent elements embedded in existing technologies (Mastrogiorgio & Gilsing, 2016; Andriani et al., 2017).

Exaptive innovations can be also encouraged by humans (Garud et al., 2016), starting a process whereby products and services are reused or recombined to create innovative solutions, with a re-functionalisation, changing the value and meaning of an artefact within a different application domain (Liu et al., 2021; Gould & Vrba, 1982). This exaptation occurs within exaptive spaces (Garud et al., 2018, 2016), characterised by specific exaptive relations (James et al., 2022). Exaptive spaces are exaptive pools, that collect codified knowledge; exaptive forums, where innovators meet physically

[1] University of Turin, Turin
[2] Federico II University, Naples

or virtually to exchange knowledge; and exaptive events, as planned meetings for innovators. Exaptive relations consider strong and weak relations among innovators and facilitators of innovation, intentionally or incidentally multiplied with the aim of solving critical difficulties. Exaptive relations have a positive impact on exaptive forums and events, which strengthen and craft them back.

In the context of innovation ecosystems, exaptation emerges from interactions with dynamic environments characterised by rapid technological and competitive evolution, producing knowledge transformation and ecosystem evolution (Schiavone et al., 2022; Ardito et al., 2021). Its relevance highlights how renewal may arise when legacy technological elements, routines, or competencies are redeployed into novel purposes and stabilized by experimentation.

This is exemplified by the field of emerging technologies, where AI models are in a constant state of evolution. They are moving away from conventional models, which are often used to solve specific tasks, towards Agentic AI models that are capable of "exhibiting autonomous decision-making, goal-oriented behaviour, and continuous learning while interacting with dynamic environments" (Hosseini & Seilani, 2025). Agentic AI signifies the latest phase in the evolution of artificial intelligence systems. These architectures are characterised by their multi-agent design, which enables them to achieve objectives with a high degree of autonomy (Acharya et al., 2025; Sapkota et al., 2025; Hughes et al., 2025; Lee & Su, 2025). This autonomy encompasses the execution of complex tasks in dynamic and uncertain environments with minimal oversight, the adaptation of these systems over time via continuous learning and self-improvement, context-sensitive reasoning that enables flexible, situation-appropriate decisions, persistent memory to store and leverage information over the long term, dynamic orchestration of tools and subtasks to accomplish higher-level objectives, and multi-agent coordination to scale problem-solving based on distributed roles and interactions.

Despite growing research on innovation ecosystems, technological exaptation, and AI-enabled transformation, we still lack a clear explanation of how Agentic AI may support exaptive search and knowledge transformation across ecosystems. Existing studies have mainly examined exaptation as technological repurposing within specific organizational or technological domains, while research on Agentic AI has emphasized technical features, organizational applications, and decision-making potential. This paper addresses this gap by conceptualizing Agentic AI as a frontier technology that can activate exaptive search across ecosystem participants. We argue that these capabilities can make exaptive search faster and more visible by supporting testing, adaptive decision environments, and iterative learning across different ecosystem participants. Through this mechanism, legacy knowledge embedded in automotive and manufacturing ecosystems can be transformed toward smart mobility knowledge streams.

The empirical setting is the city of Turin, where mobility-related innovation initiatives have progressively built testing infrastructures and routines based on open innovation. Turin City Lab is a living lab that can be recognised as an exaptive space, a socio-technical environment that increases the likelihood of exaptive matches by bringing together varied actors, infrastructures, and demonstrators. Building on this substrate, ToMove project, an exaptive event that builds platform capacities via three demonstrators and an experimentation pipeline that also leverages Agentic AI. In this framing, demonstrators are not treated as isolated pilots; they function as exaptive vehicles through which knowledge and technologies are co-option and adapted into future-oriented urban mobility services and decision environments.

The study examines how Agentic AI-triggered exaptation contributes to knowledge transformation and to the transition from manufacturing-centric legacies toward smart mobility configurations. The expected outcomes include business knowledge streams such as service operations know-how, data-driven governance routines, validation practices in urban contexts, and mobility data space trajectories. These outcomes will be examined in subsequent stages based on partner interviews and process tracing, with the goal of specifying when and how ToMove contributes to longer-term ecosystem evolution.

Overall, the paper contributes to three connected debates. It advances technological exaptation theory by theorizing Agentic AI as a catalyst of exaptive search and re-functionalization, rather than merely as an automation tool. It also contributes to innovation ecosystem research by explaining knowledge transformation as a mechanism through which legacy capabilities are recombined into service-oriented and data-intensive configurations. Finally, it develops an event-based perspective on ecosystem evolution by interpreting Turin City Lab as an exaptive space and ToMove as an exaptive event.

Purpose of the paper. *The innovation process is driven by technological changes, both in terms of their intensity and direction (Dosi and Nelson, 2010). Technological change has given rise to new forms of ecosystems, characterised by reconfigured relationships between agents and artefacts that may support emerging scenarios and challenges (De Sordi et al., 2019). In such contexts, firms and ecosystem participants are compelled to renew, transfer, and recombine knowledge to sustain value creation. The transition of the automotive industry toward smart mobility is an emblematic case of this broader phenomenon. It requires the recombination of heterogeneous assets, such as digital and physical infrastructures, data governance arrangements, and service operations, across multiple actors. This view is consistent with the structural perspective on ecosystems, which emphasizes the alignment of actors, activities, and complementarities around a value proposition (Adner, 2017).*

Technological exaptation is the theoretical lens adopted to explain how ecosystems can transform their inherited knowledge base by recombining existing technologies, competencies, and routines into new functions and applications. Exaptation theory suggests that, within innovation ecosystems, the interplay of cooperative and competitive dynamics can generate "exaptive leaps," particularly in industries characterized by strong couplings between physical and digital components (Beltagui et al., 2020).

Building on this view, we argue that Agentic AI may act as a frontier technological catalyst that supports exaptive search and the transformation of legacy capabilities toward smart mobility configurations.

This empirical setting is used to examine how structured experimentation contexts can make ecosystem-level knowledge transformation observable. Turin City Lab provides the broader infrastructure, while ToMove offers a focused context in which demonstrators and experimentation pipelines may reveal how existing technologies and competencies are re-functionalized toward smart mobility applications. The main aim is to understand how Agentic AI-enabled technological exaptation supports knowledge transformation in the automotive innovation ecosystem and fosters smart mobility trajectories that may be transferable to other data-intensive, service-oriented settings.

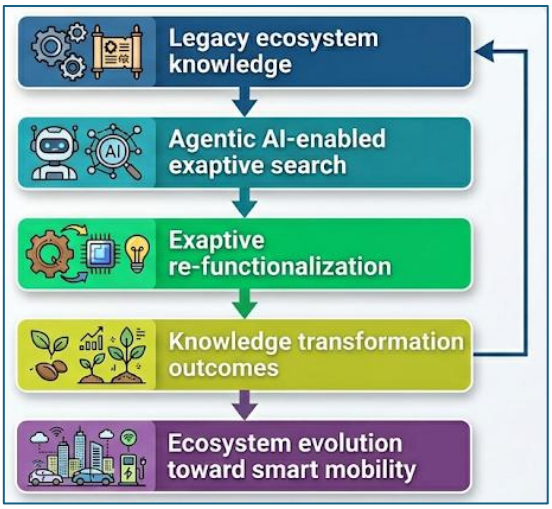
Accordingly, the paper addresses the following research question: How does Agentic AI-enabled exaptation generate ecosystem-level outcomes, such as distinctive complementarities, shared routines, and innovation pipelines, and how can these outcomes be traced in the transition from automotive legacy to smart mobility?

As a work-in-progress nature, this paper develops an initial conceptual mechanism and expected propositions, and it outlines a follow-up qualitative research design (partner interviews and process tracing) to examine how exaptive moves translate into ecosystem evolution through novel business knowledge streams, experimentation routines, and follow-on project pipelines.

Methodology. *This paper is designed as a conceptual and exploratory mechanism-building study. It develops an initial explanation of how Agentic AI-enabled exaptation may support knowledge transformation in innovation ecosystems. Turin City Lab and ToMove provide an illustrative and theoretically relevant setting for grounding the conceptual argument and guiding subsequent empirical validation. Consistent with this aim, we adopt a narrative research approach. As argued by Garud, Gehman, and Giuliani (2016, p. 156), "narratives afford the capacity to act by imagining the future, remembering the past, and seizing the moment," thereby stimulating the emergence of innovation opportunities. In the context of exaptation, narratives are performative, as they help actors interpret technological possibilities, mobilize attention, and reconfigure meaning and value. These performative aspects are grounded in both the relational and temporal properties of narratives. The relational dimension concerns how exaptation creates new connections among actors and artefacts. Exaptive dynamics often unfold by an abductive process (Peirce, 1974) that enables participants (e.g., scientists, entrepreneurs, innovators, investors, public agencies) to converge on shared interpretations, "speak the same language," and collectively attribute original significance, value, and functionalities to technological elements (Bartel & Garud, 2009). The temporal dimension concerns how narratives link legacy knowledge to future-oriented trajectories.*

Literature selection and analytical logic. The literature was selected with a theory-driven approach aimed at building the proposed mechanism rather than conducting a systematic review. The review focused on innovation ecosystems, technological exaptation, Agentic AI, and knowledge transformation because these streams jointly support the conceptual architecture of the study: the ecosystem as the level of analysis, exaptation as the explanatory mechanism, Agentic AI as the enabling technology, and knowledge transformation as the expected outcome.

Empirical setting and conceptual positioning. Following Garud et al. (2016, 2018), exaptive leaps may occur wherever agency is disseminated across networks of connections, particularly within exaptive spaces where "problems meet solutions." In this study, Turin City Lab is conceptualised as an exaptive space, an environment that concentrates trial opportunities and heterogeneous actors, increasing the likelihood of exaptive matches. Building on this substrate, we assert that ToMove plays the role of an exaptive event, a concentrated initiative that produces an enabling platform and stimulates technological exaptation (Garud et al., 2016) to generate innovative solutions (Gould & Vrba, 1982; Liu et al., 2021). In our framing, ToMove operationalizes exaptation through three demonstrators and a structured trialling pipeline, within which Agentic AI can be observed as an enabling technological component in the production of unexpected functionalities and solutions.



The analysis focuses on the exaptive event trajectory associated with ToMove by tracing demonstrator-level episodes in which inherited capabilities are redirected toward different application domains, as well as the ecosystem-level consequences rising from these episodes. Consistent with the research question, the study focuses on three classes of ecosystem outcomes:

1. *Emerging complementarities, captured as newly formed or intensified interdependencies among actors, infrastructures, and artefacts (e.g., couplings between data resources, infrastructure operators, service providers, and research partners).*
2. *Shared routines, captured as recurrent practices that stabilize testing and learning (e.g., shared protocols for trials, recurring evaluation and validation practices, shared vocabularies and templates that reduce coordination friction).*
3. *Innovation pipelines, captured as follow-on trajectories that extend beyond the initial event (e.g., subsequent project portfolios, scaling initiatives, and data-governance trajectories such as mobility data spaces).*

Building on the theoretical discussion, we propose an initial mechanism model that links Agentic AI-enabled exaptation to ecosystem knowledge transformation. The model builds on the idea that legacy ecosystems, such as automotive and manufacturing-based ones, accumulate knowledge in technologies, routines, infrastructures, and relationships among actors. Agentic AI may trigger exaptive search by enabling actors to explore alternative uses of these existing assets via experimentation, simulation, adaptive decision environments, and autonomous service

configurations. Through these search processes, existing knowledge elements may acquire new functions in smart mobility contexts. Over time, these exaptive moves help redirect ecosystem knowledge toward business capabilities relevant for smart mobility.

Figure 1. Agentic AI-enabled exaptation and ecosystem knowledge transformation: an initial mechanism model

Source: Authors' elaboration

The model does not assume that Agentic AI automatically produces ecosystem evolution. It suggests that Agentic AI can support ecosystem evolution when its use is embedded in exaptive spaces and events that connect participants, provide innovative opportunities, and stabilize learning into reusable knowledge.

Data collection and analysis. Data collection is organised to support narrative reconstruction and outcome tracing.

The first stage regards the narrative reconstruction on project documents and artefacts associated with the ecosystem and the ToMove event (e.g., official decks and descriptions of demonstrators, calls and selection materials available, public and partner communications, and archival records documenting the evolution of experimentation activities). These sources are used to build an initial narrative of how ToMove mobilises legacy knowledge, how Agentic AI is embedded in demonstrators and trials (where documented), and how exaptive re-functionalization is articulated. In the next stage, we will validate the narrative and trace ecosystem-level outcomes through semi-structured interviews with key partners, including public orchestrators, infrastructure and system integrators, mobility operators, firms/startups/SMEs, and research institutions. The interview protocol will examine how existing technologies, competencies, routines, or infrastructures were reused or reinterpreted within ToMove-related demonstrators; how Agentic AI or AI-enabled experimentation supported adaptive decision-making, simulation, service configuration, or operational learning; how actors recognized and stabilized new functionalities for existing assets; and how complementarities, routines, and follow-on pipelines emerged over time.

Data analysis will proceed through iterative narrative coding aligned with exaptation theory. First, we will identify narrative elements that signal exaptation. We will then examine the relational mechanisms through which actors reinterpret existing technologies and competencies. Finally, we will map narrative evidence onto the three outcome categories: complementarities, routines, and innovation pipelines. Throughout the analysis, we will use abductive logic to refine the emerging explanation (Bartel & Garud, 2009; Garud et al., 2016).

The research setting. The investigation is based on Turin, an Italian city in the northwest of Italy. Turin has a dense entrepreneurial fabric, with more than 221,000 companies (CamCom Torino, 2026) and 672 start-ups (LaStampa, 2026). ts research system is organised around two main institutions able to involve more than 120,000 students: the University of Turin, with strong expertise in the humanities, social sciences and economics, and the Polytechnic University of Turin, mainly focused on technology and engineering (Comune di Torino, 2026). In 2024 Turin has been awarded the title of European Capital of innovation and European Capital of Smart Tourism for the 2024-2025 biennium (Torino City Lab, 2026). Turin is considered one of the most innovative Italian cities (EY, 2020), even in the European region, already investigated in scientific articles for the relevance of the approach of its open innovation ecosystem (Cillo et al., 2020; Grimaldi, 2022).

The Turin setting provides an analytically coherent context because it combines an established open innovation and participatory ecosystem approach, called Turin City Lab (TCL). TCL supports companies and other ecosystem actors in testing innovative solutions under real-life urban conditions by facilitating access to experimentation opportunities, infrastructures, and institutional support. In this perspective, TCL is an exaptive space where the likelihood to link features to context and producing an exaptive leap is maximized. Among those, the "ToMove" project could be identified as the exaptive event able to induce the technological exaptation, leading to the emergence of an innovation ecosystem, called "Smart Road Mobility".

Figure 2. ToMove's demonstrators

Source: https://torinocitylab.it/en/to-move/

The ToMove project

ToMove is a large-scale open laboratory with the objective of advancing the digital and sustainable transition towards more efficient, secure, and adaptable urban mobility solutions. It is a technological and service innovation programme, integrating investigation on Mobility as a Service (MaaS) with the evaluation of cooperative, connected, and autonomous mobility solutions (CCAM). Along with this, ToMove is guiding the urban mobility transformation orchestrating diverse stakeholders and facilitating the user adoption.

The ToMove initiative is situated within the national MaaS4Italy programme, promoted by the Department for Digital Transformation with support from the Ministry of Transport. It received a grant exceeding €10 million in funding. It is scheduled until June 2026, and it is closely associated with overarching sustainability objectives, including the alignment with the European Mission "100 Climate Neutral Cities," to which Turin is committed. The programme includes funding for living labs demonstrating autonomous driving in urban transport and other actions related to data governance.

The project promotion and governance are overseen by the City of Turin, in collaboration with a Promoting Committee that includes mobility operators, research institutions, and business actors, with a formalised structure of the ecosystem orientation and initiative organization, such as co-experimentation, a coordinated portfolio of trials and applied research activities.

ToMove is articulated into two complementary components. The ToMove Living Lab functions as the primary open testing environment for developing original smart and sustainable mobility scenarios, explicitly integrating CCAM solutions into MaaS-oriented service models and supporting applied, multidisciplinary research programs aimed at assessing impacts and effectiveness. MaaS ToMove conducts a trial to assess whether integrated mobility services can offer citizens and user communities viable alternatives to private car use. These two are the focus of the initiatives and so they are involved in analysis, co-design, and testing, which positions the programme to evaluate feasibility beyond technical performance, including acceptability, usability, and perceived value of emerging service configurations. Furthermore, it explores how CCAM technologies can be embedded within service models rather than remaining as stand-alone pilots.

All the above-mentioned reasons demonstrated that ToMove provides an appropriate context for examining how a city orchestrates a multi-actor mobility innovation ecosystem based on formal governance and staged experimentation.

Results. *As this is a work-in-progress conceptual and exploratory study, the results are presented as expected conceptual insights and propositions. These propositions will be refined through partner interviews and process tracing of ToMove-related exaptation episodes.*

The first expected insight concerns the role of Agentic AI in supporting exaptive search. By combining autonomous task orchestration, adaptive decision-making, simulation, and continuous learning, Agentic AI may help ecosystem actors explore alternative uses for existing technologies, data resources, infrastructures, and competencies, making exaptive opportunities more visible and actionable (Gould & Vrba, 1982; Bartel & Garud, 2009).

Proposition 1. Agentic AI-enabled experimentation makes exaptive search more likely by helping actors explore alternative uses for existing technologies, data resources, and ecosystem capabilities.

ToMove may be interpreted as an exaptive event because it concentrates different participants, demonstrators, demonstrator-based learning opportunities, and governance arrangements around emerging smart mobility challenges (Peirce, 1974; Bartel & Garud, 2009; Garud et al., 2016). In this context, exaptation is not limited to technological repurposing; it also involves the creation of emerging complementarities among public orchestrators, mobility operators, infrastructure providers, technology firms, research institutions, and users.

Proposition 2. Exaptive events foster new complementarities when they connect actors and artefacts around shared experimentation problems and support the re-functionalization of existing knowledge toward different application domains.

Repeated exaptive episodes are expected to contribute to knowledge transformation when the learning generated through demonstrators becomes stabilized into shared routines, validation practices, data governance arrangements, and

follow-on innovation pipelines (Garud et al., 2016, 2018; Liu et al., 2021). In this sense, the outcome of exaptation is the emergence of technological applications and the transformation of the ecosystem knowledge base.

Proposition 3. Agentic AI-triggered exaptation supports knowledge transformation when repeated experimentation becomes embedded in shared routines, complementarities, and follow-on innovation pipelines.

The last expected result relates the knowledge transformation and its support to the ecosystem evolution by allowing automotive and manufacturing-rooted capabilities to be recombined into data-intensive, service-oriented, and AI-enabled streams (Garud et al., 2016, 2018; Liu et al., 2021) for the smart mobility.

Proposition 4. Ecosystem evolution toward smart mobility depends on whether knowledge transformation extends beyond individual demonstrators and produces reusable service, data, and governance capabilities.

Research implications. *The study has implications for three connected debates. For innovation ecosystem research, it suggests that ecosystem evolution can be interpreted in terms of governance, orchestration, or complementarity formation, and as a process of knowledge transformation. For technological exaptation theory, it moves the analysis from specific artefacts, technologies, or firms to distributed processes involving actors, infrastructures, routines, data resources, and governance arrangements. For the emerging debate on Agentic AI in management, it shifts attention from automation and decision support to exaptive search and the renewal of ecosystem knowledge.*

Research limitations. *The study is work in progress and currently relies primarily on documentary and publicly available project materials; therefore, ecosystem-level outcomes are framed as expected and will require validation through the planned interview phase. Besides, a key limitation concerns the current granularity of evidence on the specific role of Agentic AI within ToMove demonstrators. For this reason, the paper does not claim that Agentic AI has already produced measurable ecosystem-level effects. It develops a mechanism that will be empirically examined by tracing how AI-enabled experimentation supports exaptive search, re-functionalization, and knowledge transformation. As a single-case, mechanism-building study, generalization is analytical, not statistical. The contribution is to specify a narrative mechanism and outcome categories that can be examined in other ecosystem settings through replication and comparative work.*

Managerial implications. *From a managerial perspective, the study suggests that frontier AI technologies can be mobilized beyond efficiency gains, as catalysts for exaptive search and knowledge transformation. Ecosystem orchestrators, such as cities, living labs, and intermediaries, can use demonstrator portfolios and pipelines to help actors re-functionalize legacy technologies and capabilities. Firms embedded in automotive and manufacturing ecosystems may benefit from these settings when experimentation generates reusable service and system capabilities for smart mobility. For policymakers and ecosystem designers, the key implication is that living labs and demonstrators should be assessed not only as isolated pilots, but as mechanisms for producing durable ecosystem outcomes.*

Originality of the paper. *This paper contributes by integrating technological exaptation and Agentic AI to explain knowledge transformation in innovation ecosystems, theorizing Agentic AI as a frontier technology that can accelerate exaptive search and re-functionalization. It advances an event-based ecosystem view by conceptualizing Turin City Lab as an exaptive space and ToMove as an exaptive event that builds enabling platform capacities through demonstrators and a portfolio pipeline. Methodologically, it applies a narrative and abductive approach to trace how exaptive meanings, connections, and temporal linkages translate into ecosystem-level outcomes, such as complementarities, routines, and innovation pipelines, providing a transferable mechanism for future comparative research.*

Territorial purpose and emotional place branding in rural development: Storytelling, identity and place value creation

ROSAMARIA REIG-RAMELLAT

Abstract. *Rural territories across the world are experiencing profound socio-economic transformations driven by globalization, demographic change, and economic restructuring. These dynamics have weakened traditional development models while simultaneously opening new opportunities for place-based strategies rooted in territorial identity, cultural heritage, and community participation. This conceptual paper examines how rural actors are reframing development narratives through emotional place branding strategies that emphasize identity, authenticity, and sense of place. Building on literature from place branding, territorial development, and place identity studies, the paper introduces the concept of territorial purpose; the collective articulation of a territory's mission integrating economic development, cultural preservation, environmental supervision, and community well-being. The paper argues that emotional attachment and place identity play a central role in mobilizing stakeholders and shaping territorial narratives, and proposes a framework linking identity, emotional place branding, stakeholder collaboration, and place-based value creation. The paper contributes to emerging debates on purpose-driven development by extending the notion of corporate purpose to the territorial scale.*
Keywords: *Territorial purpose; place branding; emotional place branding; rural development; place identity; rural storytelling.*

Framing of the research. *Rural territories have historically played a fundamental role in economic production, social organization, and cultural heritage. Traditionally associated with agriculture and natural resource exploitation, rural areas have been central to sustaining regional economies and preserving cultural landscapes. However, globalization, technological change, and urbanization have significantly transformed rural territories, altering traditional socio-economic structures and challenging conventional development models.*

These transformations have generated multiple structural challenges for rural regions. Many rural areas experience demographic decline, aging populations, limited economic diversification, and reduced access to services and infrastructure. Rauhut and Halme (2025) highlight that rural development has progressively shifted away from purely agricultural models toward multi-sectoral approaches that better reflect the complexity of contemporary rural economies. Furthermore, rural territories often face negative stereotypes portraying them as economically stagnant or socially marginal; perceptions that may hinder investment, discourage migration, and reinforce territorial inequalities.

Despite these challenges, rural territories also possess significant opportunities for innovation and renewal. Contemporary development paradigms increasingly emphasize the importance of place-based development strategies that leverage local resources, cultural identity, and territorial narratives. Rather than relying exclusively on external investment or large-scale industrial development, place-based strategies focus on mobilizing endogenous assets such as landscapes, cultural heritage, local knowledge, and social capital. Baccarani, Cassia, Rossato and Cavallo (2019) underscore how territory, firms, and communities operate in synergy through processes of value co-creation, in which place-specific assets serve as a shared foundation for competitive advantage and identity-building.

Within this context, place branding has emerged as an important tool for territorial development. Anholt (2010) argues that the reputation of places is shaped not only by communication campaigns but by the cumulative effect of policies, behaviors, and lived experiences associated with a territory. Place branding therefore should be understood as a multidimensional process that integrates communication strategies, governance practices, and stakeholder interactions. Kavaratzis (2004) conceptualized this transition as a move from traditional place marketing toward a more holistic approach centered on identity construction and strategic communication. More recently, Kavaratzis and Hatch (2013) have further developed this identity-based perspective, arguing that place brands emerge from ongoing interactions among multiple stakeholders rather than being controlled by a single organization.

In rural contexts, the relevance of place branding has grown substantially. Jafarli and Canavari (2025) provide a comprehensive review of the rural place branding literature, identifying how rural regions increasingly deploy branding strategies to differentiate their territories within globalized markets. Gulisova (2021) further synthesizes this literature through a meta-analysis of rural place branding processes, demonstrating that successful initiatives tend to involve participatory governance, authentic narratives, and long-term commitment from diverse stakeholder groups. Logar (2025) reinforces this perspective from a geographical standpoint, analyzing how place branding approaches have been adopted in rural development scholarship across multiple disciplinary traditions.

Alongside place branding scholarship, rural development research has also engaged with questions of identity and narrative. San Eugenio-Vela and Barniol-Carcasona (2012) investigate how territorial brands function as instruments of local development in inland Catalonia, demonstrating how place-based narratives can mobilize community engagement and reshape external perceptions of marginalized rural areas. Moroz, Karachyna, Vakar and Vitiuk (2020) similarly analyze territorial branding as an instrument for enhancing rural competitiveness in Eastern European contexts,

highlighting the role of institutional support and stakeholder coordination. These contributions collectively suggest that place branding, when rooted in authentic identity and participatory governance, can constitute a powerful mechanism for territorial development.

At the same time, contemporary management literature has increasingly emphasized the importance of purpose-driven strategies. The concept of corporate purpose refers to the broader societal mission of organizations beyond profit generation, integrating economic performance with social and environmental responsibility. Bonetti and Simoni (2011) examine the integration between tourism marketing and territorial marketing as a lever for economic development, arguing that place-based development systems require coherent strategic frameworks that align the objectives of multiple actors. This paper argues that similar dynamics are emerging at the territorial level, giving rise to the concept of territorial purpose.

Purpose of the paper. *This paper presents a **work-in-progress research** project aimed at developing and validating the concept of territorial purpose as a framework for understanding rural development through emotional place branding. The first objective of the project is to conceptually define territorial purpose by synthesizing insights from place branding, territorial development, and place identity literatures. The second objective is to validate this concept through qualitative fieldwork in selected European rural territories.*

Territorial purpose is defined as the shared strategic narrative through which a territory expresses its identity, values, and development aspirations, mobilizing stakeholders to create economic, cultural, and social value rooted in place. Territorial purpose extends the concept of corporate purpose to the territorial scale by emphasizing collective identity, stakeholder collaboration, and place-based value creation. While corporate purpose focuses on the mission and societal contribution of individual organizations, territorial purpose reflects the broader mission of a territory and its communities, integrating economic development with cultural preservation, environmental stewardship, and social well-being.

Three key dimensions characterize territorial purpose. The first is collective identity formation, which refers to the processes through which communities construct shared meanings and narratives about their territory. Giovanardi, Lucarelli and Pasquinelli (2013) contribute to this dimension through their brand ecology framework, which conceptualizes place brands as dynamic ecosystems of meaning shaped by the interactions among multiple stakeholders, institutions, and symbolic resources. The second dimension is place-based value creation, which refers to the capacity of territories to generate economic value by linking products, services, and experiences to local identity and heritage. The third dimension is emotional attachment and sense of place, which refers to the affective bonds that individuals and communities develop with their territory. Campelo, Aitken, Thyne and Gnoth (2014) demonstrate that sense of place is a critical determinant of destination branding effectiveness, arguing that places derive their competitive advantage not merely from physical attributes but from the emotional meanings that communities attach to them.

Identity formation often finds concrete expression through community narratives, or what can be described as rural storytelling. Govers (2018) explores how communities construct imaginative narratives around place identity, showing that the most admired cities, regions, and countries are those capable of articulating compelling collective stories that resonate both internally and externally. In rural contexts, such narratives frequently emphasize authenticity, heritage, tradition, and connection to nature; themes that resonate with contemporary societal trends including sustainable tourism, local food systems, and experiential consumption. Rural narratives play an important role in strengthening community resilience: by reinforcing shared identity and collective purpose, they foster cooperation among stakeholders and support collaborative forms of governance. They also provide symbolic resources that communities can mobilize to navigate economic and social transformations, legitimizing hybrid economic models that combine commercial activities with social and cultural objectives.

Hankinson (2004) contributes to this understanding by conceptualizing place brands as relational networks, in which different actors collectively contribute to constructing and communicating the brand meaning of the territory. This network perspective underlines the importance of cooperation and coordination among stakeholders in order to develop coherent and credible place branding strategies; a principle that is central to the concept of territorial purpose proposed here.

The conceptual framework proposed links territorial identity and emotional attachment to place branding, stakeholder collaboration, and ultimately sustainable rural development. In this framework, sustainability becomes a core guiding principle of territorial purpose, integrating environmental protection, cultural preservation, and economic development within coherent territorial narratives. Zenker and Braun (2017) argue that place branding strategies can contribute to sustainable territorial development when they successfully align economic goals with social and environmental values. Kavaratzis (2012) reinforces this by framing sustainable place branding as a collaborative governance process that requires the active participation of local stakeholders in defining the identity and future vision of the territory.

Conceptual framework: territorial purpose model

Territorial identity (culture, heritage, landscape)
↓
Emotional attachment (sense of place)
↓
Emotional place branding (narratives, storytelling)
↓
Stakeholder collaboration (institutions – businesses – community)
↓
Territorial purpose (shared mission and development vision)
↓
Place-based value creation (economic + cultural + social value)
↓
Sustainable rural development

Source: Author's own work

Methodology. *This study adopts a conceptual and qualitative research design. The first phase, which informs the present paper, involves a systematic review and conceptual synthesis of the literature on place branding, territorial development, rural identity, and corporate purpose. Drawing on this synthesis, the paper proposes the concept of territorial purpose and the associated conceptual framework. The literature review follows an integrative approach, combining contributions from management, marketing, economic geography, and territorial planning in order to capture the multidisciplinary nature of the phenomenon under study.*

The second phase of the research project, currently being designed, will incorporate an empirical component based on qualitative fieldwork in two European rural territories. This phase adopts a cross-border comparative design, deliberately selecting cases from different national contexts in order to test the transferability of the proposed framework across diverse institutional and territorial settings. The two cases presented below are not meant to be exhaustive but serve as illustrative pilot studies that will initiate a broader comparative research programme. They have been selected because they represent contrasting yet complementary expressions of territorial purpose: one rooted in agri-food heritage and landscape identity, the other in community-driven sustainable tourism. The first case study will focus on the wine-producing region of Piedmont in northern Italy, where gastronomy, landscape, and cultural heritage play a central role in territorial identity and place branding strategies. The second case study will examine rural tourism initiatives in the Catalan Pyrenees in Spain, a region characterized by strong community traditions, natural landscapes, and emerging sustainable tourism models.

Data collection in both case studies will involve semi-structured interviews with key stakeholders including local governments, producers, community-based organizations, rural tourism businesses, and territorial development actors. The qualitative analysis will seek to explore how different rural actors articulate territorial narratives, how these narratives contribute to strengthening emotional attachment to place, and how territorial purpose manifests in governance and development practices. The findings from these two pilot cases will subsequently inform the design of additional case studies in other European rural contexts, progressively strengthening the generalizability of the territorial purpose framework. The comparative cross-border design reflects the conviction, grounded in the work of Rauhut and Halme (2025), that internationally comparative approaches are essential for advancing generalizable theoretical frameworks in rural place branding research.

Results. *The conceptual contribution of this paper is the territorial purpose framework, which integrates insights from place branding, territorial identity, and purpose-driven development. The framework proposes the following logic chain: territorial identity (culture, heritage, landscape) generates emotional attachment (sense of place), which activates emotional place branding (narratives, storytelling), fostering stakeholder collaboration (institutions, businesses, community), which gives rise to territorial purpose (shared mission and development vision), enabling place-based value creation (economic, cultural, and social value), and ultimately supporting sustainable rural development.*

This framework integrates and extends several key contributions from the literature. The emphasis on identity as the foundation of territorial purpose builds on Kavaratzis and Hatch (2013), who argue that place brands are fundamentally identity-based phenomena. The role of emotional attachment in activating branding narratives reflects the insights of Campelo, Aitken, Thyne and Gnoth (2014), who demonstrate that sense of place is a critical driver of place branding effectiveness. The relational network dimension of stakeholder collaboration draws on Hankinson (2004), while the sustainability orientation of the framework reflects Zenker and Braun (2017) and Kavaratzis (2012). The role of storytelling as the communicative vehicle of territorial purpose is informed by Govers (2018) and by the rural branding literature reviewed by Gulisova (2021), Logar (2025), and Jafarli and Canavari (2025).

This framework suggests that rural place branding functions not only as a marketing strategy but also as a governance mechanism that aligns stakeholders around shared values and long-term development goals. Concrete examples of territorial purpose in practice include community-based tourism initiatives, cooperative agricultural networks, territorial

product labels, and local food systems rooted in regional identity. Such models demonstrate how emotional place branding can generate not only symbolic value but also tangible economic and social benefits, consistent with the value co-creation perspective advanced by Baccarani, Cassia, Rossato and Cavallo (2019) and the territorial branding competitiveness literature developed by Moroz, Karachyna, Vakar and Vitiuk (2020).

As this is a work-in-progress project, empirical results are not yet available. The expected results of the forthcoming fieldwork phase will provide evidence on how territorial purpose is interpreted and enacted by rural stakeholders in different contexts, and how emotional place branding shapes governance arrangements and development trajectories. The cross-border comparative design will allow testing whether the framework holds across different national institutional contexts, contributing to its potential generalizability and international applicability.

Research limitations. *As a conceptual paper based on literature synthesis, this study has several limitations. First, the proposed framework has not yet been empirically tested, and the fieldwork validation phase remains forthcoming. The propositions advanced are therefore theoretical in nature and require empirical scrutiny across diverse rural contexts. This is a deliberate feature of the work-in-progress design: the conceptual phase provides the foundation upon which the empirical phase will build, following a two-stage research logic.*

Second, the paper draws primarily on European rural territories as its empirical referents. The framework may require adaptation when applied to rural contexts in the global south or other institutional settings characterized by different patterns of land governance, community organization, or cultural heritage management. Third, the concept of territorial purpose, while drawing on well-established literatures, involves integrating perspectives from different disciplines (management, geography, marketing, and planning) which introduces inherent complexity and some definitional challenges. The multidisciplinary synthesis pursued in this paper reflects the perspective of Giovanardi, Lucarelli and Pasquinelli (2013), who argue that place branding scholarship benefits from embracing theoretical diversity rather than converging on a single disciplinary perspective.

Future research should therefore explore how territorial purpose influences governance structures, stakeholder participation, and sustainable development outcomes across different rural contexts. Comparative studies across regions and countries could help identify the institutional arrangements and policy frameworks that best support purpose-driven territorial development, building on the cross-national tradition in rural development scholarship exemplified by Rauhut and Halme (2025).

Managerial implications. *The territorial purpose framework offers important insights for practitioners and policymakers involved in rural development. For territorial managers and local governments, the framework highlights the importance of fostering participatory processes in which residents, businesses, and civil society organizations collaboratively define and communicate territorial identity. This approach aligns with Kavaratzis (2012), who emphasizes that stakeholder involvement is not merely a procedural requirement but a substantive contributor to the credibility and legitimacy of place branding strategies.*

For rural entrepreneurs and producers, the framework suggests that anchoring economic activities to place identity and cultural meaning can strengthen competitiveness and open new markets, particularly in sectors such as agri-food, rural tourism, and creative industries. By linking products and services to authentic territorial narratives, rural actors can differentiate their offerings within increasingly competitive markets; a strategy validated empirically by San Eugenio-Vela and Barniol-Carcasona (2012) in the context of inland Catalonia and theoretically supported by the value co-creation framework of Baccarani, Cassia, Rossato and Cavallo (2019).

For policymakers at regional and national levels, the concept of territorial purpose provides a lens through which rural development policy can be reoriented toward place-based, identity-driven approaches that integrate economic, cultural, and environmental objectives. This implies supporting not only infrastructure and economic incentives, but also the intangible dimensions of rural development such as community engagement, cultural heritage preservation, and narrative-building capacity. The integration of tourism and territorial marketing strategies proposed by Bonetti and Simoni (2011) offers a practical reference for designing coherent policy frameworks that harness the potential of territorial purpose in public administration.

More broadly, the territorial purpose framework suggests that rural development policy should move beyond sectoral approaches, focused narrowly on agriculture, tourism, or infrastructure, toward integrated territorial strategies that recognize the interdependence of economic, cultural, and environmental dimensions. Moroz, Karachyna, Vakar and Vitiuk (2020) provide empirical support for this orientation, demonstrating that territorial branding initiatives are more effective when embedded within comprehensive rural development strategies rather than implemented as isolated communication campaigns.

Originality of the paper. *The primary contribution of this paper is the introduction of the concept of territorial purpose, which extends the notion of corporate purpose to the territorial scale. While the relationship between place branding and rural development has received growing attention in the literature (Gulisova, 2021; Logar, 2025; Jafarli & Canavari, 2025; Rauhut & Halme, 2025), no previous study has systematically linked corporate purpose theory with territorial identity and emotional place branding in a rural development context.*

The paper also contributes to the emerging literature on purpose-driven development by highlighting the role of emotional attachment, rural storytelling, and stakeholder collaboration in shaping territorial narratives. By proposing a coherent conceptual framework that integrates identity, emotion, governance, and value creation, this work provides a foundation for future empirical research on rural place branding and territorial governance. The framework synthesizes and extends contributions from Anholt (2010), Kavaratzis (2004; 2012), Kavaratzis and Hatch (2013), Campelo, Aitken, Thyne and Gnoth (2014), Hankinson (2004), Govers (2018), and Giovanardi, Lucarelli and Pasquinelli (2013), integrating them within a single conceptual architecture oriented toward rural territorial development.

Furthermore, by explicitly positioning this study as a work-in-progress with a forthcoming qualitative fieldwork phase, the paper contributes to ongoing methodological debates on how to investigate complex territorial phenomena through place-based, participatory research approaches.

An additional dimension of originality lies in the cross-border design of the empirical phase. Rather than focusing on a single national context, the research deliberately seeks comparative evidence across different European countries, with the explicit aim of testing the transferability of the proposed framework beyond specific territorial or institutional settings. This cross-border approach responds to the growing need for internationally comparative research in rural place branding (Rauhut & Halme, 2025) and reflects the conviction that territorial purpose, as a conceptual framework, is exportable and applicable across diverse rural contexts within , and potentially beyond, Europe. The comparative design is also consistent with the territorial competitiveness perspective of Moroz, Karachyna, Vakar and Vitiuk (2020), who emphasize the value of cross-national evidence in assessing the effectiveness of territorial branding strategies.

AI involvement in international business decisions: How decision type and agency level shape managers' adoption intentions

BARBARA FRANCIONI[1], ALICE AIUDI[2], KEVIN CLARK[3], ROBERTA DE CICCO[4]

Abstract

This paper presents a work-in-progress research involving two experimental studies, examining how International Business (IB) decision type (strategic vs. operational) and artificial intelligence (AI) involvement influence managers' intention to adopt AI-supported decision-making processes. Study 1 investigates how the type of decision shapes adoption intentions, while Study 2 introduces the degree of AI agency (information provider, advisor, decision-maker) as an additional dimension. Drawing on IB decision-making theory, algorithm aversion and appreciation research, the study hypothesizes that AI adoption intentions vary systematically across human-AI paradigms depending on decision type. The research also explores the mediating role of perceived control over AI, risk, trust, and effectiveness, as well as the moderating effect of AI self-efficacy, in shaping these managerial responses.

Keywords: *Artificial intelligence; International business; Decision-making; AI adoption, AI self-efficacy*

Conceptual development.

Study 1: How decision type shapes managers' intention to adopt AI in international business. *The International Business (IB) literature distinguishes between two primary types of managerial decisions: strategic and operational.*

Strategic decisions in IB have broad implications for the firm, shaping its relationships with the external environment and influencing resource allocation over time. They involve competitive, activity, and temporal interdependence, meaning that present choices constrain future options and require resource commitments under substantial uncertainty (Leiblein et al., 2022). Csaszar et al. (2024) describe strategic decisions as inherently high-stakes, ambiguous, and subject to delayed and noisy feedback. When making strategic decisions, managers are confronted with incomplete information about foreign environments, uncertainty about the behavior of international partners and competitors, and the need to integrate tacit, experiential knowledge that is difficult to quantify or systematize (Johanson & Vahlne, 1977; Aharoni et al., 2011). These are typical scenarios for decisions such as foreign market entry mode selection or international ownership restructuring (Johanson & Vahlne, 1977; Leiblein et al., 2022; Buckley & Casson, 2019).

Operational decisions in IB, by contrast, are more structured, repetitive, and data-intensive, with more clearly defined inputs and outputs (Egelhoff, 1991; Buckley & Casson, 2019). They include international transfer pricing adjustments (Egelhoff, 1991; Buckley & Casson, 2019), routine cross-border supply chain and logistics coordination (Bartlett & Ghoshal, 1989; Menzies et al., 2024), and cross-market optimization of digital advertising budget allocation (Davenport et al., 2020). Unlike strategic decisions, operational decisions usually involve a shorter time horizon, are more easily reversible, and can be assessed more readily through objective performance criteria (Leiblein et al., 2022; Egelhoff, 1991).

A growing body of literature has begun to examine how organizations leverage artificial intelligence (AI) to facilitate these types of decisions, distinguishing between "automation", where AI substitutes for human tasks, and "augmentation", where AI enhances human capabilities while leaving ultimate judgment in human hands (Raisch and Krakowski, 2021), arguing that operational decisions are inherently more suitable for automation, while complex managerial tasks requiring human intuition and accountability resist full algorithmic substitution. According to Hasan and Ojala (2024), AI is particularly well-suited to automating IB operational processes such as market data aggregation, supply chain optimization, and routine internationalization performance monitoring because these tasks generate well-defined, quantifiable data flows that current AI systems are designed to process efficiently. Menzies et al. (2024) similarly show that AI primarily contributes to operational activities, including international market trend forecasting, demand prediction, and routine resource allocation, rather than to strategic choices such as entry mode selection or ownership configuration, which depend more heavily on judgment and contextual sensitivity. Following Rana et al. (2023), AI's computational rationality should complement the bounded-rationality that constrains human managers in international contexts, particularly for tasks where large volumes of structured data can be processed to optimize decisions within clearly defined parameters. However, their analysis also reveals a critical asymmetry: while AI helps reduce bounded-rationality constraints in operational IB activities, it faces fundamental limitations in strategic domains, where dynamic institutional environments, cultural specificities, and managerial accountability make it difficult to fully formalize or delegate decision-making authority.

A behavioral perspective on AI in IB decision-making calls for a distinction between augmentation and automation, suggesting that the appropriate mode depends on the task's cognitive demands (Ratten et al., 2024). Lindner et al. (2025) demonstrate that AI-augmented decision-making in multinational enterprises differentially affects the biases underlying strategic versus operational IB choices, with AI showing greater promise in reducing bounded-rationality constraints for the latter, while the former continues to require experience-based human judgment that current AI systems cannot replicate.

These arguments are reinforced by evidence from the research literature on algorithm aversion and appreciation. According to algorithm aversion literature (Dietvorst et al., 2018), people's willingness to rely on algorithmic support is systematically moderated by the nature of the task. Castelo et al. (2019) demonstrated that trust in algorithms is higher for tasks perceived as objective, which are quantifiable and rule-based, compared to subjective tasks based on intuition. Strategic IB decisions align closely with this definition of subjectivity, as they involve judgment calls and managerial accountability that resist full quantification (Dane & Pratt, 2007; Highhouse, 2008). In contrast, operational IB decisions mirror the characteristics of objective tasks, being more process-oriented and thus naturally compatible with algorithmic support (Egelhoff, 1991).

The preference for algorithmic over human judgment, a phenomenon known as algorithm appreciation, is particularly evident in tasks with quantifiable and objectively assessable outcomes (Logg et al., 2019). In the domain of marketing, Davenport et al. (2020) argue that AI adoption is shaped by task characteristics, with standardized and rule-based tasks being more amenable to automation, while holistic and contextually complex decisions that characterize much of international marketing strategy tend to resist full algorithmic processing. While AI systems excel at the analytical processing of complex data, human judgment retains a comparative advantage in conditions of uncertainty and equivocality (Jarrahi, 2018), precisely the conditions that define strategic decision-making in IB (Aharoni et al., 2011; Sniazhko, 2019).

Taken together, these findings suggest that decision type should significantly influence managers' intention to adopt AI-supported processes, with greater acceptance expected for operational than for strategic decisions.

Study 2: How human-AI decision-making paradigms and decision type shape managerial acceptance of AI in international business

Beyond the influence of task characteristics, the degree of agency granted to the AI system constitutes a fundamental dimension of the decision-making process. In Study 2, this agency is introduced as an independent variable with three distinct levels, designed to capture the transition from high human oversight to full AI autonomy.

The conceptual foundation for this manipulation draws on two converging streams of literature.

First, Kern et al. (2022) established that perceptions of fairness and acceptability of automated decision-making systems vary systematically depending on "who makes the final decision", distinguishing between solely human decision-making assisted by a computer program, human decision-making based on an automated recommendation, and fully automated decision-making by an algorithm.

Second, Li et al. (2025) operationalized three human-AI collaboration paradigms, namely "AI as advisor", "AI as peer collaborator", and "AI as decision maker under human supervision", demonstrating that these paradigms produce measurable differences in human cognitive responses during joint decision making tasks and that these roles carry distinct implications for human agency, reliance, and confidence calibration.

Building on these foundations and extending them to the use of AI in the IB decision-making context, this study operationalizes the human-AI decision-making paradigm as a three-level manipulation:

The first level is "AI as information provider": the AI system processes and organizes decision-relevant data, presenting structured information to the manager without offering any interpretive output or directional suggestion. The manager retains full analytical and decisional agency. This condition reflects the concept of basic computational support described by Kern et al. (2022), who observe that computer programs can offer data processing and outputs without proposing a specific recommendation.

The second level is related to "AI as advisor": the AI system provides an explicit recommendation, while the manager retains authority over the final decision. This corresponds to the automated recommendation condition of Kern et al. (2022) and the AI-as-advisor paradigm of Li et al. (2025). The authors describe this approach as the most widely used framework in Human-Computer Interaction (HCI) and AI research. In this setup, the AI augments managerial judgment without replacing it, consistent with the concept of decision augmentation (Leyer & Schneider, 2021).

The last level is about "AI as decision-maker": the AI system autonomously produces the final decision, with no residual decisional role for the manager. This corresponds to the fully automated condition of Kern et al. (2022), in which the program determines the final outcome without any human involvement in the decision process.

As shown in Table 1, the three levels of human-AI decision-making paradigm operationalized in the present study reflect a continuum of increasing AI autonomy and decreasing human control over the outcome.

Table 1. Operationalization of the Human-AI Decision-Making Paradigm in Study 2

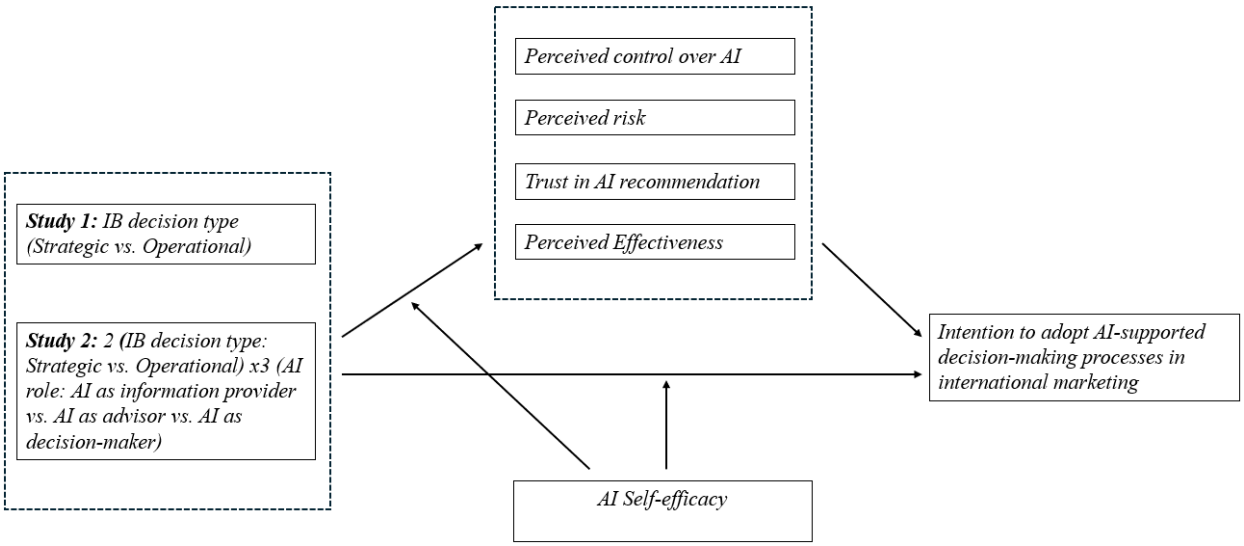
	AI as Information Provider	***AI as Advisor***	***AI as Decision-Maker***
AI role	*Processes and organizes data; presents structured information; no recommendation*	*Provides an explicit recommendation*	*Autonomously produces the final decision*
Human role	*Full analytical and decisional agency*	*Retains final decision authority*	*No residual decisional role*
AI autonomy	*Low*	*Medium*	*High*
Human control	*High*	*Medium*	*None*
Theoretical grounding	*Kern et al. (2022)*	*Kern et al. (2022); Li et al. (2025); Leyer & Schneider (2021)*	*Kern et al. (2022); Leyer & Schneider (2021)*

Source: Authors' own elaboration

This distribution of agency and decision authority is expected to shape managerial reactions to the use of AI. Managerial responses to AI are not neutral; they vary systematically with the distribution of decision-making authority. Hybrid arrangements, where AI provides recommendations while humans retain final authority, are perceived as more acceptable than fully automated processes (Kern et al., 2022). This preference is driven by a documented hesitation among managers to delegate decisions entirely, as the desire for control remains a primary barrier to full automation (Leyer & Schneider, 2021). Consequently, reactions to AI differ profoundly depending on whether the system is designed for augmentation or automation. These responses are moderated by task characteristics, such as the degree to which a task is perceived to require uniquely human abilities (Langer & Landers, 2021).

Because managerial responses to AI depend on task characteristics, reactions may differ depending on whether managers face operational decisions or strategic choices.

Strategic decisions are characterized by high levels of ambiguity, contextual complexity, and managerial accountability (Eisenhardt & Zbaracki, 1992). These choices are difficult to evaluate against objective criteria and require experience-based judgment as well as sensitivity to cultural and institutional factors (Hitt & Tyler, 1991; Johanson & Vahlne, 2009). Consequently, trust in algorithms is lower for tasks that require personal intuition, as managers perceive automated systems as lacking the contextual and affective abilities needed for such work. In high-stakes environments, the complete removal of human judgment, as seen in the "AI as decision maker" condition, generates resistance because it eliminates accountability and conflicts with the need for human oversight (Castelo et al., 2019). This perspective is further supported by the argument that AI is most effective when applied to standardized, rule-based tasks, whereas it tends to struggle with the holistic, contextually complex decisions of international strategy (Davenport et al., 2020). In this context, the AI as information provider condition may be perceived as failing to leverage the full benefits of algorithmic processing. Conversely, the "AI as advisor" paradigm offers a middle ground, augmenting judgment while preserving final authority. This arrangement aligns with evidence that granting individuals control over algorithmic outputs increases engagement, satisfaction, and conviction in the technology's utility (Dietvorst et al., 2018). By allowing managers to accept or reject suggestions, the advisor role maximizes the autonomy and responsibility required in consequential decision-making contexts (Leyer & Schneider, 2021).



Operational decisions are more structured, repetitive, and data-intensive, with more clearly defined inputs and outputs, and for which algorithmic processing is more straightforwardly applicable (Simon, 1960). In such contexts, the perceived subjectivity of the task is substantially lower, which, as demonstrated by Castelo et al. (2019), directly increases trust in and reliance on algorithms. Algorithm appreciation rather than aversion emerges for tasks characterized by an objectively assessable outcome, a condition more representative of operational than strategic decisions (Logg et al., 2019). Under these conditions, full delegation to AI becomes more acceptable, as the costs of relinquishing control are perceived as lower and the efficiency gains of automation more salient. Leyer and Schneider (2021) corroborate this reasoning, arguing that decision automation is most valuable for routine operational tasks because it frees managerial capacity for more complex and demanding activities. Conversely, a condition in which AI merely organizes and presents data without recommending a course of action, as in the AI as information provider condition, is likely to be perceived as underutilizing the technology's potential, particularly when the task structure would support a more directive algorithmic output. The "AI as advisor condition" occupies an intermediate position, offering directional guidance while preserving human authority, but for operational decisions, this residual human involvement may be perceived as unnecessary friction rather than a valued safeguard.

In both studies, individual differences in managers' perceived self-efficacy regarding the use of AI technologies are expected to constitute a boundary condition for AI acceptance. AI self-efficacy (AISE) can be defined as an individual's general belief in their ability to use and interact with AI technologies and products, encompassing not only technical competence but also comfort during interaction and perceived usefulness of AI assistance (Wang & Chuang, 2024). Rooted in Bandura's (1977) social cognitive theory, self-efficacy is a domain-specific construct that shapes individuals' expectations about their capacity to perform a given task and, consequently, their willingness to engage with the tools involved in that task. AISE comprises four main components: assistance, anthropomorphic interaction, comfort with AI, and technological skills (Wang and Chuang, 2024). Together, these dimensions reflect the multifaceted nature of individuals' self-perceived competence in AI interactions.

In "AI-supported decision making", AISE serves as a key moderator between the human AI paradigm and managerial acceptance. This influence is predicted to be most significant at the extremes of the agency continuum. For strategic decisions, high AISE likely amplifies the preference for the advisor condition by increasing confidence in evaluating recommendations while retaining authority, consistent with the motivational benefits of perceived control (Dietvorst et al., 2016). For operational decisions, high AISE may facilitate the acceptance of full AI autonomy by reducing the anxiety associated with delegation, aligning with the positive relationship between confidence and willingness to delegate to algorithmic systems (Leyer & Schneider, 2021).

Figure 1 displays the hypothesized model of this research.

Figure 1. Research model

Source: Authors' own elaboration

Objectives. *The present research pursues two interconnected research objectives, each addressed through a dedicated experimental study.*

Study 1 aims to investigate whether and how the type of IB decision influences managers' intention to adopt AI-supported decision-making processes. Specifically, it examines whether managers' adoption intentions differ systematically when AI is introduced in the context of strategic decisions, characterized by high ambiguity, contextual complexity, and managerial accountability, compared to operational decisions, which are more structured, repetitive, and amenable to algorithmic processing. This first study will provide a foundational understanding of how the nature of the task shapes managerial openness to AI involvement.

Study 2 builds on these foundations and introduces an additional layer of complexity by examining how different configurations of human-AI collaboration interact with decision type to shape managerial responses. It investigates how three distinct human-AI decision-making paradigms, reflecting increasing levels of AI autonomy and decreasing degrees of human control, influence managers' perceptions and acceptance of AI-supported decision processes in strategic and operational IB decisions. The second study will address the more specific question of which form of AI involvement is most acceptable and under what conditions of international business decision-making.

Both experimental studies will investigate the role of potential mediators in the relationship between decision type and intention to use AI systems. These variables, namely perceived control over AI, perceived risk, trust in AI recommendations, and perceived effectiveness, are included in the model because they are considered important factors influencing the intentions to use AI systems (Ismatullaev et al., 2024).

This research includes an exploratory comparison of data from international business managers in the U.S. and Italy to identify differences in their perceptions of AI's role in decision-making. Given that national contexts influence how

managers view digitalization and AI, this cross-country analysis provides fresh insights into the intersection of technology and international business (Cannavale et al., 2025).

Together, the two studies provide a progressive and theoretically grounded examination of the factors shaping managerial acceptance of AI in international business.

Methodological framework. *The proposed research adopts a quantitative experimental approach to examine how AI agency and decision type shape managerial acceptance of AI-supported decision-making in IB contexts.*

The research will consist of two studies, both grounded in the Experimental Vignette Methodology (EVM; Aguinis & Bradley, 2014), a well-established approach that combines the internal validity of experimental designs with the contextual richness of scenario-based stimuli. EVM is particularly well-suited to the present research questions because it allows for the clean manipulation of relevant independent variables, namely the type of decision and the level of AI agency, while keeping all other contextual features constant through random assignment to conditions (Eckerd et al., 2021). The studies will employ a between-subjects design, in which each participant is exposed to only a single experimental condition. Prior to the main data collection phases, all vignettes will be subjected to a structured pretest sample of professionals in order to verify scenario realism, clarity, and the correct perception of the intended manipulations; stimuli that fall below acceptable realism thresholds or that fail to produce clear differentiation between conditions will be revised iteratively until validity criteria are met.

For the manipulation of IB decision type, three decision types were identified in the literature for each category. The strategic category included foreign market entry mode selection, international location choice for FDI, and international ownership restructuring (Johanson & Vahlne, 1977; Leiblein et al., 2022; Buckley & Casson, 2019). The operational category included international transfer pricing adjustments, routine cross-border supply chain and logistics coordination, and cross-market optimization of digital advertising budgets across subsidiaries (Davenport et al., 2020; Menzies et al., 2024; Hasan & Ojala, 2024; Egelhoff, 1991).

*Manipulation checks will be administered after vignette exposure to confirm that participants perceived the experimental conditions as intended (Oppenheimer et al., 2009), and attention checks will be embedded throughout the survey to identify and exclude inattentive respondents (Hulland et al., 2018). Sample size will be determined through an a priori power analysis for between-subjects comparison, conducted using G*Power 3.1 (Faul et al., 2007), considering a 20% recruitment buffer to account for anticipated attrition and exclusions.*

Study 1 employs a single-factor between-subjects design in which the independent variable is IB decision type, manipulated at two levels. The strategic condition presents participants with an AI-supported scenario centered on a high-stakes decision. Such decisions involve long-term consequences for the firm's international competitiveness and significant resource commitments, consistent with the IB grounded definition of strategic decisions provided by Leiblein et al. (2022). Candidate scenarios include foreign market entry mode selection (e.g., greenfield investment versus joint venture) and international ownership restructuring, decisions characterized by competitive, activity, and temporal interdependence and by the irreversibility of resource commitments under deep uncertainty (Buckley & Casson, 2019; Johanson & Vahlne, 1977). In the operational condition, a structurally equivalent scenario describes an AI-supported, routine, and more reversible decision with shorter-term consequences and clearly defined performance criteria. Candidate scenarios include international transfer pricing adjustments and the cross-market optimization of digital advertising budgets across subsidiaries (Hasan & Ojala, 2024; Menzies et al., 2024). The two vignettes will be matched in length, linguistic complexity, and framing of AI involvement to ensure that any observed differences in the dependent variable(s) are attributable to the manipulation of decision type rather than to incidental stimulus features.

Study 2 will extend the design by introducing a second independent variable – the human-AI decision-making paradigm – and will employ a 2 × 3 between-subjects factorial design crossing decision type (strategic vs. operational) with three levels of AI agency: AI as information provider, AI as advisor, AI as decision-maker.

Data will be collected through an online survey using specialized market research companies that maintain proprietary panels of employed professionals, ensuring that all respondents are currently active in business roles relevant to the research context. Participants will be selected based on screening criteria related to their professional experience in international business. They will receive an incentive from the panel supplier, in accordance with standard market research practice. This approach is increasingly adopted in experimental marketing and management research because it combines sample quality with scale (Hulland et al., 2018). It offers a methodological advantage over convenience samples by guaranteeing verified professional backgrounds and reducing the ecological validity concerns often raised against vignette studies conducted with student panels.

Hypothesis testing will rely on independent-samples comparisons and factorial ANOVA as appropriate, supplemented by mediation and moderation analyses using Hayes's (2013) PROCESS macro.

The study will employ validated scales to measure the constructs of interest, with all items rated on a seven-point Likert scale ranging from 1 (strongly disagree) to 7 (strongly agree).

Perceived control over AI will be measured using a three-item scale adapted from Belanche et al. (2022). The scale captures the extent to which managers perceive that they retain control over the use of the AI system during the decision process (e.g., "When I use the AI system in international marketing decision making, I feel that I have control over the actions I take"). Perceived risk will be measured using a four-item scale adapted from Höddinghaus et al. (2021). The items assess managers' perception of the potential uncertainty and negative consequences associated with the AI-supported international marketing decision-making process described in the scenario. Trust in AI recommendations will

be measured using a three-item scale adapted from Shin (2021). The items capture the extent to which managers perceive the AI system as trustworthy and reliable in providing recommendations for international marketing decision-making. Perceived effectiveness will be measured using a three-item scale adapted from Castelo et al. (2019). The scale assesses managers' evaluation of the usefulness and expected performance of the AI supported decision-making process described in the scenario.

AI self-efficacy will be measured using the AI Self-Efficacy Scale developed and validated by Wang and Chuang (2024). The scale was selected because it demonstrated strong psychometric properties in the original validation and because it was purposely designed to capture individuals' perceived self-efficacy in the use and interaction with AI technologies and products, going beyond general technology self-efficacy by incorporating dimensions that are unique to the AI context, such as anthropomorphic interaction and comfort with AI. The scale comprises 22 items distributed across four sub-dimensions: assistance, anthropomorphic, comfort with AI, and technological skills. The sub-dimension scores will be considered for supplementary exploratory analyses.

Managerial acceptance will be operationalized as managers' behavioral intention to adopt AI-supported decision-making processes. This will be measured using a three-item scale adapted from Venkatesh et al. (2003), which is the most widely validated measure of technology acceptance intention in the information systems literature, as the scale demonstrated excellent psychometric properties in the original validation study.

Beyond Borders: A Systematic Review of Internationalization Pathways for Performing Arts Organizations

CLAUDIO BECAGLI[1], MATILDE MILANESI[1], STEFANIA OLIVA[1]

Abstract. *This paper provides a systematic review of the literature on the internationalization pathways of performing arts organizations (PAOs), a distinctive and still underexplored segment within the cultural and creative industries. Drawing on a structured analysis of 66 peer-reviewed articles published between 1994 and 2026, the study examines how PAOs approach internationalization strategies while facing structural constraints such as high production costs, limited scalability, and strong cultural embeddedness.*

The findings highlight the growing academic interest in this field, particularly after 2010, and reveal a fragmented yet multidisciplinary body of research spanning cultural economics, international business, and tourism studies. However, the wide dispersion of publications across journals suggests a limited ability to address the topic cohesively and integrate it within a more unified scholarly domain.

Overall, this study advances research on cultural organizations by offering a comprehensive overview of internationalization strategies in the performing arts and outlining directions for future interdisciplinary research.
Keywords: *Internationalization; Cultural industries; Performing arts*; *Cultural organizations; International business*

Framing of the research. *The internationalization of performing arts organizations (PAOs) represents a critical frontier in contemporary cultural economics, emerging as a strategic response to the "earnings gap" - the structural disparity between rising costs and stagnant revenues in live performance (Baumol & Bowen, 1966). While industrial cultural sectors - such as film, recorded music, and publishing - have traditionally leveraged economies of scale derived from the commercialization of intellectual property rights, near-zero marginal costs, standardized formats, and access to private capital to facilitate global expansion, PAOs remain constrained by the inherent nature of live shows. These constraints impose high variable costs and a structural productivity lag, alongside significant cultural and logistical barriers.*

The drivers of international expansion for PAOs, particularly non-profits, can be categorized as either internal or external.

***Internal Determinants and Managerial Resilience**. From an internal perspective, internationalization offers an opportunity for risk sharing, achievable by distributing substantial fixed production costs across a larger number of performances through international co-productions (Mariani, 2007; Mariani, 2009). These collaborations function not only as financial levers but also activate collaborative learning processes that accelerate the acquisition of cross-border competitive advantages. Furthermore, internationalization enables PAOs to increase revenues through the development of new business models (Schiuma, 2017) and the adoption of new technologies for cultural distribution, such as digital live-streaming (Ouazzani et al., 2022). These technologies allow PAOs to partially decouple economic performance from the physical limitations and logistical costs of touring, while simultaneously fostering "phygital engagement" capable of attracting younger generations (Pesce & Franzè, 2025). From a competitive standpoint, international projection strengthens organizational prestige and, crucially, helps overcome the "liability of outsidership" (Johanson & Vahlne, 2009). By participating in international networks - often through network intermediaries (e.g., international agents, festival artistic directors) who act as gatekeepers to elite circuits - organizations can reduce not only the physical and cultural distance from foreign markets but also the disadvantage of lacking local relational embeddedness. This, in turn, enhances the capacity to attract top international talent and incremental financial resources from private supporters (Shekhtman & Barabási, 2023).*

***External Determinants and Cultural Diplomacy**. From an external perspective, a strong push toward internationalization stems from the political will of national governments or supranational institutions (e.g., the EU) seeking to capitalize on cultural soft power (Nye, 2004). PAOs are viewed as vital instruments for "nation branding" (Anholt, 2007), contributing to a country's international reputation and generating positive externalities in other sectors, such as cultural tourism (Abromaite et al., 2025) and foreign trade, while opening privileged diplomatic channels. Within the European context, programs such as Creative Europe and Perform Europe (European Commission, 2016, 2018, 2021) promote the safeguarding and development of European cultural and linguistic diversity. These initiatives aim to strengthen the competitiveness and economic potential of cultural and creative sectors, pursuing not only economic objectives but also social cohesion and intercultural dialogue. At the national level, governments support internationalization to bolster the competitiveness of domestic firms and contribute to the renewal of the national cultural capital and artistic languages within increasingly saturated domestic markets.*

Given the highly differentiated nature of the performing arts and the local specificity of their offerings compared to industrial cultural products, internationalization cannot be reduced to mere export. Instead, it requires strategies aimed at building long-term cultural relationships, preserving the symbolic components of the artistic product without

[1] Department of Economics and Management, University of Florence, Florence, Italy

compromising cultural authenticity, and projecting offerings toward foreign markets that are as sensitive to aesthetic-historical-cultural value as they are to economic considerations (Rastrollo-Horrillo & Casillas, 2020).

Pursuing these internationalization strategies compels PAOs—particularly non-profits—to undertake a profound organizational reconfiguration. From a Resource-Based View (RBV) perspective (Barney, 1991), these organizations often lack human resources with the managerial capabilities necessary to develop international networks and successfully navigate global markets (Symbola & Unioncamere, 2024). They also frequently face the "dual leadership" paradox (Cray, Inglis, & Freeman, 2007), which can generate internal tensions between artistic direction (artistic mission) and business management (financial sustainability), leading to slower decision-making on complex strategic choices. One area where dual leadership manifests is in market selection: artistic directors may prioritize high-prestige markets to maximize reputational returns, while business directors may favor "profitable" markets or those with greater access to transnational subsidies (e.g., EU grants). This lack of specialized competencies is further exacerbated by the scarcity of financial resources for internal development - a consequence of both the 'cost disease' (Baumol & Bowen, 1966) and a structural dependency on public subsidies, which are still largely allocated based on historical parameters or domestic impact (e.g., number of local performances or tickets sold).

Purpose of the paper. *This paper aims to provide a systematic synthesis of current research on the internationalization pathways of PAOs, summarizing distinctive characteristics of the internationalization of such organizations and highlighting research gaps.The paper also aims to develop future research trajectories characterized by cross-cutting and interdisciplinary approaches.*

Methodology. *This study adopts a systematic literature review (SLR) methodology in order to rigorously and transparently identify, analyze, and synthesize existing research related to the internationalization of PAOs. The review process was conducted following established guidelines and structured into several stages: definition of the research questions, identification of relevant data sources, selection of pertinent studies, and data analysis. Specifically, the literature search was carried out across SCOPUS, a recognized academic database, using a combination of keywords and Boolean operators to ensure comprehensive coverage. The search string was "performing art*" OR "cultural industr*" OR "CCIs" in the title, abstract or keywords sections. In this phase, an effort was made to include as many journals as possible, starting from the ABS ranking within the categories of International Business, Marketing, and sector-specific journals (e.g., culture and tourism). The use of the ABS ranking serves as a guarantee of the quality of the publications considered. By combining a keyword-based search with the list of ABS-ranked journals in the aforementioned fields, an initial database of 530 articles was obtained. At this stage, a highly inclusive approach was preferred, given the specific nature of the topic and the possibility that it may be addressed across a wide range of heterogeneous journals. Inclusion and exclusion criteria were defined a priori to guarantee consistency and replicability, taking into account factors such as thematic relevance and methodological quality. During the eligibility phase, we selected articles that were specifically focused on issues related to the internationalization of PAOs. The screening process led to the exclusion of numerous studies that were not thematically or methodologically relevant, resulting in a final sample of 66 articles. Finally, the extracted data were synthesized using a content analysis, with the aim of identifying recurring patterns, gaps in the literature, and directions for future research.*

Results. *The analysis of the identified articles offers an interesting overview of the evolution of the current research on the internationalization pathways of PAOs. Analyzing the distribution of the articles over the time span considered (1994-2026), the results reveal a growth in the number of contributions over time, with an acceleration after 2010 and a further increase in recent years, with 9 articles published in 2023 and 13 articles in 2025. This finding suggests a rising academic interest in the global dynamics of PAOs.*

In terms of sources, the articles are published across 30 journals, suggesting a relatively broad but fragmented publication landscape. This aspect sheds light on the multidisciplinary nature of the phenomenon and shows a research strand dispersed across multiple outlets rather than concentrated in a few core journals.

The articles counted a total of 1,579 citations, with an average of 23.8 citations per article and of 47.8 citations per year. This indicates a moderate level of scholarly impact, with few highly cited contributions driving the overall citations. This pattern suggests that the field is undergoing continuous development, as demonstrated by the concentration of publications in recent years, even if the first contributions date back to several decades.

Table 1 offers some descriptive statistics that synthesize the main characteristics of the internationalization pathways of PAOs' intellectual structure.

Tables 2 and 3 namely show the journals which publish more on the topic and the list of the most cited articles. In the first case, we considered those journals that published more than 2 articles among the identified contributions. In this case, the analysis suggests a concentration of articles in a limited number of sources, where the "International Journal of Arts Management" (14 articles) and the "Journal of Cultural Economics" (11 articles) represent the dominant publication venues. This result reflects the roots of the topic that remain anchored in the field of economic and management of cultural and creative organizations, which represent the core disciplinary foundations of the research strand. However, across the most publishing journals emerge at the third position"Journal of International Business Studies" (5 articles), followed by "Asia Pacific Business Review", highlighting an increasing integration with international business literature. Finally, it is interesting to note the presence of journals concerning the domain of

tourism research, that offer a perspective on the opportunity offered by PAOs' activities to increase the attractiveness of tourism destinations. This result, moreover, again confirms the multidisciplinary nature of the topic.

Table 1. Descriptive Statistics

Variable	*Value*
Total number of articles	*66*
Time span	*1994–2026*
Number of journals	*30*
Total citations	*1579*

Concerning the analysis of the most cited articles, we considered the articles with more than 50 citations. Among the top three cited contributions, Prentice and Andersen (2003) and Frey (1994) demonstrate the long-standing importance of festivals and cultural events as key contexts for studying performing arts and cultural consumption. Moreover, more recent works point out some emerging topics that characterize most in general the field of cultural and creative industries, such as the need to find alternative funding sources (Bœuf et al., 2014) or risk and opportunities related to the digital transformation (see for example Mueser and Vlachos, 2018).

Finally, the analysis focused on word frequencies in abstracts and keywords to identify the core topics of the articles.

Table 4 shows the results for word frequencies in the abstracts, distinguishing between one-word analysis and two-word analysis (bigram), and identifying the top 20 frequencies. Findings show that the most frequent words and bigrams pertain to the sectors where the organisations operate, as the case of "perform" (100 occurrences) or "performing arts" (63 occurrences). These results suggest a clear focus of the literature, confirming that the dataset is strongly centred on the performing arts domain. A second major thematic area emerges around cultural and creative industries, frequently

cited as "cultur" (121 occurrences), "cultur industri" (23 occurrences) and "creativ industri" (9 occurrences). This pattern indicates that research on performing arts is often embedded within the broader framework of cultural and creative industries, highlighting an interdisciplinary perspective.

Furthermore, a part of highly cited words and bigrams suggest a focus on topics related to managerial, market and strategic dimensions. This element is revealed by words such as "market" (64 occurrences) or "business model" (10 occurrences), suggesting research focuses on organisational structures and management practices. The presence of words and bigrams related to the international market and international tourists highlights the field's global dimension.

This is also confirmed by the international dimension of the geographical settings, which range across several experiences in different countries, as in the case of Cantonese opera (9 occurrences). These terms indicate that empirical research is often grounded in specific cultural settings and case studies, reinforcing the contextual nature of performing arts research.

Table 4. Most frequent words and bigrams in abstracts

Word	*Frequency*	*Bigram*	*Frequency*
cultur	*121*	*perform art*	*63*
perform	*100*	*cultur industri*	*23*
art	*97*	*art organ*	*11*

Source: Authors' elaboration

Table 5 shows the results for word frequencies in the keywords, even in this case, distinguishing between one-word analysis and two-word analysis (bigram), and identifying the top 20 frequencies. The results of the keywords' analysis corroborate the previous findings. In particular, the focus on data from the performing arts sector is confirmed, both in words (cultur=30 occurrences; art=22 occurrences) and in bigrams (perform art=16 occurrences). Moreover, even keywords analysis reveals that the collected literature also focuses on the economic, managerial, and international dimensions (market=18 occurrences; busi model=4 occurrences). Finally, the presence of terms such as "innov" (6 occurrences), "technolog" (6 occurrences) and "digit" (5 occurrences) points to a growing interest in aspects related to technological innovation and digital transformation.

Table 5. Most frequent words and bigrams in abstracts

Keyword	*Frequency*	*Bigram*	*Frequency*
cultur	*30*	*('perform', 'art')*	*16*

Source: Authors' elaboration

Research limitations. *Despite its rigor and transparency, this systematic literature review has several limitations. First, the scope of the review is inherently constrained by the selection of databases, journals, and keywords, which may have led to the omission of relevant studies published in less accessible or non-English-language sources. Second, the heterogeneity of methodologies and conceptual frameworks across the included studies poses challenges for synthesis and comparability. Third, given the relatively limited number of studies specifically addressing the internationalization of PAOs, the findings may not fully capture the diversity of practices across different cultural and national contexts. Future research might overcome these limits and seek to develop a taxonomy of the typical internationalization pathways of PAOs.*

Managerial implications. *The preliminary results of the study drive some managerial implications of internationalization in the PAOs.*

First, there is a need to develop new business models that place internationalization at the core of organizational strategies. Cultural institutions and live performance organizations are increasingly required to reduce their dependence on public funding by diversifying their revenue streams. In this regard, international tournée, co-productions with foreign partners, and participation in global festivals represent key mechanisms for expanding target markets, enhancing visibility, and mitigating financial risks. Second, the adoption of new technologies constitutes a strategic lever to support internationalization processes. The integration of digital tools—such as live streaming, on-demand platforms, and interactive digital services—enables organizations to diversify their publics. This approach not only broadens access to cultural content but also fosters the development of new revenues opportunities and forms of audience engagement. Third, it is essential to incentivize the sector to develop strategies capable of attracting inbound international flows. Performing arts can play a crucial role as a driver of tourism attractiveness, contributing to the enhancement of culture through internationally relevant live events. From this perspective, it is crucial to promote support policies and partnerships among cultural institutions, public authorities, and tourism operators in order to create integrated ecosystems that strengthen destination positioning and generate positive spillovers. Finally, it is fundamental to overcoming outsidership through network intermediaries: success in foreign markets depends less on physical distance and more on relational embeddedness. PAOs managers must build strong ties with network intermediaries—such as international agents and festival directors—who act as gatekeepers to elite global circuits.

Originality of the paper. *The paper represents an initial attempt to systematize the literature on the internationalization pathways of PAOs, a highly specific category of organizations characterized by distinctive and unique features. It provides insightful reflections while identifying gaps and outlining avenues for future research. From an international business perspective, contemporary research in international business on cultural industries, and specifically on PAOs, would benefit from stronger cross-disciplinary integration. Over the past decades, studies on cultural industries conducted across various disciplines have largely evolved in parallel, with growing yet still limited interaction. Enhancing these cross-disciplinary linkages would enable IB scholars to draw on a wider range of scientific approaches—including concepts, theoretical perspectives, and methodologies—thereby fostering a more comprehensive understanding of cultural industries and related research domains.*

Beyond Intermediaries. A Theoretical Framework for Technology-Oriented Negotiation (TON) in SME Internationalization

FAHEEM UDDIN SYED, RAFFAELE ALBANI, VALERIO NATALE, RICCARDO RIALTI

1. Introduction. Internationalisation refers to the outward movement of a company's operations from its home market into a foreign market (Karlsen et al., 2003). For the majority of small and medium-sized enterprise (SME) companies internationalisation is important to improve performance, ensure long term viability and to provide access to new knowledge and technology (Pangarkar, 2008). However, internationalisation is complex as SMEs have to navigate different legal systems, cultures and political climates, and therefore, internationalisation can be especially difficult for SMEs due to the *liability of smallness* due to a lack of financial resources, limited specialised managerial skills, and limited ability to take on the high levels of risk associated with cross border trade. The primary difficulty faced by SMEs when attempting to internationalise is managing three key flows; product flow, finance flow and information flow (Korneliussen & Grønhaug, 2003). These flows rely heavily on the success of negotiations between parties who are geographically separated and who do not necessarily have an existing relationship or level of trust (Lancaster & Reynolds, 1998). Traditional international business transactions are characterised by high transaction costs, significant risks of information leakages, and reliance on third party intermediaries (such as financial institutions), to protect against the risks of fraud and counter default. As a result, many SMEs may find themselves unable to expand beyond their domestic markets, due to the barriers created by the need for successful negotiation within an increasingly globalised environment.

The majority of research on SME internationalization has viewed digitalization broadly as an enabler of internationalization (Bargoni et al., 2024; Gaweł et al., 2023; Luu et al., 2026); much of the focus has been placed on the corporate website, digital platform and e-commerce as methods to reduce the costs associated with geographic distances (Jean & Kim, 2020). Scholars have applied the resource-based view (RBV) and network theories to illustrate how digital capabilities enable SME to identify international opportunities and acquire foreign market intelligence at a reduced cost (Kaur & Kumar, 2024). Additionally, recent research has highlighted the use of Industry 4.0 technologies (i.e., blockchain, smart contracts) to revolutionize trade finance through decentralized, tamper-proof ledgers that provide enhanced transparency and eliminate the need for trusted intermediaries to conduct business internationally (Toorajipour et al., 2022). Nonetheless, there exists a significant gap in understanding the technological solutions that can assist in supporting the negotiation phase of the internationalization process of SME. In particular, current research is generally categorized into either a communication-focused approach or a document-focused approach (Ribau et al., 2018); i.e., communication-focused approaches model the message exchanges occurring during the negotiation phases of internationalization (Treviño & Doh, 2020), however, do not capture the document management aspects of internationalization negotiations. Conversely, document-focused approaches capture the final negotiated contract agreements among parties (Woldegiyorgis et al., 2018), however, lose the rich history and rationale behind each step taken by parties negotiating the agreement. Finally, there exists limited research that examines the *third party less* approach (Brousseau & Chaves, 2005), i.e., when the technology itself (i.e., through the self-executing logic of smart contracts) is used as the main facilitator of peer to peer (P2P) business transactions in international trade. While blockchain is commonly referred to as a *machine for creating trust*, existing conceptual models fail to illustrate how the automated contractual obligations of the negotiation process affect the behaviour and strategic decision-making of entrepreneurs in industries that rely heavily on technology. Therefore, we consequently wish to answer the following research question:

RQ. How does technology-oriented negotiation (TON), facilitated by the self-executing mechanisms of smart contracts and blockchain, transform the traditional trust-commitment sequence to enable disintermediated internationalization for resource-constrained SMEs?

This study will address this important theoretical and empirical gap by examining the ways in which technology-oriented negotiation (TON) supports the internationalization process for SMEs. The study will focus specifically on the use of smart contracts and blockchain technology as the underlying mechanisms for SMEs to navigate the complexity of international trade, and therefore reduce their dependency on traditional third-party intermediaries. The contribution of this research study is three-fold. Firstly, using a socio-technical perspective (STP), this research will move beyond the functional analysis of digital tools to analyse the *joint optimization* of both technical subsystems-the algorithmic rules of the ledger-and social subsystems-human negotiators, organizational dynamics and the strategic goals of the firm. A STP is particularly relevant here, since it challenges technological determinism (Amanollahnejad et al., 2026), arguing that the success of TON depends on the alignment of the automated *if-then* logic of smart contracts with the complex communicative acts necessary for negotiating complex P2P transactions. Secondly, this study will re-imagine the traditional trust-commitment theory (TCT) within the context of the industry 4.0. In traditional TCT models, interpersonal trust is seen as the necessary precursors to relationship commitment (Ling-Yee Li et al., 2017). However, in the context of a blockchain enabled environment, the need for interpersonal benevolence is replaced by industrialized trust based on the immutability and transparency provided by the shared ledger, providing a means by which commitment may be manifested through the reliability of the technology itself, thus potentially allowing for a *loose-coupling view* of digital

globalization whereby SMEs may participate in secure transactions without the resource intensive processes associated with developing long-term social bonds.

Our research is focused on an Italian-based consulting technology company located in Tuscany which has historically relied heavily on local networking, but currently finds itself facing increasing challenges due to the demands of global competition (Ottati, 2024). Utilizing a single-case methodology, we utilize in-depth interviews with top management team to create a detailed mapping of the firm's negotiation behaviour and develop a comprehensive theoretical framework that combines technological affordance with international strategic considerations. The developed theoretical framework will examine how digital tools, specifically *if-then* algorithmic commands may be utilized to enable the automation of the implementation of agreements, thus reducing the risk of opportunistic behaviour, while also providing a *single-source-of-truth* among all parties involved in negotiations. Following the development of this theoretical framework, we will conduct a small-scale survey of entrepreneurs to verify our findings and confirm the broader applicability of our model throughout the SME. This methodological approach allowed us to move beyond simplistic automation frameworks and towards a more detailed understanding of *negotiation support*, where technology enables human negotiators to undertake more complex, semi-structured communication about bundles of products and/or services.

2. Literature Review

2.1 The Entrepreneurial Trajectory of SME Internationalization. Internationalisation of SMEs have traditionally been understood through an Uppsala theory, based on the idea that the firm's foreign market expansion occurs sequentially, incrementally, and through a process of experiential learning (Figueira-de-Lemos et al., 2011; Forsgren, 2002). Based on this, SMEs will generally begin by developing activities in markets that are both geographically and culturally close in order to reduce the *liability of smallness.* As the SME develops its experiential knowledge of the new market(s), it increases its level of commitment to those markets. This traditional view of SMEs assumes that the *liability of smallness*, which is the resource constraint caused by limited financial resources, limited administrative capacity, and limited management expertise, is a major disadvantage for SMEs when attempting to pursue global opportunities (Acs et al., 2020). However, the rapidly changing nature of the global business environment has challenged these incremental assumptions about SMEs and has given rise to two new concepts; the *international new venture (INV)* and the *born global firm (BGF)* (Fan & Phan, 2007; Rumyantseva & Welch, 2023). Both of these concepts describe businesses that skip the traditional stages of development and enter multiple remote or distant markets at inception using unique capabilities and global networks.

Further understanding the internationalization journey of SMEs, larger volume of literature has explained it through the resource-based view (RBV) for examining its accelerated development (Anwar et al., 2024). RBV views valuable, rare, inimitable and non-substitutable resources as the basis for competitive advantage (Parker & Lawrence, 2021). The Penrosian Logic, however, views the degree of flexibility that exists within a firm's resources as the primary means by which a firm can create, capture, and deliver value (Prashantham, 2008). The degree of flexibility allows SMEs to *do more with less* than larger enterprises and therefore overcome size-related barriers via resourcefulness. Additionally, due to digitalization, the digital technology is now an important resource that enables SMEs to transform their firm capabilities and reduce costs related to both physical distance and information processing (Bargoni et al., 2024). Therefore, digital technology functions as an export enabler that allows SMEs to access a global customer base without having to develop the bureaucracy typically found in large multinational corporations.

Moreover, network theory emphasizes on the idea that relationships are key in the internationalization process (Anwar et al., 2024). Business networks for SMEs are important for bridging foreign markets, and in doing so, provide SMEs with access to strategic information and resources that they do not have within their organization. The international entrepreneurship literature has built upon this, viewing internationalization as the behavioural process of identifying and leveraging opportunities across national borders (Reuber et al., 2018). The emergence of digital platforms has significantly altered this field as well. Digital platforms can be viewed as *matchmakers*, eliminating transaction costs and enabling SMEs to expand internationally quickly and sequentially through digital interaction. As such, SMEs' internationalization is no longer simply a series of commitments, but rather an emergent, socially embedded change process that is influenced by the continuous digital interactions between firms.

2.2 Negotiation in the Internationalization Process. Internationalization requires communication among many people around the world; therefore, communication is an important component of an organization's internationalization strategy as it is a large number of interactions and transactions with different types of international customers, partners, and other stakeholders (Szkudlarek et al., 2020). The high-stakes process of communicating in international trade is called negotiation and it is the means through which the exchange of goods, services, money, and ideas take place internationally (Jeong et al., 2008). Communication between two individuals or organizations that are located in different countries and cultures can be a challenge since they have no prior relationship, geography and culture can serve as barriers to successful negotiation. International negotiations involve increased uncertainty, ambiguity, and risk than domestic negotiations because the parties negotiating are subject to different laws, economic conditions, and customs of doing business. Internationalization literature has traditionally focused on intercultural negotiation, recognizing that cultural norms and individual differences affect negotiation style (Hurn, 2007). Therefore, negotiators must recognize and accommodate the

negotiation style of their counterpart in another country, and this becomes increasingly difficult as the cultural distance increases.

Grounded in transaction cost economics, the purpose of international negotiation is primarily to reduce search costs, contracting costs, and agreement enforcement/monitoring costs (Hennart, 2010). Resource constrained SME's have significant difficulties in reducing their transaction costs due to the barriers they create when trying to enter into foreign markets. A major problem identified by literature in P2P business transactions are information asymmetries that exist among the parties involved because there is no pre-established trust between the parties (Musti & Baporikar, 2023). This lack of pre-established trust creates a need for the use of costly third-party intermediaries such as; Banks issuing *Letters of Credit* (LC). While these intermediaries create an environment of trust, they also introduce other problems to be solved, including; lengthy processes, high costs, and the potential loss of confidential information.

Negotiation literature differs between the deal making and relationship building (Usunier, 2018). A *deal* refers to the specific attributes of the transaction that are negotiated, while the *relationship* refers to the social/emotional bonds developed during the negotiation process. In high-trust cultures, the relationship typically precedes the deal. In low-trust or transactional environments, the deal must be secured by formal contracts first. Building the necessary relational capital for internationalization is time consuming and resource intensive for SMEs building (Usunier, 2018). While information and communication technology (ICT) has been used to support the preparation phase of negotiations (Meyer et al., 2025), however, there is limited research on how decentralized technologies reconfigure the execution and strategic behavioural aspects of these interactions.

The introduction of human machine interaction has enabled the concept of technology-based negotiations and taken the concept of automation to the next level in creating a structure to enable human negotiators to negotiate and complete complex P2P transactions. Therefore, we recognized the necessity of developing the TON model which is based on a paradigm shift that enables technology, specifically through use of blockchain and smart contract, moving from the status of a *neutral tool* to an active *governance mechanism* that will enable P2P trading, which is accomplished without *third-party intermediaries*. The STP provides the strong theoretical basis for the TON model by enabling the *co-optimization* of social and technological systems/subsystems. the social subsystem comprised of all of the human involved in negotiating with each other in order to achieve their own goals within their organizations that are influenced by their cultural values. The technical subsystem is comprised of the *if-then* rules of an algorithm, the immutability of a shared ledger, and the transparency of the technical subsystem; this in turn provides the ability for businesses to automate their existing business logic into self-executing code through the technology.

STP argues that technological excellence is insufficient if it is not tailored to the needs of the organizational members (Sarkar, 2026). In the context of TON, this translates into aligning the *blind execution* of smart contract with the complex and semi-structured communicative actions required to negotiate the details of B2B packages. This perspective contests the concept of *technological determinism.* Blockchain technology is viewed as a site where authority, legitimacy, and participation are continually being negotiated. Thus, STP views organizations as dynamic combinations of social and technical sub-systems that interact with one another and the innovation outcomes are dependent on the recurrent alignment of organizational routines and technical affordances. The negotiation during the internationalization process is an ongoing adjustment of worker autonomy and algorithmic control to achieve a joint optimum. Therefore, TON serves as a method to reduce information asymmetry and transaction risk by providing a "single source of truth" for all parties involved.

2.3 Digital technologies as the Underlying Mechanisms of Digital Internationalization. With the rise of Industry 4.0, digital transformation has transitioned from an enabling role to a central element in the internationalization strategy of SMEs (Bargoni et al., 2024). Cloud computing, big data and artificial intelligence represent the "backbone" that enables SMEs to overcome geographical and cultural distance when entering foreign markets with limited resources (Mallela et al., 2024). While there exists a *U-shaped* relationship between digital innovation and international performance (Wan et al., 2025) such that firms must exceed a certain level of digital technology innovation to generate sustainable competitive advantages, a significant knowledge gap exists; current research tends to treat digitalization as a general enabler of foreign market entry and neglects the detailed pre-contractual mechanisms, specifically the negotiation process, through which trust is formed.

Blockchain technology can be seen as a radical change in the way that information in global value chains is being authenticated and exchanged (Chang et al., 2020). Blockchain is a decentralized/distributed ledger that has the potential to provide security, transparency, and immutability which could act as a machine for creating trust (Wittine et al., 2022). The core design of Blockchain makes it impossible to alter financial records, thus decreasing the cost of distrust and therefore the need for centralization of monitoring(Chen et al., 2022). For SMEs, Blockchain provides a third party less environment to conduct international trades by allowing P2P business transactions that do not require traditional institutions such as banks to facilitate these trades (Egwuonwu et al., 2022). Blockchain based documents provides an environment that will increase efficiency, reduce costs, and enhance information security in the trade finance process.

A key part of this blockchain technology is the smart contract which refers to an executable program that is composed of a set of rules or promises, defined by a developer, that will be automatically invoked on a blockchain based system, when certain pre-defined conditions have been satisfied (Sinha & Roy Chowdhury, 2021). Smart contracts utilize the *trustless* property of blockchain to enable parties to negotiate mutually beneficial agreements without the need for a basis of trust between them (Khan et al., 2021). The use of *if-then* commands through smart contracts, ensures that all obligations contained within contractual arrangements are fulfilled autonomously and therefore eliminate many of the

risks associated with opportunistic behaviour and counter-default (Toorajipour et al., 2022). As such, smart contracts provide for credible exchange in no-trust contracting environments, a function that can be especially valuable to SME's that enter into new markets in which their reputation has yet to be established.

The introduction of this new technology changes the way we look at TCT, as well as how we have looked at STP. STP states that trust has to be built before commitments occur (De Ruyter et al., 2001). Once the commitment occurs, it will reduce opportunism on the part of either party. However, once blockchain is integrated into an organization's business model, the commitment is established by the reliability and immutability of the code itself. This means the organization does not have to go through the traditional process of building a relationship prior to establishing a commitment. The shift from building trust in an individual, to building trust in technology affords SMEs the ability to create a *Loose Coupling view* of globalization (Nambisan & Luo, 2021). *Loose Coupling Theory* states that organizations can remain responsive to the changing needs of local markets, while maintaining the distinctiveness of their global platforms (Luo, 2022). Affordances and Generativity allow SMEs to create flexible, dynamic systems of value creation, with their foreign partners. Therefore, by combining algorithmic protocols with strategic flexibility, SMEs can better navigate the complexities of digital globalization and ensure that all transactions are verifiable and irrevocable, regardless of the level of external uncertainty.

The synthesized literature shows us that we have a good understanding of how digital transformation can support SME's; however, we have little to no understanding of how this will shape their strategic behaviour in the pre-contractual negotiation phase. Most studies on digital transformation are focused on the broad use of e-commerce platforms or post-contractual supply chain transparency; therefore, the pre-contractual negotiation phase is currently an *under-theorized black box.* Furthermore, there is also an obvious, theoretical contradiction between the 'human-trust' paradigm of traditional STP, and the 'no-trust' paradigms of decentralization technology. This study addresses this void with a new theoretical model called TON, which will be used to integrate both the technical and social subsystems.

3. Methodology: This study is using a sequential exploratory mixed-methods design adhering to the steps adapted by Asante et al. (2025), well-suited for the development of new theories around emerging technologies as they allow researchers to conduct qualitative investigations into emergent technologies (e.g., blockchain and smart contracts), and quantitative investigations into whether or not these emerging technologies can support business strategy development. The exploratory sequential method describes the process of developing a new theory through multiple phases where each subsequent phase builds upon the previous phase (Mihas, 2019).

The first phase of this study will initially conceptualize the TON framework based on the results from a series of in-depth semi-structured interviews with 10 senior technology consultants working in Tuscany, Italy. Tuscany was selected as a theoretical exemplar due to the high density of SMEs currently attempting to digitally transform their relationship-based trade practices to more decentralized forms of trade. The technology consultants were selected via purposeful sampling as having a minimum of five years of experience with the implementation of blockchain and international trade financing for their client base. Secondary triangulation will occur through review of company whitepapers and technical documentation associated with the smart contracts being utilized to provide evidence supporting the validity of the developed theory. In conjunction with the use of primary sources of data, abductive reasoning will also be used to further refine the TON constructs by identifying how industrialized trust modifies the typical order of trust-commitment in relationships among SMEs.

The second phase of the research will involve collecting additional data through a survey of 40-60 SMEs in the high tech and consulting sectors to empirically validate the TON framework. As the proposed sample size is relatively small, fuzzy-set qualitative comparative analysis (fsQCA) will be employed instead of traditional regression techniques. FsQCA provides researchers with the ability to determine causal recipes or combinations of social and technical factors that would be sufficient for an SME's successful internationalization (e.g., high levels of digital orientation + adoption of smart contract). Insights collected during the qualitative exploratory phase of the research will be used to provide anchor points for the fuzzy-set calibration process thereby allowing for a seamless integration of the two separate research strands.

4. Expected Findings. We anticipate identifying certain social/technological mechanisms which allow SMEs to attain *industrialized trust*, circumventing long term interpersonal bonding. Our findings will most likely show that when managerial vision aligns recursively with *if-then* logic, *algorithmic commitment* (a new mediator) is created; where transaction reliability is anchored in self-executing code. We also anticipate that our mixed method analysis using fsQCA will demonstrate that technological enabled pathway, will provide disintermediated internationalization opportunities for resource constrained firms to overcome their *liability of smallness*; through the use of blockchain based governance as an intermediary replacement, providing a better solution for rapid and secure foreign market entry.

Country Risk Premium in Non-Financial Firms. A Systematic Literature Review

RAIMONDO ROCCHI*, SEBASTIAN PUSCEDDU•

Abstract. *In recent decades, the increasing internationalization of firms and the growing heterogeneity of institutional environments have renewed attention to country risk within corporate finance. More recently, heightened geopolitical tensions and global market disruptions have further emphasized the relevance of country-level risk in investment decision-making. In this context, the country risk premium ("CRP") has gradually emerged as a relevant factor in estimating the cost of capital and in asset valuation, particularly for firms operating in international and emerging markets.*

This paper reviews how the academic literature has addressed the estimation and incorporation of CRP into the cost of equity for non-financial firms, to identify the main perspectives and methodological approaches developed by scholars. To this end, the study adopts a systematic literature review approach and examines a set of peer-reviewed contributions published over the past two decades.

The analysis identifies three broad streams of research: studies treating CRP as an input in valuation processes, contributions focusing on the methodologies used to estimate CRP, and research emphasizing the geographical dimension of country risk. Overall, the literature generally associates CRP with asset valuation outcomes, although considerable diversity remains in the empirical proxies and estimation approaches employed.

The analysis focuses on journal articles and non-financial firms, which may limit the inclusion of related strands of research. Nevertheless, the review provides an overview of how CRP has been addressed in the literature and seeks to organize the existing contributions while highlighting possible directions for future research on the role of country risk in corporate valuation. In doing so, it may also offer useful insights for practitioners involved in estimating the cost of capital and incorporating country risk into valuation decisions in international contexts.

Keywords: *Country risk premium; Cost of capital; Asset valuation; Corporate finance; Systematic literature review*

Framing of the research. *Over the past decades, particularly amid increasing globalization and financial integration, the assessment of country risk has attracted growing attention from policymakers, investors, academics, and corporate practitioners (Damodaran, 2025). This trend has recently intensified amid emerging geopolitical tensions, including trade fragmentation, regional conflicts, and the reconfiguration of global supply chains, contributing to heightened uncertainty and disruptions in international business activities.*

In this context, recent practitioner-oriented analyses (McKinsey & Company, 2026) highlight how geopolitical risk is increasingly becoming a structural component of firms' strategic decision-making, influencing investment allocation, supply chain resilience, and access to critical resources. At the same time, cross-border activity remains a key driver of value creation, having surged in 2025 and continuing to play a central role in securing strategic assets (JP Morgan, 2026). Overall, these dynamics underscore the growing relevance of geopolitical risk in shaping the global economic landscape, with significant implications for financial markets, asset pricing, and investor behavior (Bain, 2026; Rafi & Ali, 2026).

Firms are required to internalize such dynamics when evaluating investment decisions; in this regard, the estimation of the CRP provides a framework for reflecting geopolitical risk exposures in valuation and investment decisions.

In this context, the concept of the country risk premium ("CRP") has become an important component in estimating the cost of capital for firms operating in international markets. As companies expand their activities across diverse institutional and macroeconomic environments, incorporating country-specific risk factors into valuation models has become increasingly relevant in corporate finance and investment analysis.

In the corporate finance literature, estimating the cost of equity is a fundamental element of investment appraisal, capital budgeting, and firm valuation. Traditional asset pricing models, such as the Capital Asset Pricing Model ("CAPM"), were originally developed in the context of integrated and mature financial markets. However, their application to firms operating in emerging or institutionally heterogeneous economies has raised several methodological and theoretical challenges (Estrada, 2001; Pereiro, 2006). In particular, scholars and practitioners have questioned whether and how additional country-level risk components should be incorporated into the discount rate used in corporate valuation frameworks. Furthermore, the selection of the risk-free rate also affects the choice of the equity risk premium, since it is necessary to assess which component of the CRP is already embedded in the risk-free rate (Bini, 2018).

To address these issues, the literature has proposed various approaches to estimate and incorporate the country risk premium (Roggi et al., 2017). These approaches include sovereign spread-based methods, volatility-adjusted models, estimates of the implied equity premium, and modified versions of the CAPM designed to account for partial market

segmentation and institutional differences across countries. Despite the increasing relevance of these models in both academic research and valuation practice, significant heterogeneity remains in the methodologies adopted and in the assumptions regarding the nature and transmission of country risk. Sun et al. (2021) identify one possible way to classify CRP estimation methodologies, distinguishing between two different frameworks: a multi-criteria framework (based on macroeconomic fundamentals) and an asset-pricing-based framework (based on market information).

At the same time, the growing body of literature addressing the role of country risk in corporate valuation has developed across different strands of research, including international finance, asset pricing, and emerging markets valuation. However, a comprehensive and systematic synthesis of these contributions remains relatively limited, particularly regarding the implications of country risk premium estimation for non-financial firms operating across different economic and institutional contexts.

More broadly, the lack of consensus on the appropriate estimation and application of the country risk premium appears to stem from three main sources. First, different studies rely on alternative theoretical assumptions regarding the degree of integration or segmentation of international financial markets. Second, scholars adopt different empirical proxies to measure country risk, including sovereign bond spreads, credit ratings, volatility measures, and implied market premiums. Third, the literature diverges on the extent to which country-level risk should be incorporated into firm-level discount rates, raising concerns about the potential overestimation or double-counting of risk in corporate valuation models. Consequently, different implementation choices may lead to substantial differences in the estimated cost of capital, even within the same country (Aguilar et al., 2024).

In light of these considerations, this study addresses the following research question: How has the academic literature conceptualized, estimated, and applied the country risk premium in estimating the cost of equity for non-financial firms? Addressing this question is essential to clarify how country-level risk is incorporated into corporate valuation frameworks and to provide a structured understanding of the methodological and theoretical heterogeneity that characterizes the existing literature.

Purpose of the paper. *Building on this research question, this paper aims to analyze and categorize the main contributions to the literature on the country risk premium in the estimation of the cost of equity for non-financial firms. Specifically, the study seeks to organize the existing research by identifying the principal methodological approaches adopted to estimate country risk, clarifying the underlying theoretical assumptions, and discussing the implications for corporate valuation across different economic contexts.*

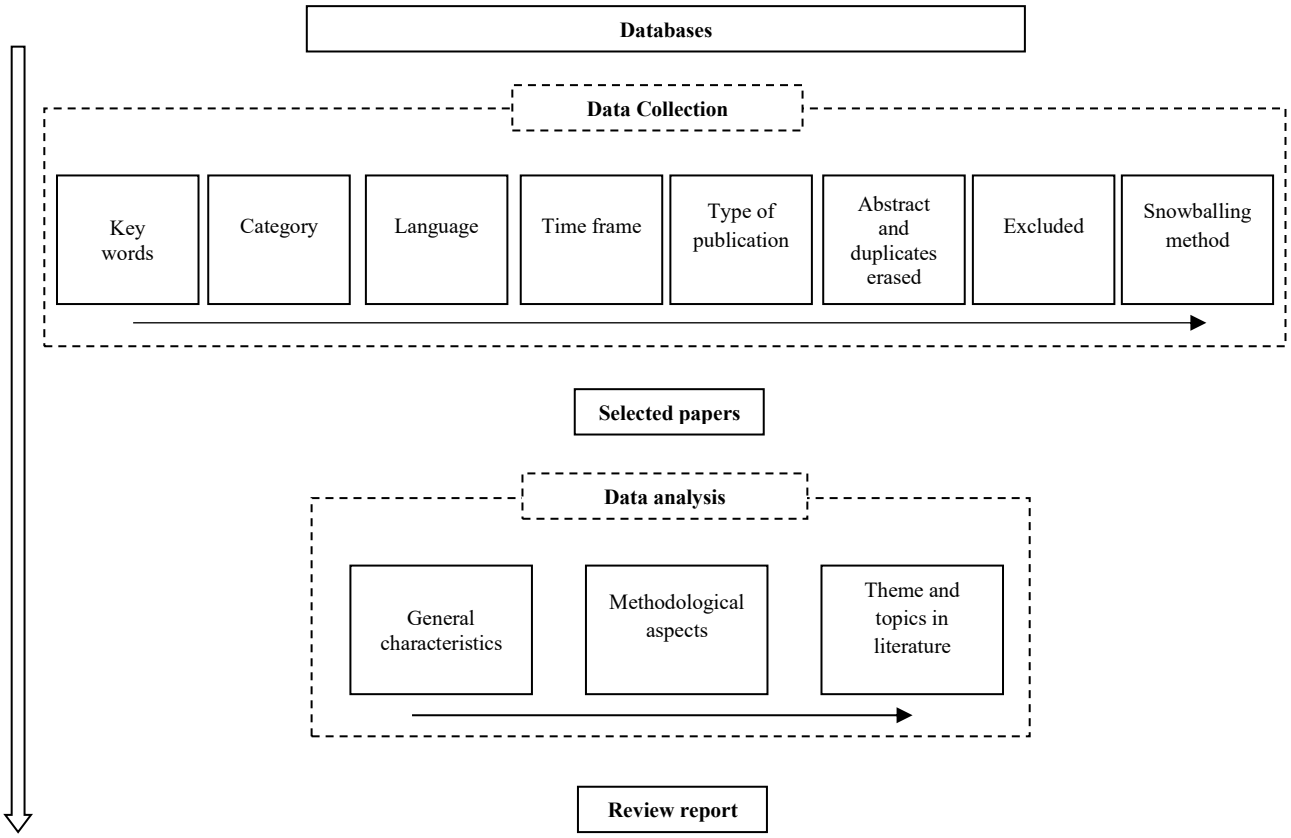
More precisely, the paper aims to provide a structured overview of the existing body of knowledge, identify the main research streams, highlight areas of convergence and divergence among scholars, and outline potential avenues for future research on the topic. To achieve these objectives, the study adopts a systematic literature review (SLR) methodology, which provides a structured process for identifying, screening, and classifying relevant academic contributions that address the role of the country risk premium in corporate valuation frameworks.

Methodology. *The study adopts an SLR methodology, commonly structured into three phases: planning, execution, and reporting (Tranfield et al., 2003). The review was conducted between February 20th, 2026, and March 2026. The analysis was carried out in a series of steps that enabled the construction of a database comprising the main characteristics of the selected papers. In particular, the database collects information on publication details, the methodological approaches used to estimate the country risk premium, and the theoretical assumptions underlying each contribution.*

The resulting dataset enabled analysis of the literature from different perspectives. It provided a structured overview of international academic contributions addressing the role of the country risk premium in estimating the cost of equity for non-financial firms.

In the planning stage, the specific aims of the research and the key data sources have been defined. On this point, we chose peer-reviewed journals (articles) as the primary source, since they can be considered validated knowledge and are likely to have the highest impact in this field.

Figure 1 shows the entire review process.



The research started by identifying Scopus and EBSCO as databases from which the papers were extracted. The databases were selected for their primary international use in management studies and for recommendations from the online libraries of major universities. These databases proved to be among the most comprehensive in terms of the collection of scientific publications and provided a great combination of variables, useful for performing the SLR. Moreover, filters were used to limit the research to the topic under analysis.

The execution phase of the SLR process consisted of two steps, i.e., (i) data collection and (ii) data analysis.

The data collection step included extracting all materials from the electronic resources. The academic journals were screened, looking at articles matching the following keywords in the box "title, keywords, or abstract", i.e. ("country risk premium" OR "country risk" OR "sovereign spread" OR "default spread" OR "country spread" OR "emerging market premium") AND ("cost of equity" OR "cost of capital" OR "CAPM" OR "valuation" OR "DCF" OR "discount rate") AND ("firm" OR "firms" OR "company" OR "companies" OR "corporate" OR "corporation") AND NOT ("bank" OR "banking" OR "insurance" OR "financial institution")([a]).

([a]) The selection of the keywords was based on previous review of the literature and brainstorming.

Fig. 1: Review process

Source: our elaboration

Moreover, the bibliographic research was conducted considering the following set of criteria:

- *articles in the category "Management", "Business", and "Business Finance";*
- *articles written in English;*
- *a publication time frame that covers the period 2001-2026. The search was limited to the period 2001-2026, as the explicit use of the country risk premium within corporate valuation frameworks became widespread in the early 2000s;*
- *papers and reviews published in academic journals.*

The article search query was defined using highly restrictive criteria and returned n. 43 studies are consistent with the established selected parameters.

The data analysis phase included different activities. First of all, materials were labeled and stored. Only papers that were relevant and available for our research were considered, excluding those with scarce or no reference to the managerial and business domains; case studies and books were also excluded. Furthermore, using the snowballing method (reference list of the papers and where they were referenced and cited), n. 5 papers have been added to our sample (Wohlin, 2014).

One Damodaran paper (2003) retrieved through has been substituted with the updated version of the same study (2022).

At the end of this screening procedure, n. 30 papers were selected.

Tab. 2: Step II – Data analysis

Total papers	**43**
Excluded	18
Refined papers	**25**
Snowballing method	5
Selected papers	**30**

Source: our elaboration

The data analysis step dealt with the analysis of each article, through a content analysis technique (Hsieh & Shannon, 2005) that considered the following categories:

- *reference data: year, journal, country (first author's university affiliation);*
- *content issues: aim, main topic, process (if applicable), eco-system (if applicable), results and implications;*
- *context issues: geography;*
- *methodology issues: types (theoretical, empirical), sampling procedures, case study selection criteria, and data analysis techniques.*

Results. *The findings suggest that, about CRP and the methodologies used to assess it, scholarly interest is particularly strong across the body of literature examined. In their contributions, scholars have sought to develop a deeper understanding of the mechanisms underlying both the valuation and incorporation of the CRP, given that, at present, no dominant theoretical framework appears to exist regarding its quantification.*

Within the broader discussion surrounding CRP estimation methodologies, it is equally important, in the context of this SLR, to consider how CRP may influence asset valuation. From this perspective, two distinct mechanisms emerge: a direct effect, in which empirical evidence explicitly identifies CRP as a determinant of asset valuation, and an indirect effect, in which CRP enters the valuation process through its incorporation into the cost of capital, thereby affecting valuation outcomes indirectly. About the latter mechanism, it appears reasonable to argue that whenever CRP is incorporated into the computation of the cost of capital, it is likely to affect asset valuation to the extent that the cost of capital is used as an input in the valuation process.

Having clarified these two distinct mechanisms through which CRP may affect asset valuation, a first relevant finding is that most authors (n. 27 of the analyzed papers) found, either directly or indirectly, an impact of CRP on asset valuation. No significant CRP effect was reported in only n. 3 cases (Janakiramanan et al., 2005; Schnusenberg et al., 2007; Sanvincente et al., 2017). These three cases are particularly worth examining, as they offer a perspective that differs from the prevailing view in the academic literature.

About Janakiraman et al. (2005), they examine the impact of international joint venture announcements (by Australian firms) on shareholder returns and do not identify any significant CRP effect, instead attributing the observed outcomes to other factors that may better explain them.

Schnusemberg et al. (2007) found that changes in Coface country ratings do not affect valuations in the corresponding stock markets, suggesting that such revisions do not appear to influence investors' decisions in equity markets.

Regarding Sanvincente et al. (2017), they found that, in the Brazilian stock market, CRP has no particular relevance. Considering that Brazil, for instance, is classified as an emerging market in Damodaran's geographical classification, a significant CRP effect would have been expected. However, the authors' findings may instead suggest that Brazil should not be interpreted strictly through the conventional emerging-market lens; rather, the country's risk premium may exhibit characteristics more commonly observed in mature markets, indicating the need to identify alternative risk factors.

After examining the three contributions that diverge from the general research trend, the analysis turns to the three main analytical frameworks identified in this SLR on CRP and its estimation, namely CRP as input, CRP as output, and CRP associated with a specific geography. To provide a structured overview of the studies discussed in the results section, Table 3 classifies the contributions by both their analytical perspective and the significance of the CRP effect on asset valuation, distinguishing among CRP as input, CRP as output, CRP associated with specific geographical contexts, and studies that do not identify a significant CRP effect.

Tab. 3: CRP literature classification

CRP effect on asset valuation	Analytical perspective	Articles	N.
Significant	CRP as input	Click & Weiner (2010); Jerry Ho *et al.* (2011); Wu (2012); Haque *et al.* (2016); Lepore *et al.* (2018); Vengesai & Muzindutsi (2020); Renaud & Kumral (2021); Aguilar *et al.* (2024); Ekawati *et al.* (2025).	9

Source: our elaboration

CRP as input. Scholars may address CRP from two distinct perspectives: either by treating it as an input in their analyses to assess the relevance and magnitude of its effect on asset valuation, or by considering it as an output, namely by investigating which estimation methodologies are most appropriate in a given context.

As far as the input perspective concerns, authors have found that CRP has an impact on their asset valuation (Haque et al., 2016), firm financial decisions (Vengesai & Muzindutsi, 2020) and can destroy asset value (Click & Weiner, 2010), even though in a portfolio selection study, CRP was identified as the factor exerting the smallest influence on expected market returns, nevertheless it retains a measurable effect (Jerry Ho et al., 2011). In the context of mining companies, Renaud & Kumral (2021) suggest that accounting for CRP will become increasingly important due to globalization and the growing relevance of operations in foreign countries; accordingly, identifying an appropriate estimation methodology becomes essential.

As previously noted, there is no universally accepted method for incorporating CRP into a firm's cost of capital. Consequently, different implementation choices may lead to substantial differences in the estimated cost of capital, even within the same country, because the inputs used to estimate it may vary (Aguilar et al., 2024).

It is also noteworthy that ESG criteria and CRP can be analyzed jointly. In particular, the evidence suggests that CRP acts as a moderating lever in the relationship between ESG implementation and the cost of capital: firms adopting ESG criteria experience an increase in the cost of capital when operating in countries characterized by high CRP, whereas a reduction in the cost of capital is observed when ESG adoption takes place in lower-CRP environments (Ekawati et al., 2025).

CRP as output. As previously anticipated, there is no universally accepted methodology for CRP estimation. The literature proposes a variety of approaches, often substantially different from one another; the following discussion summarizes the main evidence emerging from this SLR. The relevance of CRP also lies in its ability to provide additional information that, for instance, is not fully reflected in beta (Damodaran, 2022), a measure included in the CAPM methodology.

Damodaran (2025) identifies the different sources of CRP, in particular, the stage of the cycle, company, political risk, legal risk, and economic structure. Moreover, he proposes three options for CRP estimation: using historical data, using a build-up method with additional risk premiums, or using the market's implied equity risk premium.

Another approach may include a modular and risk-weighting techniques (Renaud & Kumral, 2021), and it is also worth noting a study showing that (in the context of Johannesburg Stock Exchange) Credit Default Swap spreads explain CRP more effectively than Bond Default Spread (Muzindutsi, 2025).

Regarding CRP estimation methodologies, the Chinese equity market is particularly interesting, as it exhibits a marked separation between domestic and foreign investors. Listed firms issue Class A shares for domestic investors and Class B shares for foreign investors. Although the underlying assets are identical, these share classes display different valuation levels; such differences can be attributed to CRP, insofar as foreign investors require higher compensation for exposure to CRP (Zhang & Zhao, 2004). This circumstance allows estimation of CRP for China using market data directly linked to listed equities, rather than relying, for example, on CDS.

CRP can also be estimated through index-based or rating-based approaches (Erb et al., 1996), which allow the inclusion of dimensions that are otherwise difficult to capture. Corporate performance has been analyzed in relation to ownership structure and the contestability of the largest shareholder's power (Lepore et al., 2018), while IPO valuation has been examined using indices of economic freedom and transparency (Wu, 2012).

Another approach examines firms' ability to assess CRP by considering their intangible asset base (Doukas & Padmanabhan, 2002). This perspective is noteworthy insofar as it emphasizes risk-management capability rather than direct CRP measurement.

CRP associated with a specific geography. As expected, given the nature of the topic, the literature analyzed in this SLR highlights the strong relevance of the geographical dimension, with several authors examining CRP in relation to specific geographical contexts, particularly emerging economies ("EM"). Perotti & Oijen (2001) found that political risk (a source of CRP) has a strong effect on local stock market development and excess return in EM. Regarding EM, it is noteworthy that, in emerging economies, the traditional CAPM could not fully capture the range of risks affecting stocks (Petrović et. al., 2021), which suggests the need for alternative CAPM specifications (Estrada, 2000; Pereiro, 2005; Girard & Omran, 2007; Roggi et al., 2017; Acuña & Acuña, 2026).

The following section presents considerations emerging from this SLR with reference to specific geographical areas.

Regarding Arab capital markets, risk factors, particularly political risk, appear significant. At the same time, a constant beta does not seem to provide an adequate measure of risk for these thinly traded emerging markets (Girard & Omran, 2007).

About China, the valuation differential between Class A and Class B shares has already been discussed as a possible basis for estimating CRP. More specifically, Zhang & Zhao (2004) observe that political risk may account for an important share of this CRP. China's CRP is significant, and policymakers and international investors should take it into account (Wang & Huang, 2015).

Regarding the Philippines and firms operating in the renewable energy sector ("RE"), the impact of CRP was observed in the short term across all companies. In contrast, in the medium to long term, it remained significant only for

the firm exclusively engaged in RE (Saculasan & Kanamura, 2020). This finding is particularly relevant, as it links CRP sensitivity to a specific type of business activity.

About Africa, one study focusing on the electricity sector estimates the Weighted Average Cost of Capital ("WACC") across several African countries. The results show WACC levels above global benchmarks, with the cost of equity in Africa almost twice that of debt (Dato et al., 2025). Such differences may be attributed, at least in part, to CRP.

About Serbia, it is noteworthy that n. 2 articles, conducted in different sectors, reach the same conclusion that CRP emerges as the main component in the determination of the cost of capital, and in both cases, it seems assessed as high (Momcilovic et al., 2015; Popovic & Paunovic, 2018).

In conclusion, the present SLR shows that although the academic literature on the CRP has grown substantially over recent decades, it remains marked by notable heterogeneity in both theoretical frameworks and empirical methodologies. The evidence from this systematic review indicates that CRP is a significant component in estimating the cost of capital and, by extension, in asset valuation processes, especially in international and emerging markets, where country-specific risks profoundly influence investment decisions and corporate financial outcomes. Concurrently, the literature displays a persistent lack of consensus regarding the optimal methods for estimating and integrating CRP into corporate valuation models, reflecting divergences in methodological choices, empirical proxies, and assumptions about the transmission of country-level risk to firm-specific discount rates. As global economic integration continues to advance alongside institutional heterogeneity and heightened geopolitical uncertainty, and as evolving macroeconomic conditions emerge, the relevance of country risk in corporate finance is expected to increase. Future research should aim to further elucidate the determinants and transmission mechanisms of CRP, with particular emphasis on the interaction between country-level risk and firm-specific characteristics, the impact of institutional and macroeconomic environments, and the development of more robust, context-sensitive methodologies for incorporating country risk into valuation and financial decision-making frameworks.

Research limitations. *As with any SLR, this study is subject to certain limitations. First, the scope of the analysis is intentionally limited to contributions addressing the role of the country risk premium in estimating the cost of equity for non-financial firms, which may exclude related strands of research in international finance or sovereign risk. Second, although a structured review methodology has been adopted, the processes of article selection, evaluation, and categorization inevitably involve a degree of interpretive judgment.*

Furthermore, the literature search relied on a specific set of keywords and a limited number of databases, which may have excluded potentially relevant contributions. For this reason, the present analysis should be considered illustrative rather than exhaustive, providing an overview of the existing literature rather than a definitive classification of all contributions on the topic.

Future research could further refine the framework proposed in this study by incorporating additional contributions, extending the search to other databases, and exploring complementary strands of literature in international asset pricing, emerging market finance, and corporate valuation.

Managerial implications. *The findings of this study may offer useful insights for corporate finance practitioners, investors, valuation professionals, and policymakers involved in investment decisions in international contexts. By reviewing the main approaches proposed in the literature for estimating the country risk premium, the study highlights the underlying assumptions and methodological differences that characterize existing valuation practices.*

In particular, the classification of methodological approaches may help practitioners better understand how to incorporate country risk adjustments into the estimation of the cost of equity, especially for firms operating in emerging or institutionally heterogeneous markets.

Originality of the paper. *This study provides a systematic overview of the academic literature on estimating the CRP in corporate valuation. While the topic has been widely discussed across different research areas – such as international finance, asset pricing, and emerging market valuation – the existing contributions remain relatively fragmented and often rely on heterogeneous methodological approaches.*

By organizing these contributions into a common analytical framework, the paper aims to clarify how the literature has approached the estimation and use of the country risk premium in corporate valuation. In doing so, the study also points to several areas that may benefit from further research, particularly regarding the translation of country-level risk into firm-level discount rates for internationally operating firms.

Governare la sostenibilità: un framework per analisi delle relazioni inter-organizzative che coinvolgono le imprese multinazionali

CRISTINA LEONE[1], GABRIELLA LEVANTI[2], PASQUALE MASSIMO PICONE[3]

Abstract. *Nel corso dell'ultimo decennio si è registrato un crescente ricorso a forme d'interazione tra imprese multinazionali (MNE) e organizzazioni della società civile, per affrontare congiuntamente le sfide della sostenibilità. Tali sfide rappresentano obiettivi globali condivisi e, al contempo, ambiti di ridefinizione delle logiche competitive e dei modelli di creazione del valore nel lungo periodo. Parallelamente, si è osservata una notevole proliferazione di studi dedicati a partenariati e alleanze orientate alla sostenibilità. Tuttavia, la letteratura esistente rimane caratterizzata da una marcata frammentazione concettuale, soprattutto per quanto concerne l'uso spesso indistinto di termini quali coordinazione, cooperazione e collaborazione. La presente ricerca, ancora* in fieri*, adotta il framework di Castañer e Oliveira (2020) al fine di operare una distinzione sistematica tra i concetti di coordinazione, cooperazione e collaborazione nel contesto delle relazioni (IOR) tra MNE e società civile orientate alla sostenibilità. Tale distinzione si fonda su due dimensioni analitiche: la fase temporale dell'interazione (definizione degli obiettivi* versus *implementazione) e la natura degli obiettivi perseguiti (obiettivi comuni dell'IOR* versus *obiettivi privati). In questa prospettiva, la coordinazione si riferisce alla definizione congiunta degli obiettivi di sostenibilità; la cooperazione concerne le azioni intraprese per l'implementazione di obiettivi condivisi; la collaborazione attiene al supporto volontario fornito ai partner dell'IOR per l'attuazione di obiettivi comuni e/o privati. La ricerca, inoltre, si avvale del framework di Castañer e Oliveira (2020) per esaminare le relazioni tra MNE e fornitori, perché pur non essendo questi ultimi, sovente, partner "formali" nelle relazioni tra MNE e società civile, essi rappresentano il principale* locus *di implementazione delle pratiche di sostenibilità e sono sempre più al centro delle pressioni esercitate dalla società civile sulle MNE. Ne consegue che le IOR tra MNE e società civile non possono essere interpretate senza una considerazione inclusiva delle relazioni più ampie che coinvolgono MNE, attori della società civile, fornitori e, frequentemente, attori pubblici. Nel complesso, il paper contribuisce a una maggiore precisione concettuale, favorendo lo sviluppo cumulativo della conoscenza sulle IOR per la sostenibilità, e offre implicazioni pratiche.*
Parole chiave: *imprese multinazionali; società civile; sostenibilità; relazioni inter-organizzative; coordinazione; cooperazione; collaborazione; catene globali del valore*

Inquadramento della ricerca. *Nell'attuale contesto competitivo, la ricerca della sostenibilità costituisce una condizione strategica inevitabile che coinvolge imprese di ogni dimensione, operanti in pressoché tutti i settori dell'attività economica. Le imprese del XXI secolo non possono più prescindere da una sistematica considerazione dell'impatto ambientale e sociale generato dalle proprie attività produttive e dai modelli di gestione adottati (Marti et al., 2024; Whelan e Fink, 2016; Zaheer, 2025). Tale imperativo trova un solido fondamento anche negli obiettivi dell'Agenda 2030 per lo Sviluppo Sostenibile. Come noto, le Nazioni Unite hanno evidenziato l'urgenza di promuovere un'azione condivisa orientata al conseguimento di obiettivi globali di sostenibilità. Nel 2015, i 193 Stati membri hanno adottato un programma organico volto a integrare crescita economica, tutela ambientale e protezione sociale, delineando, per tale via, un percorso di sviluppo sostenibile su scala globale.*

È opportuno osservare come l'Agenda 2030 rappresenti l'esito di un processo regolativo caratterizzato da un grado di inclusività senza precedenti: le MNE, gli attori della società civile e i governi sono stati coinvolti nella co-creazione di regole e di incentivi finalizzati alla promozione della sostenibilità (Leone, 2025; Montiel et al., 2021). Si è, inoltre, progressivamente consolidato un percorso volto alla promozione di partnership per la sostenibilità, formalmente riconosciute nell'Obiettivo 17 delle Nazioni Unite, dedicato al rafforzamento delle collaborazioni multi-livello e multi-attore. Tali considerazioni inducono a riconoscere il ruolo sempre più centrale assunto dalle relazioni inter-organizzative (IOR) nel management internazionale e nella governance per la sostenibilità, come pure nella letteratura che si occupa di tali tematiche.

Tale evoluzione ha contribuito a una riconfigurazione dell'autorità nella governance globale della sostenibilità, all'interno della quale imprese e attori della società civile svolgono ruoli sempre più rilevanti nel colmare i vuoti regolativi lasciati dagli Stati (Rana e Sørensen, 2021; Teegen et al., 2004). In questo scenario sono emerse molteplici forme di partenariato per la sostenibilità, che si estendono da alleanze tra imprese e organizzazioni non governative a iniziative multi-stakeholder, fino a schemi di certificazione e standard privati transnazionali, quali la Global Reporting Initiative, l'UN Global Compact, il Fairtrade e il Forest Stewardship Council.

Tuttavia, la frammentazione concettuale che permea tanto la letteratura sulle relazioni IOR quanto quella sui partenariati per la sostenibilità rischia di indebolire la validità discriminante dei concetti, compromettere la parsimonia teorica e ostacolare il progresso cumulativo della conoscenza. In particolare, termini quali coordinazione, cooperazione

e collaborazione sono stati frequentemente impiegati come sinonimi o con sfumature differenti, senza che ne siano stati esplicitati i tratti distintivi, sebbene rinviino a forme distinte d'interazione, caratterizzate da differenti atteggiamenti, comportamenti ed esiti (Castañer e Oliveira, 2020; Glasman e Albarracín, 2006). Parallelamente, una specifica tipologia di IOR – quella che coinvolge MNE e organizzazioni della società civile – ha acquisito crescente centralità tanto nel dibattito accademico quanto in quello politico (Bruijn et al., 2024; Liu e Heugens, 2024). Ciò è riconducibile principalmente alla sempre maggiore rilevanza assunta dalla sostenibilità quale obiettivo globale condiviso, formalmente sancito dall'Agenda 2030 delle Nazioni Unite. In questo contesto, le MNE sono progressivamente chiamate a interagire con attori della società civile per affrontare questioni eterogenee, quali il cambiamento climatico, la tutela dei diritti umani, le condizioni di lavoro e la protezione ambientale, sfide che non possono essere gestite in modo efficace né attraverso meccanismi puramente di mercato né mediante interventi statali tradizionali (Burritt et al., 2020).

Obiettivo del paper. *L'obiettivo principale di questo paper è fornire maggiore chiarezza concettuale nello studio delle relazioni tra MNE e società civile per la sostenibilità, distinguendo in modo sistematico tra le nozioni di coordinazione, cooperazione e collaborazione. Adottando il quadro teorico di Castañer e Oliveira (2020), il lavoro intende chiarire il significato di coordinazione, cooperazione e collaborazione nel contesto delle relazioni tra MNE e società civile, mettendo in luce come tali modalità d'interazione si articolino in funzione della fase temporale e della natura degli obiettivi perseguiti. In particolare, il paper riconosce che le relazioni tra MNE e società civile non si esauriscono in interazioni di natura meramente bilaterale, ma includono frequentemente anche attori pubblici e, soprattutto, fornitori lungo le catene globali del valore. Questi ultimi, pur non essendo sempre parte formale dei partenariati tra MNE e società civile, costituiscono un ambito cruciale in cui gli obiettivi di sostenibilità vengono tradotti in pratiche concrete*.

Metodologia. *Il paper è di natura teorico-concettuale, fondato sull'analisi e sull'estensione del framework di Castañer e Oliveira (2020), che distingue i concetti di coordinazione, cooperazione e collaborazione sulla base di differenti atteggiamenti, comportamenti ed esiti, nonché della fase temporale e della natura degli obiettivi perseguiti. Castañer e Oliveira (2020) identificano tre dimensioni interazionali– atteggiamento, comportamento ed esito – che caratterizzano coordinazione, cooperazione e collaborazione nelle IOR. In particolare, l'atteggiamento si riferisce agli orientamenti cognitivo-valutativi che influenzano il modo in cui organizzazioni e individui percepiscono e valutano oggetti, idee, attori o situazioni; il comportamento comprende le azioni concrete attraverso cui tali orientamenti vengono messi in atto; e l'esito indica gli effetti o i risultati generati da tali azioni (Castañer e Oliveira, 2020; Glasman e Albarracín, 2006).*

Castañer e Oliveira (2020) sostengono che le interazioni IOR differiscono lungo due dimensioni discriminanti: (a) la fase temporale dell'interazione, che distingue tra le fasi di decisione e deliberazione e la successiva fase di implementazione degli obiettivi, e (b) il tipo di obiettivo (Khanna et al., 1998), che indica se gli obiettivi perseguiti sono obiettivi privati oppure collettivamente condivisi. Sulla base di queste due dimensioni, Castañer e Oliveira (2020) concettualizzano in senso ampio la coordinazione come l'insieme di atteggiamenti, comportamenti ed esiti che comportano la definizione di obiettivi comuni all'interno di una IOR. La cooperazione si riferisce agli atteggiamenti, ai comportamenti e agli esiti associati all'implementazione di obiettivi concordati tra i partner dell'IOR. Infine, la collaborazione emerge quando atteggiamenti, comportamenti ed esiti sono collegati al supporto di un partner nel perseguimento di un obiettivo condiviso della IOR oppure di un obiettivo privato del partner.

Si sostiene che il quadro teorico sviluppato da Castañer e Oliveira (2020) sia particolarmente adatto all'analisi delle IOR orientate alla sostenibilità poiché esse si sviluppano tipicamente nel tempo – passando dall'articolazione e deliberazione degli obiettivi, all'implementazione e al monitoraggio – e, sovente, coinvolgono una combinazione di obiettivi privati e collettivi. Piuttosto che un semplice trasferimento tra ambiti di ricerca, l'adozione del framework di Castañer e Oliveira per le relazioni tra MNE e società civile orientate alla sostenibilità comporta un'estensione teorica che rafforza la chiarezza concettuale all'intersezione tra gli studi di management internazionale e sostenibilità.

In maggior dettaglio, il metodo seguito può essere descritto come un processo di estensione teorica: il framework originariamente sviluppato per analizzare le IOR in generale viene applicato e rielaborato alla luce del contesto specifico delle relazioni tra MNE e società civile orientate alla sostenibilità. Questa operazione non consiste in un semplice adattamento, ma in una rielaborazione concettuale che tiene conto delle peculiarità di tali relazioni, in particolare del ruolo degli attori civili, delle dinamiche di legittimità e della rilevanza delle catene globali del valore.

Inoltre, il paper intende integrare evidenze empiriche tratte dalla letteratura esistente, utilizzate in modo illustrativo per supportare e arricchire l'argomentazione teorica.

Risultati. *I risultati della ricerca ancora in una fase embrionale si articolano in tre parti principali, corrispondenti alle tre forme d'interazione analizzate: coordinazione, cooperazione e collaborazione.*

La coordinazione *si riferisce agli atteggiamenti, ai comportamenti e agli esiti coinvolti nella deliberazione, negoziazione e costruzione del consenso attorno a un obiettivo condiviso, ossia alla definizione congiunta di obiettivi comuni all'interno di una IOR. Un atteggiamento di coordinazione riflette l'inclinazione degli attori a riconoscere bisogni condivisi e ad allinearsi attorno a un obiettivo collettivo. I comportamenti di coordinazione includono le attività intraprese dai (potenziali) partner per prepararsi, negoziare e formalizzare accordi su obiettivi comuni nelle fasi iniziali della IOR (Doz, 1996; Ring e Van de Ven, 1994). Gli esiti della coordinazione si riflettono sia nell'identificazione di un obiettivo condiviso sia nell'incapacità di raggiungere un accordo.*

Nel dominio della sostenibilità nel management internazionale, la coordinazione implica processi che si sviluppano attraverso contesti nazionali e istituzionali eterogenei, mediante i quali vengono stabiliti collettivamente l'ambito di azione, il contesto operativo, le risorse necessarie e le priorità per definire obiettivi di sostenibilità. Tre questioni interrelate caratterizzano tali processi.

Primo, la coordinazione riguarda la delimitazione dell'ambito degli obiettivi di sostenibilità, che raramente è semplice data la natura composita di tali questioni (Montiel et al., 2021). Recenti ricerche mostrano che la coordinazione è iterativa e segnata da tensioni tra logiche di governance differenti (Williams et al., 2024). In questa prospettiva, la letteratura di management internazionale riconosce le organizzazioni non governative come attori chiave accanto a MNE e governi (Lambell et al., 2008; Liu e Heugens, 2024; Schepers, 2006). Di conseguenza, la coordinazione nelle relazioni MNE–società civile implica deliberazione multi-attore su priorità, standard e rappresentazioni degli interessi sociali e ambientali (Teegen et al., 2004).

Secondo, la coordinazione è influenzata dal contesto istituzionale e dalle risorse disponibili. Molte sfide di sostenibilità costituiscono beni collettivi globali, per i quali né i mercati né la governance stato-centrica forniscono incentivi adeguati (Teegen, 2003). In presenza di vuoti istituzionali, le organizzazioni non governative internazionali emergono spesso come attori chiave di coordinazione, fungendo da "istituzioni globali informali" (Teegen, 2003, ns. traduzione). Le MNE possono colmare tali vuoti collaborando con organizzazioni non governative localmente radicate, che offrono conoscenza contestuale e legittimità informale, mentre le imprese forniscono capitale e capacità manageriali (Webb et al., 2010; Leone, 2025). Un esempio è la Business Leaders' Initiative on Human Rights*, in cui grandi MNE hanno collaborato con organizzazioni non governative per affrontare questioni attinenti ai diritti umani nei paesi* BRIC *(Lehrer e Delaunay, 2009).*

Terzo, la coordinazione è un processo di prioritizzazione, attraverso cui obiettivi globali astratti (come gli SDG dell'Agenda 2030) vengono negoziati in obiettivi condivisi considerati legittimi e fattibili in specifici contesti (Van Zanten e van Tulder, 2018). Tale processo è dinamico e può riflettere interpretazioni divergenti di responsabilità, fattibilità e impatto (Webb et al., 2010; Williams et al., 2024). Inoltre, la coordinazione è contingente alle strutture di opportunità politiche: in contesti autocratici, gli attori della società civile spesso si affidano alle MNE straniere per accedere ad "arene deliberative" (Liu e Heugens, 2024, ns. traduzione).

Infine, la fase di coordinazione è complicata dall'eterogeneità interna della società civile e dalle asimmetrie di potere tra organizzazioni non governative del Nord e del Sud globale (Schepers, 2006). Di conseguenza, gli obiettivi di sostenibilità che emergono possono riflettere le priorità di organizzazioni non governative più potenti, piuttosto che i bisogni delle comunità locali. Nel complesso, la coordinazione è un processo centrale nelle relazioni MNE–società civile, i cui esiti condizionano la possibilità di una successiva cooperazione per l'implementazione degli obiettivi di sostenibilità.

Nell'estendere il framework di Castañer e Oliveira (2020), il paper attribuisce un ruolo centrale alla coordinazione nella fase di definizione degli obiettivi di sostenibilità. La coordinazione è concettualizzata come un processo deliberativo e politico in cui gli obiettivi non sono predefiniti, ma emergono attraverso l'interazione tra attori con interessi divergenti. In questa fase, gli attori della società civile operano prevalentemente in qualità di definitori dell'agenda di sostenibilità e portavoce di interessi collettivi, mentre le MNE assumono il ruolo di promotori e di coordinatori del processo, favorendo l'allineamento tra le istanze sociali e le capacità organizzative.

La cooperazione *riguarda gli atteggiamenti, i comportamenti e gli esiti associati all'implementazione di obiettivi comuni concordati. Essa implica la disponibilità dei partner a contribuire al raggiungimento di tali obiettivi e si manifesta attraverso azioni che possono essere sia congiunte sia svolte internamente alle singole organizzazioni in modo coerente con gli obiettivi della IOR (Brattström e Faems, 2020; Das e Teng, 2002; Koza e Lewin, 1998; Gulati e Singh, 1998). La cooperazione segue la fase di coordinazione e riguarda principalmente l'attuazione degli obiettivi definiti collettivamente. La cooperazione emerge quando gli attori pubblici stabiliscono aspettative che incentivano la partecipazione di MNE e attori della società civile, senza ricorrere alla coercizione diretta (Schneider e Scherer, 2019).*

Nel dominio della sostenibilità, la cooperazione tra MNE e società civile si realizza attraverso molteplici modalità, tra cui programmi di volontariato aziendale, donazioni, iniziative multi-stakeholder e processi di co-creazione regolatoria con attori pubblici (Bruijn et al., 2024; Caligiuri et al., 2013; Jamali et al., 2011; Jamali e Keshishian, 2009; Reinecke e Donaghey, 2021; Scherer e Palazzo, 2011). Un ruolo distintivo è svolto dalle organizzazioni non governative, quali consulenti esperti, che supportano le MNE nell'interpretazione e nell'operazionalizzazione degli obiettivi di sostenibilità e, così facendo, influenzano il modo in cui tali obiettivi vengono inquadrati e implementati (Kourula, 2010; Reinecke e Ansari, 2016; Teegen et al., 2004; Webb et al., 2010).

Due fattori chiave distinguono i pattern di cooperazione: (1) il tipo di obiettivo (sociale versus ambientale) e (2) il coinvolgimento di attori pubblici. Quando l'obiettivo è la sostenibilità sociale (es. standard lavorativi, sviluppo comunitario, inclusione), la cooperazione tende a essere bottom-up *e basata su relazioni con comunità locali, organizzazioni non governative e sindacati, soprattutto in contesti istituzionalmente deboli (Lévesque et al., 2018; Rondinelli e London, 2003; Webb et al., 2010). In tali contesti, le MNE cercano legittimità e competenze locali, mentre la società civile ottiene accesso a risorse e capacità organizzative (Bruijn et al., 2024; Mena e Palazzo, 2012; Sharma e Bansal, 2017). La* Joint Ethical Trading Initiative *rappresenta un esempio di cooperazione istituzionalizzata tra MNE, organizzazioni non governative e sindacati (Reinecke e Donaghey, 2021).*

Al contrario, la cooperazione su obiettivi ambientali tende a essere top-down *e inserita in quadri di governance pubblica, spesso sotto forma di partenariati pubblico-privati e iniziative regolatorie internazionali (Eberlein, 2019;*

Kaplan, 2024). Esempi includono la Roundtable on Sustainable Palm Oil*, la collaborazione di* IBM *per la protezione del Mar Baltico e* l'Extractive Industries Transparency Initiative *(Aaronson, 2011; Ritvala et al., 2014). In questi casi, gli attori pubblici agiscono quali catalizzatori, creando un contesto di cooperazione (Adam e Rachman-Moore, 2004; Scherer et al., 2016; Shin e Gond, 2024; Schneider e Scherer, 2019).*

Tuttavia, la distinzione tra dinamiche bottom-up *e* top-down *non va intesa in termini rigidi: anche obiettivi di natura sociale possono essere perseguiti attraverso forme di cooperazione* top-down*, ad esempio mediante le convenzioni dell'*International Labour Organization*, le normative sulla* due diligence *in materia di diritti umani e le politiche di promozione dell'uguaglianza di genere (Boersma, 2018; Leone et al., 2025; Zeitler e Schwarzkopf, 2025).*

Nel complesso, la cooperazione tra MNE e società civile è un processo contingente, modellato dal tipo di obiettivo e dal ruolo degli attori pubblici, oscillando tra approcci bottom-up *e* top-down*. Con la diffusione degli obiettivi di sostenibilità lungo le catene globali del valore, l'attenzione si sposta verso modalità di collaborazione per supportare i fornitori delle MNE nell'adozione di pratiche più sostenibili (Montiel et al., 2021; Surroca et al., 2013).*

La collaborazione *si riferisce agli atteggiamenti, ai comportamenti e agli esiti connessi al sostegno volontario offerto a un partner nel perseguimento di un obiettivo condiviso della IOR o di un obiettivo privato del partner stesso (Castañer e Oliveira, 2020). Tale sostegno può essere motivato da considerazioni morali, strumentali o reputazionali (Das e Teng, 2002; Williamson, 1993). L'atteggiamento collaborativo riflette la disponibilità ad assistere volontariamente; i comportamenti si manifestano nelle azioni concrete di supporto; gli esiti comprendono il progresso verso obiettivi comuni, il sostegno ad obiettivi privati e le più ampie conseguenze reputazionali o morali che ne derivano (Bruyaka et al., 2018).*

Nel contesto delle relazioni MNE–società civile per la sostenibilità, la collaborazione diventa particolarmente rilevante quando l'attenzione si sposta sui fornitori appartenenti alle catene globali del valore. La collaborazione è identificata come particolarmente rilevante per catturare il ruolo dei fornitori delle MNE all'interno delle catene globali del valore. Anche quando i fornitori non sono partner formali nelle IOR tra MNE e società civile, essi rappresentano gli attori principali attraverso cui le richieste di sostenibilità vengono implementate in pratica. La letteratura mostra che la società civile estende sempre più la responsabilità delle MNE alle pratiche dei fornitori, ad esempio in caso di inquinamento, abusi lavorativi o asimmetrie di potere tra MNE acquirenti del Nord e fornitori del Sud globale (Grabs e Ponte, 2019; Moosmayer et al., 2019; Reinecke e Ansari, 2016; Yu, 2008).

Due aspetti chiave caratterizzano la collaborazione. Il primo aspetto riguarda la modalità di supporto: poiché i fornitori spesso affrontano vincoli strutturali, la collaborazione assume frequentemente la forma di capacity-building *e attività abilitanti (Locke et al., 2013). Esempi includono la formazione su pratiche lavorative, l'assistenza tecnica per certificazioni ambientali e le iniziative di rafforzamento delle capacità (Bartley, 2010; Benstead et al., 2018; Leone, 2025; Liu et al., 2018). Il caso di* Nestlé–Proshika *in* Bangladesh *illustra come la collaborazione possa tradurre obiettivi di sostenibilità in pratiche concrete a livello di fornitore (Rana e Sørensen, 2021). Logiche simili caratterizzano iniziative rivolte a fornitori alla base della piramide, come* l'e-Choupal*, che facilitano l'integrazione di piccoli produttori nelle catene globali (Lehrer e Delaunay, 2009; Parmigiani e Rivera-Santos, 2015; Prahalad, 2005).*

Il secondo aspetto fa riferimento all'orientamento motivazionale: la collaborazione può essere guidata da motivazioni morali, strumentali o reputazionali, che spesso coesistono e influenzano l'intensità del supporto (Mueller et al., 2009; Pies et al., 2010; Rasche, 2010). Liu e Heugens (2024) mostrano che la collaborazione tra MNE e organizzazioni non governative crea strutture di opportunità che consentono alle organizzazioni non governative di esercitare una leva indiretta sui fornitori, soprattutto in contesti autocratici. Iniziative come il Bangladesh Accord *e* l'Alliance *dopo la tragedia di* Rana Plaza *illustrano come la collaborazione motivata da preoccupazioni reputazionali possa migliorare le condizioni sociali e di sicurezza lungo le catene del valore (Donaghey e Reinecke, 2018), favorendo la diffusione della sostenibilità oltre i confini dell'impresa (Haufler, 2018).*

Nel complesso, focalizzarsi sui fornitori consente di evidenziare che le relazioni MNE–società civile non possono essere ridotte a interazioni diadiche: la collaborazione implica una governance più estesa della sostenibilità in cui MNE, società civile, fornitori e governi interagiscono per generare esiti sostenibili (Leone, 2025). Di conseguenza, il paper estende il framework di Castañer e Oliveira (2020) includendo esplicitamente i fornitori, poiché le pressioni esercitate dalla società civile sulle MNE danno origine sovente ad interventi lungo la catena di fornitura. In molti casi, danni ambientali o sfruttamento del lavoro causati dai fornitori vengono attribuiti alle MNE, spingendo le imprese a intervenire nella selezione e nel monitoraggio dei fornitori. Di conseguenza, sebbene i fornitori non siano partner formali nelle IOR MNE–società civile, essi diventano parte integrante delle dinamiche attraverso cui tali relazioni generano esiti di sostenibilità.

Limiti della ricerca. *Una prima limitazione del paper concerne la sua natura prevalentemente teorico-concettuale. Pertanto, le argomentazioni teoriche sviluppate necessitano di future corroborazioni e validazioni empiriche, basate sulla raccolta e sull'analisi di dati empirici originali.*

In secondo luogo, il quadro teorico adottato, pur risultando utile per chiarire e sistematizzare i concetti, potrebbe non cogliere pienamente la complessità e la varietà delle relazioni tra MNE e società civile nei diversi contesti istituzionali, dove, accanto a forme di collaborazione positiva, possono emergere anche dinamiche di confronto e conflitto.

Implicazioni pratiche. *Il paper offre un quadro analitico utile ai manager per valutare in modo più consapevole le modalità d'interazione - coordinazione, cooperazione o collaborazione - in funzione degli obiettivi di sostenibilità perseguiti. Più in generale, il framework consente ai decisori aziendali di selezionare con maggiore chiarezza conoscitiva e consapevolezza la forma di relazione più coerente con gli obiettivi strategici dell'impresa, come pure di valutare la necessità di adeguamenti nel tempo sulla base delle evoluzioni intervenute nella IOR e negli obiettivi condivisi e privati.*

In particolare, i manager dovrebbero riconoscere che la coordinazione richiede tempo, dialogo e capacità di gestione dei conflitti, mentre la cooperazione presuppone la capacità di progettare e implementare congiuntamente soluzioni operative. Per quanto concerne la collaborazione, il paper suggerisce che i manager dovrebbero investire maggiormente in attività di supporto e di rafforzamento delle capacità dei fornitori, anziché limitarsi a pratiche di monitoraggio e controllo.

Originalità del paper. *L'obiettivo principale di questo paper è fornire maggiore chiarezza concettuale nello studio delle relazioni tra MNE e società civile a supporto della sostenibilità, superando l'uso disinvolto di termini quali coordinazione, cooperazione e collaborazione. Il principale contributo teorico del paper consiste nello sviluppo di una classificazione per analizzare le IOR nel campo della sostenibilità, favorendo lo sviluppo cumulativo della conoscenza e aumentando la parsimonia concettuale.*

Sebbene la frammentazione – più che la convergenza – nell'uso dei concetti possa essere interpretata come un indicatore della vitalità del campo (Durand et al., 2017), il paper sostiene che, in una fase evolutiva della letteratura, l'adozione di concetti distinti e chiaramente definiti rappresenti una condizione indispensabile per un progresso teorico robusto.

Innovative Pedagogies in Enhancing Cultural Variety in the International Business Classroom

SARA CARBONE[1], BICE DELLA PIANA

Abstract. *The diversification of international business education increasingly depends on pedagogical approaches capable of fostering cross-cultural competence in classrooms that are often less internationally diverse than policy narratives assume. This paper explores how culturally responsive avatars can be used to expand opportunities for intercultural learning within an Internationalization at Home (IaH) perspective.*

Drawing on the intersection of constructivism, Culturally Responsive Teaching (CRT), and Self-Regulated Learning (SRL), the study proposes a CR-SRL framework for the design of scenario-based learning activities centred on culturally nuanced managerial dilemmas. The paper reports preliminary findings from a pilot implementation in a Cross-Cultural Management course involving 80 undergraduate students from more than ten national backgrounds. In this initial phase, the intervention relied on static avatar prototypes informed by the GLOBE dimensions and collaboratively developed through a co-creation process involving instructors and students.

Qualitative evidence from interviews, reflective narratives, and classroom observations suggests that the avatars supported perspective-taking, encouraged reflection on cultural assumptions, and reduced communication anxiety by creating a structured 'safe space' for experimentation. At the same time, the pilot highlighted the pedagogical limits of pre-scripted interactions and the need for more dynamic AI-enabled dialogue.

The paper argues that the value of avatar-mediated pedagogy lies not only in simulation, but in its capacity to make intercultural learning more inclusive, reflexive, and accessible to students who may not benefit from physical mobility. The discussion concludes by outlining design implications, ethical considerations, and the transition from static prototypes to future LLM-enabled interactions.

Keywords: *International Business Education; Cross-Cultural Management; Internationalization at Home; AI-Enhanced Avatars; Culturally Responsive Teaching; Self-Regulated Learning.*

Framing of the research. *The analytical framing of this research is situated at the intersection of a persistent pedagogical gap in international business education and the growing relevance of digitally mediated learning environments. International business programmes frequently present the classroom as a space in which students naturally encounter different cultural perspectives and develop the intercultural sensibilities required to operate in global organisational environments. Yet this expectation is often only partially fulfilled. In many higher education contexts, limited mobility opportunities, financial barriers, visa restrictions, and the cultural homogeneity of local cohorts reduce the frequency and quality of meaningful intercultural encounters. As a result, the development of cross-cultural competence cannot be left to the incidental composition of the classroom, but increasingly requires intentional pedagogical design.*

To address this gap, the paper adopts the Internationalization at Home (IaH) perspective, which emphasises the deliberate integration of international and intercultural dimensions into the home curriculum rather than relying exclusively on outbound mobility or exchange opportunities (Beelen & Jones, 2015). Within this perspective, intercultural learning becomes an inclusive educational objective for all students, including those who are unable or unlikely to participate in international experiences abroad. For international business education, this is particularly important because the field requires students not only to understand diversity in abstract terms, but also to engage with conflicting expectations, unfamiliar communication styles, and culturally situated managerial choices.

The theoretical core of the paper is the CR-SRL framework, which combines insights from Culturally Responsive Teaching and Self-Regulated Learning. CRT foregrounds the importance of recognising learners' cultural identities, prior experiences, and interpretive frames as legitimate resources for learning, while SRL highlights the learner's active role in planning, monitoring, and reflecting on complex tasks (Zimmerman, 2000). Taken together, these perspectives reposition intercultural learning as an active, situated, and reflexive process. In this sense, students are not passive recipients of knowledge about 'other cultures', but active interpreters of culturally complex situations. This perspective is also consistent with recent work showing that culturally responsive and self-regulation-oriented learning environments can strengthen motivation and engagement when students are invited to navigate meaningful tasks that connect cognition, context, and reflection (Anyichie & Butler, 2023).

Within this pedagogical architecture, digital avatars are conceptualised as mediating devices rather than merely technical novelties. They can represent differentiated managerial standpoints, allow students to rehearse interaction in a low-risk environment, and support forms of perspective-taking that are difficult to activate through lecture-based teaching alone. Earlier literature on immersive and avatar-based learning has already shown that virtual environments can increase engagement, presence, and collaborative meaning-making when they are aligned with clear educational goals

[1] 3CLab-Cross-Cultural Competence Learning & Education, Department of Management & Innovation Systems (DISA-MIS), University of Salerno

(de Freitas, 2006; Falloon, 2010). This broader pedagogical promise is also reflected in Della Piana et al. (2024), who show how avatars can be used to enhance cultural diversity and classroom dynamics when they are intentionally aligned with inclusive learning objective.

More recent scholarship on avatar-mediated instruction also suggests that these tools are becoming increasingly relevant to higher education, especially as institutions look for ways to combine learner support, digital presence, and pedagogical innovation (Hanson et al., 2025).

The relevance of avatars becomes even more pronounced when considered in relation to recent developments in generative artificial intelligence. Large Language Models make it increasingly possible to move from rigid, scripted exchanges to responsive, context-sensitive dialogue. In theory, this expands the pedagogical affordances of avatar-mediated learning: students can ask follow-up questions, negotiate meanings, test assumptions, and receive adaptive feedback within culturally situated scenarios. Work in AI and education has already stressed that the real value of intelligent systems does not lie in automation alone, but in their capacity to support richer forms of feedback, exploration, and personalised guidance (Holmes et al., 2019; Luckin, 2018). At the same time, the literature also suggests caution. The educational integration of AI requires careful design choices, strong pedagogical governance, and a clear awareness of bias, representation, and trust.

A further conceptual element concerns the social perception of digital agents. Recent work on warm and competent avatars shows that students do not engage with educational agents only because of their functionality, but also because of the relational signals such systems project (Richter et al., 2025). For intercultural education, this matters significantly. An avatar designed to support managerial learning across cultures must not only appear informative, but also credible, approachable, and respectful. In other words, the effectiveness of avatar-mediated pedagogy is linked to both cognitive and relational design.

For these reasons, the paper does not treat avatars as neutral containers of content. Rather, it considers them as pedagogical artefacts whose educational value depends on how they are designed, contextualised, and enacted. This is particularly important in international business education, where the risk of reducing culture to static categories or stereotypes is ever-present. The challenge, therefore, is to develop learning scenarios that expose students to cultural variety while avoiding essentialist representations. This concern informs the emphasis on co-creation, reflexivity, and iterative design that runs throughout the study.

Purpose of the paper. *The purpose of this paper is to explore how culturally responsive avatars can be designed and implemented to increase cultural variety and support the development of intercultural and managerial competences in international business education. The focus is not simply on adopting an emerging technology, but on understanding how such tools can function as pedagogical mediators within the IaH agenda. In this sense, the paper addresses a practical and conceptual question: how can institutions create meaningful intercultural learning opportunities for students who remain in domestic classrooms, often characterised by uneven or limited exposure to diversity?*

The study approaches this issue through the development of a pedagogical framework that links intercultural learning objectives to scenario-based interaction. More specifically, the paper examines how culturally differentiated avatars can be constructed around managerial personas inspired by the GLOBE dimensions (House et al., 2002), and how those personas can be embedded in business situations involving communication styles, negotiation practices, and decision-making norms. Rather than using culture as a fixed explanatory label, the project treats these personas as prompts for reflection, comparison, and discussion.

A second objective of the paper is to foreground participatory co-creation as a design strategy. The avatars are not conceived in a top-down manner by faculty alone, but are developed through a collaborative process involving both instructors and students. This choice is pedagogically relevant because co-creation helps reduce the risk of stereotypical cultural representations and encourages students to reflect on how cultural assumptions are built into managerial discourse. It is also methodologically relevant, as student–staff co-creation has been shown to strengthen ownership, engagement, and the educational relevance of curriculum innovation in higher education (Dollinger & Lodge, 2020).

At the same time, the paper has an explicitly developmental character. It reports an initial pilot phase based on static avatar prototypes and uses that phase to identify both pedagogical affordances and design limitations. The ambition is therefore twofold: first, to understand what static avatars can already achieve in terms of perspective-taking and reflective engagement; second, to clarify why a future transition to more dynamic, LLM-enabled interaction may be pedagogically valuable. In this way, the paper contributes to current debates on innovative pedagogy in international business education by proposing a staged pathway from symbolic representation to adaptive intercultural dialogue.

More specifically, the paper addresses the following guiding question: "How can culturally responsive digital avatars be designed and implemented to foster intercultural and managerial competence, expand cultural variety, and support inclusive learning experiences in international business education?"

Methodology. *To address the core research question, this study adopts a design-based, exploratory methodology aimed at iteratively developing and evaluating the pedagogical value of culturally responsive avatars in an authentic higher education setting. Consistent with design-based research in technology-enhanced learning, the study combines intervention design, pilot implementation, and reflective evaluation in order to examine how the proposed CR-SRL framework can support intercultural learning processes (Wang & Hannafin, 2005). The approach is grounded in constructivist learning theory, which conceives learning as an active and socially situated process in which meaning is*

co-constructed through interaction, reflection, and contextualised problem-solving. Participatory co-creation is therefore treated as a core methodological principle, positioning students and instructors as contributors to the design of the learning environment. This choice is also coherent with student–staff co-creation research in higher education, which has highlighted the value of qualitative inquiry for understanding how collaboratively designed learning activities generate engagement and ownership (Dollinger & Lodge, 2020).

The research unfolded through four iterative stages. The first stage focused on the conceptual design of the pedagogical framework and on the development of culturally responsive avatars intended to represent different managerial perspectives in international business contexts. Drawing on literature in intercultural communication, cultural intelligence, and international business education, the intervention was structured around learning objectives related to intercultural awareness, reflective engagement, and perspective-taking. Particular attention was devoted to the design of culturally nuanced scenarios involving negotiation styles, communication practices, and decision-making norms across different business environments.

The second stage consisted of the co-creation and scripting of the avatars. Instructors and students collaborated in defining character profiles, cultural traits, narrative settings, and interaction scripts, with the aim of ensuring cultural plausibility while avoiding reductive or stereotypical representations. The use of scenario-based intercultural tasks is consistent with prior educational interventions that employed digitally mediated collaboration to foster intercultural competence in higher education and business-related learning contexts (Swartz et al., 2020). The scripting process also encouraged students to surface implicit cultural expectations embedded in managerial language, thereby making the design activity itself part of the learning process.

The third stage involved a pilot implementation in a Cross-Cultural Management course attended by 80 undergraduate students from more than ten national backgrounds. At this stage, the intervention relied on static avatar prototypes designed around managerial personas informed by the GLOBE dimensions (House et al., 2002). The avatars functioned primarily as visual and symbolic anchors within fixed scenario-based modules rather than as fully interactive agents. The purpose of the pilot was therefore not to test the effectiveness of an LLM-enabled system, but to assess the pedagogical feasibility of the CR-SRL framework, students' initial engagement with the cultural scenarios, and the extent to which the avatars could support early forms of perspective-taking and reflective discussion. This staged logic is also in line with recent digitally mediated intercultural learning studies, where pilot interventions have been used to explore how virtual environments shape interaction and perceived engagement before moving toward more advanced technological implementations (Gruber et al., 2023).

Finally, data collection combined multiple sources in order to capture the experiential and interpretive dimensions of the learning process. Qualitative data were gathered through semi-structured interviews with the 80 participating students and through written reflective narratives describing their engagement with the avatars and the scenarios. Classroom observations were also used to capture how students responded to the scenarios during the pilot activities. These materials were analysed through thematic analysis using an open coding process that allowed themes to emerge inductively from the data, and were progressively grouped into broader categories related to intercultural awareness, communication confidence, perspective-taking, and perceived cultural complexity. At the current stage, the research remains predominantly qualitative and exploratory. A subsequent phase will complement these findings with self-assessment survey instruments aimed at examining changes in communication confidence, cultural empathy, perspective-taking, and perceived competence in navigating culturally diverse business situations.

Results. *Preliminary findings from the pilot suggest that avatar-mediated scenarios can support intercultural learning in ways that are both pedagogically meaningful and accessible within the home curriculum. A first recurrent theme concerns the reduction of communicative inhibition. Many students described the avatars as creating a protected space in which they could test interpretations, ask culturally sensitive questions, and rehearse responses without the immediate social pressure often associated with direct peer interaction. In this sense, the avatars appeared to lower the threshold for participation and to encourage experimentation in culturally unfamiliar situations.*

A second theme concerns perspective-taking. Students frequently reported that the scenarios helped them move beyond abstract descriptions of cultural difference and engage more concretely with how managerial expectations may vary across contexts. The use of distinct personas made it easier for participants to compare communication styles, assumptions about hierarchy, and negotiation behaviours. This did not eliminate complexity; rather, it made complexity more discussable. Reflective narratives showed that students were often less interested in 'getting the culture right' than in recognising how quickly their own assumptions surfaced when interpreting the scenario.

A third finding relates to the pedagogical value of symbolic anchoring. Even in their static form, the avatars helped transform theoretical constructs such as the GLOBE dimensions into tangible managerial situations. Students were able to connect conceptual material from the course with recognisable interactional dilemmas, thereby making the learning experience more applied and memorable. In this respect, the pilot indicates that avatars can enrich the IaH agenda not only by simulating difference, but by giving students a structured way to analyse and discuss it.

At the same time, the pilot made the limits of the current design highly visible. Because interactions remained pre-scripted, the scenarios could not sustain prolonged dialogue, unexpected questions, or adaptive feedback. Students could interpret the avatars and reflect on them, but they could not genuinely negotiate with them. This limitation is analytically important because it clarifies that the most promising contribution of future AI-enabled avatars lies in responsiveness

rather than visual representation alone. The pilot therefore generated two complementary outcomes: encouraging evidence of pedagogical usefulness in the static phase, and a clearer rationale for the next design iteration based on dynamic interaction.

Research limitations. *Despite these promising early findings, several limitations define the current boundaries of the study. First, the pilot was conducted within a single Cross-Cultural Management course and should therefore be read as a context-specific exploration rather than as a generalisable evaluation of effectiveness. The sample was pedagogically rich, given its range of national backgrounds, but the intervention remains tied to one institutional setting and one curricular context.*

Second, the present phase relied on static avatar prototypes. This was a deliberate design choice for feasibility and pedagogical testing, but it necessarily constrained the scope of interaction. Students could engage in reflection and scenario interpretation, yet the absence of responsive dialogue limited the extent to which they could practice negotiation, improvisation, and real-time adjustment in culturally complex conversations. In this respect, the study identifies a clear boundary between symbolic representation and genuine conversational scaffolding.

Third, the current evidence base is predominantly qualitative and centred on participants' reported experiences. This is appropriate for an exploratory phase, but it means that claims about impact must remain cautious. The paper therefore avoids treating the pilot as proof of learning gains in a strict causal sense. Instead, it presents the results as preliminary indications of pedagogical value that require further triangulation through structured self-assessment measures and, ideally, longitudinal follow-up.

A final limitation concerns the wider challenge of design governance. Developing culturally responsive digital agents requires sustained collaboration among disciplinary experts, instructional designers, and technical specialists. It also requires explicit attention to the risks of cultural simplification, representational bias, and misplaced trust in AI-mediated interaction. For this reason, the future evolution of the project depends not only on technological enhancement, but also on robust pedagogical and ethical oversight.

Managerial implications. *The findings of this study offer several implications for managers of higher education programmes, curriculum designers, and faculty members engaged in the renewal of international business education. First, the paper reinforces the strategic relevance of Internationalization at Home as more than a compensatory approach for students who do not go abroad. Properly designed avatar-mediated activities can make intercultural learning a regular component of the curriculum, rather than an opportunity reserved for the mobile minority.*

Second, the study suggests that innovative digital pedagogies should be integrated at the level of curriculum design rather than treated as isolated classroom experiments. In practical terms, this means embedding scenario-based intercultural tasks into course objectives, assessment logics, and reflective activities. In international business education, avatars can help operationalise abstract goals such as cultural awareness, communication adaptability, and ethical sensitivity by translating them into concrete managerial situations. To facilitate this, instructors should adopt a phased implementation: starting with low-risk scenarios to build confidence, followed by structured debriefing sessions where student-led reflective narratives are used to bridge the gap between avatar interaction and theoretical constructs.

Third, the project highlights the organisational implications of AI adoption in education. Institutions interested in scaling similar initiatives need faculty development, instructional design support, and explicit governance structures for the ethical use of AI. The issue is not only technical feasibility, but educational legitimacy: who designs the personas, how cultural assumptions are reviewed, how bias is mitigated, and how students are guided to interpret avatar interactions critically rather than passively.

Finally, the findings indicate that avatar-mediated pedagogy may be especially useful in monocultural or low-exposure contexts, where students have limited opportunities to test intercultural judgement in practice. In such settings, avatars do not replace authentic human diversity, but they can function as transitional pedagogical devices that make intercultural complexity more discussable, more inclusive, and more systematically teachable. For management education, this is a relevant contribution because it links curriculum innovation, inclusion, and digital transformation within a single pedagogical agenda.

Originality of the paper. *The originality of the paper lies in the way it connects three conversations that are often treated separately: Internationalization at Home, culturally responsive and self-regulated learning, and avatar-mediated pedagogical design. Rather than discussing AI avatars as generic educational tools, the paper situates them within the specific challenge of increasing cultural variety in international business classrooms where intercultural exposure cannot be assumed.*

A second element of originality is the emphasis on participatory co-creation. The study does not simply apply pre-existing avatars to a teaching context; it frames their development as a collaborative pedagogical process through which students and instructors jointly negotiate representation, plausibility, and meaning. This helps counter the risk of essentialising culture and makes the design process itself educationally productive (Minkov & Hofstede, 2011).

Finally, the paper contributes by documenting a staged transition from static prototypes to the prospect of future LLM-enabled interaction. In doing so, it avoids overstating the current level of technological sophistication while still clarifying why responsive AI may matter pedagogically. The theoretical advancement of this work lies in redefining the role of digital agents from mere simulation tools to active cognitive mediators within the CR-SRL framework. By shifting

the focus from 'knowing about' a culture to 'navigating' its complexities through self-regulated interaction, the paper provides a conceptual bridge between culturally responsive pedagogy and AI-enabled reflexivity. This advances current theory by demonstrating how structured digital environments can systematically trigger the 'disorienting dilemmas' necessary for transformative intercultural learning, even in the absence of physical mobility.

The contribution of the paper is therefore not the claim that AI has already solved intercultural learning, but the proposal of a theoretically grounded and empirically informed pathway for developing more inclusive, reflexive, and scalable forms of intercultural pedagogy in international business education.

MNEs Resilience Amid Dual Complexities: Insights from Peripheral Areas in Turbulent Times

FRANCESCO MUTIGNANI[1], ANTONELLA ZUCCHELLA[2]

Abstract. *Global value chains' (GVCs) resilience has become a central concern in both International Business (IB) and Industrial Marketing and Purchasing (IMP) research, yet existing studies largely treat firms as operating in contextually neutral environments, overlooking how sub-national territorial characteristics shape the strategies through which disruptions are absorbed and managed. This paper addresses this gap by focusing on MNEs embedded in peripheral areas (PAs), which face both the global disruptive pressures and the structural place-related constraints.*

Drawing on a qualitative methodology based, the paper examines two place-based MNEs located in Italian inner areas with IMP lens, tracing how peripheral resources interact with international dynamics to produce distinctive resilience configurations.

The findings suggest that peripheral location, rather than being merely a constraint to compensate for, functions as a generative context, contributing as a place-based resilience infrastructure that underpins international competitiveness.
Keywords: *Resilience; MNEs; Peripheral Areas; Context; Business Network; Resources.*

Framing of the research. *In recent years, the resilience of global value chains (GVCs) has emerged as a central concern in both International Business (IB) (Malik & Terzidis, 2025; Gereffi et al., 2025) and Industrial Marketing and Purchasing (IMP) research (Guercini et al., 2024, 2025; Cinti et al., 2025). Particularly in IB literature, GVC reconfiguration has been widely discussed as a primary mechanism through which firms respond to environmental turbulence (Contractor et al., 2026). Existing studies have largely focused on how multinational enterprises (MNEs) adjust the geographical dispersion of activities, redesign governance structures, diversify suppliers, and rebalance control and coordination mechanisms across their international networks (Sacco et al., 2025). From this perspective, resilience, i.e. the ability to adapt, resist and "bounce back" after disruptions (Conz & Magnani, 2020; Hillmann & Guenther, 2021), is primarily interpreted as the outcome of strategic choices made by focal firms (Buckley, 2020; Strange, 2020) operating within complex, globally dispersed, and tightly interconnected networks (Kano, 2018; Statsenko et al., 2025).*

However, in the extant literature, the complexity that firms are assumed to manage is mainly conceived as global in nature, stemming from cross-border interdependencies, institutional heterogeneity, and exposure to exogenous shocks (Bennett & Lemoine, 2014; Petricevic & Teece, 2019), thus adopting a relatively decontextualised view (Welch et al., 2022). Much less attention has been devoted to how this complexity is shaped by the specific sub-national territorial contexts in which firms are embedded (Boschma, 2024). This perspective becomes problematic when the analysis delves into the specifics of location choices, shifting from the macro, national level to the micro, sub-regional level – that is, the precise location where the business operates. IB analyses often implicitly assume that resilience strategies unfold in environments characterised by adequate infrastructure, institutional support, access to specialised resources, and proximity to dynamic industrial ecosystems (Prashantham & Bhattacharyya, 2020). By focusing on peripheral areas (PAs) (Pugh & Dubois, 2021; Pike et al., 2023), this article demonstrates that this assumption is not always valid, highlighting how even the national context, within itself, is a varied and heterogeneous collection of places with specific characteristics that influence the active and adaptive response of firms to the changes and disruptions occurring at a global level.

With the umbrella term of PAs we refer to places characterised by sparse population, political subordination, social and economic marginality, and remoteness from hotspots of economic development (Kühn, 2015; Pugh & Dubois, 2021; Nilsen et al., 2023), outcome of the interplay of macro-context dynamics, such as technological advancement and globalisation, with place-specific weaknesses related to people, firms, and institutions (Iammarino et al., 2019). Recent events, including the financial crisis, the COVID-19 pandemic, trade wars, and geopolitical instability, have further affected these places (Woods, 2025), intensifying an already ongoing trend of peripheralisation with respect to metropolitan areas (Kühn, 2015).

Firms operating in PAs face a form of complexity that is not episodic but structurally embedded in the territory itself (Copus & Skuras, 2006; Korsgaard et al., 2015). Even during relatively stable periods, they must cope with resource constraints, thin networks, and limited opportunities for diversification (Gherhes et al., 2021; Khan et al., 2024). When GVC disruptions occur, these firms are therefore exposed to dual complexity: on the one hand, they experience the same disruptive pressures affecting global networks, including supply interruptions, demand volatility, and governance instability (Petricevic & Teece, 2019). On the other hand, these shocks interact with pre-existing territorial vulnerabilities, exacerbating constraints related to distance, dependence on external actors, and limited strategic

[2] Professor of Marketing, University of Pavia, antonella.zucchella@unipv.it

alternatives (Brown & Cowling, 2021; Almeida & Daniel, 2023). In such contexts, resilience cannot be understood merely as a firm-level response to temporary disruptions; rather, it has to be analysed as an ongoing process shaped by both global dynamics and local structural conditions (Crespo et al., 2017; McIntyre & Roy, 2023).

For this reason, it is necessary to adopt context-based analytical approaches that are capable of capturing the distinctive features and complexities of PAs. To this extent, an Industrial Marketing and Purchasing (IMP) perspective (Håkansson & Snehota, 1995; Håkansson et al., 2009) on resources (Baraldi et al., 2012; Bocconcelli et al., 2020) offers a valuable theoretical framework for examining firms' resilience strategies (Bygballe et al., 2023; Guercini et al., 2025) in relation to the context. Drawing its origins from the Uppsala Model of firms' internationalisation (Johanson & Vahlne, 1977), IMP provides excellent analytical-interpretative tools to unfold typical IB issues with a business network perspective (Guercini et al., 2025), stressing the idea that every business establishes relationships and becomes part of a network, engaging in continuous exchanges of resources and activities (Håkansson & Snehota, 1989). Where IB scholarship has concentrated on the strategic responses of focal firms and the governance of GVC configurations (Gereffi et al., 2022; Statsenko et al., 2025), IMP emphasise that resilience is an interaction outcome, treating it not as a property that firms individually possess but as a condition that emerges and underpinned through the relationships connecting actors within and across networks (Bondeli & Havenvid, 2022; O'Toole & McGrath, 2023). Resources occupy a central position in defining resilience (Bygballe et al., 2023) since disruptions are fundamentally resource deficiencies (Tunisini et al., 2023) which force the reconfiguration of resource constellation built up through the adaptation and mutual fitting of counterparts over time (Håkansson & Snehota, 1995; Baraldi et al., 2007). It is through the recombination and reactivation of resources across network relationships that firms absorb shocks and restore operational continuity, not through unilateral firm-level decisions (Bygballe et al., 2023). By analysing places as sets of resources (Håkansson et al., 2006), it is possible to highlight the elements determining the resilience of territories, such as industrial composition, the structure of knowledge exchange networks, and the institutional framework, factors that are not evenly distributed across space and that result in systematic differences in the resilience potential of firms located in different places (Crespo et al., 2017).

Purpose of the paper. *Against this background, this study addresses the following research question: How do MNEs operating in PAs configure and leverage resource interactions to build resilience in the face of GVC disruptions?*

With this in mind, the study aims to foster cross-fertilisation between the IB and IMP literatures, highlighting for both the need for a greater understanding of context and emphasising the components and characteristics of the specific locations in which firms operate, with particular regard for PAs that have been neglected in these two research areas. Specifically, by investigating how MNEs operate in resource-constrained places as PAs in times of global disruption, we will provide a context-specific analysis of resilience strategies, emphasising the necessity to adapt to both local and global dynamics. In this sense, the study advances research in the field of IB through a greater understanding of the micro-processes operating at the sub-regional level that underpin the macro-dynamics generally analysed, whilst simultaneously contributing to the development of IMP-based research on business resilience through the lens of resource interaction approach.

Methodology. *To this aim, the research adopts a qualitative explorative methodology (Halinen & Törnroos, 2005; Eisenhardt & Graebner, 2007) based on a small number of case studies with retrospective in-depth interviews, covering a period from 2015 to the present, thus including the major global challenges companies faced up to now. The analysis focuses on place-based MNEs, that is those multinational companies that are deeply embedded in their place and "cannot relocate without losing part of their value proposition, and have already committed to using local resources" (Korsgaard et al., 2026, p. 10). Purposeful sampling (Patton, 1990) was used to select the case studies according to specific criteria: a recognised international activity, a period of activity of at least 10 years and, above all, the geographical location of the headquarters in a recognised PA included in National Strategy for Inner Areas (SNAI) adopted by the Italian government (Dipartimento per le Politiche di Coesione e per il Sud, 2025). Currently, two companies have been selected, but it is our purpose to extend the analysis up to four companies (Table 1).*

Table 1: Case studies' details

Company	*Foundation Year*	*Sector*	*Region*	*Peripheral Area*
Alpha	*2007*	*Water Treatment*	*Marche*	*Montefeltro e Alta Valle del Metauro*
Beta	*1973*	*Plastic Recycling*	*Lombardy*	*Valle Seriana e Val di Scalve*

Source: Our elaboration

Primary data have been collected with face-to-face interviews with key informants withing both organisations (Table 2), while secondary sources, such as company websites and company reports, have been consulted to triangulate information. For confidentiality reasons agreed upon with the participating organisations at the time of interview, the companies are referred to with pseudonyms. However, given the specificity of the cases in terms of sector, location, and founding year, the empirical grounding of the study remains fully transparent and verifiable.

Table 2: Case study informants

Company	***Informant position***	***Interview date***	***Length***
Alpha	*Ceo*	*10.03.2026*	*30 min*
Beta	*Purchasing & Environmental manager*	*10.03.2026*	*60 mins*

Source: Our elaboration

Company Alpha is an Italian company active since 2007 and specialized in innovative solutions for the treatment and recovery of civil and industrial water. Although Company Alpha has a physical presence in more than 10 countries across Europe and a global customer base, its production remains firmly rooted in the "Montefeltro and Alta Valle del Metauro" inner area, which comprises 17 municipalities in the province of Pesaro Urbino. The territory, which is predominantly hilly and mountainous, exhibits a robust manufacturing and agricultural sector, yet is also marked by demographic ageing and depopulation.

Company Beta is an Italian company specialising in the recovery and regeneration of polyethylene. Active since 1973 and with roots in a previous entrepreneurial venture, it is one of Europe's leading companies in the sector. The company mainly produces bags and sacks for waste collection (for use in apartment buildings, homes, industry and commerce) using regenerated raw materials. Company Beta is situated in the "Valle Seriana e Val di Scalve" Inner Area, which encompasses 42 municipalities in the province of Bergamo. The territory, which is predominantly mountainous, is experiencing a decline in population and economic activity, with a concentration of resources and services in the valley floor. The local economy has traditionally been characterised by a manufacturing-based structure, with a particular focus on the textile and mechanical engineering sectors.

Results are analysed with systematic combining abductive method (Dubois & Gadde, 2002), moving iteratively between empirical data and the literature. In the light of the GVCs' networked structure (Buckley, 2011; Buckley & Strange, 2015; Kano, 2018) and the importance of business relationships and business networks for companies operating in PAs (Copus & Skuras, 2006), data analysis adopts the IMP perspective (Håkansson & Snehota, 1995; Håkansson et al., 2009), which allows us to understand resilience emerging process within and across business networks (Cinti et al., 2025; Bondeli & Havenvid, 2022), thus beyond firm-centric and purely strategic explanations. Drawing from Håkansson et al. (2006), who conceptualise places as sets of resources, to understand the relationship between companies and their embedding location, we need to investigate how they interact with it (Gaddefors & Anderson, 2019). To this aim, this study adopts the Resource Interaction Approach (RIA) lens (Baraldi et al., 2012; Bocconcelli et al., 2020; Prenkert et al., 2022), investigating how resources interact within and across organisations with a networked and shared perspective. According to the RIA, resources are heterogeneous (Penrose, 1959), with their value arising from interaction with other resources. This implies that resources are open and variable objects over which companies have only limited control (Baraldi et al., 2012; Bocconcelli et al., 2020; Prenkert et al., 2022). RIA classifies resources are into four categories, which define the 4R Model (Håkansson and Waluszewski, 2002; Baraldi et al., 2012): products (Ps), production facilities (PFs), organisational units (OUs), and business relationships (BRs). This framework allows precise analyses of interaction processes, making it possible to represent business networks at both a particular point in time and of complex processes, identifying involved resources and interfaces (Baraldi et al., 2012).

Results. *The initial findings highlight the characteristics of the public administrations in which the multinationals under analysis are based, emphasising the key elements of their resilience strategies. Notably, from the perspective of those who work there on a daily basis, these areas do not merely suffer from the well-known limitations in terms of infrastructure and innovative resources. On the contrary, they offer access to other - hidden - key resources that are capable of compensating for these shortcomings. The decision to establish and maintain headquarters there is neither accidental nor purely biographical, but fundamental to the company's identity. Both companies are deeply imprinted by their peripheral location, which determines their internal culture, cohesion and staff motivation, resources that are difficult to replicate in urban contexts. This place embeddedness derives from the Italian entrepreneurial tradition to build the production facility close to the house, addresses as "home and workshop model" (Beta - Purchasing & Environmental manager), and that still governs the boundary between private and working life, producing an organisational cohesion with the local context. This place-based work ethic extends beyond the founder to permeate the entire workforce: the high dedication of Alpha's employees is explicitly attributes by the CEO to the industrious character of the local community and functions as an organisational resource in its own right, enhancing productivity, reducing coordination costs, and sustaining performance levels that would be difficult to achieve through formal incentive mechanisms alone. Moreover, even if they do not operate within a classic industrial district, both companies draw on what may be called a residual relational substrate, that is the surviving local micro-activities and service provider who maintain operational proximity and informal trust. The practical value of this local network materialises in moments of operational urgency, as in the case of Beta which relies on local metalwork firm whose owner already knows the plant's structural layout and can intervene within hours, or in joint and territorial development projects, as expressed by Alpha's CEO concerning the social relationships across entrepreneurial and institutional settings, through which information, contacts, and collaborative dispositions circulate.*

Undoubtedly, the network of international relationships forms the basis of both companies' operations, as they both operate within GVCs where suppliers and customers are globally dispersed; hence, maintaining access to these channels and their resources is essential. Early evidence points to two distinct resilience strategies, shaped by their GVC architectures. Alpha's upstream linkages are purely transactional it source raw materials from petrochemical MNEs suppliers which offer no relational buffer against input price shocks, making upstream exposure its primary vulnerability. Downstream, however, Alpha targets distributors serving public sector clients and infrastructure operators, where procurement is governed by technical specifications and regulatory compliance rather than unit price, enabling the consolidation of long-term buyer-supplier ties that partially offset this fragility. Alpha's products' category, an integrated water treatment system, is engineered to be irreplaceable within the client's operational infrastructure. By positioning its offer as "not a product but a plant" (Alpha – CEO), the company embeds technical complexity, regulatory compliance, and long-term serviceability into the product itself, creating a configuration that is inherently resistant to price-based substitution. Furthermore, the growing structural relevance of water scarcity as a global challenge functions as a demand-side stabiliser. Beta presents an inverse profile, with upstream supply chain ties built with long-term interaction. Beta actively advises suppliers on material quality and monitoring second-tier flows, thus acting as a distributed quality assurance node and gaining preferential access in return. Downstream, Beta's products are recycled polyethylene bags for waste disposal achieves a comparable resilience effect through their recognised quality. In a commodity-adjacent market where Eastern European and Asian competitors can match or undercut Beta's price, the firm has built its international position on a quality standard so reliably maintained that it becomes the primary selection criterion for sophisticated B2B clients. Beta targets buyers, primarily institutional clients, who prioritise consistent quality and reliable delivery over price, and for whom it can therefore leverage its manufacturing expertise. When managing supplies and sales, particularly at an international level, both companies recognise that logistics in PAs involve higher costs. The current energy crisis caused by the war in the Persian Gulf has further increased transport costs. Yet both Alpha and Beta consider their location to be non-negotiable, preferring to absorb the costs by increasing the efficiency of their production processes, as in the case of the former, or by implementing logistics and warehouse management systems that minimise costs as much as possible, as in the case of the latter.

Through the RIA, it is possible to analyse the resilience strategies of these enterprises in terms of their micro-components – namely, their resources – whilst also understanding the processes by which they interact. The "Home & Workshop" model perfectly describes the nature and organisational approach that characterises OUs, determining their strong roots in the local area and in the network of BRs – both formal and informal – with the local actors who support the enterprise. This approach is also reflected in the BRs with the international partners of the GVCs, with whom the enterprises tend to establish long-term BRs, based on the quality and reliability of the Ps exchanged. The logistical complexity due to their peripheral location impacts the functionality of the PFs, becoming a disciplining factor in the management of internal processes within the OUs as well as external ones relating to the BRs.

In summary, the firms analysed so far offer a perspective on how PAs are not a sterile environment for MNEs but, on the contrary, demonstrate how they are able to adapt and respond to periods of increasing turbulence and complexity at a global level.

Research limitations. *The research is still a work in progress and only a limited number of interviews have been conducted so far. The use of PAs officially recognised by the Italian Ministry of Territorial Cohesion and the South allows, on the one hand, to investigate homogeneous contexts in terms of territorial marginality criteria but, on the other hand, limits the possibility of generalising the results at European level, which will nevertheless be possible in future research once common criteria, beyond geography, for identifying such territories have been defined.*

Managerial implications. *Operating in peripheral areas is inherently challenging due to their remoteness from major centres, as well as the need to rely on external channels for procurement and sales. Yet the data emerging from these cases highlight how the strong local roots of businesses in these areas have shaped their organisational structure, disciplining it and preparing it for conditions of natural resource scarcity. The two cases particularly highlight how businesses in peripheral areas, vulnerable to fluctuations in logistics costs, can nevertheless remain competitive thanks to the lasting relationships they establish with suppliers and customers, based on the high quality of their production, which has been developed over the course of their operations.*

Originality of the paper. *This study advances a cross-fertilisation agenda that enriches both IB and IMP fields through three interrelated theoretical contributions. First, it extends the IB contextualisation agenda (Welch et al., 2022) by demonstrating that sub-national territorial conditions are not background variables but constitutive elements of MNE resilience. Specifically, PAs are indeed complex contexts but still they can produce distinctive resource configurations available for embedded organisations (Granovetter, 1985). Second, by integrating IMP's RIA into an IB framework, the study advances a relational account of GVC resilience that moves beyond firm-centric and purely strategic explanations (Hillmann & Guenther, 2021; Sacco et al., 2025) to a condition that emerges through the interaction of place-based and internationally dispersed resources, that is culturally imprinted OUs, constraint-disciplined PFs, and trust-anchored BRs whose are consolidated through PS quality and technical irreplaceability. At last, we show how peripheral MNEs may be structurally accustomed to managing resource deficiencies (Tunisini et al., 2023), which paradoxically constitutes an experiential resilience advantage under conditions of global turbulence.*

Network centrality and establishment mode choice: An empirical analysis on European firms

GABRIELE GALLI, ROBERTO URBANI, LOUIS MULOTTE

Abstract. *Foreign establishment mode choice represents one of the most consequential strategic decisions firms face when expanding internationally. When entering foreign markets, firms typically choose between building new operations through greenfield investments or acquiring existing firms through cross-border mergers and acquisitions (M&As). This decision determines the level of resource commitment, organizational integration, and strategic control associated with international expansion. The Resource-Based View (RBV) predicts that firms endowed with strong technological resources possess the capabilities required to replicate organizational routines and production systems abroad and are therefore more likely to pursue greenfield investments. Conversely, firms lacking strong technological capabilities are expected to rely on acquisitions in order to access external resources.*

However, empirical evidence suggests that this prediction does not always hold. Several studies have documented cases in which firms with relatively weak technological resources nevertheless undertake greenfield investments even in resource-intensive contexts. This pattern presents a theoretical puzzle that cannot be fully explained by internal resources alone.

This study develops a relational extension of the RBV to explain this phenomenon. Specifically, we argue that board network centrality constitutes a network-enabled strategic resource that can compensate for technological capability gaps. Firms embedded in central positions within board interlock networks gain privileged access to strategic information, reputational legitimacy, and connections to specialized intermediaries. These relational advantages reduce uncertainty and coordination costs associated with establishing new operations abroad.

Using a dataset of 414 European publicly listed firms observed between 2017 and 2023 and 10,663 cross-border investment events, we examine how technological capabilities and board network centrality jointly influence establishment mode choices. Our findings show that firms with stronger technological capabilities are significantly more likely to enter foreign markets via greenfield investments rather than acquisitions, consistent with RBV expectations. More importantly, firms occupying more central positions in board interlock networks also display a higher propensity to choose greenfield investments.

The analysis further reveals a compensatory mechanism: network centrality exerts its strongest pro-greenfield effect among firms with weaker technological capabilities. In other words, central firms lacking technological depth can leverage network-derived resources to undertake greenfield investments that would otherwise be difficult to implement. These findings contribute to the literature on international business and strategic management by integrating network-enabled resources into RBV explanations of establishment mode choice and by demonstrating how relational resources reshape firms' international expansion strategies.

Keywords: *establishment mode; board interlocks; network centrality; resource-based view.*

Framing the research. *Foreign establishment mode choice represents one of the most consequential strategic decisions in the internationalization process of multinational enterprises (Slangen and Hennart, 2007; Brouthers and Hennart, 2007). Firms seeking to expand into foreign markets must decide whether to build new operations from scratch through greenfield investments or to acquire existing firms through cross-border M&As (Agarwal and Ramaswami, 1992; Meyer et al., 2009). This decision has far-reaching implications for the allocation of resources, the degree of control over foreign subsidiaries, and the risks associated with operating in unfamiliar institutional environments (Brouthers, 2002; Buckley and Casson, 1998).*

Greenfield investments allow firms to design new operations according to their own organizational structures, managerial practices, and technological systems (Kogut and Zander, 1992). This approach provides firms with a high level of control and facilitates the transfer of proprietary knowledge and capabilities from the parent company to the foreign subsidiary (Kogut and Zander, 1992; Capron and Mitchell, 2012). However, greenfield investments require substantial resource commitments and involve significant uncertainty, particularly in unfamiliar markets where firms lack local knowledge and experience (Slangen and Hennart, 2007).

Acquisitions represent an alternative entry strategy that allows firms to obtain immediate access to local resources, including technological capabilities, distribution networks, and managerial expertise embedded in existing organizations (Anand and Delios, 2002; Capron and Mitchell, 2012). Although acquisitions may reduce the time required to enter foreign markets, they often involve complex post-acquisition integration challenges and may require significant managerial attention in order to align organizational structures and corporate cultures (Capron and Mitchell, 2012).

Because of these trade-offs, a substantial body of research has sought to explain the factors influencing firms' establishment mode choices. Early studies emphasized transaction cost explanations, arguing that firms choose governance structures that minimize coordination costs and uncertainty associated with cross-border operations (Buckley and Casson, 1998). Institutional perspectives later emphasized the role of differences in regulatory frameworks, cultural norms, and political institutions in shaping foreign entry strategies (Brouthers, 2002; Meyer et al., 2009).

Alongside these perspectives, the RBV has emerged as one of the most influential frameworks for explaining firms' international expansion strategies (Barney, 1991; Peteraf, 1993). According to this perspective, firms possess heterogeneous bundles of resources and capabilities that shape their competitive advantages and strategic decisions. Firms expand internationally by deploying and leveraging these resources across different markets (Kogut and Zander, 1992).

Within the RBV, technological capabilities represent a particularly important resource (Barney, 1991; Peteraf, 1993). Firms possessing strong technological resources are better equipped to replicate production processes and organizational routines across geographical locations (Kogut and Zander, 1992). These firms are therefore more likely to pursue greenfield investments, which allow them to transfer proprietary knowledge and maintain control over technological processes abroad (Slangen and Hennart, 2007).

Conversely, firms lacking strong technological capabilities may face substantial challenges when attempting to establish new operations in foreign markets (Anand and Delios, 2002). Without sufficient technological expertise, firms may struggle to design efficient production systems, coordinate complex operations, or adapt technologies to local conditions (Kogut and Zander, 1992). For such firms, acquisitions may represent a more attractive strategy because they allow firms to internalize technological resources embedded within target firms (Anand and Delios, 2002; Capron and Mitchell, 2012).

Although this logic provides a powerful explanation for many establishment mode decisions, empirical observations suggest that the relationship between technological capabilities and entry strategies is not always straightforward (Benito, 2005). In several cases, firms with relatively weak technological resources nevertheless undertake greenfield investments in foreign markets. These observations raise an important theoretical puzzle: how can firms lacking strong technological capabilities successfully undertake resource-intensive greenfield investments?

One possible explanation lies in the relational context in which firms operate. Firms rarely operate in isolation. Instead, they are embedded within networks of interorganizational relationships that shape access to information, legitimacy, and strategic opportunities (Gulati, 1999; Lavie, 2006). These networks may allow firms to access external resources that complement or substitute for internal capabilities (Lavie, 2006).

Among the various forms of corporate networks, board interlock networks represent a particularly important governance structure linking firms together (Mizruchi, 1996; Connelly et al., 2011). Board interlocks arise when directors serve simultaneously on the boards of multiple companies, thereby connecting firms through shared governance ties (Mizruchi, 1996). Through these connections, firms gain access to information about strategic decisions, managerial practices, and organizational experiences observed in other firms (Haunschild, 1993).

Firms occupying central positions within board interlock networks may benefit from enhanced access to information and resources circulating within the corporate network (Freeman, 1978; Gulati, 1999). Central firms often enjoy greater visibility and reputational standing within the corporate community (Shipilov et al., 2014). These advantages can facilitate interactions with investors, regulators, and potential business partners (Shipilov et al., 2014).

From an international business perspective, network centrality may provide firms with access to valuable information about foreign markets, institutional environments, and competitors' strategies (Gulati, 1999; Cuypers et al., 2020). Such information advantages can significantly reduce the uncertainty associated with greenfield investments, which require substantial resource commitments and organizational coordination (Slangen and Hennart, 2007).

Furthermore, board networks may facilitate access to professional intermediaries such as financial institutions, legal advisors, and consulting firms that play crucial roles in structuring international investments (Connelly et al., 2011). These intermediaries provide expertise regarding regulatory frameworks, financing arrangements, and strategic opportunities in foreign markets.

Taken together, these arguments suggest that relational resources embedded within corporate networks may influence firms' establishment mode choices (Lavie, 2006). By reducing uncertainty and improving access to external expertise, network centrality may enable firms with limited technological capabilities to undertake greenfield investments that would otherwise be difficult to implement (Gulati, 1999; Cuypers et al., 2020).

Purpose of the paper. *The purpose of this study is to examine how internal technological capabilities and external relational resources jointly influence firms' foreign establishment mode choices (Barney, 1991; Lavie, 2006). In particular, the paper investigates whether board network centrality can compensate for limitations in firms' technological capabilities when firms expand internationally (Gulati, 1999; Cuypers et al., 2020).*

The international business literature has long emphasized the role of firm-specific resources in shaping entry strategies (Meyer et al., 2009; Brouthers and Hennart, 2007). According to the RBV, firms possessing strong technological capabilities are better equipped to replicate production processes and organizational routines across borders (Barney, 1991; Kogut and Zander, 1992). These firms are therefore more likely to favor greenfield investments, which allow them to transfer proprietary knowledge and maintain control over their operations abroad (Slangen and Hennart, 2007).

In contrast, firms with weaker technological capabilities may face substantial challenges when establishing new operations in foreign markets (Anand and Delios, 2002). These firms may lack the technical expertise required to design production systems, coordinate complex international operations, or adapt technologies to local environments (Kogut and Zander, 1992). As a result, acquisitions may represent a more attractive entry strategy, as they allow firms to obtain technological resources embedded within existing organizations (Anand and Delios, 2002; Capron and Mitchell, 2012).

However, empirical evidence suggests that firms with relatively limited technological capabilities sometimes undertake greenfield investments in foreign markets (Benito, 2005). This observation raises an important theoretical question regarding how firms lacking strong internal resources are able to pursue resource-intensive international expansion strategies.

This study argues that relational resources embedded within corporate networks may provide an explanation for this phenomenon (Lavie, 2006). Firms are embedded in networks of interorganizational relationships that shape access to information, legitimacy, and strategic opportunities (Gulati, 1999). Board interlock networks, in particular, connect firms through shared directors and create channels through which strategic knowledge can flow across organizations (Mizruchi, 1996; Connelly et al., 2011).

Firms occupying central positions within board interlock networks may benefit from greater access to information about foreign markets, institutional environments, and competitors' strategies (Freeman, 1978; Cuypers et al., 2020). In addition, network connections may enhance firms' reputational standing and facilitate access to professional intermediaries involved in international investments (Shipilov et al., 2014).

Building on these arguments, this study investigates whether board network centrality enables firms with limited technological capabilities to undertake greenfield investments that would otherwise be difficult to implement (Gulati, 1999; Cuypers et al., 2020). By examining the joint effects of technological capabilities and network centrality, the paper contributes to a more comprehensive understanding of how internal resources and external relationships shape firms' international expansion strategies (Barney, 1991; Lavie, 2006).

Methodology. *This study investigates how technological capabilities and board network centrality influence firms' foreign establishment mode choices (Slangen and Hennart, 2007; Brouthers, 2002). To address this research question, a longitudinal dataset combining firm-level financial information, corporate governance data, and international investment records was constructed. The analysis focuses on cross-border investment events undertaken by European publicly listed firms, allowing us to observe how internal resources and network positions shape strategic decisions regarding foreign market entry (Meyer et al., 2009).*

The dataset was assembled using multiple modules of the Bureau van Dijk ORBIS database, which provides harmonized information on firms' financial performance, ownership structures, corporate governance characteristics, and international investment activities. ORBIS is widely used in international business research due to its standardized firm identifiers and broad coverage of publicly listed firms across multiple countries. The observation period spans from 2017 to 2023, allowing the construction of a panel dataset capturing firms' international expansion activities over time.

The initial sample included publicly listed firms headquartered in European countries for which reliable financial and governance information was available. Firms operating in financial industries were excluded from the analysis because their regulatory environments and investment patterns differ substantially from those of non-financial corporations. Firms lacking reliable information on board composition or international investment activities were also excluded, as these data are necessary to construct the network variables and identify foreign establishment events. The final sample consists of 414 firms headquartered in fourteen European countries. These firms operate across a wide range of industries, including manufacturing, technology, consumer goods, and business services.

The dataset contains 10,663 cross-border investment events observed during the study period. These events include both greenfield investments and cross-border acquisitions undertaken by the sampled firms. Information on greenfield projects was obtained from the ORBIS Cross-Border Investments module, which records the characteristics of new foreign investment projects. Data on cross-border acquisitions were obtained from the ORBIS M&A database, which provides detailed information on acquisition transactions, including the identity of acquiring firms and target firms. Using Bureau van Dijk's standardized firm identifiers, these investment events were matched with firm-level financial and governance data.

The dependent variable in the analysis is foreign establishment mode. This variable captures whether a firm enters a foreign market through a greenfield investment or through a cross-border acquisition (Agarwal and Ramaswami, 1992; Slangen and Hennart, 2007). Following common practice in the international business literature, establishment mode was coded as a binary variable. The variable takes the value of one when a firm enters a foreign market through an acquisition and zero when the entry occurs through a greenfield investment.

The main independent variable capturing firms' internal resources is technological capability (Barney, 1991). Technological capabilities were operationalized using indicators reflecting firms' innovation activities and technological knowledge base. In particular, measures related to research and development investments and patent activity were used to capture firms' technological resources. These indicators reflect both firms' ongoing innovation efforts and the accumulation of technological knowledge over time (Kogut and Zander, 1992).

The second key explanatory variable is board network centrality. To construct this variable, board interlock networks were created using information on corporate board memberships (Mizruchi, 1996; Connelly et al., 2011). Board interlocks arise when directors serve simultaneously on the boards of multiple companies, thereby connecting firms through shared governance ties (Mizruchi, 1996). Using board membership data from ORBIS, instances in which two firms shared at least one board member in a given year were identified. These shared directorships were used to construct firm-to-firm network connections. Based on these connections, yearly networks were constructed in which nodes represent firms and ties represent board interlocks.

Within these networks, degree centrality was calculated as the primary measure of firms' network positions (Freeman, 1978). Degree centrality captures the number of direct connections maintained by a firm within the board interlock network. Firms with higher degree centrality occupy more central positions within the corporate network and therefore have greater access to information and resources circulating among connected firms (Gulati, 1999).

Several control variables were included in the empirical models to account for alternative explanations of establishment mode choice. Firm size was measured as the natural logarithm of the number of employees. Larger firms often possess greater financial and organizational resources that may influence their preferred mode of foreign market entry (Anand and Delios, 2002). Leverage was measured as the ratio of total debt to total assets, capturing differences in firms' financial structures that may affect their ability to finance international investments. Firm age was also included as a control variable, as more mature firms may possess greater organizational experience and international exposure. The models also include measures capturing firms' international experience. International experience was operationalized as the cumulative number of foreign investments undertaken by the firm prior to the focal year. Firms with greater international experience may possess more knowledge about foreign markets and therefore face lower uncertainty when establishing new operations abroad (Meyer et al., 2009). Host-country experience was also included to capture whether firms had previously invested in the same host country.

In addition, geographic distance between home and host countries and cultural distance were included as country-level controls (Brouthers, 2002). Greater distance between countries may increase uncertainty and coordination costs associated with international expansion. Year fixed effects were included to control for global economic shocks and temporal trends affecting cross-border investment activities during the observation period.

By combining firm-level measures of technological capabilities with network measures capturing firms' positions within board interlock networks, the empirical framework allows us to examine how internal resources and relational resources jointly influence foreign establishment mode decisions (Barney, 1991; Lavie, 2006).

Results. *The empirical analysis examines how technological capabilities and board network centrality influence firms' foreign establishment mode choices (Slangen and Hennart, 2007). The objective is to determine whether relational resources embedded within corporate networks can compensate for limitations in firms' internal technological capabilities when firms expand internationally (Lavie, 2006). To address this question, a series of regression models were estimated in which the dependent variable captures whether firms enter foreign markets through greenfield investments or cross-border acquisitions (Agarwal and Ramaswami, 1992).*

The analysis first examines the direct relationship between technological capabilities and establishment mode choice. Consistent with expectations derived from the RBV, the results indicate that firms with stronger technological capabilities are significantly more likely to undertake greenfield investments when entering foreign markets (Barney, 1991; Peteraf, 1993). Firms with greater innovation-related resources appear better equipped to replicate production processes and organizational routines abroad (Kogut and Zander, 1992). As a result, these firms may prefer greenfield investments because this entry mode allows them to maintain full control over technological processes and operational structures in foreign subsidiaries (Slangen and Hennart, 2007).

This finding aligns with existing research emphasizing the role of firm-specific capabilities in shaping international expansion strategies (Meyer et al., 2009). Firms possessing strong technological resources often rely on internal development strategies when entering foreign markets because these strategies allow them to leverage proprietary knowledge while avoiding the integration challenges typically associated with acquisitions (Capron and Mitchell, 2012). Greenfield investments enable such firms to transfer organizational routines directly from headquarters to newly established foreign operations (Kogut and Zander, 1992).

The analysis then examines the role of board network centrality in shaping establishment mode decisions. The results show that firms occupying more central positions within board interlock networks display a higher propensity to choose greenfield investments rather than acquisitions. Firms with greater network centrality appear more likely to establish new operations abroad rather than relying on acquisitions to enter foreign markets (Gulati, 1999; Cuypers et al., 2020).

This result suggests that relational resources embedded within corporate networks may play an important role in shaping firms' international expansion strategies (Lavie, 2006). Firms occupying central positions within board interlock networks may benefit from improved access to strategic information regarding foreign market opportunities, regulatory environments, and competitors' international expansion experiences (Gulati, 1999). Access to such information may reduce uncertainty associated with foreign investments and facilitate the identification of attractive opportunities for greenfield expansion (Slangen and Hennart, 2007).

In addition to information advantages, network centrality may enhance firms' reputational standing within the broader corporate community (Shipilov et al., 2014). Firms connected to prominent organizations through board interlocks may enjoy higher levels of legitimacy among investors, regulators, and business partners (Connelly et al., 2011). Such legitimacy may facilitate negotiations with local stakeholders and improve firms' ability to secure financing or regulatory approvals when establishing new operations in foreign markets.

The analysis also examines whether board network centrality moderates the relationship between technological capabilities and establishment mode choice. In particular, the models test whether firms with weaker technological capabilities rely more heavily on relational resources derived from corporate networks when undertaking foreign expansion.

The results provide evidence supporting this compensatory mechanism. The interaction between technological capabilities and network centrality indicates that the influence of network centrality on greenfield entry is stronger for firms with relatively limited technological capabilities. In other words, firms lacking strong technological resources appear more likely to undertake greenfield investments when they occupy central positions within board interlock networks.

This finding suggests that relational resources embedded within corporate networks may partially compensate for deficiencies in firms' internal resource base (Lavie, 2006). Firms with limited technological capabilities may leverage their network positions to access external information, legitimacy, and expertise that facilitate the establishment of new operations abroad (Gulati, 1999). Network centrality therefore appears to function as a strategic resource that allows firms to overcome internal capability constraints.

The control variables included in the models behave largely as expected. Larger firms show a higher propensity to engage in acquisition-based entry strategies, likely reflecting their greater financial resources and capacity to finance large acquisition transactions (Anand and Delios, 2002). Firms with greater international experience display a higher likelihood of pursuing greenfield investments, suggesting that accumulated international knowledge reduces uncertainty associated with establishing new operations abroad (Meyer et al., 2009).

Geographic and cultural distance between home and host countries are associated with a higher likelihood of acquisition-based entry strategies. These findings are consistent with prior research suggesting that firms may prefer acquisitions when entering more distant or uncertain markets in order to access local knowledge embedded within target firms (Brouthers, 2002; Meyer et al., 2009).

Overall, the results support the central argument of this study: both technological capabilities and board network centrality influence firms' foreign establishment mode choices, and network centrality appears to play a particularly important role for firms with weaker technological capabilities. These findings highlight the importance of considering both internal resources and external relational resources when examining firms' international expansion strategies (Barney, 1991; Lavie, 2006).

Research limitations. *Despite its contributions, this study presents several limitations that open avenues for future research. First, the empirical analysis focuses on publicly listed firms headquartered in European countries. Although this context provides a suitable setting to examine board interlock networks and international investment activities (Mizruchi, 1996; Connelly et al., 2011), the results may not fully generalize to privately held firms or firms operating in other regions of the world. Smaller firms or firms located in emerging economies may face different constraints when expanding internationally, and the role of corporate networks in shaping their strategic decisions may differ (Meyer et al., 2009).*

Second, the study focuses specifically on board interlock networks as a source of relational resources. While board networks represent an important governance mechanism connecting firms (Mizruchi, 1996), organizations may also benefit from other types of interorganizational relationships, including strategic alliances, joint ventures, ownership ties, and supply chain partnerships (Gulati, 1999; Lavie, 2006). These alternative network structures may provide firms with additional sources of information and resources that influence international expansion strategies. Future research could examine how different types of networks interact in shaping firms' foreign establishment mode decisions.

Third, although the empirical models include several firm-level and country-level control variables, potential endogeneity concerns cannot be completely ruled out. For example, firms that are more internationally oriented may simultaneously seek more central positions within corporate networks and pursue more ambitious international expansion strategies (Cuypers et al., 2020). Future studies could employ alternative empirical approaches, such as instrumental variable techniques or natural experiments, to further examine the causal relationship between network centrality and establishment mode choice.

Finally, the present study focuses on the choice between greenfield investments and acquisitions, but does not examine the subsequent performance of these investments. Future research could investigate whether the compensatory role of network centrality also influences the long-term performance of international investments undertaken by technologically weaker firms (Anand and Delios, 2002).

Managerial implications. *The findings of this study offer several important implications for managers involved in international expansion strategies.*

First, the results highlight the strategic value of corporate networks. Firms embedded in central positions within board interlock networks appear better positioned to access strategic information, reputational benefits, and professional expertise that facilitate foreign expansion (Gulati, 1999; Shipilov et al., 2014). Managers should therefore recognize that corporate networks represent not only governance structures but also valuable channels through which firms can access external resources relevant to international strategy (Lavie, 2006).

Second, the study suggests that relational resources may partially compensate for limitations in firms' internal capabilities. Firms with relatively weak technological resources may still pursue ambitious international expansion strategies if they are embedded in well-connected corporate networks (Barney, 1991; Lavie, 2006). Access to information and expertise through board networks may reduce uncertainty associated with establishing new operations abroad and help firms overcome internal capability constraints (Gulati, 1999).

Third, the findings indicate that board composition and governance structures may have strategic implications beyond traditional monitoring functions. Directors who serve on multiple boards may bring valuable knowledge about foreign markets, investment opportunities, and institutional environments (Haunschild, 1993; Connelly et al., 2011). Firms may therefore benefit from considering directors' network connections when designing board structures. Overall, the results suggest that managers should view corporate networks as an important component of the firm's strategic resource base (Barney, 1991). By leveraging relationships embedded within board networks, firms may enhance their ability to identify and pursue international growth opportunities.

Originality of the paper. *This study contributes to the international business and strategic management literature by integrating internal technological capabilities and external relational resources into a unified explanation of firms' foreign establishment mode choices (Barney, 1991; Lavie, 2006). While prior research has extensively examined how firm-specific resources influence entry strategies, relatively little attention has been devoted to understanding how firms' positions within interorganizational networks shape these decisions (Gulati, 1999).*

First, the paper extends resource-based explanations of foreign establishment mode choice by incorporating relational resources derived from corporate networks. The RBV traditionally emphasizes internal resources and capabilities as the primary determinants of firms' strategic behavior (Barney, 1991; Peteraf, 1993). By highlighting the role of board network centrality, this study demonstrates that external relational structures can also provide firms with valuable strategic resources that influence international expansion decisions (Lavie, 2006).

Second, the study identifies a compensatory mechanism through which network centrality enables firms with limited technological capabilities to undertake greenfield investments. Existing research typically assumes that firms lacking strong technological resources are more likely to rely on acquisitions when entering foreign markets (Anand and Delios, 2002; Slangen and Hennart, 2007). The findings of this study suggest that firms embedded in central network positions may overcome such resource constraints by leveraging relational advantages embedded within corporate networks (Gulati, 1999).

Third, the study contributes to the growing literature on corporate networks by demonstrating that board interlock networks influence firms' strategic decisions beyond traditional governance outcomes (Mizruchi, 1996; Connelly et al., 2011). While prior research has primarily examined how board networks affect corporate governance practices and firm performance, this study shows that network positions also shape firms' international expansion strategies (Cuypers et al., 2020).

Taken together, these contributions provide a more comprehensive understanding of how internal capabilities and external relational resources jointly influence firms' establishment mode choices in international markets (Barney, 1991; Lavie, 2006).

Organisational Resilience in Extreme Environments: Key Success Factors

BELAL ALBASHITI, DIALA KABBARA, ZUCCHELLA ANTONELLA, STEFANO DENICOLAI

Abstract. *This proposed qualitative exploratory study examines organisational resilience in Gaza's small and medium-sized manufacturing firms during wartime extremes. Using a QCA-informed multiple-case design, it focuses on the testing of potential success factors—operational slack, supply chain collaboration, flexible operations, and networking capabilities—and how disruption severity shapes their relevance. Through semi-structured interviews and cross-case comparison, the study will identify patterns of adaptation and the changing role of internal and relational capabilities under different disruption levels. It aims to generate configurational insights into resilience in resource-scarce conflict settings.*

Keywords: *Firm Resilience, Supply Chain Collaboration, Networking Capabilities, Operational Slack, Operational Flexibility, Disruption Severity, Wartime Context.*

1. An introduction. Firms in extreme environments face challenges that go beyond the assumptions of most resilience research. War zones, blockades, collapsed infrastructure, and ongoing institutional disruptions create repeated, overlapping shocks that threaten not just recovery, but basic continuity, resource access, and survival. Unlike isolated events studied in much of the literature, these conditions demand constant adaptation, improvisation, and coordination with others, revealing resilience as a dynamic process rather than a fixed trait. The Gaza Strip stands out as a critical case for understanding these processes. Since the prolonged blockade and recurring conflicts, including the 2023-2025 war, firms in Gaza's food and manufacturing sectors have navigated border closures, acute shortages of fuel and raw materials, widespread infrastructure damage, chronic power outages, and direct wartime threats. These pressures have collapsed markets, disrupted supply chains, and forced reliance on informal networks and smuggling, exposing the shortcomings of traditional contingency planning. Yet, Gaza's firms, making up the bulk of the private sector, have shown remarkable endurance by blending internal capabilities with external ties, such as solidarity networks and adaptive informal economies. While resilience studies increasingly highlight both internal strengths (like flexible operations) and external links (like supply chain collaboration), few explore their interplay under prolonged, severe conflict. This gap is especially relevant in Gaza, where SMEs represent 85% of economic activity and are vital for local livelihoods amid humanitarian crises. This study addresses this by asking: How do Gaza-based SMEs build organizational resilience under severe wartime disruption, and how does disruption severity shape the relative importance and enactment of different resilience mechanisms? Drawing from established literature, the analysis centers on four key mechanisms refined through the Gaza context: (1) operational slack, which provides buffers like excess inventory or capacity to handle shortages; (2) supply chain collaboration, enabling shared risks and alternative sourcing despite blockades; (3) flexible operations, allowing quick shifts in production amid power cuts and material gaps; and (4) networking capabilities, leveraging community ties, informal markets, and partnerships for survival. The study argues that its novelty lies not in new concepts, but in demonstrating how these mechanisms are reprioritized, recombined, and improvised when disruptions intensify, for instance, favouring networks over slack when resources vanish entirely. Methodologically, this is an exploratory qualitative study using a QCA-informed multiple-case design and interviews with Gaza SMEs to generate configurational insights rather than broad generalizations. It aims to explain how resilience is enacted in extreme wartime settings and offer practical and analytical value for crises such as conflict and climate shocks.

2. Theoretical Foundation. Organisational resilience has been conceptualised as the capacity to absorb shocks, adapt operations, recover performance, and learn from disruption (Pradana & Ekowati, 2024; Galy et al., 2023; Hall & Koupaei, 2024). In manufacturing and supply settings, this often includes the ability to sustain operational continuity despite supply interruptions, uncertainty, and sudden environmental change (Ambulkar et al., 2015; Rahimazar et al., 2024). However, much of this literature is developed from contexts where institutions remain broadly functional and disruptions, though serious, are bounded in duration or scope. In extreme wartime environments, resilience takes on a more complex character. The challenge is not only to recover after disruption, but to continue functioning during repeated breakdowns in logistics, infrastructure, markets, and governance. This shifts attention from resilience as an outcome to resilience as an evolving organisational accomplishment shaped by resource constraints, social relations, and adaptive routines (Karunaratne, 2022; Davey et al., 2024). The Gaza setting therefore allows resilience to be examined in its most exposed form, where survival depends on both organisational ingenuity and embeddedness in broader support networks. The resource-based view (RBV) helps explain why some firms are better positioned than others to withstand disruption because they possess valuable and hard-to-replicate resource bundles (Barney, 1991). In this study, operational slack, flexible operations, collaborative relationships, and networking capabilities can all be understood as resources or resource configurations that support resilience under pressure (Conz et al., 2023; Wang et

al., 2022; Barney, 1991). RBV is useful here because it highlights that resilience depends in part on the resources and capabilities firms possess before and during a crisis. Dynamic capabilities theory (DCT) complements this perspective by focusing on how firms sense threats, seize response options, and reconfigure resources as conditions change (Eisenhardt & Martin, 2000; Teece et al., 1997). In wartime settings, resilience depends not only on possessing buffers or relationships, but on mobilising them quickly and creatively as disruption unfolds. Flexible operations, rapid decision-making, and relational coordination are therefore not simply static assets; they are enacted capabilities that allow firms to improvise and recombine resources under pressure (You et al., 2023; Essuman et al., 2023).
Integrating RBV, which highlights enduring resilience resources such as operational slack and networks, with DCT's emphasis on dynamic reconfiguration through flexibility and collaboration, reframes organisational resilience in Gaza's food and manufacturing sectors. Here, communal lifelines (e.g., NGO and family networks) surpass solo efficiency, as firms rely on relational ties to absorb shocks and adapt amid blockades and outages Barney, 1991; Eisenhardt & Martin, 2000). Studies converge on absorption, adaptation, and learning: Pradana & Ekowati (2024) on sustaining performance amid interruptions (e.g., dairy spoilage delays); Rahimazar et al. (2024) on flexibility (textiles-to-aid); Galy et al. (2023) on shock resistance (recipe tweaks); Davey et al. (2024), Bawati et al. (2025), Hall & Koupaei (2024), Thannhauser et al. (2024) on foresight, recovery, and agility. Table 1 defines these resilience dimensions in the manufacturing context.

Table 1: Definitions of Firm Resilience

Definition	Sources
The capacity of a manufacturing firm to absorb and recover from various disruptions, including supply chain interruptions, while maintaining operational performance.	Pradana & Ekowati (2024)
The ability of organizations in the manufacturing sector to be flexible in their operations, allowing for quick adaptations during crises while also ensuring long-term sustainability.	Rahimazar et al. (2024)
A measure of a manufacturing firm's capability to withstand shocks, adapt to changes in the environment, and leverage disruptions to improve strategic positioning.	Galy et al. (2023)
The process through which manufacturing firms build capabilities to anticipate risks, manage disruptions, and achieve recovery through strategic foresight and resource reevaluation.	Davey et al. (2024)
The degree to which a manufacturing firm can foresee and effectively cope with challenges while optimizing performance and innovation during adverse conditions.	Bawati et al. (2025)
The inherent ability of a manufacturing organization to recover quickly from operational challenges and apply learned lessons to enhance future performance and survival capacity.	Hall & Koupaei (2024)
A manufacturing firm's systematic ability to employ agile manufacturing techniques that facilitate rapid response to market changes and emerging threats.	Thannhauser et al. (2024)

3. Critical Success Factors CSFs. This study examines four critical success factors (CSFs) for organisational resilience in Gaza's food and manufacturing firms: operational slack, supply chain collaboration, flexible operations, and networking capabilities, which literature affirms as core for firms facing acute disruptions (Ali et al., 2017; Scholten & Schilder, 2015; Essuman et al., 2023; Badwan, 2025). RBV frames these as valuable, inimitable resource bundles: slack offers redundancy buffers, collaboration and networking build social capital, flexibility embeds agility (Barney, 1991; Conz et al., 2023). Disruption severity anchors analysis via scale (e.g., revenue losses), breadth (production to supplies), and duration (outages to sieges), revealing why mild shocks lean on internal slack/flexibility, but Gaza's protracted war demands relational CSFs for survival (Statsenko et al., 2023; Li et al., 2022; Found et al., 2024). DCT complements RBV by explaining dynamic enactment: firms sense threats to seize collaborative reroutes, reconfiguring slack into flexible responses amid airstrikes (Teece et al., 1997; Eisenhardt & Martin, 2000). This RBV-DCT lens addresses a gap in resilience theory because uniform models often overlook extreme contexts where interdependence intensifies, as in Gaza, where self-reliance alone is often insufficient. The study highlights tailored pathways such as building networks in advance and combining slack with collaboration to support firms facing prolonged crises.
3.1. Operational Slack. Operational slack refers to surplus resources, including financial, human, capacity, and inventory, that can be mobilised when shocks occur (Badwan, 2025; Conz et al., 2023). This includes financial slack (cash reserves, accessible credit), human slack (extra or multi-skilled staff), capacity slack (unused but available production capability), and inventory slack (strategic buffer stocks). These reserves give firms room to absorb disruptions and maintain basic operations without immediately resorting to drastic cuts (Alessandro, 2024; Guo et al., 2025). Existing evidence suggests that slack does not automatically translate into resilience; what matters is how it is directed and used (Essuman et al., 2023). Studies that integrate resource-based and attention-based views show that slack supports operational resilience when managers facing critical threats deliberately allocate it to cushioning disruptions and enabling recovery.
3.2. Supply Chain Collaboration. Supply chain collaboration refers to establishing trust-based relationships among suppliers, manufacturers, distributors, and customers so that they plan and act together instead of in isolation (Badwan, 2025). It typically involves joint planning, open information sharing, frequent communication, and coordinated problem solving, which enhance visibility, speed, and flexibility across the chain (Ali et al., 2017; Scholten & Schilder, 2015). During disruptions, such collaboration supports early detection of issues, sharing of scarce resources, and rapid adjustment of production and deliveries (Ali et al., 2017). Research finds that collaboration serves as an antecedent to

key resilience mechanisms such as visibility, velocity, and flexibility, helping firms absorb shocks and recover, even if it does not always lower costs in stable times (Scholten & Schilder, 2015; Badwan, 2025).

3.3. Flexible Operations. Flexible operations capture a firm's ability to reconfigure production processes, adjust schedules, shift capacity, and change product mixes quickly in response to shifting conditions, while still maintaining acceptable quality and cost levels (Statsenko et al., 2023; Essuman et al., 2023; Badwan, 2025). This includes process adaptations, cross-task mobility of workers, rapid volume or product changes, and the use of technologies such as automation and analytics to support real-time reconfiguration (Badwan, 2025). Across crisis and disruption studies, operational flexibility consistently appears as a central enabler of resilience because it expands the range of feasible responses when inputs are unstable, transport is constrained, or demand becomes highly volatile (Essuman et al., 2023).

3.4. Networking Capabilities. Networking capabilities describe a firm's skill in building, sustaining, and leveraging external relationships with a broad set of stakeholders, including suppliers, customers, peer firms, institutions, and community actors, to access resources, information, and support during disruption (Essuman et al., 2022; Scholten & Schilder, 2015; Kabbara et al., 2013). Strong networks can provide early-warning information, alternative sourcing routes, and shared problem-solving capacity, which become crucial when internal resources alone are insufficient (Badwan, 2025). Empirical findings link networking to adaptive responses, innovation, and faster recovery in disrupted environments, suggesting that networking enhances the ability to improvise and coordinate recovery across organisational boundaries (Guo et al.,2025).

3.5. Disruption Severity. Disruption severity lies at the heart of this study. In tough settings like Gaza, it captures how badly a shock hits: its scale (say, lost revenue or damaged gear), reach (hitting production lines, warehouses, or whole supply chains), and length (quick blackouts versus months of rebuilding), a key idea in resilience research (Statsenko et al., 2023; Guo et al., 2025). It shows up directly in how well firms keep performing, measuring drops in output and the hard slog back to normal (Li et al., 2022). For Gaza's food and manufacturing SMEs amid airstrikes and blockades, high severity forces heavy use of slack (to handle rotting goods or cash shortages), networks (for community help), collaboration (quick info shares and fixes), and learning—unlike minor hiccups that barely need them (Found et al., 2024). Things like buffering cover urgent gaps, while collaboration thrives in the mess with fast teamwork (Essuman et al., 2023; Crespo et al., 2025; Scholten & Schilder, 2015; Found et al., 2024). By digging into severity, we uncover how these tools shift roles, helping build smarter strategies for endless crises.

4. Research Design. This study adopts a Qualitative Comparative Analysis (QCA) perspective within an exploratory qualitative multiple-case design. QCA is suitable because it allows the study to work with a relatively small number of cases while identifying equifinal pathways to resilience and success across firms facing the same extreme environment. The design is especially appropriate for Gaza, where resilience processes are still not fully understood and cannot be captured well through standard measures, making a configurational and context-sensitive approach more suitable. The study is interpretive and theory-building in orientation. It addresses the "how" question by examining how resilience is enacted in practice across firms exposed to prolonged and severe disruption, rather than testing predetermined causal relationships. Semi-structured interviews are used to capture mechanisms, sequences, and meaning-making, which is essential in an extreme context such as Gaza's war zone. A multiple-case design strengthens the analysis by enabling comparison within and across firms, helping to identify both shared patterns and context-specific responses. The analysis uses the four critical success factors and disruption severity as sensitising concepts, while remaining open to new themes and patterns that emerge from the interview data. This approach provides a structured yet flexible way to explain not only what resilience looks like in Gaza SMEs, but how it develops under severe disruption.

4.1. Sampling and case selection. The study is based on twelve semi-structured interviews from six Gaza firms in food processing and plastic manufacturing. These sectors face high wartime risks but differ in product needs, operations, and supply chains. This variation is useful because it allows cross-case comparison while maintaining contextual comparability. We will use purposive sampling, not random, to pick firms and people. Firms were chosen for their track record of enduring long disruptions, checked with experts, for the richest stories. Respondents handle production, supply chains, or key decisions first-hand (Memon et al., 2025). To address the referee's concern about clarity, the study now treats the sample as two sectoral clusters rather than three sectors, consistent with Table 2. The sample size is appropriate for an exploratory short study because the objective is depth of insight into process and mechanism, not representativeness.

4.2. Data collection. Data are generated through semi-structured interviews lasting approximately 45 to 60 minutes, conducted either online or over WhatsApp calls, depending on access. The interview protocol is organized around the four CSFs, disruption severity, and observed resilience outcomes, while leaving sufficient room for respondents to narrate concrete incidents, adaptations, and decision processes. This structure supports comparability across cases without losing contextual richness. The design also makes explicit how the interview questions map onto the research question. Questions on slack examine how firms buffer shocks and preserve continuity; questions on flexibility probe rapid operational adjustments; questions on collaboration and networking explore inter-firm and extra-firm coordination under constraint; and questions on disruption severity examine how respondents interpret and respond to different levels of threat. This alignment strengthens methodological fit and helps show how the data can answer the core research question. Table 3 summarizes domains with illustrative questions from resilience literature.

Table 2: Respondents' Profile (Gaza Wartime Interviews)

ID	Industries	Position	Firm Size (Employees)	Work Experience (Years)
1	Food Processing	Direct Manager	22	25
2	Food Processing	Production Manager	22	25
3	Plastic Manufacturing	CEO	55	30
4	Plastic Manufacturing	Supply Chain Manager	55	30
5	Food Processing	Direct Manager	15	14
6	Plastic Manufacturing	Operations Supervisor	40	35
7	Food Processing	Production Manager	33	20
8	Food Processing	Direct Manager	33	20
9	Plastic Manufacturing	Supply Chain Analyst	20	25
10	Plastic Manufacturing	Plant Manager	45	18
11	Plastic Manufacturing	Plant Manager	45	18
12	Plastic Manufacturing	Plant Manager	45	18

Table 3: The interview main questions

CSF Domain	Illustrative Questions	Informed By
Operational Slack	- How do you maintain financial, inventory, or capacity buffers during wartime disruptions? - Can you describe a time when unused resources helped absorb a shock?	Essuman et al. (2023); Badwan (2025)
Supply Chain Collaboration	- How do you coordinate with suppliers/customers during supply shortages or border closures? - What joint planning or information-sharing practices have aided recovery?	Scholten & Schilder (2015); Ali et al. (2017)
Flexible Operations	- How quickly can you adjust production processes, staffing, or product mixes under constraints? - What technologies or worker skills enable rapid reconfiguration?	Statsenko et al. (2023)
Networking Capabilities	- Which external partners (NGOs, peers, institutions) provide critical support or information? - How have relationships helped access alternatives during isolation?	Essuman et al. (2022); Martin & Grodach (2023)
Disruption Severity	- How would you rate the intensity, scope, and duration of wartime shocks on your operations? - How does shock severity change your reliance on the above CSFs?	Statsenko et al. (2023); Found et al. (2024)

4.3. Data Analysis. The analysis proceeds in three stages. First, interview transcripts are read closely and coded to identify incidents, practices, and interpretations related to resilience, disruption, and the four CSFs. Second, codes are grouped into higher-order themes capturing how resilience mechanisms are enacted at different levels of disruption severity. Third, a cross-case comparison is conducted to identify recurring patterns, contrasts between sectors, and possible configurations of resilience mechanisms. To improve transparency, the study specifies that the analysis seeks to capture micro-manifestations such as ad hoc production shifts, informal sourcing arrangements, relational work, trust mobilisation, inventory rationing, and improvised logistics. These are the kinds of fine-grained practices through which resilience becomes observable in extreme environments. Analytical robustness is strengthened through comparison across firms, iterative coding, and the use of respondent accounts tied to concrete episodes rather than abstract general statements. Ethical safeguards include informed consent, anonymisation, and secure data storage.

5. Expected Findings. We expect all four CSFs to matter, but their roles change with the timing and strength of disruptions. Supply chain elements play a big part, bringing out less obvious factors like trust and flexible arrangements. Short-Term Shocks (Lower Severity): Operational slack (extra stock or capacity) and flexible operations (quick changes to recipes or lines) should help most at first. They let firms keep going during fuel shortages or small attacks. Hidden supply chain details show up here, such as backup deals with local suppliers. Long or Harsh Disruptions: When problems drag on (like long blockades), collaboration and networking become key. Firms turn to partners for info, shared resources, and fixes. This reveals supply chain "secrets" like favor-trading, verbal agreements, and aid links—vital when normal paths fail.

6. Theoretical and Managerial Implications. Theoretically, the study contributes by refining RBV and DCT for an extreme setting where institutional support is weak and resilience depends heavily on relational embeddedness. It suggests that resilience in wartime SMEs is not only a function of valuable resources or dynamic reconfiguration, but also of socially mediated access, trust, and cross-boundary coordination. This gives the case theoretical relevance even without formal generalisation.
Managerially, the study suggests that resilience planning in extreme environments should not focus exclusively on internal efficiency or stockpiling. Managers may need to invest simultaneously in slack, flexible operating routines, trusted supply relationships, and broader support networks. For policymakers and NGOs, the findings point to the importance of enabling shared logistics, communication channels, and collaborative infrastructures that help firms survive severe and prolonged disruption.

7. Limitations of the Study. This study has clear limits. Its small, purposive sample targets two sectors (food and manufacturing) in Gaza's unique extreme context, supporting analytical transfer to similar settings rather than statistical generalization. As a concise study on ongoing research, empirical claims align with the current analysis phase, avoiding premature overstatements.

8. Originality of the Study. These limitations focus rather than weaken the study's contributions as a theory-informed exploratory study. Its strengths lie in rare access to Gaza firms amid active conflict, where primary data collection is challenging. The process focus reveals managers' real-time adaptations, details often absent from surveys or retrospective accounts. It also advances targeted propositions on CSF shifts with disruption severity, enabling future comparative studies across conflicts (e.g., Ukraine, Yemen) or mixed-methods designs integrating qualitative depth with quantitative validation.

Partnering with International Clients through Ingredient Branding: Leveraging Sustainability and Digital Communication

GIULIA MONTEVERDE[1], ANDREA RUNFOLA[2], MATILDE MILANESI[3], SIMONE GUERCINI[4]

Abstract. *This paper explores ingredient branding, a pivotal business-to-business strategy, as a means for suppliers to attract international customers and partner with them, with a focus on the intersection of sustainability and digital communication. While this strategy has traditionally been associated with the technological superiority of the ingredient brand, our study posits a strategic shift, particularly within the international context. Utilizing a qualitative multiple-case study methodology to analyze six small and medium-sized enterprises (SMEs) operating as ingredient brands, our research reveals that sustainability and digital communication competencies are becoming as vital as technological ones. The findings suggest that an ingredient brand can differentiate itself and become an attractive partner for international clients by excelling in sustainability and digital outreach. To expand beyond national borders and achieve international recognition, ingredient brands must strategically blend technological, sustainable, and digital communicative competencies to legitimize themselves and be chosen by international customers. This paper contributes to the literature by highlighting the evolving nature of ingredient branding and emphasizing the growing importance of digitalization and sustainability factors in the global arena. Precisely, we discuss managerial implications for SMEs seeking to leverage this strategy for international expansion, suggesting that a mixed offering of "ingredients" can enhance the supplier's strategic attractiveness within the international client's selection process.*
Keywords: *international clients; partner selection; ingredient branding*; *sustainability*; *digitalization*; *business-to-business setting*

Framing of the research. *How to attract international customers and establish strategic partnerships with them? Extant literature underscores the pivotal role of partner selection in ensuring the viability of new partnerships (Geringer, 1991; Cavusgil and Evirgen, 1997). Previous scholarship has scrutinized this phenomenon through various lenses, ranging from technological development to the complexities of international joint ventures, cross-border marketing initiatives, and dynamic markets (Varis et al., 2005; Ishii and Kikumori, 2024). Companies choose partners to compete in the global marketplace. For supplier firms, attracting international customers and fostering strategic partnerships are essential objectives; however, the complexity of today's market environment complicates organizations' ability to clearly distinguish themselves from competitors. In this study, we focus on a key branding strategy, i.e., the ingredient branding strategy, and advance it as a means for supplier companies to partner with international clients.*

In the last decade, scholars have increasingly focused on the significance of branding strategies within business-to-business (B2B) markets, even in an international perspective (Kaufmann et al., 2015; Pyper et al., 2020). The global corporate landscape has witnessed a profound expansion in the strategic application of B2B branding, which now serves as a critical mechanism for cultivating and sustaining long-term industrial partnerships. Robust B2B branding enhances a firm's international prestige and institutional credibility, providing a competitive edge in the global context (Marvi et al., 2024). Recent scholarly contributions underscore that a sophisticated global brand presence is instrumental in mitigating perceived risk and bolstering the decision-making confidence of industrial buyers (Anaza et al., 2023). Such high-equity brands do more than signal technical or functional superiority; they leverage powerful associative cues that stimulate heightened procurement interest among organizational buyers (Brown et al., 2011). In this vein, effective B2B brands must offer decision-makers a streamlined, cognitively and emotionally resonant pathway that facilitates more efficient, decisive purchasing outcomes (Blankson and Kalafatis, 2019; Mogaji et al., 2023). B2B branding policies can foster relationships with clients, many of whom operate internationally due to the inherent nature of these markets.

Effective B2B branding extends beyond mere aesthetic elements, such as logos or slogans. It involves strategically positioning companies to resonate with business customers, thereby influencing their decision-making. This is achieved by establishing trust, demonstrating clear value propositions, and distinctly highlighting a company's unique offerings in the marketplace (Leek and Christodoulides, 2011; Marvi et al., 2024). Indeed, after years of research, B2B branding has evolved from irrelevance and consideration of branding as a pure business-to-consumer (B2C) phenomenon towards being important for business marketing practice (Österle et al., 2018). Hence, building and maintaining strong, recognized B2B brands is a major objective and an integral part of the marketing strategy in industrial markets. The B2B branding literature has explored the unique aspects of branding in the industrial realm, highlighting, for example, the role of digital strategies and tools (Lipiäinen and Karjaluoto, 2015; Pardo et al., 2022), even for the definition of an international marketing strategy in a B2B domain (Katsikeas et al., 2020). Moreover, the sustainability theme in B2B

markets has steadily attracted attention and academic investigation in recent times (Voola et al., 2022; Runfola et al., 2025), including the specific issue of sustainability communication in digital environments (Guercini et al., 2025).

However, surprisingly, despite its relevance and historical prominence, the ingredient branding strategy—a key B2B branding technique—has not received substantial scholarly attention, especially in the international realm, which this paper focuses on.

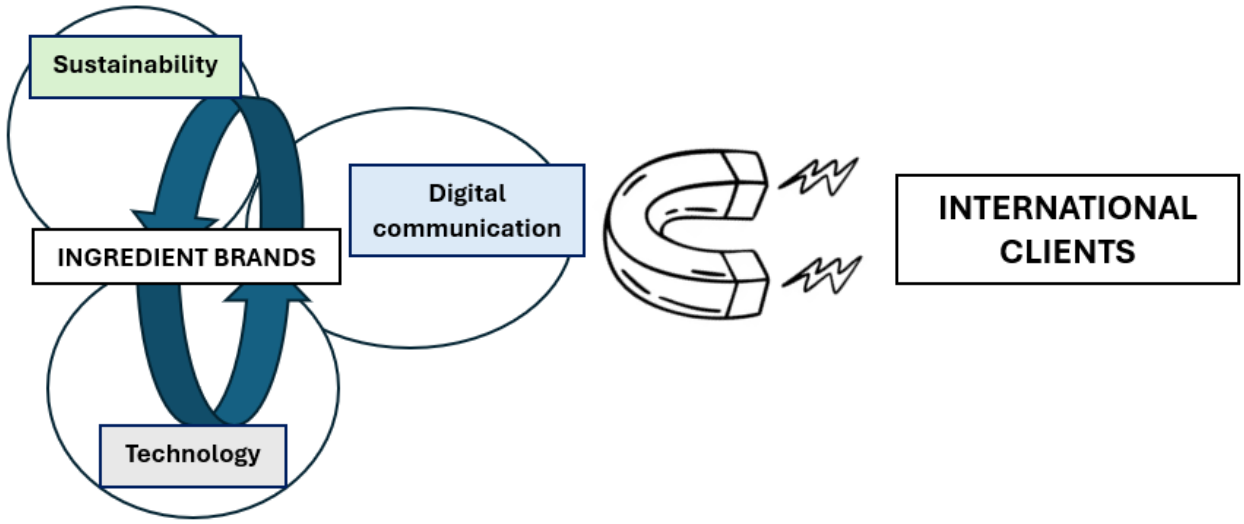
The ingredient branding strategy is realized when "key attributes of one brand are incorporated into another brand as ingredients" (Desai and Keller, 2002, p. 73), thereby leveraging the established reputation and perceived quality of a component brand (the ingredient brand) to bolster the overall appeal of the host brand's final product. In particular, when an ingredient is branded with a distinct name or other brand elements associated with a separate firm, it can be classified as a cobranded ingredient (Desai and Keller, 2002). In the B2B relationship between the manufacturer and the supplier, the supplier's end product becomes one of the components of the manufacturer's offering (Erevelles et al., 2008). The "Intel Inside" effect is a well-known strategy that is valuable to both brands in terms of relationship benefits and the association between the host and the ingredient (Norris, 1993).

From a historical perspective, ingredient branding strategy has been primarily associated with firms that can distinguish themselves within host brands through technological competencies (e.g., patents and R&D investments) and the technical superiority of their products (Moon and Sprott, 2016). This paper aims to investigate ingredient branding strategy in light of recent empirical shifts, particularly the growing role of digital communication and sustainability as drivers of ingredient branding. Moreover, the study considers these empirical shifts pivotal for the ingredient brand to expand internationally and attract international clients.

The strategic prioritization of sustainability has fundamentally altered the selection criteria firms use to identify potential international suppliers, thereby significantly influencing relational outcomes (Galkina, 2021). Specifically, within the buyer-supplier relationship, a supplier's sustainable brand image provides customers with positive emotional benefits. Consequently, suppliers are increasingly repositioning themselves as sustainable entities to cultivate organizational trust—a critical factor that, in turn, enhances buyer performance (Casidy and Lie, 2023). Ultimately, sustainability serves as a transformative force, reshaping the nature of customer-supplier relationships and redefining the strategic role of B2B brands (Maleki et al., 2023). At the same time, given ongoing technological advancements, B2B relationships have become increasingly dependent on digital communication platforms. In this context, social media platforms have assumed a strategic role in cultivating and maintaining these industrial partnerships. To optimize both customer acquisition and retention, an increasing number of B2B organizations—specifically supply-side firms—are integrating digital communication tools into their operations, recognizing them as essential vehicles for capturing business opportunities (Fraccastoro et al., 2021; Pardo et al., 2022).

Sustainability and digitalization are increasingly emerging as decisive competitive drivers, particularly for small and medium-sized enterprises (SMEs) with a strategic international orientation. This shift occurs within a landscape where digital transformation and sustainable development have become inextricably linked challenges, reshaping the modern market environment (Lee et al., 2019; Denicolai et al., 2021). The integration of digitalization not only introduces new complexities but also presents significant opportunities, acting as a powerful catalyst for the international expansion of smaller firms (Jean et al., 2010; Sinkovics et al., 2013). By leveraging these digital advancements, SMEs can access novel tools and methodologies to engage global customer bases more effectively, while simultaneously optimizing their organizational structures and business operations to better align with a more interconnected global economy (Falahat et al., 2020). At the same time, sustainability is currently an international growth path for firms, even as countries increasingly issue regulations, protocols, and guidelines (Gadenne et al., 2009; Denicolai et al., 2021).

Purpose of the paper. *This paper focuses on the strategic positioning of B2B brands that, as SMEs, seek to transcend national boundaries by leveraging ingredient branding. This strategy provides them with an opportunity to overcome inherent liabilities and challenges. Specifically, the research investigates how integrating other "ingredients"—namely, sustainability and digital communication competencies—alongside more traditional technological competencies enables B2B brands to scale in the international landscape. In other words, the study emphasizes the importance of sustainable and digital communicative competencies to legitimize both the ingredient brand and the host brand. In doing this, we advance the idea that B2B brands can enhance their global legitimacy and significantly increase their attractiveness as preferred partners for international clients.*



Within our conceptualization, we posit that ingredient branding enables suppliers to leverage core competencies—technology, sustainability, and the digital communication of sustainability—to facilitate their selection as strategic partners by customers in the international context.

Methodology. *This study employs a qualitative research methodology grounded in multiple case studies (Eisenhardt, 1989). Specifically, the paper analyzes six case studies of Italian ingredient brands, developed through interviews with company representatives and the collection of secondary materials. We also conducted non-participant observation on digital channels, taking notes of the content posted by the ingredient brands. They are all SMEs that operate across different industries, including textile, fashion, furniture, and manufacturing. We adhered to specific criteria for the identification of these ingredient brands: they have a marked orientation towards the sustainability requirements and, at the same time, communication, especially through digital channels; also, they boast established relationships with their customers (i.e., the host brands), which are both national and international. For the semi-structured, in-depth interviews,*

an interview protocol was used. The face-to-face interviews, conducted both online and in person, were subsequently recorded and transcribed verbatim.

Results. *Based on the study's results, we argue that the ingredient brand (the supplier) can leverage sustainability to become a valuable component for the host brand (the customer), especially on an international level. In this context, sustainability emerges as a key competency. Additionally, the ingredient brand's ability to effectively communicate its sustainability efforts—particularly through modern digital channels such as social media platforms, corporate websites, mobile apps, newsletters, and virtual communities—greatly enhances the overall ingredient branding strategy for both parties involved. This is because the host brand benefits from the ingredient brand's communication efforts. Essentially, our research reveals that the traditionally studied ingredient branding strategy is evolving, and we present a nuanced, mixed perspective, emphasizing that alongside technological expertise, competencies in sustainability and digital communication are becoming increasingly important. In fact, the ingredient brand chosen by the host brand might not be the most technologically advanced, but rather the most sustainable or the most skilled at communicating its sustainability digitally. By adopting this strategy, the ingredient brand can differentiate itself and become a more appealing partner for international clients. This multifaceted value proposition is especially vital for ingredient brands, especially SMEs aiming to grow internationally, as it allows them to go beyond national boundaries by offering a hybrid value that aligns with global trends. By integrating sustainability and digital outreach, these firms create international resonance that boosts their visibility and customer appeal, ultimately gaining a significant competitive edge in the interconnected global economy. Figure 1 visually illustrates our reasoning.*

Figure 1. The effectiveness of a mixed ingredient branding strategy in attracting international customers.

Source: Own elaboration

Moreover, through the ingredient branding strategy, the supplier brand can also strengthen its own corporate identity. This approach helps the supplier validate its brand and increase international recognition. Host brands also gain advantages: by incorporating a specific sustainable ingredient, they can confirm their commitment to sustainability. This is especially important since host brands are often B2C companies that need to show their sustainability efforts to the mass market. Therefore, while sustainability sets the ingredient brand's products apart, host brands benefit by showcasing their dedication to sustainability globally through their final-market offerings. Digital communication from the ingredient brand can also enhance these benefits for host brands.

In summary, the concept of the ingredient branding strategy proposed relies on a triad of core competencies: technological, sustainable, and digital communication. The integration of these diverse skills suggests that B2B brands offering such a multifaceted value proposition can gain a significant competitive advantage over traditional suppliers. This strategic positioning not only enables crossing national borders but also increases the likelihood of being chosen as a preferred partner by international clients, thereby attracting them.

Therefore, this paper advances the B2B branding literature by exploring the intersection of sustainability and digitalization (Lipiäinen and Karjaluoto, 2015; Pardo et al., 2022; Voola et al., 2022; Marvi et al., 2024), with a new focus on ingredient branding strategies. From this perspective, sustainability and communication are major global trends in international marketing (Pyper et al., 2020; Denicolai et al., 2021; Runfola et al., 2022), helping suppliers become integrated into—and prioritized by—international customers for strategic partnerships (Varis et al., 2005).

Research limitations. *Despite the significant insights provided, this study has limitations that should be acknowledged. First, given the qualitative nature of the research, the paper focused on a multiple case study approach involving six Italian SMEs; while these cases, as ingredient brands, offer depth, they may reflect specific characteristics related to the country or sector. Second, concentrating on SMEs might overlook dynamics unique to large multinational corporations, where resource abundance could lead to different strategic priorities regarding competencies. Additionally, future research could use longitudinal designs to observe how the ingredient branding strategy develops over time; in other words, future studies should examine potential trade-offs or hierarchical dominance between sustainability and digital communication competencies in attracting international customers during the supplier selection process.*

Managerial implications. *From a managerial perspective, this paper shows how the ingredient branding strategy can be used by all firms, especially SMEs. Combining sustainable and technological skills broadens access to this strategy, allowing more companies to utilize it effectively. At the same time, digital communication greatly extends the reach of the ingredient branding strategy, creating international impact and helping to reach a growing global audience. Therefore, our view differs from the traditional view of ingredient branding, which is usually applied to large companies (e.g., Intel or Google Android) with strong technological and R&D capabilities. Sustainability and digital communication become key growth drivers for companies adopting the ingredient branding strategy. In this context, international clients' choice of suppliers as partners may hinge on the opportunity to incorporate supplier components that excel not only in technology but also in sustainability and digital communication into their value propositions and offerings.*

Originality of the paper. *The originality of this paper lies in its exploration of the ingredient branding strategy, which plays a key role in the B2B branding literature, through the dual lenses of sustainability and digital communication, as well as the technological lens, from an international perspective. While the existing literature has traditionally anchored ingredient branding in technological superiority, this study posits a paradigm shift in which non-technological factors become the primary drivers of competitive advantage in the international setting. By proposing a triad of core competencies (technological, sustainable, and digital communicative) within a mixed-ingredient branding strategy, the research offers a more nuanced, multifaceted value proposition for ingredient brands as suppliers. Furthermore, the paper provides evidence that SMEs, often perceived as resource-constrained, can leverage these competencies to attract international clients and, at the same time, gain international recognition and expand. Indeed, the ingredient brand's technological, sustainable, and digital communicative competencies can attract international host brands, adding a novel dimension to the understanding of B2B relationship dynamics. This study highlights the necessity of integrating novel "ingredients" that align with contemporary empirical shifts—specifically, the urgency of sustainability and the outreach facilitated by digital communication. Such a multifaceted approach enhances the brand's prospects of being selected as a preferred supplier partner by international customers.*

Psychological Contract and Job Performance among Chinese Expatriates in Thailand: The Moderating Role of Trustworthiness

PORNLAPAS SUWANNARAT[1], RUNGRAWAN WIWATPIYAWONG[2]

Abstract. *This study examines the impact of psychological contract on job performance through the mediating roles of job satisfaction, organisational citizenship behavior, organisational commitment, and intention to quit among Chinese expatriates working in Thailand. In addition, the study investigates the moderating role of trustworthiness in the relationships between psychological contract and the four mediating variables. A quantitative survey approach was employed, and data were collected through structured questionnaires. A total of 144 valid responses from Chinese expatriates working in Thailand were obtained and used for the final analysis. The findings reveal that psychological contract fulfillment has significant positive effects on job satisfaction, organisational citizenship behavior, and organisational commitment. Job satisfaction also positively influences job performance, while job performance significantly enhances employee sustainable performance. Moreover, trustworthiness negatively moderates the relationship between psychological contract and intention to quit. The results provide important managerial implications for Chinese multinational enterprises (MNEs) operating in Thailand, highlighting the need to effectively manage psychological contract in order to foster supportive work environments that promote Chinese expatriates' satisfaction, well-being, and long-term work engagement.*
Keywords: *Psychological Contract; Trustworthiness; Job Satisfaction; Job Performance; Organisational Citizenship Behavior; Sustainable Performance*

Framing of the research. The rapid globalisation of Chinese multinational enterprises (MNEs) has significantly increased the number of Chinese employees assigned overseas as a result of China's outward foreign direct investment (Wang et al., 2022). Thailand has emerged as an important destination for this expansion, hosting a growing number of Chinese subsidiaries (Sorndee et al., 2017). To maintain coordination between headquarters and overseas operations, Chinese firms frequently deploy expatriates to managerial positions abroad. Despite their strategic importance, expatriates often face substantial adjustment challenges in host countries, including cultural differences, uncertainty, and limited social support (Caligiuri and Bonache, 2016). These difficulties may result in psychological strain, reduced work engagement, or premature assignment termination, which can generate significant organisational costs. Psychological contract research has traditionally focused on Western organisational contexts, even though Asia has become a major centre of global economic activity (Budhwar et al., 2017). Because psychological contracts are subjective and shaped by cultural norms, Western-based assumptions may not fully explain employment relationships in Asian contexts (Cooke, 2018). Greater attention to Asia-based empirical studies is therefore needed. Similarly, expatriate management research has largely examined Western expatriates, while Chinese expatriates remain relatively underexplored despite China's rapidly expanding global investment (He, An, and Berry, 2018). Chinese expatriates are often associated with strong performance orientation and cost efficiency; however, adjustment challenges and workplace tensions have also been reported. Thailand provides a particularly relevant context for studying Chinese expatriates. As a key ASEAN hub and major destination for Chinese investment (Athukorala, 2017; Luo and Tung, 2018), Thailand hosts an increasing number of Chinese professionals working in multinational subsidiaries. Understanding how psychological contracts influence expatriate attitudes and performance in this context can therefore contribute to both international HRM research and expatriate management practice.

Purpose of the paper. This study focuses on the effect of psychological contract on job performance via job satisfaction, organisational citizenship behavior (OCB), organisational commitment, and intention to quit of Chinese expatriates working in Thailand. As well, the moderation role of trustworthiness in moderating the associations between psychological contract and four mediators has also been investigated. The sets of hypotheses of the study which heavily grounded on the extensive literature review were established in the following.

Psychological Contract and Psychological Contract Fulfilment: The psychological contract refers to employees' beliefs about mutual obligations between themselves and their employer that are not formally specified in legal agreements (Denise Rousseau, 1995). Psychological contract fulfilment reflects employees' perceptions that these obligations have been delivered. Grounded in Social Exchange Theory (George Homans, 1961), which emphasises reciprocity and mutual obligations, psychological contracts influence employee attitudes and behaviours (Cropanzano and Mitchell, 2005). Empirical studies show that contract fulfilment is associated with lower turnover intention and improved employee wellbeing (Lu et al., 2023).

Intention to Quit: Intention to quit refers to employees' conscious willingness to leave the organisation and is widely recognised as a strong predictor of actual turnover (Tett and Meyer, 1993). Research indicates that higher quitting

[1] Kasetsart University, Thailand, e-mail: pornlapas.su@ku.th
[2] University of International Business and Economics, China, e-mail: rungrawan@uibe.edu.cn

intentions are associated with poorer job performance and reduced organisational citizenship behaviour (Wang, 2025b). Meta-analytic evidence also suggests that psychological contract fulfilment significantly reduces turnover intention (Chiang and Hsieh, 2012).

H1: Psychological contract fulfilment negatively associates with employees' intention to quit.

Job Satisfaction: Job satisfaction refers to a positive emotional evaluation of one's job (Herzberg et al., 1959). Prior studies consistently show that psychological contract fulfilment enhances job satisfaction by reinforcing perceptions of fairness and organisational support (Zhang et al., 2025).

H2: Psychological contract fulfilment positively affects job satisfaction.

Organisational Commitment: Organisational commitment reflects employees' psychological attachment and willingness to contribute to organisational goals (Mathis and Jackson, 2003). Both job satisfaction and psychological contract fulfilment are important antecedents of organisational commitment (Jehanzeb and Bashir, 2025).

H3: Psychological contract fulfilment positively associates with organisational commitment.

Organisational Citizenship Behaviour (OCB): Organisational citizenship behaviour refers to discretionary behaviours beyond formal job duties that support organisational effectiveness (Organ, 1997). Research shows that OCB enhances organisational performance and is encouraged by supportive organisational climates and relational employment relationships (Podsakoff et al., 2000).

H4: Psychological contract fulfilment positively affects organisational citizenship behaviour (OCB).

Association between Intention to Quit and Job Satisfaction: Intention to quit is often viewed as part of a cognitive withdrawal process resulting from dissatisfaction. Empirical evidence consistently demonstrates a significant negative relationship between job satisfaction and turnover intention across organisational contexts (Ersoy, 2024).

H5: Job satisfaction negatively influences intention to quit.

Job Performance: Job performance reflects employees' effectiveness in fulfilling work duties and contributing to organisational goals (Eshete et al., 2025). It is influenced by motivation, psychological resources, and supportive work environments (Pomaranik and Kludacz-Alessandri, 2024).

Job Satisfaction and Job Performance: Research consistently shows that job satisfaction is positively associated with job performance because satisfied employees demonstrate higher motivation and engagement (Ersoy, 2024).

H6: Job satisfaction positively affects job performance.

Intention to Quit and Job Performance: Employees who intend to leave the organisation often reduce effort and disengage from work responsibilities, which may weaken performance outcomes (Bui et al., 2024).

H7: Intention to quit negatively affects job performance.

Organisational Commitment and Job Performance: Organisational commitment reflects employees' psychological attachment and loyalty to their organisation. Highly committed employees demonstrate stronger role investment and willingness to support organisational goals, thereby enhancing job performance (Zhao et al., 2025).

H8: Organisational commitment positively affects job performance.

OCB and Job Performance: OCB involves discretionary behaviours that support colleagues and organisational functioning (Cao et al., 2022). Such behaviours improve workplace collaboration and contribute to job performance through improved teamwork and organisational efficiency (Saad et al., 2024).

H9: OCB positively affects job performance

Employee Sustainable Performance: Sustainable work performance emphasises maintaining productivity through the continuous renewal of human and social resources (Docherty et al., 2009). Building on this perspective, employee sustainable performance involves achieving high performance while maintaining well-being and resource vitality (De Jonge and Peeters, 2019).

Association between Job Performance and Employee Sustainable Performance: Job performance reflects short-term task outcomes, whereas employee sustainable performance emphasises long-term productivity while maintaining employee wellbeing and energy resources (Ji et al., 2021).

H10: Job performance positively affects employee sustainable performance.

Trust and Trustworthiness: Trust refers to the willingness to accept vulnerability based on positive expectations that others will not exploit that vulnerability (Roger Mayer et al., 1995). Trustworthiness represents the attributes that make an exchange partner worthy of trust and can provide competitive advantage (Barney and Hansen, 1994).

Trustworthiness consists of three dimensions—ability, benevolence, and integrity—which reflect competence, concern for others, and adherence to ethical principles (Mayer et al., 1995). These attributes foster employees' trust in leaders and are associated with positive organisational outcomes such as organisational citizenship behaviour and team performance (Simon et al., 2025). Accordingly, the following hypotheses are proposed:

H11: Trustworthiness negatively moderates the association between psychological contract and intention to quit.

H12: Trustworthiness positively moderates the association between psychological contract and job satisfaction.

H13: Trustworthiness positively moderates the association between psychological contract and organisational commitment.

H14: Trustworthiness positively moderates the association between psychological contract and OCB.

Methodology. In this study, questionnaires of survey based on the proposed research model were distributed to Chinese expatriates working in Thailand whose companies are members of the Thai-Chinese Chamber of Commerce. According

to Thai-Chinese Chamber of Commerce (2026), currently has 389 member companies. However, the actual number of Chinese expatriates working in these companies is unknown. The researcher contacted the Chamber and requested its assistance in distributing the questionnaires to Chinese expatriates employed in member companies through the human resources departments of each firm. The questionnaires using the five-point Likert scale were formulated in English and Chinese and then were sent to the Chamber. The appropriate sample size for structural equation modeling (SEM) can be determined from the number of observed variables, using the recommended ratio of 5:1 (five respondents per observed variable) proposed by Bentler and Chou (1987). In this study, there are 46 observed variables; therefore, a minimum sample size of approximately 230 respondents (46 × 5) is required to adequately perform SEM. Convenience sampling method has been applied to this study. Finally, a total of 144 valid responses were obtained from Chinese expatriates working in Thailand and were included in the final analysis. This compares favourably to similar studies in the extant literature (e.g., Dam et al., 2023). To test nonresponse bias, a comparison was made between early and late respondents, as suggested by Armstrong and Overton (1977). The results show no significant differences between early and late responses. Partial least squares structural equation modeling (PLS-SEM) has been used to test the proposed hypotheses. This is because PLS-SEM does not require the normality assumption and can efficiently handle non-normal data distributions (Hair et al., 2024). In addition, PLS-SEM is particularly appropriate for theory development and model exploration, as it is designed for predictive purposes rather than strict model confirmation. Importantly, PLS-SEM is also suitable for studies with relatively small sample sizes, making it advantageous when the available respondent pool is limited ((Hair et al., 2024). Although determination of appropriate sample size is one of the critical issues in SEM, however, there is no consensus in the literature regarding what would be the appropriate sample size for SEM (Tabachnick and Fidell, 2001; Kline, 2005). A number of researchers (e.g., Tabachnick and Fidell, 2001) argue that a minimum sample size of between 100 - 150 is considered an acceptable sample size for conducting SEM.

Results. The structural model demonstrates satisfactory explanatory power. The explained variance (R^2 and adjusted R^2) values indicate that the model accounts for substantial variance in the endogenous constructs. Specifically, the model explains 48.7% of employee sustainable performance, 59.9% of job performance, 57.7% of job satisfaction, 53.0% of organisational citizenship behavior, and 67.1% of organisational commitment. In contrast, intention to quit shows relatively low explanatory power ($R^2 = 0.194$), suggesting that turnover intention may also be influenced by contextual and labour market factors. The similarity between R^2 and adjusted R^2 values indicates model stability and limited bias due to model complexity.

Effect size analysis shows that intention to quit has a slight effect on job performance, whereas job performance has a very strong effect on employee sustainable performance. Job satisfaction shows small effects on both employee sustainable performance and intention to quit. Organisational citizenship behavior and organisational commitment contribute positively to job performance with small-to-moderate effects. Psychological contract fulfilment shows strong effects on job satisfaction, organisational commitment, and organisational citizenship behavior, indicating that it is a central driver of employees' attitudes and behaviours. Trustworthiness demonstrates somewhat effect on job satisfaction and a strong effect on organisational commitment but only small effects on intention to quit and organisational citizenship behavior. Interaction effects of trustworthiness between intention to quit and psychological contract fulfilment are generally small, indicating a limited moderating influence.

Predictive relevance analysis using the Stone–Geisser Q^2 statistic confirms that the model has predictive capability (Stone, 1974). All endogenous constructs produce Q^2 values greater than zero. Intention to quit shows relatively low predictive relevance, whereas job satisfaction, organisational citizenship behavior, job performance, employee sustainable performance, and organisational commitment demonstrate moderate to strong predictive power. These results confirm the model's ability to predict key organisational outcomes (Hair et al., 2024).

Overall model fit is satisfactory. The Goodness-of-Fit index exceeds the threshold for a large effect size (Tenenhaus et al., 2005). In addition, the standardised root mean square residual (SRMR) is below the recommended threshold of 0.08, indicating acceptable model fit (Hu and Bentler, 1999; Hair et al., 2024).

Hypothesis testing shows that eight of the fourteen hypotheses are supported while six are rejected. Psychological contract fulfilment does not significantly influence intention to quit (H1: $\beta = 0.011$, $p = 0.938$), leading to the rejection of H1. However, psychological contract fulfilment significantly and positively affects job satisfaction (H2: $\beta = 0.590$, $p < 0.001$), organisational commitment (H3: $\beta = 0.501$, $p < 0.001$), and organisational citizenship behavior (H4: $\beta = 0.621$, $p < 0.001$). Therefore, H2, H3, and H4 are supported. Job satisfaction significantly influences intention to quit (H5: $\beta = 0.362$, $p = 0.007$), but the relationship is positive rather than negative as hypothesised. Because the direction contradicts the hypothesis, H5 is rejected. Job satisfaction also positively affects job performance (H6: $\beta = 0.192$, $p = 0.033$), supporting H6. Intention to quit does not significantly influence job performance (H7: $\beta = 0.048$, $p = 0.501$), leading to the rejection of H7. Organisational commitment significantly and positively affects job performance (H8: $\beta = 0.319$, $p = 0.001$), supporting H8. Similarly, organisational citizenship behavior positively influences job performance (H9: $\beta = 0.328$, $p < 0.001$), supporting H9. Job performance strongly predicts employee sustainable performance (H10: $\beta = 0.698$, $p < 0.001$), confirming H10.

Regarding moderation effects, trustworthiness significantly moderates the relationship between psychological contract fulfilment and intention to quit (H11: $\beta = -0.219$, $p = 0.001$). The negative coefficient indicates that higher perceived trust weakens employees' intention to quit when psychological contract fulfilment is high. Therefore, H11 is

supported. However, the moderating effects of trustworthiness on the relationships between psychological contract fulfilment and job satisfaction (H12), organisational commitment (H13), and organisational citizenship behavior (H14) are not statistically significant. Consequently, H12, H13, and H14 are rejected.

These findings highlight the central role of psychological contract fulfilment in shaping positive work attitudes and behaviours. When employees perceive that organisational promises are fulfilled, they experience higher job satisfaction, stronger organisational commitment, and greater engagement in discretionary behaviours that benefit the organisation. This result supports psychological contract theory, which suggests that employees evaluate employment relationships based on whether organisational obligations are honoured (Rousseau, 1995). Fulfilled obligations strengthen perceptions of reciprocity and fairness within the employment relationship (Cropanzano and Mitchell, 2005). Empirical evidence also shows that psychological contract fulfilment contributes positively to job satisfaction across organisational contexts (Gan et al., 2020). The strong relationship between psychological contract fulfilment and organisational commitment supports prior findings that fulfilled obligations enhance employees' attachment and identification with the organisation (Meyer and Allen, 1997; Coyle-Shapiro and Conway, 2005). When organisations consistently fulfil commitments, employees develop stronger loyalty and willingness to remain.

Psychological contract fulfilment also increases organisational citizenship behavior. Employees who perceive fairness and organisational support tend to reciprocate through voluntary behaviours beyond formal job requirements (Zhao et al., 2007). These behaviours enhance cooperation and organisational effectiveness (Podsakoff et al., 2000). Although traditional turnover models predict that job satisfaction reduces intention to quit (Tett and Meyer, 1993), the results show a positive relationship. This unexpected finding may reflect employees' consideration of external career opportunities or advancement prospects (Lee et al., 2023). Turnover intention may therefore be influenced not only by satisfaction but also by labour market opportunities and career aspirations (Griffeth et al., 2000).

The results also confirm that job satisfaction positively affects job performance, as satisfied employees tend to be more motivated and engaged (Judge et al., 2001). In contrast, intention to quit does not significantly influence job performance. Employees may maintain acceptable performance even when considering leaving, particularly in professional environments with strong performance expectations (Jiang et al., 2017). Both organisational commitment and organisational citizenship behavior significantly contribute to job performance. Employees who feel attached to the organisation are more likely to exert additional effort (Meyer and Allen, 1990), while citizenship behaviours foster cooperative environments that enhance productivity (Podsakoff et al., 2000). Finally, job performance strongly predicts employee sustainable performance. This finding supports the view that sustainable performance reflects the ability to maintain effective job outcomes over time while preserving employees' psychological and professional resources (De Jonge and Peeters, 2019; Ji et al., 2021).

Moderation analysis further shows that trustworthiness reduces employees' intention to quit when psychological contracts are fulfilled. Trustworthiness reflects perceptions of competence, benevolence, and integrity within organisational relationships (Mayer, Davis and Schoorman, 1995). When organisational actors are perceived as trustworthy, fulfilment of obligations becomes more meaningful and reduces uncertainty in the employment relationship (Dirks and Ferrin, 2002). However, trustworthiness does not significantly moderate the relationships between psychological contract fulfilment and job satisfaction, organisational commitment, or organisational citizenship behavior. This suggests that psychological contract fulfilment alone may be sufficient to generate positive attitudes and behaviours without additional trust reinforcement. Job satisfaction and organisational commitment are primarily shaped by employees' evaluations of whether organisational obligations are fulfilled (Rousseau, 1995; Meyer and Allen, 1997), while organisational citizenship behavior may be driven more by internalised norms of cooperation and prosocial motivation (Organ, 1997; Podsakoff et al., 2000).

Research limitations. Despite its contributions, this study has several limitations that provide opportunities for future research. First, the sample focuses exclusively on Chinese expatriates working in Thailand, which may limit the generalisability of the findings to other international contexts. Future studies could extend the investigation to expatriates from different nationalities or examine similar relationships across other ASEAN host countries, allowing broader cross-cultural comparisons within the China–ASEAN region. Second, the use of self-reported survey data may raise concerns related to common method variance and potential social desirability bias. To strengthen measurement validity, future research could incorporate multi-source data, such as supervisor assessments, peer evaluations, or objective performance indicators, particularly when examining constructs such as job performance, organisational citizenship behavior, and employee sustainable performance. Third, although trustworthiness was examined as a moderating variable in this study, future research could explore additional contextual or individual boundary conditions. Variables such as cultural intelligence, language proficiency, leadership style, perceived organisational support, and institutional distance between home and host countries may further shape expatriates' attitudes and behavioural outcomes. Fourth, this study relies on cross-sectional survey data, which restricts the ability to establish causal relationships among psychological contract fulfilment, trustworthiness, work attitudes, and performance outcomes. Future research could employ longitudinal or time-lagged research designs to capture how expatriates' perceptions and behaviours develop over different stages of international assignments. Finally, future studies may benefit from adopting qualitative or mixed-method approaches, including interviews or case studies, to provide richer insights into how Chinese expatriates interpret psychological contracts and trustworthiness in real organisational settings.

Managerial implications. This study also provides important managerial implications for Chinese MNEs operating in Thailand and ASEAN. The results highlight the central role of psychological contract fulfillment in strengthening expatriates' job satisfaction, organisational commitment, and OCB. Expatriate management should therefore extend beyond formal contracts and compensation to include clear expectations, career development, and organisational support in unfamiliar cultural contexts. The moderating role of trustworthiness (ability, benevolence, and integrity) further suggests that expatriates respond more positively when managers are perceived as competent, ethical, and supportive. Developing trust-based leadership can therefore reduce uncertainty and psychological strain during expatriate assignments. Moreover, the relationships between job attitudes, job performance, and sustainable performance indicate that expatriate success should be evaluated not only through short-term results but also through long-term effectiveness and well-being. Accordingly, Chinese MNEs should promote sustainable performance through balanced workloads, cross-cultural training, and continuous support. Finally, in the ASEAN context—where relational norms and informal coordination are prominent—encouraging extra-role behaviors and trust-based relationships is essential for long-term organisational effectiveness and regional legitimacy.

Originality of the paper. This study refines psychological contract paradigm by positioning trustworthiness as an asymmetric boundary condition rather than a universal amplifier of exchange-based reactions. The findings show that trustworthiness significantly moderates the relationship between psychological contract fulfillment and intention to quit, but not its effects on job satisfaction, organisational commitment, or OCB. This pattern suggests that trust is particularly consequential for withdrawal-related cognitions, where uncertainty and vulnerability are most salient, thereby challenging the assumption that trust uniformly strengthens exchange outcomes. (Organ, 1997; Simon et al., 2025).

Reconfiguring Global Value Chains through Reshoring: An Evaluation Model for the Ceramic Industry

ANDRÉS FERNÁNDEZ MIGUEL[1], VALERIO VEGLIO[2]

Abstract. *This research employs the Circularity, Economic Resilience and Sustainability (CERES) model to evaluate sourcing configurations for a strategic raw material in the Italian ceramic sector amid geopolitical disruption and a circular transition. The study focuses on feldspathic fluxes in the Sassuolo district and develops a proof-of-concept simulation that combines a bi-objective optimization structure with a decision framework integrating economic cost, geopolitical disruption exposure, supply resilience, and circular performance. The first objective function (Z_1) captures the total expected economic burden of sourcing, including procurement, configuration, reshoring, and disruption costs. The second objective function (Z_2) captures circular sustainability through the Integrated Circular Readiness (IRC) index, which is based on virgin raw material substitution, servitization potential, territorial contribution, and logistics carbon impact. Using firm-level data, the simulation compares business-as-usual global sourcing, nearshoring, and reshoring. Results show that business-as-usual global sourcing occupies the least favorable position in the Integrated Sustainability Performance (ISP) space, while nearshoring and reshoring offer progressively stronger economic–circular performance. The paper interprets these configurations through a Circular Business Model lens, providing a strategic reading of sourcing transition pathways in hard-to-abate manufacturing.*
Keywords: *circular supply chain management; geopolitical risk; circular business models; sourcing resilience; global sourcing, reshoring.*

Framing of the research. The global commodity sourcing model that underpinned resource-intensive manufacturing rested on structural assumptions that are no longer guaranteed: political stability in extractive regions, low-cost maritime logistics, and a regulatory environment that externalized environmental and social costs. COVID-19 exposed fragilities in geographically concentrated supply chains; the Russia-Ukraine conflict triggered energy price volatility and disrupted transport routes; and EU sustainability regulation — through the Green Deal, CSRD, EU Taxonomy, and Critical Raw Materials Act — is imposing new obligations for traceability, impact measurement, and circular integration on European manufacturers (Lin et al., 2024).

For the Italian ceramic tile industry — a globally significant, hard-to-abate sector anchored in the Sassuolo district — these pressures are particularly acute. In this sector, global sourcing has been historically associated with quality upgrading rather than cost minimization. The industry is structurally dependent on raw materials sourced from geopolitically sensitive regions: feldspathic fluxes from Turkey, ball clay fluxes from Ukraine, Eastern European and North African deposits, and industrial minerals concentrated in politically unstable or logistically vulnerable areas (Javed et al., 2025). The traditional equilibrium among cost, availability, and quality that justified global procurement is no longer self-evidently optimal when disruption costs, environmental externalities, and circular-economy requirements are incorporated. Interruptions to logistics flows, rising transport costs, carrier scarcity, and export restrictions show that conventional assumptions underpinning global raw material sourcing can no longer be taken for granted (Choudhary et al., 2023).

The supply chain management and operations research literature has increasingly adopted analytical frameworks addressing sustainability, resilience, and circularity. Within this stream, research on circular supply chain management (CSCM) has developed a typology of circular strategies, repositioning circularity as a strategic industrial lever rather than merely a dimension of environmental compliance (Kategaya and Yavuz, 2025). In parallel, supply chain resilience literature has produced models that capture disruption probabilities and recovery capacities, with geopolitical risk increasingly conceptualized as structural rather than episodic (Bednarski et al., 2025). At the same time, complex sourcing strategies, such as AI-driven, dual, or hybrid sourcing, increasingly depend on firms' digital maturity (Fornasiero and Tolio, 2025; Niu et al., 2025). Furthermore, multi-objective optimization has demonstrated the tractability of jointly addressing cost and sustainability objectives (Bhawna et al., 2024). Despite these advances, the integration of these three strands into a unified, applied decision-making framework remains underdeveloped. Specifically, there is a lack of models capable of simultaneously evaluating economic efficiency, geopolitical resilience, and circular sustainability within a defined industrial sourcing context.

Three key knowledge gaps underpin the present research. First, applied models that simultaneously evaluate cost, geopolitical risk, and circularity in manufacturing supply chains remain scarce. Existing firm-level approaches are fragmented and fail to capture supply chain behavior under both stable and disruptive conditions (Bhawna et al., 2024). Second, operationalized circularity metrics that enable meaningful supplier comparisons remain underdeveloped, particularly when suppliers differ in geographic proximity, logistics, secondary material use, and territorial embeddedness

[2] Department of Economics and Management, University of Pavia, Pavia, Italy; valerio.veglio@unipv.it

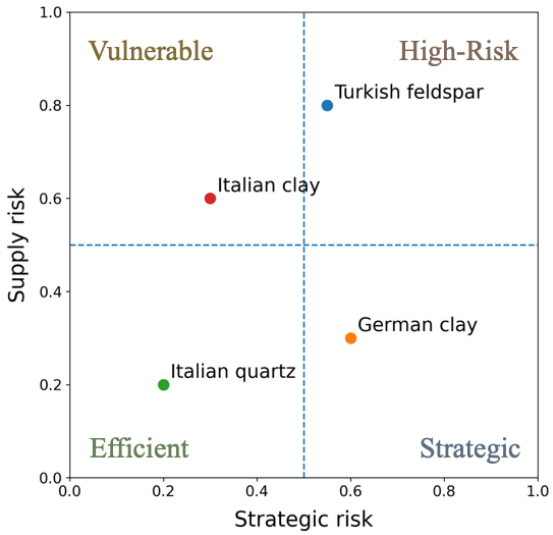
(de Koning et al., 2024). Third, sector-specific interpretive frameworks that translate sourcing optimization outcomes into actionable circular business configurations remain scarce, especially within the ceramic industry (Van Loon et al., 2021).

Purpose of the paper. This study applies the CERES (Circularity, Economic Resilience and Sustainability) model to identify and compare sourcing configurations within the Integrated Sustainability Performance (ISP) space, jointly evaluating strategic sourcing costs and circularity performance under geopolitical disruption. The configurations generated by the model are then interpreted through a Circular Business Model (CBM) lens, providing a strategic reading of alternative pathways available to firms within the ceramic district under crisis conditions. Unlike decision-support approaches that assess cost, geopolitical risk, and circularity separately, CERES is an original bi-objective tool for sourcing in the ceramic sector, developed within the Viability for circuLar manufacTuring (VOLT) project. Its analytical structure combines strategic sourcing cost — including procurement, disruption, and configuration-related costs — with the circular and territorial performance of sourcing alternatives, captured through the Integrated Circular Readiness (IRC) index. This research addresses two questions:

1) Which sourcing configurations emerge when strategic sourcing cost and circularity performance are jointly assessed within the Integrated Sustainability Performance space?

2) How can these configurations be interpreted as circular business model transition pathways for the ceramic sector?

To address these questions, the study focuses on strategic procurement of raw materials in the Sassuolo district, particularly feldspar fluxes and clays previously classified as "high-risk" using an adapted Kraljic matrix. The analytical horizon is medium-term, enabling the model to account for investments associated with reshoring and nearshoring strategies.



Methodology. The methodology adopted in this study is based on CERES, a model developed within the Viability for circuLar manufacTuring (VOLT) research project for the Italian ceramic tile industry. It unfolds across four integrated phases: (1) theoretical-conceptual model construction; (2) strategic prioritization through Kraljic matrix analysis; (3) mathematical formalization; and (4) operationalization through indicator construction and numerical simulation. Together, these phases translate a broad conceptual framework into a "bi-objective" Pareto frontier model in which sourcing alternatives are evaluated along two analytical dimensions: strategic sourcing cost and circularity performance.

The theoretical architecture of CERES is built around five interacting constructs. Integrated Sustainability Performance (ISP) represents the systemic output of the supply chain, combining economic competitiveness, reduced environmental impact, and territorial social value (Hervani et al., 2022). The ISP is used as a two-dimensional space in which different sourcing alternatives are positioned based on strategic sourcing cost and circularity performance. Geopolitical Risk (GR) is operationalized as the probability and severity of supply interruptions linked to political instability, route concentration, and export restrictions. GR is treated as a structural parameter to be incorporated into procurement decisions rather than an exceptional shock (Bednarski et al., 2025). Digital Maturity (DM) captures the firm's capacity to monitor, anticipate, and dynamically adjust sourcing decisions through ERP-IoT systems, predictive analytics, and digital twin infrastructures, functioning as a moderating variable that enables advanced sourcing strategies. Circular Supply Chain Management practices (CSCM) are evaluated across four strategic logics – narrowing, closing, slowing, and intensifying – representing the operational levers for circular transition (Kategaya and Yavuz, 2025). More specifically, narrowing reduces virgin resource use, closing recovers and reintegrates materials, slowing extends material use through more contained supply configurations, and intensifying increases utilization through service-based arrangements. Finally, Resilient Sourcing Strategies (RSS) encompass the full configuration space of procurement alternatives – global, regional, domestic, AI-driven, dual sourcing, and hybrid – as structural responses to geopolitical and circular pressures (Niu et al., 2025). In the conceptual model, GR and institutional pressures act as external drivers, RSS and CSCM practices as mediating mechanisms, DM as a moderator, and ISP as the systemic output. This conceptual architecture is subsequently translated into the formal structure of the CERES model: Z1 represents the strategic sourcing cost dimension, including procurement costs, disruption-related expected costs, and the economic implications of alternative sourcing configurations under geopolitical risk, whereas Z2 captures circular and territorial performance through the IRC-based assessment. The joint behavior of these two objective functions defines the ISP space within which alternative sourcing configurations are evaluated and interpreted.

The operationalization begins with a strategic analysis based on an adapted Kraljic matrix for the ceramic industry. In this study, this matrix is not developed as a stand-alone analytical output, but used as the result of a prior screening exercise classifying critical raw materials for the ceramic supply chain. Within CERES, its function is to justify the prioritization of the materials subsequently analyzed. In line with recent work that adapts Kraljic-type tools for sustainability-oriented procurement decisions (Corsini et al., 2024), raw materials are classified along two risk dimensions. Supply risk captures the potential for disruption or cost volatility arising from external conditions; in this study, it reflects exposure to carbon-related regulatory pressure, geopolitical instability, social fragility, macroeconomic and financial uncertainty, and long-term reserve availability. Strategic risk, in turn, captures the extent to which a material affects broader business objectives in terms of competitiveness, adaptability, and resilience; it is therefore associated with transportation costs, inbound logistics complexity, and storage capacity. Taken together, these two dimensions distinguish between longer-term structural vulnerability and more immediate operational exposure, defining four categories: Efficient, Vulnerable, Strategic, and High-Risk. Their aggregation follows a data-driven scoring procedure based on PCA-derived weights. Figure 1 presents a simplified extract of this prior Kraljic classification. As shown, Turkish feldspar is

positioned in the high-risk quadrant, which justifies its selection as a critical raw material for subsequent analysis through the CERES model.

Figure 1: Simplified Kraljic matrix for raw material screening in the ceramic supply chain

Empirical data for the simulation are provided by a globally leading firm in the Italian ceramic tile industry, ensuring that the model reflects real operational and sourcing conditions. The CERES model is structured around four formal sets: materials, potential suppliers, geopolitical risk scenarios, and alternative sourcing strategies. Key exogenous parameters include unit purchase costs, logistical costs, reshoring investment costs, supplier capacities, scenario probabilities, expected supply loss rates, minimum demand levels, and suppliers' digital maturity. Decision-making is captured through three types of variables: quantities purchased from each supplier, activation of domestic suppliers, and selection of sourcing strategies. The economic and circular implications of this architecture are formalized below through two complementary objective functions, namely Z_1 and Z_2.

The first objective function, Z_1, represents the economic sustainability of the sourcing configuration and formalizes the cost-side implications of geopolitical risk, and the selection of a resilient sourcing strategy. It captures the total expected cost of the selected sourcing strategy by integrating four components: direct material procurement costs, strategy-related sourcing costs, reshoring investment costs, and expected disruption costs associated with geopolitical risk scenarios. In this way, Z_1 reflects the model's core economic rationale: quality-driven global sourcing configurations may become economically less attractive once reconfiguration efforts and exposure to disruption are explicitly incorporated into the decision framework.

$$Z_1 = \sum_{i \in I} \sum_{j \in J} c_{ij} x_{ij} + \sum_{s \in S} f_s y_s + \sum_{r \in R} \rho_r z_r + \sum_{\omega \in \Omega} p_\omega \, DC_\omega$$

In this formulation, $c_{ij}x_{ij}$ captures direct procurement costs associated with material flows, $f_s y_s$ represents strategy-specific sourcing or configuration costs associated with the activation of more complex sourcing strategies, such as AI-driven, dual, or hybrid sourcing, which typically require a minimum level of DM to be effectively implemented, $\rho_r z_r$ denotes reshoring-related investment costs, and $p_\omega DC_\omega$ captures the expected disruption cost under each geopolitical scenario ω, weighted by its probability of occurrence. Accordingly, Z_1 does not measure purchase cost alone, but the total expected economic burden of each sourcing configuration.

The second objective function, Z_2, represents the circular sustainability of the sourcing configuration and formalizes the contribution of circular supply chain management (CSCM) practices through the Integrated Circular Readiness (IRC) logic. Consistent with recent CSCM research that frames circularity through strategies such as narrowing, closing, slowing, and intensifying resource flows, Z_2 captures four complementary dimensions of circular performance: virgin raw material substitution, servitization potential, territorial contribution, and logistic carbon impact. These dimensions operationalize circular strategies, which are selected in response to the material's sourcing risk profile as identified by the adapted Kraljic matrix. Thus, Z_2 evaluates both suppliers' circular characteristics and their strategic relevance within a given sourcing context. Importantly, the relative weights assigned to these four dimensions are not arbitrary but are derived from this sequential logic, whereby the material's Kraljic positioning informs the appropriate circular strategy mix, and that mix determines the relative importance of each dimension within the IRC.

For each supplier j, the Integrated Circular Readiness index is defined as:

$$IRC_j = w_1 VRS_j + w_2 SP_j + w_3 TC_j + w_4 LCI_j$$

The second objective function aggregates the circular value generated by the selected sourcing configuration, weighted by the quantity of material i sourced from each supplier j:

$$Z_2 = \sum_{i \in I} \sum_{j \in J} x_{ij}\, IRC_j$$

In this formulation, VRS_j denotes the virgin raw material substitution rate for supplier j, capturing the share of recycled material, by-products, or regenerated waste in the total supplied input. SP_j represents the servitization potential index, reflecting the supplier's systemic readiness to support circular supply chain practices through return-oriented arrangements and information-sharing capabilities. TC_j denotes the territorial contribution index, capturing the supplier's social and territorial contribution through a hybrid proxy that combines socio-economic evidence and geographical proximity. Finally, LCI_j represents the logistic carbon impact indicator, capturing the CO_2 impact associated with transporting the material from the supplier to the manufacturing site. The weights w_1, w_2, w_3, and w_4 reflect the strategic weighting assigned to each dimension within the IRC. This relationship between Kraljic positioning, circular strategy mix, and dimension relevance is summarized in Table 1. Accordingly, Z_2 maximizes the overall circular value of the sourcing configuration by aggregating the circular performance of the selected suppliers, weighted by the material flows assigned to them.

Table 1: Strategic mapping between Kraljic quadrants, circularity strategies, and IRC dimensions

Kraljic quadrant	Circular strategy mix	Dominant dimensions	Secondary dimensions
Efficient	Narrowing + Intensifying	VRS / SP	LCI
Vulnerable	Narrowing + Slowing	VRS / SP	TC / LCI
Strategic	Closing + Intensifying	SP / VRS	LCI
High-Risk	Narrowing + Closing + Slowing	VRS / SP	TC / LCI

Because Z_1 and Z_2 are naturally conflicting, the model produces a Pareto frontier rather than a single optimal solution, allowing decision-makers to explore trade-offs between cost efficiency and circular performance. In this sense, the Pareto frontier defines the ISP space within which alternative sourcing configurations can be positioned and compared based on their joint economic and circular performance.

For numerical simulation, the model focuses on a representative strategic material – a feldspathic flux with an annual demand of 36,000 tonnes – using real procurement and performance data from the firm. This material falls within the High-Risk quadrant of the adapted Kraljic matrix and is therefore associated with a circular strategy mix that combines narrowing, closing, and slowing approaches. Three sourcing channels are considered: a global supplier, a regional EU/Mediterranean supplier, and a domestic supplier, with unit costs of 110 EUR/t, 75 EUR/t, and 40 EUR/t, respectively, and distinct IRC scores. In the ceramic tile industry, sourcing decisions have historically been driven not only by cost minimization but also by product quality and technological performance. The shift from local red clays to higher-quality, more plastic white clays enabled the production of larger-format, higher-value tiles, while Turkish feldspars became critical as fluxing materials to support the firing behavior of these compositions. Accordingly, the global sourcing baseline should be interpreted as a quality-driven configuration rather than a cost-minimizing one.

Since the simulation focuses on relocation-based sourcing alternatives rather than advanced configurations such as AI-driven, dual, or hybrid sourcing, digital maturity is not explicitly computed in the numerical results. Two geopolitical scenarios are modeled: a "normal" scenario as stable baseline for conventional cost assessment, and a "severe crisis" scenario with differentiated supply-loss rates to assess CERES under disruption conditions. Reshoring investment for the domestic supplier is set at 300,000 EUR/year, reflecting realistic extraction-site activation and compliance costs.

Through this setup, the CERES model provides an empirically grounded framework for evaluating sourcing strategies that balance economic efficiency, supply resilience, and circular value in a resource-intensive industrial context.

Results. The simulation generates three sourcing configurations within the ISP space: Business as Usual (BAU), Nearshoring (NEAR), and Reshoring (RESH). Table 2 and Table 3 report the key values underlying both objective functions: Z_1 includes direct procurement, reshoring investment, and expected disruption-related costs, while Z_2 is calibrated through the four IRC dimensions.

The economic comparison distinguishes between a stable-cost baseline and the CERES expected Z_1. The stable-cost baseline includes only direct procurement and reshoring investment. CERES expected Z_1 additionally incorporates two geopolitical scenarios: a normal scenario (p=0.70) with no significant supply loss, and a severe crisis scenario (p=0.30) with differentiated supply-loss rates: 40% for the global supplier, 10% for the regional supplier, and 0% for the domestic supplier.

The Z_2 values are stylized and hypothetical calibration points used to calibrate the IRC under the three sourcing profiles. Each IRC dimension is assigned one of four stylized levels of circular integration: limited (0.20), emerging

(0.40), structured (0.60), and advanced (0.80). Since the reference material falls within the High-Risk quadrant, the IRC weighting gives greater relevance to VRS and SP, while TC and LCI play a secondary role, consistent with the narrowing, closing, and slowing strategy mix.

Table 2: Main values of the economic objective function Z_1

Scenario	Sourcing profile	Stable-cost baseline (€)	Crisis supply-loss rate	Expected disruption cost (€)	CERES expected Z_1 (€)
BAU	Global sourcing	3,960,000	40% global	475,200	4,435,200
NEAR	50% global + 50% regional	3,330,000	40% global; 10% regional	278,100	3,608,100
RESH	Domestic sourcing	1,740,000	0% domestic	0	1,740,000

Table 3: Main values of the circular objective function Z_2 through IRC calibration

Scenario	VRS (w = 0.33)	SP (w = 0.29)	TC (w = 0.19)	LCI (w = 0.19)	IRC (Z_2)
BAU	0.20	0.20	0.20	0.40	0.25
NEAR	0.40	0.60	0.60	0.80	0.55
RESH	0.80	0.80	0.80	0.80	0.80

Note: Weights correspond to the High-Risk quadrant of the adapted Kraljic matrix. IRC dimension values are stylized calibration points and do not represent empirical measurements.

In the BAU scenario, the full annual demand of 36,000 tonnes is sourced globally. This yields the highest CERES expected Z_1, 4,435,200 EUR, due to direct procurement costs and disruption exposure. Under the severe crisis scenario, a 40% supply-loss rate reduces the net received quantity to 21,600 tonnes, creating a supply deficit of 14,400 tonnes. In circular terms, BAU corresponds to a predominantly limited IRC profile: VRS, SP, and TC are calibrated at the limited level, while LCI reaches only an emerging level. BAU therefore achieves an IRC value of 0.25 and represents the least favorable economic–circular configuration.

The NEAR scenario allocates demand equally between global and regional suppliers, with 18,000 tonnes sourced globally and 18,000 tonnes regionally. Economically, this reduces CERES expected Z_1 to 3,608,100 EUR, mainly by lowering disruption costs. Under the severe crisis scenario, the global share faces a 40% supply-loss rate, while the regional share faces a 10% loss rate, resulting in a net received quantity of 27,000 tonnes and a supply deficit of 9,000 tonnes. From a circular perspective, NEAR represents a transition toward a more structured sourcing profile: VRS remains at an emerging level, while SP and TC reach structured levels and LCI reaches an advanced level. This yields an IRC value of 0.55, indicating a substantial economic–circular improvement over BAU.

Under the RESH scenario, all 36,000 tonnes are sourced domestically. This yields the lowest CERES expected Z_1 of 1,740,000 EUR, even including the 300,000 EUR reshoring investment, because disruption costs are eliminated. In the severe crisis scenario, the domestic supplier is unaffected by supply loss, so the full demand of 36,000 tonnes is met and no supply deficit occurs. From a circular standpoint, RESH corresponds to an advanced IRC profile across all four dimensions, with high material substitution, systemic and informational integration, territorial contribution, and logistical efficiency. Consequently, RESH achieves an IRC value of 0.80, the highest among the evaluated configurations.

Taken together, the results show a clear progression across the three sourcing configurations. BAU combines the highest stable-cost baseline with the highest disruption exposure and a limited circular profile. NEAR reduces both the stable-cost baseline and the expected disruption cost, while moving toward structured circular integration. RESH achieves the strongest joint performance: its stable-cost baseline already includes the reshoring investment and remains the lowest among the three alternatives, while its zero-disruption cost and advanced IRC profile further reinforce its position within the ISP space.

Figure 2: Positioning of sourcing configurations in the ISP space (Z_1–Z_2)

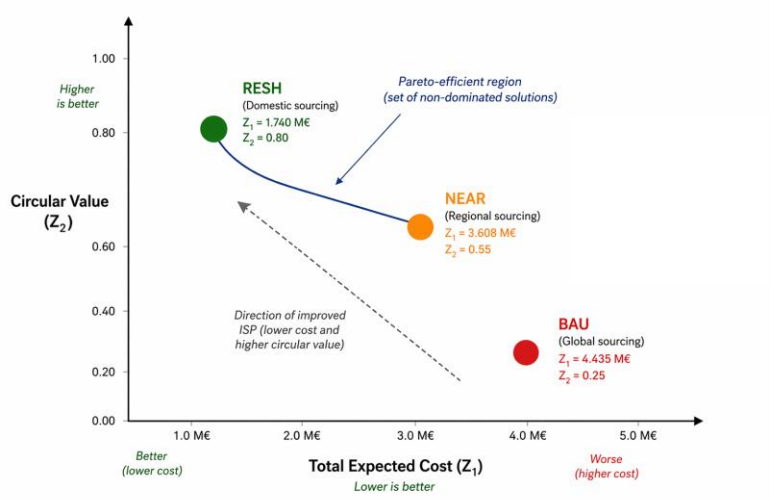


Figure 2 visualizes these configurations within the ISP space, making the overall pattern clear: BAU occupies the least favorable position, NEAR marks a clear improvement in both economic and circular terms, and RESH defines the most efficient configuration toward lower cost and higher circular value.

Interpreting these configurations through a circular business model lens highlights three distinct pathways. The BAU scenario reflects a predominantly linear configuration, marked by limited circular integration and high exposure to external disruptions. The NEAR scenario corresponds to a partially circular configuration, in which shorter supply chains and improved coordination enable intermediate levels of material recirculation and system efficiency. The RESH scenario represents a highly integrated circular configuration that combines strong material substitution, systemic coordination, and territorial embeddedness, thereby reinforcing both resilience and local value creation.

Research limitations. The present study has several limitations that constrain the generalizability of its findings. First, the numerical simulation is based on industrial-scale data for a limited set of strategic raw materials in the Italian ceramic district and should therefore be interpreted as an initial proof of concept rather than a fully generalizable empirical validation of CERES. In addition, the global sourcing baseline reflects a quality-driven configuration specific to the ceramic tile industry rather than a cost-minimizing benchmark, which limits the direct transferability of the numerical results to other sectors.

Second, the IRC weights are currently set through strategic prioritization aligned with the adapted Kraljic matrix and the associated circular strategy mix. Future research should refine this weighting system through formal multi-criteria methods such as AHP, TOPSIS, or Bayesian inference, thereby enhancing the objectivity and replicability of the composite index.

Third, Digital Maturity is recognized in the model as an enabler of more advanced sourcing configurations, but it is not explicitly operationalized in the simplified simulation presented in this paper. The analysis focuses on relocation-based strategies — BAU, NEAR, and RESH — rather than on digitally intensive configurations such as AI-driven, dual, or hybrid sourcing.

Finally, the CBM pathways discussed in this paper remain exploratory because they are derived from a single-material simulation. Further developments of CERES should test the model across broader material portfolios and industrial contexts, validate the CBM interpretation across additional raw materials, and incorporate dynamic transition pathways, investment timing, market evolution, and digital maturity thresholds to better represent the evolution of the ISP space over time.

Managerial implications. The results of the CERES model have relevant implications for procurement management and industrial strategy in the ceramic sector and, more cautiously, for other hard-to-abate manufacturing industries facing similar raw material vulnerabilities.

The most fundamental implication concerns the limits of partial cost logic as the dominant criterion for sourcing decisions. In the ceramic tile industry, global sourcing should not be interpreted simply as a low-cost option, but as a historically quality-driven configuration associated with specific product and technological requirements. The simulation shows that this configuration combines the highest stable-cost baseline with the highest exposure to disruption, whereas reshoring remains the lowest-cost configuration, even after accounting for the annual reshoring investment. For the single material analyzed, the expected annual cost advantage of reshoring over global sourcing exceeds 2.7 million EUR. From this perspective, Total Cost of Ownership frameworks should incorporate geopolitical disruption costs as a standard accounting category rather than an exceptional risk provision.

The ISP space representation offers a structured basis for comparing sourcing alternatives in terms of both cost efficiency and circular performance. Rather than presenting sustainability as a cost center, the CERES results suggest that

circular sourcing strategies may become economically preferable once full-cost accounting is adopted. This also suggests that sustainability governance should be integrated into procurement strategy rather than treated as a separate compliance function. The IRC framework also supports supplier assessment beyond conventional criteria such as price, quality, and delivery reliability by incorporating material circularity, systemic integration, territorial contribution, and logistical carbon intensity.

The CBM pathways suggest a possible phased transition strategy for the Italian ceramic district: firms with high global exposure may prioritize nearshoring as an achievable first step and domestic reshoring as a medium-term target, while digitally enabled sourcing configurations remain a longer-run extension of CERES. Finally, digital maturity should be interpreted as enabling infrastructure for future AI-driven, dual, or hybrid sourcing strategies, rather than as an operational result of the present simulation.

Originality of the paper. The paper makes three contributions to the management literature. The first is the formal integration of economic cost, geopolitical disruption risk, and circular sourcing value into a single bi-objective optimization model. Prior research has addressed these dimensions separately: supply chain disruption modeling has focused on probability-weighted cost functions; circular supply chain management has developed typological frameworks without formal optimization structures; and multi-objective sustainability models have treated cost and environmental impact without incorporating the geopolitical dimension (Bhawna et al., 2024). CERES brings these dimensions together within a single analytical structure, whose ISP space makes explicit the joint economic–circular positioning of alternative sourcing configurations. The theoretical contribution is therefore not the empirical finding that relocation strategies may outperform global sourcing in the case analyzed, but a formal decision-support logic connecting sourcing resilience, geopolitical exposure, and circular supply chain management.

The second contribution is the construction of the IRC as a composite operational metric that translates circular supply chain management constructs into quantitative, normalized, and comparable supplier scores. In this way, the IRC helps bridge the gap between theoretical circularity frameworks and empirically measurable procurement variables identified in the literature (de Koning et al., 2024; Van Loon et al., 2021). Its four-dimensional structure and Kraljic-informed weighting procedure make it both theoretically grounded and sector-specific. At the theoretical level, the IRC advances circular supply chain management by linking circular strategies — narrowing, closing, slowing, and intensifying — to measurable supplier-level dimensions and by showing how their relative importance can vary with the strategic risk profile of the material.

The third contribution is interpreting the resulting sourcing configurations through a Circular Business Model lens. Unlike CBM taxonomies constructed through qualitative typologization or single-firm case analysis, this paper interprets the three simulated configurations — BAU, NEAR, and RESH — as circular transition pathways derived from the model's economic and circular performance patterns. They are therefore analytically linked to the simulated sourcing configurations rather than presented as independent archetypes. This extends the systemic multi-level CBM framework of Rovanto and Bask (2021) into the domain of quantitative supply chain strategy for hard-to-abate manufacturing, while providing an interpretive roadmap from linear global sourcing toward more circular, resilient, and territorially embedded supply chain configurations. More digitally intensive CBM configurations, including AI-driven circular logistics, platform-based coordination, and industrial symbiosis networks, are positioned as future extensions of CERES rather than as outputs of the present proof-of-concept simulation

Scalability Without Trade Offs: International Scaling in Hybrid Firms

MARGHERITA MILOTTA[1], BIRGIT HAGEN[2]

Abstract. *Scaling is often treated as a single phenomenon in international business literature, yet research approaches it through two distinct lenses guided by organizational purpose. In social entrepreneurship (SE), scaling is primarily associated with expansion of social impact. In for-profit research, by contrast, scaling denotes rapid economic growth achieved with less than proportional increases in resources, emphasizing growth achieved by doing more with fewer resources. Although both perspectives address closely related dynamics of growth and expansion, they have developed in isolation. Hybrid firms, characterized by dual economic and social missions, increasingly challenge this separation by growing revenues and social outcomes in parallel across countries, raising questions about how such scaling is achieved. These questions are critical because international scaling that delivers economic profitability and preserves social objectives has been shown to be difficult, let alone at the same time.*

This study adopts a resource-based perspective to conceptualize scalability as an organizational capacity that enables international expansion without proportional increases in resource inputs. It examines how hybrid firms build scalability across heterogeneous markets through resource orchestration and explains why some configurations allow international scaling to reinforce, rather than erode, the firm's resource base, thereby integrating insights from scaling and international business research.

Keywords: *scalability; purpose; international scaling; qualitative case study; abductive research;*

Framing of the research. The concept of scaling has attracted increasing attention from both academia and practice. Existing literature suggests that despite being fewer in number, scaleups outperform their counterparts (Acs and Mueller, 2008; Halabisky et al., 2006), generating a greater societal impact in terms of employment, value creation, and diffusion of innovation (Belitski et al., 2023). As its relevance has increased, academic research on scaling has developed along distinct streams that reflect differences in organizational purpose (Tippmann et al., 2023). In social entrepreneurship, scaling is primarily associated with expansion of social impact (e.g., Bloom & Chatterji, 2009; Rangan & Gregg, 2019), captured through reach, diffusion of mission, or numbers of beneficiaries, whereas research on for profit firms defines scaling as a process of growth with less than proportional increases in resources (Palmié et al., 2023), typically focusing on economic outcomes. Entrepreneurship research distinguishes scaling from generic growth: while growth means any increase in size, scaling refers to growth achieved with less than proportional (Palmiè et al., 2023) or even without (Coviello et al., 2024) increases in resources - essentially, "doing more with less". While the two perspectives address related dynamics, they have largely evolved in parallel, leaving open questions about how firms pursue scaling when economic and social objectives coexist. This gap is increasingly important as boundaries between social and profit purposes become blurred in practice (Battilana & Lee, 2014), as many hybrid firms were born. Hybrid firms are those firms that pursue a profit-impact objective and that need to scale their business across markets, thus internationalizing, to achieve the spreading social impact. Thus, Hybrid firms (HFs) challenge the siloed perspectives described above by embedding financial performance and social or environmental impact within a single organizational purpose (Doherty et al., 2014). In their attempt to maximize both impact and reach, many hybrid firms pursue international scaling by replicating their solutions across multiple markets (André & Pache, 2016; Tippmann et al., 2023). Consequently, the internationalization process becomes central to achieve scaling. At the same time, these firms often depend on locally embedded, context specific activities and intensive human engagement. Such features heighten organizational complexity, exacerbate tensions between profit and purpose (Lall & Park, 2022; Ebrahim et al., 2014), and hinder replication across heterogeneous institutional and market contexts, making international scaling especially challenging. Prior research has mainly attributed these difficulties to the risk of mission drift inherent in dual-purpose organizations (Ebrahim et al., 2014). Actually, we argue that the challenge may lie in the lack of the underlying capacity of this process, thus scalability. This emphasis leaves open a more fundamental challenge: how hybrid firms can create scalability in ways that allow them to grow without drifting from their mission. Whereas existing work often treats scalability as an exogenous attribute of scale free or digital resources (Giustiziero et al., 2023), this study conceptualizes scalability as an emergent capacity that arises from resource orchestration and allows to achieve growth with less than proportional inputs.

Resource based theories emphasize value creation and appropriation through valuable, rare, inimitable, and non substitutable resources (Barney, 1991); however, they were not developed to explain non proportional growth. Similarly, Penrosean theory explains firm growth through the redeployment and versatility of resources (Penrose, 1959) but does not explicitly address conditions under which firms expand across markets without proportional increases in resource inputs. As a result, existing resource based perspectives leave open questions about how scalability itself is constructed.

[1] University of Pavia, e-mail: margherita.milotta@unipv.it
[2] University of Pavia, e-mail: birgit.hagen@unipv.it

Furthermore, considering scalability at the international level implies complementarity with, but also a conceptual distinction from, existing theories of internationalization and resource-based perspectives. Traditional International Business research conceptualizes international expansion primarily as a process of growth unfolding through sequential commitments and localized resource accumulation (Johanson & Vahlne, 1977). Within this literature, internationalization is typically explained through two dominant logics. The gradual or Uppsala model describes international expansion as a step-by-step process in which firms enter psychically close markets, rely on simpler entry modes, and increase their international involvement as experiential knowledge accumulates (Johanson & Vahlne, 1977; 1990). In contrast, the international new venture or born global perspective (Oviatt & McDougall, 1994; Hennart et al., 2021) explains early and rapid internationalization by emphasizing firms that enter distant markets from inception despite limited resources, relying on entrepreneurial orientation, founders' prior international experience, and network-based resources, niche business models, rather than on incremental resource accumulation. While the born global perspective explains how firms internationalize early with scarce resources, it remains largely silent on how firms sustain growth across markets without proportional increases in organizational inputs over time.

Despite these differences, both perspectives primarily focus on explaining the initiation and speed of international expansion. In doing so, they tend to treat international growth as a process that entails increasing resource commitments over time, whether incrementally or rapidly from the outset. What distinguishes them is therefore how fast and how early firms commit resources internationally, rather than whether international expansion can occur without proportional increases in organizational inputs.

Yet we follow Palmié et al. (2023) and suggest that (international) scaling emphasizes how firms organize and deploy core resources so that they can be replicated across markets with limited additional inputs. This is particularly evident in digital and platform-based contexts, where standardized architectures and centralized resource bases enable replication across countries at low marginal cost (Coviello et al., 2024; Monaghan et al., 2020). Beyond the traditional IB view of standardization and adaptation, the integration of the SE view will sensitize and inform about the context-dependence of resources, those being held and those needed for international scaling. Overall, international scaling challenges growth-centric assumptions in IB by suggesting that geographic expansion may not necessarily require (over)proportional increases in resources. International scaling focuses on the non-proportionality of the input-output relationship: how some companies manage to grow their output and international impact without increasing their organizational inputs in the same way. Scalability can be the missing conceptual link for understanding this distinction.

As the following summary shows (Table 1), extant research offers limited insight into how scalability is created and sustained when firms with economic and social objectives scale internationally, and each stream leaves questions open. Furthermore, whether and how digital resources in hybrid firms come into play needs to be explored. As a result, we lack understanding of how scalability operates in organizations that balance profitability and impact, especially when scaling involves cross-border adaptation due to institutional heterogeneity, and the need of mission preservation. Moreover, while digitalization is widely recognized as a driver of scalability in for-profit settings, its role in building scalability in organizations with hybrid purposes remains underexplored (Assenova, 2020; He et al., 2022). Addressing this gap requires integrating insights from the literatures on scaling, international expansion, and organizational hybridity, which have largely developed in isolation.

Table 1. Core assumptions and puzzles in scaling literature

Core assumption	Implication for scalability across markets	Unresolved puzzles motivating this study
International expansion requires proportional accumulation of country-specific resources (Johanson & Vahlne, 1977; Penrose, 1959)	Geographic scope increases coordination costs and limits efficiency at scale	How can firms expand across multiple markets without proportional increases in localized resources
Scalability depends on the possession of scale-free resources with declining marginal costs (Giustiziero et al., 2023; Somaya et al., 2024)	Firms with scale-free resources should scale more easily across contexts	How is scalability created when core activities appear context-dependent or resource intensive
Digitalization enables replication and reduces marginal costs of expansion (Adner et al., 2016)	Digital platforms support international scaling	How does digitalization enable scalability when firms must preserve mission and legitimacy across heterogeneous contexts
Dual missions increase organizational complexity and constrain scalability (Battilana & Lee, 2014; Bacq & Eddleston, 2018)	Tensions between profit and impact limit growth	Under what conditions can hybridity support rather than constrain scalability
Scaling is primarily assessed through impact expansion (Ebrahim et al., 2014)	Impact growth does not imply organizational scalability	How do firms build organizational models that support both economic and social scaling

Source: authors' elaboration

Purpose of the paper. Building on this framing, this study conceptualizes scalability as an emergent organizational capacity that allows firms to increase the value they create at a higher rate than the growth of resources committed to the focal business (Giustiziero et al., 2023; Somaya et al., 2024). While recent work on scalability has emphasized scale free intrinsic characteristic of resources as key enablers of non-proportional growth, often treating scalability as an exogenous attribute of specific resource types (Giustiziero et al., 2023; Somaya et al., 2024). This approach is less applicable to hybrid firms operating across heterogeneous institutional environments and relying extensively on non-scale free resources such as locally embedded activities and human intensive processes (Battilana & Lee, 2014; Bacq & Eddleston, 2018). Responding to calls to endogenize scalability (Giustiziero et al., 2023), this study adopts a resource based perspective and draws abductively on Resource Orchestration Theory. Resource Orchestration Theory shifts attention from resource possession to managerial action, focusing on how resources are structured, bundled, and leveraged over time (Sirmon et al., 2007; 2011).

Applying this perspective to International Business, the study wants to complement the growth centric views that assume international expansion requires proportional accumulation of country specific resources (Johanson & Vahlne, 1977; Bartlett & Ghoshal, 1989; Verbeke, 2013) with a different perspective. While prior research has acknowledged that digital and platform based firms may internationalize rapidly and at low marginal cost (Monaghan et al., 2020; Coviello et al., 2024), the organizational mechanisms enabling non proportional international expansion remain underspecified. Responding to calls to endogenize scalability (Giustiziero et al., 2023), the study aims to understand how scalability can be constructed and sustained when operating across multiple markets while pursuing dual economic and social missions. Responding to calls to endogenize scalability (Giustiziero et al., 2023), rather than treating scalability as an intrinsic property of particular resources, it examines how firms create and sustain scalability as they expand internationally while pursuing both economic and social objectives.

Methodology. The research is exploratory, aiming at understanding complex phenomena from a holistic perspective. A multiple case study design is therefore suitable (Ghauri & Gronhaug, 2010), as it allows contextualized analysis and supports theory building (Ghauri et al., 2020). Case selection followed purposive, theory-driven sampling (Piekkari et al., 2010; Dubois & Gadde, 2017). We targeted firms with a declared hybrid identity (e.g., mission, communication, B-Corp certification) and evidence of scalability, defined as the capability to grow with less than proportional resource increases (Coviello et al., 2024). Following prior studies, we identify four criteria that indicate the presence of such a capability: 1) demonstrate disproportionate growth relative to costs, for example through declining marginal costs as output expands, a feature particularly salient in digital resource bundles (Giustiziero et al., 2023) 2) replicability of the business model, routines, platforms, or processes across markets or customer segments (Mula et al., 2024) 3) scalable digital infrastructures, enabling expansion without equivalent resource increases (Grimstad et al. 2025) 4) output metrics that capture when investments in scaling begin to translate into profitability or at least positive operating margins. This ensures that growth trajectories rely not only on continuous rounds of investment but on a disproportionate increase in output relative to inputs (Coviello et al., 2024). Case firms had to meet a minimum of three out of the four criteria to be considered eligible. This approach balances inclusivity with rigor, avoiding over-restrictive sampling while maintaining theoretical alignment.

We relied on both primary and secondary data from multiple sources. We collected primary data through semi structured interviews guided by an interview protocol. This protocol covered specific topics and facilitated probing for precise examples of emerging issues and themes during the interview. We recorded all interviews and transcribed them verbatim using Microsoft Teams option. Interview protocol was mainly standardized across cases, with some changes based on key characteristics of the company. Primary data was used as a starting point to develop an in-depth understanding of the two cases, drawing on internal perspectives and managerial interpretations of the firms' strategies and missions.

At the same time, companies are well-known and extensively covered in public sources, which provide rich information that is rarely systematically analyzed in qualitative research. We therefore relied on a broad set of secondary data to complement the primary interviews. News coverage from LexisNexis was used to trace key organizational events and changes over time, as well as how the firms were portrayed externally. Given the high public visibility of the companies, initial searches resulted in more than 10,000 articles. To ensure relevance and focus, we applied targeted search strings aligned with our research questions, substantially reducing the number of articles included in the analysis. These data were complemented with company documents, including public materials such as annual reports, websites, and press releases, as well as private documents shared with us after the interviews. These sources provided detailed information on strategic priorities, organizational changes, and business model development. We also used digital media, particularly YouTube interviews, which were valuable for capturing entrepreneurs' reflections on firm evolution and decision-making. We purposefully selected videos that provided relevant information into strategy and organizational development, excluding promotional or purely marketing-oriented content.

Results. This study examines how hybrid firms create scalability across international markets and how scalability shapes the relationship between economic and social outcomes during international expansion. By shifting attention from scaling outcomes to the organizational capacity that enables non-proportional expansion, the analysis identifies three mechanisms through which scalability is constructed in practice: (1) structuring a reusable core with modular international replication,

(2) making resources scalable through organizational design, experimentation, and prioritization, and (3) embedding mission-aligned decision rules into digital systems.

Mechanism 1: Structuring a scalable core with modular international replication. Scalability in international markets emerged from the deliberate construction of a replicable organizational core combined with modular and peripheral local adaptation. Rather than relying on progressive accumulation of country specific resources, firms organized international expansion around selective replication, rendering core resources reusable across contexts. Local resources were positioned as complementary inputs that enabled activation, legitimacy, and market access, without becoming primary cost drivers. This design prevented local activities from turning into binding constraints on growth and allowed firms to expand across markets without building heavy organizational infrastructures. The unit of replication varied across cases, including digital platforms, operational models, cities, sectors, or social ecosystems, depending on the nature of the business. Modularity enabled firms to confine adaptation to specific elements such as content, value propositions, services, or product design, while preserving a standardized core. Over time, replication was supported by codified routines and playbooks that disciplined international expansion, often developed through early failures and subsequent learning. Scalability thus relied on defining what was repeated, what remained flexible, and how replication routines were progressively formalized.

Mechanism 2: Making resources scalable through organizational design and experimentation. Firms relied on experimentation, prioritization, and disciplined pacing to ensure that scarce resources such as time, human effort, and engineering capacity were deployed only when initiatives demonstrated clear potential. High speed experimentation enabled rapid learning and reduced the risk of committing resources prematurely, while prioritization mechanisms helped eliminate initiatives with limited impact or scalability. Non scale free activities were not eliminated but reorganized so they did not become bottlenecks as scale increased. Manual, labor intensive processes were often embraced early on to learn the work, set standards, and establish quality thresholds, and were later translated into standardized routines, tools, or technologies that reduced marginal costs. Organizational design choices such as centralized high impact functions, generalist roles, and network based coordination further supported scalability by limiting overhead and allowing firms to grow output without proportional increases in inputs.

Mechanism 3: Embedding mission aligned decision rules into digital systems. Scalability was sustained by embedding mission aligned decision rules into digital systems that constrained opportunistic growth and limited mission drift as scale increased. Rather than relying on informal controls or local interpretation, firms codified priorities, trade offs, and ethical boundaries directly into everyday operations, ensuring consistency across markets. These system level constraints often required accepting slower short term growth or foregone revenues in order to preserve long term purpose. Revenue models were designed so that economic activity and social impact were tightly coupled, making growth in users, transactions, or partners automatically translate into mission consistent outcomes. Digital systems standardized how impact was generated, measured, and communicated, stabilizing the relationship between profit and purpose across contexts. As a result, profit and impact scaled through shared resource loops, where the same organizational and digital resources simultaneously supported financial sustainability and the expansion of social outcomes.

Together, these mechanisms explain how hybrid firms are able to expand across heterogeneous markets without proportional increases in resource commitments, thereby mitigating coordination costs and tensions between profit and purpose. Interpreting these mechanisms through Resource Orchestration Theory (Sirmon et al., 2007; 2011) allows the study to move beyond resource possession and to show how managerial action - through structuring, bundling, and leveraging - enables scalability to emerge as an organizational capacity (Giustiziero et al., 2023; Somaya et al., 2024).

Confronting these findings with International Business literature allows the study to refine the process of international expansion. The three mechanisms identified in this study show how firms reorganize international expansion around a reusable core and modular adaptation, allowing them to scale across markets without rebuilding localized infrastructures in each country. In this way, scalability reframes internationalization not as the accumulation of country-specific resources, but as the reuse and redeployment of organizational resources across contexts.

The study shows that through resource orchestration, hybrid firms actively transform initially rival or context-dependent resources into configurations that behave as non-rival over time. By codifying routines, standardizing governance mechanisms, and embedding mission-aligned rules into organizational systems, firms enable international expansion without proportional resource accumulation. In doing so, the study extends IB research by showing that scalability across markets is not achieved by eliminating rival resources, but by organizing international expansion around non-rival resource configurations that can be leveraged repeatedly across heterogeneous institutional contexts.

Research limitations. This study focuses on hybrid firms that exhibit evidence of scalability, defined as the ability to grow with less than proportional increases in resources. While this choice is theoretically motivated for examining how scalability is constructed in practice, the analysis may primarily capture scaling trajectories that have progressed beyond early or interrupted stages. As a result, dynamics associated with incomplete, stalled, or abandoned scaling efforts may not be fully observed. In addition, the reconstruction of scaling processes relies on retrospective accounts of organizational decisions and developments. Although triangulation with secondary sources supports the credibility of these

reconstructions, some micro level dynamics and alternative paths that were considered but not pursued may not be fully visible.

Managerial implications. This study shows that scaling across markets does not require prioritizing profit at the expense of broader societal goals. Instead, it demonstrates that profit and purpose can be deliberately integrated through how firms design and manage scalability. For managers, the key implication is that social objectives do not need to remain peripheral or symbolic, but can be embedded into the scalable core of the business.

The findings clarify how this integration can be achieved in practice by defining what is replicated across markets, by structuring local adaptation so that it supports rather than constrains growth, and by organizing resources in ways that allow expansion without proportional increases in inputs. In doing so, the study provides managers with concrete guidance on how to move beyond a profit only logic and implement scalable models that jointly generate economic performance and societal impact. At the same time, the study can provide knowledge on the elements that enable the creation of entrepreneurial ecosystems where firms can scale while generating a societal impact. Instruments at policy level are already in place, especially at the European Level, as the EU Commission emphasizes the relevance of scaling for the European ecosystem, noting that scaleups typically produce at least 10% more output than other SMEs with equal resources (Odenthal, European Commission). Yet, existing policy frameworks are with an economic focus rather than complementing it with a societal impact.

Originality of the paper. This paper conceptualizes scalability as an endogenous organizational capacity that can be deliberately constructed through the orchestration of resources, routines, and decision rules, rather than as an exogenous attribute of specific technologies or resource types. By focusing on how scalability is created, the analysis shifts attention from observed scaling outcomes to the underlying conditions that enable growth with less than proportional increases in inputs.

The study examines this capacity in the context of hybrid firms, where economic and social objectives coexist within the same organization. While prior research has emphasized the tensions associated with dual missions, this paper shows how scalability can be constructed without separating or subordinating social and economic goals, addressing an area that remains underexplored.

The paper further situates scalability within International Business research by using it to explain international expansion without proportional accumulation of resources. Rather than treating internationalization primarily as incremental growth, scalability is used to reinterpret how firms organize and replicate activities across markets.

The role of Corporate Heritage in Market Selection and Market Entry strategies: A multiple case study of the Italian Food & Beverage Industry

CAROLINA MARIA ROGNONI[1], FEDERICA SACCO[2]

Abstract. *Corporate heritage is increasingly recognized as a strategic resource that can convey legitimacy, trust, and authenticity. As its interpretation is rooted in the past and local context, we propose it might have implications on firms' internationalization process adopting a new institutional theory perspective. Organizations operating cross borders deal with several different contexts, which affect their decision-making; in particular, the institutional environment produces isomorphic phenomena among firms to appear legitimate. From this perspective, the informal institutions that arise from preestablished cognitive frameworks might have a deep influence on the strategies of internationalized companies endowed with corporate heritage. Consequently, we conceptualize corporate heritage as a system of informal institutions to study the implications that it might have on foreign market selection and entry. Our analysis is based on a multiple case study in the context of the Italian Food & Beverage industry. We outline a preliminary finding that links corporate heritage and entry mode choices, furthering international business and corporate heritage literature.*
Keywords: *corporate heritage; international business; market selection; entry mode; internationalization; Food & Beverage industry*

Framing of the research. *Over the last two decades, the concept of corporate heritage has gained growing attention in the corporate management and communications research fields, as it offers an interesting perspective on how organisations create and manage value over time. Heritage is a deeply rooted historical construct that shapes organisational identity (Balmer, 2013; Balmer & Burghausen, 2019). The etymology of the word itself ("to pass on") suggests that corporate heritage should not be reduced to mere history; instead, it encompasses an aspect of legacy, i.e. transmitting something to future generations (Burghausen & Balmer, 2014b). This trait d'union between temporal dimensions is distinctive of corporate heritage, as it represents "all the traits and aspects of an organisation that link its past, present and future in a meaningful and relevant way" (Burghausen & Balmer, 2014b, pp. 394-395). In this sense, corporate heritage overcomes the conceptualisation of corporate history, that is "an interpreted account of the historical trajectory and development of an organisation, representing an attempt in the present to explain, celebrate, justify, or otherwise make sense of changes over time" (Burghausen & Balmer, 2014b, pp. 392-393).*

The corporate communications literature has detailed six criteria to recognise corporate heritage, i.e.: omnitemporality, institutional trait consistency, tri-generational hereditary, augmented role identities, multigenerational stakeholder utility, and management tenacity (Balmer, 2013; Balmer & Burghausen, 2019). The expression corporate heritage identity indicates a peculiar identity type composed by institutional traits that have maintained their relevance over time (Burghausen & Balmer, 2014a). Because of the "transtemporal" facet, organisations must find a balance between continuity and change; indeed, corporate identity and its heritage traits are continuously under stakeholder scrutiny, which may lead to new interpretations and transformations over time, posing challenges for big and small enterprises (Balmer, 2011, 2013). If managed with the proper stewardship, organisations can leverage their heritage to build authenticity and reputation (Balmer, 2013; Hakala et al., 2011; Wiedmann et al., 2013). Moreover, "bi-lateral trust" must exist between corporate heritage institutions and stakeholders to have a legitimate and trustworthy corporate heritage identity (Balmer, 2011).

Corporate heritage contributes to perceptions of legitimacy and reliability because it encompasses the values, symbols, stories and traditions of an organization that are historically embedded in the local context in which the entity was founded or operates (Spielmann et al., 2021). These elements form a system of meanings and practices that guide organizational behaviour and stakeholder expectations over time. Consequently, corporate heritage acquires meaning within a specific context; if removed from that context, its interpretation might shift, as the context both forms and shapes the interpretations of heritage traits. This issue is particularly relevant for internationalised firms endowed with corporate heritage, as they operate across diverse socio-cultural and institutional environments.

However, only few previous works have investigated the relation between firm internationalization and corporate heritage. Kano and Verbeke (2018) conceptualized that heritage assets (family values, reputation, legacy routines) shape strategic choices, including internationalization pace and partner selection, in family firms. Similarly, Arikan et al. (2022) provided a microfoundational explanation of how legacy organizational elements shape internationalization cognition and processes. Yet, these contributions do not explicitly address how corporate heritage may affect corporate level decision-making related to the internationalization process phases, such as foreign market selection or entry mode.

International Market Selection (IMS) and Foreign Market Entry (FME) represent strategic decisions that are central to the success of a firm's international competitive strategy (Francioni & Martín Martín, 2024). IMS is commonly described as the process through which firms evaluate and select foreign markets – namely specific countries or cross-national segments – in which they intend to expand (Papadopoulos & Martín Martín, 2011). This process requires a complex reasoning under conditions of bounded rationality and may be influenced by organizational characteristics such as firm size and international experience (Benito, 2015; Papadopoulos & Martín Martín, 2011; Simon, 1959). In parallel, FME decisions concern the modality through which firms enter foreign markets, ranging from non-equity modes – such as exports and contract agreements (the latter including licensing and franchising) – to equity modes, namely Joint Ventures (JVs), strategic alliances, and Foreign Direct Investment (FDI), whether through greenfield or acquisitions (Pan & Tse, 2000).

IMS and FME choice are closely interrelated and often occur concurrently (Papadopoulos & Martín Martín, 2011). To explain these strategic choices, the international business (IB) literature has developed several theoretical perspectives. The OLI paradigm conceptualizes international expansion as the outcome of ownership, location and internalization advantages, largely grounded in resource, efficiency and cost considerations (Dunning, 1988; Makino & Neupert, 2000). Transaction Cost Theory suggests that firms select entry modes that minimise transaction costs, ranging from market-based arrangements to hierarchical control structures (Rindfleisch, 2019). The Uppsala model instead emphasises a gradual internationalisation process, whereby firms expand progressively into more psychically distant markets as they accumulate knowledge and commit resources over time (Johanson & Vahlne, 1977, 1990).

More recent IB research has increasingly recognized the importance of context, giving rise to theoretical approaches that emphasise the role of institutions in shaping firm's choices. Institutional theory explores the influence of formal and informal constraints within the institutional environment on organizational behaviour (Peng et al., 2008). Institutions can be understood as the shared "rules of the game in a society" that structure interactions among actors (North, 1990, p. 3). An important distinction between formal and informal institutions must be made to clarify their potential effects: formal institutions consist of codified rules such as laws and regulations, while informal institutions refer to unwritten norms, values, customs, and shared understanding that guide behaviour within a society (North, 1990, 2010).

The dynamic combination of these creates the institutional environment, which becomes an area of interaction that can be interpreted and negotiated (Dau et al., 2022).

Organisations are one of the many actors that are bounded to these social rules, which shape organisational behaviour and determine the scope of business opportunities; in turn, the institutional environment can be modified by firms' actions (North, 1990).

Within this perspective, the new institutional theory (Powell & DiMaggio, 2012; Scott, 2001) offers a useful lens for examining the relationship between corporate heritage with IMS and FME. Institutions provide regulative, normative and cognitive frameworks that both constrain and enable organizational action. On the other hand, organizations tend to conform to institutionalized expectations to appear legitimate, producing isomorphic patterns of behaviour within organizational fields (DiMaggio & Powell, 1983; Scott, 2001). In this sense, decision-making may follow a logic of appropriateness, whereby actors enact socially defined roles and rules rather than purely efficiency-driven choices (March & Olsen, 1989). Over time, such processes contribute to the diffusion and reproduction of institutional practices through coercive, normative and mimetic mechanisms, generating path-dependent organizational trajectories isomorphism (Mizruchi & Fein, 1999; Powell & DiMaggio, 2012). Informal institutions play a particularly relevant role in contexts characterized by uncertainty, where actors rely on shared norms and taken-for granted cognitive structures to guide their decisions (Kostova et al., 2019; Scott, 2001).

In this framework, corporate heritage may be conceptualized as a set of historically embedded informal institutions rooted in corporate identity. Through enduring values, traditions, narratives and organisational practices, corporate heritage contributes to shaping the normative and cognitive frameworks within which firms interpret strategic choices. Owning to its "transtemporal" character, corporate heritage may therefore generate forms of organisational path dependence that influence how firms approach international expansion. At the same time, when firms operate across borders, they are exposed to multiple institutional environments, both in their home and host countries, which may impose different or even conflicting legitimacy expectations (Kostova & Zaheer, 1999). In such circumstances, corporate heritage may be considered as a form of path-dependency that might influence foreign market selection and entry, producing implications in terms of isomorphic behaviours in the internationalisation process.

Purpose of the paper. *This paper aims to answer the following research question: how does corporate heritage influence firm's market selection and choice of entry mode?*

Corporate heritage has been defined as a multidimensional construct encompassing organizational traits that have remained meaningful over time and that maintain a deep connection with the context in which they emerged (Balmer, 2013; Spielmann et al., 2021). Because of this transtemporal nature, corporate heritage links past organisational practices and values with present and future strategic organizations. As such, it may shape decision-making processes, organisational behaviour and stakeholder relationships, as heritage traits can be continuously interpreted and valorised over time (Balmer, 2017; Napolitano et al., 2018; Pecot et al., 2018).

While existing studies recognize corporate heritage as a valuable resource for differentiation and competitive advantage, especially in branding and consumer perception (Balmer & Greyser, 2006; Hakala et al., 2011; Pecot et al.,

2019), its potential role in shaping strategic decisions related to internationalisation has received comparatively limited attention.

Methodology. *This research adopts a qualitative inductive research design, based on a multiple case study methodology (Stake, 1995). We chose this approach as it is well suited for new research areas for which existing theory is lacking. The multiplicity feature guarantees more robust evidence through the triangulation of different data collection methods, which is valuable for theory-building. Furthermore, case studies are an effective method to address 'how' and 'why' questions, thereby aligning with the purpose of this research (Eisenhardt, 1989; Rowley, 2002).*
The study's empirical analysis focuses on the Italian Food & Beverage industry, a choice justified by the following rationale. First, Italy is a country with a long-standing tradition in several manufacturing sectors – such as fashion, furniture, food processing and automative – due to deep linkages with its cultural scenario. The Italian Food & Beverage industry in particular is characterised by a prevalence of enduring companies that leverage tradition, craftmanship and authenticity to conquer both local and foreign consumers (Garofano et al., 2020). Moreover, given the context-specific nature of corporate heritage, adopting an industry-focused perspective may enable to identify specific mechanisms typical of the industry.

Hence, we focus on the Food & Beverage industry, which represents a central pillar for the national economy: the turnover of the industry, amounting to €156 billion according to ISTAT data for 2021, represents 14.5% of the total value of the manufacturing sector. In addition, Italian companies have an international orientation, as shown by the predominant role of F&B products within Italy's agri-food trade, accounting for approximately 86% of exports and nearly two-thirds of imports in 2022 (Castellotti et al., 2024). Therefore, considering the above-described context, the Italian Food & Beverage industry is a particularly fertile ground for studying the strategic implications of corporate heritage on internationalisation strategies of Italian companies, in relation to market selection and entry mode choices.

For what concerns case selection, we identified three purposeful-sampling criteria (Patton, 2014): i) the company operates with its core business in the Food & Beverage industry; ii) the company's corporate heritage fulfils the "tri-generational/50-year corporate heritage requisite" (Balmer, 2011, 2013); iii) the company conducts operations outside Italy via equity or non-equity entry modes. Based on these criteria, we drew up a prospective list of 21 companies from the database of "Centromarca" (Associazione Italiana dell'Industria di Marca) – which gathers almost 200 associated companies operating in sectors producing durable and non-durable consumer goods – and from the associates of "Associazione Marchi Storici d'Italia". From this list, seven companies agreed to be interviewed and participated in the research project: Riso Scotti, Illycaffè, Acetaia Giusti, Mutti, Antica Pasta Italiana, Lavazza e Lucano 1894. One of the selected companies – renamed Antica Pasta Italiana – preferred to stay anonymous.

The empirical analysis relies both on primary and secondary data. We collected primary data through semi-structured interviews, which consisted of ten questions built with a 'how' and 'why' form, related to corporate heritage, market selection, and market entry modes. We interviewed one managerial figure per company, occupying leadership positions in the sales, marketing, communication and/or export department. We chose not to focus only on international business leaders as corporate heritage is a significant cross-cutting dimension, especially embedded in marketing processes and communication; for instance, in one case the international business head of the firm purposefully redirected us to another colleague working in the communication division. Nevertheless, we still selected managers involved in the internationalization process of the company. Table 1 presents key details of the case firms and the informants that took part in the data collection. The eight interviews were conducted online via videoconferencing platforms (such as Microsoft Teams and Google Meet), via telephone call or in presence. They were audio-recorded with the participants' consent and transcribed within five days from the interview. After double-checking by the authors, we sent to each participant the interview transcript for approval, with the freedom of making any further integration or correction, where necessary. All interviews were conducted in Italian from January 2026 to March 2026, with an average duration of 37 minutes each. Subsequently, the primary data will be triangulated using secondary data retrieved from proprietary websites, companies' monographies, and newspaper articles, to enhance the reliability of the data by adopting multiple perspectives (Stake, 2006).

Data analysis was subsequently conducted following the Gioia methodology (Gioia et al., 2013), which is particularly suitable for qualitative studies in IB, and it enables the development of a proper data structure and a clear presentation of the findings (Magnani & Gioia, 2022). The data analysis of the qualitative interviews was based on a rigorous iterative process that required the researchers to compare data and theoretical foundations for each case. As a first step, we familiarised with the interview transcripts to develop a proper understanding of the company and its features. The most relevant informants' quotations were analysed to identify first-order codes, which were clustered to form coherent categories (Gioia et al., 2013). Currently, this phase has been only partially completed, as the data collection is ongoing and not all the transcripts have been approved. We will proceed in the following steps of the Gioia methodology to develop the final findings: we will merge similar categories according to their thematic relationship and develop second-order concepts; then, key aggregated dimensions will be identified to abstract from the empirical level to the theoretical level and create conceptual categories (Gioia et al., 2013). The final stage of analysis will consist in applying a gradual abduction to systematically combine qualitative data with extant theory with the purpose of building new theorical insights.

Table 1. Key information of selected cases

Company	***Foundation date***	***Turnover (2024, mil/€)***	***% of foreign sales***	***Informant Role***	***Interview duration (minutes)***

Results. *Considering that the data collection and analysis phases are currently underway, the findings presented at this stage should be regarded as preliminary. Nevertheless, an initial assessment has produced the following relevant insights.*

With regard to FME choices, the analysed cases appear to favour entry modes that allow firms to preserve and transmit corporate heritage in the transition from the home to the host country, as well as its subsequent translation in marketing and communication practices. Corporate heritage is perceived by firms as a source of competitive advantage and, consequently, as a strategic resource that should remain protected and consistent across markets, similarly to other critical assets under the firm's control, such as intellectual capital. In this sense, corporate heritage appears to span multiple layers of intellectual capital: it is embedded in organisational processes and routines and contributes to the creation of trust and legitimacy in stakeholder relationships, thus resembling a form of relational capital.

Moving beyond the theorization of corporate heritage as an identity dimension composed of values, symbols, stories and traditions, the preliminary evidence suggests that its context-dependent nature and its interpretation as a set of informal institutions embedded within the firm may influence entry mode decisions. On the one hand, it may guide managerial decision-making by shaping how firms evaluate the risk-control trade-off of entry modes. On the other hand, it may limit the adoption of less resource-committing entry modes (e.g. exports), which offer lower control and, therefore, may be considered as less suitable for safeguarding and coherently transmitting corporate heritage in foreign markets.

For instance, Acetaia Giusti opted for high involvement entry modes (e.g. subsidiaries) to enter key markets such as Korea and the US in order to maintain stronger control ad alignment on corporate heritage. In particular, the company progressively transitioned from local management structures to the presence of Italian personnel in these markets. Rather than relying primarily on on-site training of local staff, Acetaia Giusti preferred to employ personnel who already possessed a deep understand of its corporate heritage.

A similar pattern can be observed in the case of Illycaffè, leading coffee maker founded in Trieste. The firm established international branches of its Coffee University – an international centre of knowledge supporting every aspect of the supply chain through training, research and the promotion of the culture of quality coffee – in several key markets, where subsidiary or owned trading and distribution company were already present, resulting in a degree of alignment between the location of these educational initiatives and the firm's organizational presence.

Research limitations. *Given the exploratory nature of the study, it presents some limitations. First, the research concerns a specific industry (i.e. the Food & Beverage industry) that has its own distinctive features, which could influence and limit the study's findings and their generalizability. Second, the Italian context is the setting of our study and therefore the analysis is limited to the Italian competitive environment. Third, despite being a multiple case study analysis – which, compared to a single case design, ensures more robust research outcomes (Rowley, 2002; Stake, 1995) – with a proper number of cases (Yin, 2017), the sampling is more oriented towards larger companies for a reason of availability of interviewees, providing an unequal representation of the empirical context.*

Based on these limitations, we suggest that future research could replicate the study in another sector – for example the Fashion industry, also known for a strategic valorisation of corporate heritage (Cooper et al., 2015; Jackson, 2019) – and explore beyond the Italian cultural setting to discover if the findings are related to the national context and if the strategic role of corporate heritage in international strategies is perceived differently in other countries, leading to new implications. In addition, it could be interesting to extend the debate with a deeper focus on SMEs and test if their peculiarities have some kind of reflection on the operationalisation of corporate heritage.

Managerial implications. *The preliminary research finding strengthens the view of heritage as a valuable resource for competitive advantage in the international context, where firms can leverage the heritage traits of their identity. In*

addition, the study provides insights to practitioners into the current strategic implementation of corporate heritage in the internationalization process. It also gives advice on how corporate heritage should be enacted, interpreted and operationalised, as well as its potentialities or limits when expanding internationally.

Originality of the paper. *Our investigation provides original contributions at the intersection between corporate heritage and internationalization strategies, two research streams that rarely interact. To the best of our knowledge, this is the first study to investigate the strategic implications of corporate heritage in market selection and entry mode choices, as the integration of these topics is still unexplored. It extends the current international business literature and corporate heritage literature respectively by adding a new relevant internationalization determinant (i.e. corporate heritage) to the institutional theoretical framework (Dau et al., 2022) and goes beyond the predominant focus on marketing and communication that has characterized corporate heritage studies till now (Balmer, 2011, 2013; Balmer & Burghausen, 2019). Another innovative trait of the research consists in moving the focus from the brand to the corporate level, which allows to explore corporate phenomena, such as internationalization. Finally, the study opens the debate and future line of enquiry on corporate heritage and its strategic integration in decision-making.*

Universities as Orchestrators of International Entrepreneurial Ecosystems

BIRGIT HAGEN[1], DIALA KABBARA[1], LUCA CAVONE[1], PATRICEA ELENA BERTEA[2]

Abstract. *Entrepreneurial ecosystems are usually tied to a specific place - a city, a region, a country. But can a university deliberately build one that crosses national borders? This paper argues that it can and shows how this happens in practice. We examine three programs run by a single European university - referred to here as Program A, Program B, and Program C - that together span the micro, meso, and macro levels of an emerging international entrepreneurial ecosystem. Using a nested case analysis approach and drawing on Stam's (2015) entrepreneurial ecosystem framework, we show that the three programs do not simply operate in parallel — they are deliberately coordinated by the university, which acts as a central orchestrating node connecting all three levels simultaneously. Together they produce four types of capital: human capital, social capital, institutional capital, and market capital, which jointly support productive international entrepreneurship. Our main argument is that international entrepreneurial ecosystems do not have to emerge spontaneously from geographic clusters. They can be deliberately constructed through sustained multilevel governance and universities are particularly well positioned to do this, because they hold legitimacy across education, research, and policy at the same time, something that private actors and governments alone typically cannot achieve.*
Keywords: *international entrepreneurial ecosystems, nested ecosystems; university as orchestrator; transnational entrepreneurship*

Framing of the research. *Over the last decade, research on entrepreneurial ecosystems (EE) has grown considerably and produced sophisticated frameworks for understanding how actors, institutions, and resources interact to support productive entrepreneurship (Stam, 2015; Spigel, 2017; Audretsch et al., 2024). Despite this progress, most of the literature remains strongly focused on territory - that is, ecosystems are typically defined at the regional or national level, with relatively little attention to internationalization. Even less attention is paid to the question of who builds such international configurations, and how this process takes place (Theodoraki & Catanzaro, 2022; Ceci et al., 2026).*

A second gap concerns the role of universities. The "entrepreneurial university" tradition (Etzkowitz, 2003) documents well how higher education institutions contribute to national innovation systems - through spin-offs, knowledge transfer, and industry partnerships. More recently, some scholars have also begun to examine how universities enable international entrepreneurial learning (Laine et al., 2025). However, most studies still treat universities as participants within ecosystems rather than as architects of them. The governance mechanisms through which universities can intentionally coordinate cross-border actors, align incentives, and build multilevel support structures remain almost completely underexplored.

This paper tries to address both gaps at the same time. We examine three European programs where UnIT acts as lead partner. To ensure blind review, the three programs examined in this study are referred to throughout as PROGRAM A, PROGRAM B, and PROGRAM C, corresponding to the analytical level at which each primarily operates within the nested ecosystem framework. PROGRAM A is a blended intensive learning programme, PROGRAM B is an international accelerator initiative and PROGRAM C is an European Campus of City-Universities, an alliance of nine universities). Using Stam's (2015) nested ecosystem framework, we trace how each program mobilizes actors, governance structures, and different forms of capital across micro, meso, and macro levels - and how, taken together, they produce an emerging international entrepreneurial ecosystem.

Our central claim is twofold. First, international entrepreneurial ecosystems can be deliberately constructed - they do not simply emerge from geographic proximity. Second, universities - particularly those operating within international alliances - are in a uniquely strong position to act as orchestrators in this construction process, because they hold legitimacy simultaneously in education, research, and institutional policy domains. This is something that private intermediaries generally do not have.

Purpose of the paper. *Most research on entrepreneurial ecosystems treats them as geographically bounded structures - defined by a city, a region, or a country. Yet entrepreneurial activity increasingly crosses borders, and the question of how ecosystems can be built and sustained across national boundaries remains largely unanswered. Theodoraki and Catanzaro (2022) are among the few scholars who address this gap directly, showing that entrepreneurial ecosystems can extend beyond geographic borders and that a glo-cal culture - combining adaptation to local contexts with global integration - is central to making this work. However, their study, like most in this tradition, focuses on describing and mapping international ecosystem configurations rather than explaining how they are deliberately constructed and by whom.*

More recently, Audretsch et al. (2024) take this further. They show that entrepreneurial ecosystems do not have to be tied to a specific place. Instead, a new type of ecosystem is emerging - one that sits above local ecosystems and connects them, giving entrepreneurs access to resources and knowledge from multiple locations at the same time. This kind of ecosystem does not replace local ones. It works alongside them, helping entrepreneurs go beyond the limits of their immediate context. This connects directly to the nested logic of Stam (2015) and Stam and van de Ven (2021), where ecosystem layers sit inside each other and each layer depends on the ones around it. What Audretsch et al. (2024) add is a transnational dimension to this picture: the outermost layer of a nested ecosystem does not have to be a national or regional structure - it can be a cross-border structure that links multiple local ecosystems together into a larger whole.

Following Stam (2015) and Stam and van de Ven (2021), we work with three analytical levels. At the micro level, the unit of analysis is the individual - the entrepreneur, the student, the faculty member - and the dominant dynamics are agency, human capital, and entrepreneurial cognition. At the meso level, the focus shifts to networks, organizations, and coordination: incubators, accelerators, inter-university partnerships, and support offices all function as relational infrastructure. At the macro level, institutional systems - including EU funding architectures, regulatory frameworks, and formal alliances - provide the structural incentives and constraints within which the other levels operate. We further analyse three different programs coordinated by one university we call UnIT.

The Blended Intensive Learning Programme (PROGRAM A) is coordinated by UnIT and has already run multiple editions over the last decade. Each edition combines a one-week residential entrepreneurial program in Italy with participation from partner institutions in Germany, France, Poland, Finland, and Austria, together with online collaborative activities. The primary actors are international students and faculty from partner institutions, complemented by startup founders, startup centers, and domain experts from practice.

At the micro level, PROGRAM A produces the foundational human capital of the emerging international entrepreneurial ecosystem: cross-cultural entrepreneurial competence, international opportunity recognition skills, and experiential knowledge about foreign market conditions. Students function as opportunity recognizers and business "consultants" for the startups; faculty serve as knowledge brokers; and entrepreneurs act as role models and direct "mentors". Over eleven editions, a dense informal network of alumni, faculty collaborators, and practitioners has accumulated - and this constitutes the relational substrate on which the other programs can build.

PROGRAM A governance is primarily personal and trust-based at the operational level - grounded in long-term professional relationships among partner professors - while being formally anchored in Erasmus+ agreements at the institutional level. This combination of informality and formality is characteristic of productive meso-level coordination, and it provides the social capital that may later scale into more formalized configurations.

PROGRAM B operates as an international incubation and acceleration initiative involving UnIT, partner universities in Cologne and Granada, and affiliated incubators and technology parks - including related startup centres and entrepreneurial networks in the partner universities. Its principal actors are startup founders, incubator managers, faculty with entrepreneurial experience, and international students in joint accelerator programs.

At the meso level, PROGRAM B performs what Spigel (2017) calls the relational coordination function that is constitutive of ecosystem quality. It creates an international accelerator architecture - shared governance of joint acceleration programs, coordination between incubators across three countries, and structured interactions between startups and cross-national expert networks. The recurring international meetings that bring together academics, startup founders, and incubator representatives function as ecosystem convening events that generate and maintain inter-organizational ties.

PROGRAM C (European Campus of City-Universities) is a nine-university strategic alliance, funded under the European Universities Initiative, with partners across seven EU member states. It has a formal institutional governance structure - including a General Assembly and alliance-level coordination mechanisms - and carries the institutional legitimacy of an EU-recognized higher education brand.

At the macro level, PROGRAM C provides the institutional capital that gives the emerging international entrepreneurial ecosystem its structural stability and legitimacy. The PROGRAM C brand functions as a quality signal to EU funders, industry partners, and policy actors. The alliance governance architecture aligns institutional strategies across nine universities, embedding entrepreneurial internationalization within higher education institutional frameworks rather than leaving it as a peripheral project activity.

Moreover, PROGRAM C creates a shared institutional identity - something like what Theodoraki and Catanzaro (2022) call a "glo-cal culture" - that can sustain the international ecosystem beyond individual project cycles.

Beyond its governance architecture, PROGRAM C has developed a structured, multi-level system of components that actively support entrepreneurial activity across member universities and their cities. The central element of this system is the Entrepreneurial Academy, which combines online lectures with intensive Entrepreneurial Weeks organised in rotation at different partner cities. During these weeks, student teams from all member universities work together on innovation projects connected to the United Nations Sustainable Development Goals (Stam, 2015; Audretsch et al., 2024). From a theoretical point of view, this rotating format is significant: rather than concentrating entrepreneurial education in a single location, PROGRAM C distributes this function across multiple university cities, allowing each local context to develop its own entrepreneurial conditions while remaining part of a common international structure.

A second important component is the Innovation Sphere, developed within the RI4C2 Horizon 2020 project and coordinated by the University of Jena. This component creates a shared networking space that brings together researchers, entrepreneurs, innovation managers, city representatives, and civil society organisations from all seven

partner communities (Spigel, 2017). Within this space, the Lighthouses of Innovation serve as local collaboration points where knowledge produced at the alliance level is translated into concrete innovation activities in each partner city - reflecting the Quadruple Helix model proposed by Carayannis and Campbell (2009).

A third and more recent structural element is the EITEN network - the Entrepreneurship, Innovation and Transfer Expert Network - developed as part of WP9 of the current PROGRAM C project phase. EITEN focuses on building connections between the individuals who directly support research and innovation processes across the alliance: researchers, managers, and administrators from each partner university.

Methodology. *As discussed in the previous section, relatively little is known about how international entrepreneurial ecosystems are built and sustained through deliberate governance action. The phenomenon is relatively new, and empirical documentation of such configurations remains sparse in the literature. Standard deductive approaches are therefore not well suited as a starting point for this kind of inquiry.*

We therefore proceed with an exploratory objective, based on an abductive approach. The purpose of this research is not to develop new international entrepreneurship theory from empirical data alone. Rather, existing theory and literature are folded into the analysis to help extend our understanding of international entrepreneurship and its outcomes at various levels (Davidsson, 2008). This means we move iteratively between theoretical frameworks and empirical observations, using each to refine and challenge the other.

We draw on several complementary theoretical traditions - including entrepreneurial ecosystem theory, the triple helix model of university-industry-government relations, and relational perspectives on innovation networks - all of which see universities as critical players in building entrepreneurial structures across institutional and geographic boundaries. What remains less theorized, and what we seek to advance, is the specific orchestrating role that universities can play when they operate simultaneously across micro, meso, and macro levels of an international ecosystem.

We follow a nested case analysis approach (Thomas, 2011; McGaughey, 2007). In nested studies, the breakdown of analysis occurs within the principal UnIT of analysis. In our case, we study a portfolio of internationally relevant programs within UnIT. The nested study differs from a multiple case study in that it gets its coherence from the wider case: the comparison is not between separate, independent cases, but between nested elements that only have meaning in relation to the wider whole (Thomas, 2011). This design is appropriate when the research interest lies in understanding how constituent elements together produce a systemic outcome - in our case, how three programs together constitute an emerging international entrepreneurial ecosystem.

The three programs under analysis were selected because each operates at a distinct level of the ecosystem and together, they provide multilevel coverage of UnIT's international entrepreneurial portfolio. The first is a Blended Intensive Programme (PROGRAM A) with entrepreneurial internationalization at its core, operating primarily at the micro level of individual actor development. The second is PROGRAM B, an Erasmus Strategic Partnership Programme aimed at developing migrant, female, and international student audiences for new venture creation, operating primarily at the meso level of network coordination. The third is PROGRAM C, a European Universities alliance with the overarching aim of developing entrepreneurship and innovation at systemic scale, operating primarily at the macro level of institutional governance.

UnIT thus constitutes an instrumental case (Stake, 1994) - a case selected not primarily for its intrinsic interest, but because it offers new insight into a broader theoretical question: namely, how a university, through a portfolio of projects, can build an international entrepreneurial ecosystem that fosters entrepreneurship at micro, meso, and macro levels simultaneously. The instrumental case design is appropriate here because UnIT's portfolio is sufficiently documented, accessible to the research team, and theoretically interesting as an instance of deliberate ecosystem construction.

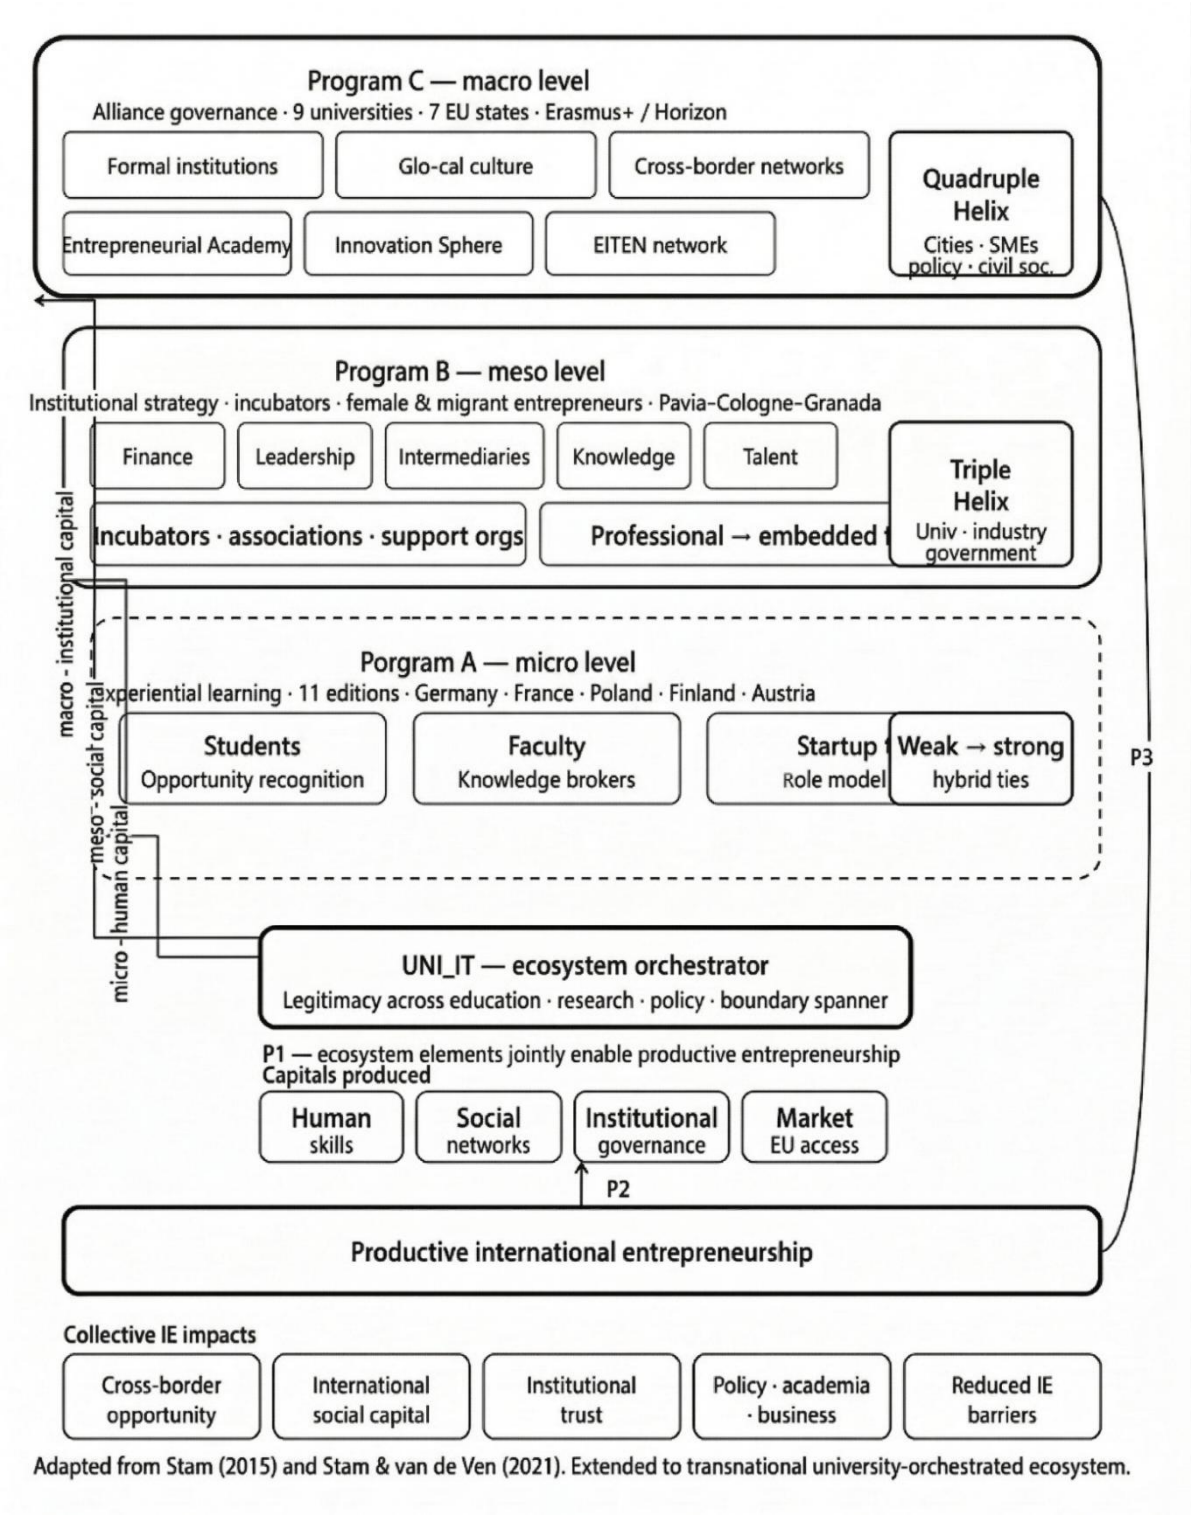
Our analysis is both real-time and retrospective: we examine the three programs and their intersections from their respective start dates up to the current state of development. This longitudinal perspective allows us to trace not only the static structure of each program but also the dynamic processes through which inter-program connections and ecosystem-level effects have emerged over time.

Sources of data include semi-structured interviews and informal conversations with various stakeholders - program coordinators, partner university representatives, startup founders, and student participants; documentary sources such as project applications, descriptions of work packages, monitoring reports, and institutional communication materials; and direct observation, given that all authors are actively involved in at least one of the three programs under analysis.

We identify and analyse patterns of interaction, coordination mechanisms, and ecosystem outcomes that emerge across the three programs taken together. We document key facts regarding each program - including consortium composition, objectives, brief descriptions, and timeframes. To further analyse how an international ecosystem is built, the analytical framework combines content pillars (institutions, culture, actors, resources, support, markets) with systemic dimensions (structural, relational, evolutionary/spatial), explicitly tracking cross-border links, multi-level governance, and "glo-cal" culture (Isenberg, 2011; Stam & van de Ven, 2021; Theodoraki & Catanzaro, 2022;).

Results. *Universities have structural characteristics that make them particularly effective as orchestrators. They hold legitimacy across education, research, and policy domains simultaneously; they are positioned at the intersection of public and private actors; and through European frameworks such as Erasmus+ and Horizon, they have access to stable governance and financial infrastructure that private intermediaries typically lack.*

Fischer et al. (2019) show that entrepreneurial activity in universities is deeply embedded within institutional environments and organizational practices, and that individual characteristics alone cannot explain the entrepreneurial behaviour of faculty members. Their findings also reveal that formal institutional structures — incubators, technology transfer offices, entrepreneurship events — often produce limited and inconsistent effects on academic entrepreneurship, highlighting the complexity of translating governance mechanisms into entrepreneurial outcomes. This points to an important distinction: having institutional structures in place is not the same as actively orchestrating the conditions under which entrepreneurship happens. Building on this, we argue that when universities govern international entrepreneurial programs, they act not only as educational providers but as active institutional orchestrators — deliberately shaping the rules, relationships, and resource flows that structure an international entrepreneurial ecosystem. This role extends beyond the traditional conceptualization of the entrepreneurial university, which has primarily focused on knowledge commercialization and technology transfer (Etzkowitz, 2003).



Laine et al. (2025) provide direct empirical support for how universities can actively connect entrepreneurial ecosystems across national borders, rather than simply contributing to a single local ecosystem. Studying an Erasmus+ Blended Intensive Programme, they show that a university can act as an institution that bridges separate entrepreneurial ecosystems that would otherwise have no channel to interact across geographical boundaries. Their findings show that a blended study-abroad program does more than improve student learning outcomes. It also connects local and international entrepreneurial ecosystems by facilitating exchanges and value co-creation among students, faculty, industry actors, and government stakeholders across countries, following a Triple Helix logic. This positions the university as a key player in interregional knowledge transfer and international entrepreneurship development. Their work provides empirical grounding for the claim that a PROGRAM A can function not only as an educational format but as an ecosystem-bridging mechanism - supporting the argument developed in this paper that universities can deliberately connect and construct international entrepreneurial ecosystems through structured program governance.

The nested structure of entrepreneurial ecosystems is not only a theoretical idea - but recent research also shows it takes different practical forms depending on context. Ceci et al. (2026) review 48 peer-reviewed studies and identify four types of nested configurations: startup ecosystems, entrepreneurial university ecosystems, entrepreneurial innovation ecosystems, and regional innovation ecosystems. Each type is shaped by two questions: whether the dominant logic of the system is entrepreneurial or focused on innovation, and whether the system is driven from the bottom up by actors or from the top down by governance structures. The type most relevant to this paper is the entrepreneurial university ecosystem. In this configuration, the university plays a top-down coordinating role, translating research and knowledge into entrepreneurial activity through structured governance mechanisms. This supports the central argument of this paper: UnIT does not simply participate in an ecosystem - it coordinates one, by deliberately activating three nested layers through PROGRAM A, PROGRAM B, and PROGRAM C. Ceci et al. (2026) also make a broader point that is important here: there is no single model that fits all ecosystems. Effective ecosystem governance must match its mechanisms to the specific configuration it is trying to build. This is exactly what the multilevel portfolio approach of UnIT attempts to do.

Figure 1 extends the nested ecosystem model of Stam (2015) and Stam and van de Ven (2021) to an international context. In the original model, an entrepreneurial ecosystem has two layers sitting inside each other. The deeper layer is made of framework conditions - formal institutions, culture, and networks. These are the slow foundations of the system. The layer above consists of systemic conditions - talent, knowledge, finance, leadership, intermediaries, demand, and infrastructure. These are more dynamic and closer to entrepreneurial activity. The two layers together produce productive entrepreneurship as output, and a feedback loop ensures that outcomes over time strengthen the conditions that produced them. The logic is simple: the deeper layer enables the middle layer, and the middle layer enables entrepreneurial activity. What the original model does not address is how this structure can be built deliberately across national borders, and who builds it. This is what the adapted framework tries to show.

In Figure 1, the three programs of UnIT each occupy a distinct layer of the nested structure. Importantly, the three programs do not connect to each other directly. Each one connects independently to UnIT, which sits at the centre as the orchestrating node. It is this central position that turns three separate programs into a coherent nested ecosystem. PROGRAM A sits at the innermost layer - the micro level. It works directly with individuals: students, faculty, and startup founders from partner institutions across five European countries. Through eleven editions of intensive experiential learning, PROGRAM A produces the human capital that the whole ecosystem depends on. Students develop cross-cultural entrepreneurial competence and cross-border opportunity recognition skills. Networks begin as weak professional ties and evolve into stronger hybrid ties combining social, academic, and business connections. In the terms of Stam and van de Ven (2021), PROGRAM A activates the talent and knowledge components of the systemic conditions layer. It is the generative base of the ecosystem - without it, the layers above would have no internationally capable people to work with. At this level, UnIT acts as a boundary spanner connecting universities, startups, and support actors across countries.

Figure 1 – UnIT – orchestrating an international ecosystem

PROGRAM B sits at the middle layer - the meso level. It works with organizations and the relationships between them: incubators, associations, support organizations, and university units across Pavia, Cologne, and Granada. PROGRAM B builds the social capital of the ecosystem through structured international partnerships that start as professional ties and become more embedded over time. It activates multiple systemic conditions - finance, leadership, intermediaries, knowledge, and talent - and applies a Triple Helix logic, connecting universities, industry, and government across national boundaries. PROGRAM B also has a specific inclusion dimension: it targets female, migrant, and international student entrepreneurs, creating pathways for early internationalization that the other programs do not cover. PROGRAM B does not receive inputs directly from PROGRAM A. Both programs connect to UnIT independently,

and it is UnIT that mediates the relationship between the human capital of the micro level and the organizational networks of the meso level.

PROGRAM C sits at the outermost layer - the macro level. It provides the institutional architecture that gives the whole system its stability and legitimacy over time. As a nine-university alliance across seven EU member states, with formal governance and access to Erasmus+ and Horizon funding, PROGRAM C embeds the activities of PROGRAM A and PROGRAM B within a durable frame that can survive beyond individual project cycles. Inside PROGRAM C, three components support this function: the Entrepreneurial Academy distributes entrepreneurial education across rotating partner cities; the Innovation Sphere creates shared spaces that bring together universities, cities, SMEs, policy actors, and civil society following the Quadruple Helix model of Carayannis and Campbell (2009); and the EITEN network builds the cohort of connected professionals who sustain the system at the human capital level. Together these components create what Theodoraki and Catanzaro (2022) call a glo-cal culture - local enough to fit each partner context, global enough to hold the alliance together. Like the framework conditions in Stam's original model, PROGRAM C is the deepest and slowest-moving layer - the one that makes everything else durable. PROGRAM C also connects to UnIT independently, not to PROGRAM A or PROGRAM B directly.

The three programs together produce four types of capital. PROGRAM A produces human capital - skills and international mindsets. PROGRAM B produces social capital - networks and inter-organizational ties. PROGRAM C produces institutional capital - governance structures and formal legitimacy. Together, the three programs also produce market capital - access to EU markets, cross-border incubation pathways, and soft-landing mechanisms that reduce uncertainty for internationally oriented ventures. Each type of capital feeds upward through the nested layers, all mediated by UnIT.

The collective impact is larger than what any single program achieves alone. Together, the three programs increase cross-border opportunity recognition, strengthen international social capital, build institutional trust across countries, integrate policy and business actors into a shared governance framework, and reduce the barriers to international startup creation. This is the P1 logic in the diagram: when UnIT activates all three layers simultaneously, the ecosystem elements jointly produce productive international entrepreneurship as output. The P3 feedback loop then ensures that this output flows back into the system - reinforcing the macro-level institutions, deepening the meso-level networks, and attracting new talent at the micro level. This feedback works not within one territory but across seven EU member states, held together not by geography but by the deliberate action of UnIT. This is the core extension of Stam's model: the nesting is institutional rather than geographic, the layers are deliberately constructed rather than pre-existing, and the feedback loop is governed rather than spontaneous.

Taken individually, PROGRAM A, PROGRAM B, and PROGRAM C each address a distinct ecosystem dimension. Taken together, they constitute a nested multilevel international entrepreneurial ecosystem in which UnIT acts as the central orchestrating node across all three levels simultaneously.

At the micro level, UnIT recruits and develops entrepreneurial human capital through PROGRAM A's intensive experiential programs. At the meso level, it coordinates an international network of incubators, startups, and knowledge brokers through the PROGRAM B accelerator architecture. At the macro level, it leverages the institutional authority and funding infrastructure of PROGRAM C to embed these activities within a durable strategic framework. Within PROGRAM C itself, the three-tier internal structure - the Entrepreneurial Academy, the Innovation Sphere, and EITEN - further operationalises this macro-level orchestration by distributing entrepreneurial functions across student, community, and professional support layers.

This analysis leads us to a theoretical proposition that extends existing EE theory: international entrepreneurial ecosystems do not require pre-existing geographic clusters or spontaneous emergent dynamics to form. They can be deliberately constructed through sustained multilevel governance by actors - especially universities - whose institutional mandates, resource access, and cross-sectoral legitimacy enable them to perform coordination functions across borders that neither markets nor governments alone can perform.

Research limitations. *This study has several limitations that future research should address. The analysis is based on a single university and its three programs, which limits generalizability. The direct involvement of the authors in the programs under analysis, while providing privileged access to data, also introduces the risk of insider bias. The study is retrospective rather than longitudinal, meaning it maps the structure of the ecosystem at a given point in time rather than tracking outcomes over time. Finally, the perspectives of non-university actors - startup founders, students, city representatives - are underrepresented in the current analysis and would enrich the framework considerably if examined more systematically in future work.*

Managerial implications. *For university managers and rectors, the paper suggests that international entrepreneurial impact does not require a single large initiative. A portfolio of smaller, complementary programs - each operating at a different level of the ecosystem - can produce systemic effects that exceed what any one program achieves alone. The key managerial insight is that the university must position itself as the connecting node between these programs, rather than managing them as separate administrative units. This requires deliberate cross-program coordination, shared governance thinking, and a long-term commitment that goes beyond individual project funding cycles.*

Originality of the paper. *The contribution we make is the application of the multilevel schema to programs that span national borders, where each level must be reproduced across multiple institutional contexts at the same time. The challenge lies in aligning micro-level actor motivations, meso-level coordination mechanisms, and macro-level institutional logics across different national settings - all within a single coherent governance architecture. We consider this an important new research problem that the current literature does not yet address adequately.*
